Dr. Cowgill Receives Nutrition Award.—George R. Cowgill, Ph.D., professor of nutrition at Yale University, received the 1948 Award for Scientific Distinction of the Grocery Manufacturers of America, November 15. The presentation took place during a luncheon at the organization's annual meeting in the Waldorf-Astoria Hotel, New York. Dr. Cowgill was cited for "fundamental contributions to the science of nutrition, particularly his research on the functional role of vitamin B_1, his success as a teacher of young biochemists and his outstanding editorial work for the *Journal of Nutrition.*" Each year a committee of the Grocery Manufacturers of America selects for its award a scientist who has made an important contribution to public health in the science of nutrition. Dr. Cowgill, a member of the Yale faculty since 1921, has been a member of the Council on Foods and Nutrition of the American Medical Association since 1938.

Scholarships in Cerebral Palsy.—Scholarships for special study in cerebral palsy are being offered to physicians, therapists and educators by the National Society for Crippled Children and Adults. Funds in the amount of $5,000 per year for three years have been granted to the National Society for this purpose by the Alpha Chi Omega national sorority. The scholarship plan provides for the training of outstanding persons who will be able to assist member societies of the national society in developing, setting up and operating facilities and centers for the use of all public and private agencies interested in helping persons having cerebral palsy. Under the program allotments, varying from $500 to $1,000 for tuition and maintenance at a recognized training center for the minimum of three months, are given to qualified persons. Doctors, therapists, educators and other needed workers are eligible to receive the scholarships. For information address the National Personnel Registry and Employment Exchange, National Society for Crippled Children and Adults, Inc., 11 South La Salle St., Chicago 3.

Staff for WHO Secretariat Appointed.—Since September 1, when the World Health Organization formally became a specialized agency of the United Nations, a number of internationally known public health specialists have been appointed to fill top positions in the World Health Organization Secretariat. Among the persons named by Dr. Brock Chisholm, director-general of the World Health Organization, are the following: Dr. Raymond Gautier, Switzerland, assistant director-general in charge of the department of technical services; Dr. William P. Forrest, United Kingdom, special assistant to the director-general; Dr. Yves Biraud, France, director, division of epidemiology; Dr. William Bonne, Netherlands, director, division of planning; Dr. Frank A. Calderone, United States, director, Technical Liaison Office, New York; Dr. Neville Goodman, United Kingdom, director, Division of Field Operations; Dr. Norman Howard-Jones, United Kingdom, director, Division of Editorial and Reference Services, and Mr. Milton P. Siegel, United States, director of administration and finance.

American Academy of Allergy.—The annual meeting of the American Academy of Allergy will be held at Chalfonte-Haddon Hall, Atlantic City, December 6-8. All physicians interested in allergic problems are invited to attend the sessions as guests of the academy by registering without payment of fee. Included in the program are two memorial lectures to late members of long standing: The first, in memory of Dr. Harry D. Donnally, will be given by Dr. Thomas Francis, Ann Arbor, Mich., on "Immunology of Virus Diseases." The second, in memory of Dr. Robert Ward Lamson, will be given by Drs. Thomas H. Holmes, Helen Goodell, Stewart Wolf and Harold G. Wolff, New York, on "An Experimental Approach to Psychosomatic Phenomena in Rhinitis and Asthma." The presidential address will be made by Dr. Karl D. Figley of Toledo, Ohio. At the banquet December 7 William J. Hale, LL.D., consultant to Dow Chemical Company, Midland, Mich., will speak on "Today's Food and Its Aftermath."

Western Surgical Association Meeting.—The annual meeting of the Western Surgical Association will be held at the Statler Hotel, St. Louis, December 2-4, under the presidency of Dr. Harry B. Zimmerman, St. Paul. Among others the following have been invited to read papers:

Rudolph J. Noer and John W. Derr, Detroit, Revascularization Following Experimental Mesenteric Occlusion.
Arthur C. Pattison, Los Angeles, Portacaval Anastomosis in Cases of Advanced Portal Cirrhosis.
Col. Frank E. Hamilton, M.C., and Major George J. Hayes, M.C., Washington, D. C., Pre-Frontal Lobotomy in the Management of Intractable Pain.
Stanley E. Lawton and Arthur R. Marks, Chicago, Gastrojejunocolic Fistula.
E. Lee Strohl and Guy V. Pontius, Chicago, Multiple Polyposis of the Colon.
Charles W. Mayo and Roberta G. Rice, Rochester, Minn., Situs Inversus Totalis: Statistical Review of 76 Cases with Special Reference to Disease of the Biliary Tract.
Frederick R. Harper, William B. Condon and William H. Wierman, Denver, Chronic Suppurative Lung Disease.
Ralph G. Carothers, Cincinnati, and Foster J. Boyd Jr., Indianapolis, Traction Technique for the Reduction of Colles' Fractures.
Robert A. Wise, Portland, Ore., Hemipelvectomy for Malignant Tumors of the Bony Pelvis.

The presidential address will be delivered at the opening of the Friday afternoon session. The annual dinner will be December 3 at 6:30 p. m.

Pharmaceutical Manufacturers Award.—The National Institutes of Health, Bethesda, Md., have been selected to receive the American Pharmaceutical Manufacturers' Association 1948 Scientific Award. It will be presented by Dr. Ernest E. Irons, Chicago, President-Elect of the American Medical Association, at a dinner in the Waldorf-Astoria Hotel, New York, at 8 p. m., December 7. Dr. Rolla E. Dyer, director of the institutes, will give the acceptance address. The ceremony attending the award will consist of morning, afternoon and evening sessions reporting new and basic information on major research progress in drug therapy. The program is as follows:

Austin Smith, Chicago, Trends in Drug Therapy Research.
Cornelius P. Rhoads, New York, Basic Research Progress in the Field of Cancer.
Milton V. Veldee, Washington, D. C., Trends in the Field of Biologic Products.
Perrin H. Long, Baltimore, Basic Research Progress in the Field of Antibiotics.
Keith S. Grimson, Durham, N. C., Basic Research Progress in the Field of High Blood Pressure.
Randolph West, New York, Use of Vitamin B_{12} in Treatment of Pernicious Anemia.
Isaac Starr, Philadelphia, On the Stimulation of Medical Research by Means of Grants: Its Promise and Its Dangers.
Charles G. King, Ph.D., Scarsdale, N. Y., Basic Research Progress in the Field of Nutrition.
Roy R. Kracke, Birmingham, Ala., Basic Research Progress in the Field of Blood Disorders.
Arthur C. DeGraff, New York, Basic Research Progress in the Field of Heart Diseases.
Charles Ragan, New York, Basic Research Progress in the Field of Arthritis.
Howard T. Behrman, New York, Basic Research Progress in the Field of Dermatologic Disorders.

In the past four years this award has been given to the National Research Council, the Rockefeller Institute for Medical Research and the American Medical Association.

Social Hygiene and the Defense Program.—The American Social Hygiene Association has reactivated its Committee on National Defense Activities, and preliminary conferences have been held with representatives of the National Defense Establishment and United States Public Health Service. The Interdepartmental Venereal Disease Control Committee, which was appointed during World War II and comprises representatives of the Army, Navy, Air Force, National Defense Establishment as such, the U. S. Public Health Service, the Federal Security Agency, and the American Social Hygiene Association as an advisory member, also held a conference and formulated proposals for the services of the association to be included in the Defense Program. Among the proposals submitted to the president of the association were: to act as an advisor to the National Defense Establishment in matters pertaining to community education and the repression of prostitution; to make available to the armed forces, on request, educational material and advisory services; to bring citizen support to good law enforcement, social treatment and individual health education through the home, the church and the school.

A grant from the reserve funds of the United Service Organization enables the American Social Hygiene Association to undertake the services requested by the interdepartmental committee. The staff has already been recruited, trained and assigned to field and headquarters duties. Field offices have been established where required, and close cooperation with military authorities has been established on national, regional and local levels.

Among the objectives of the new project are to provide military and civilian authorities with reliable information concerning demoralizing conditions which may result in the spread of venereal diseases, especially near military posts and defense industrial establishments; to interpret to the public the present character guidance policy of the National Defense Establishment as it relates to the men and women in these services.

Dr. Walter Clarke, executive director of the American Social Hygiene Association, has general supervision of the project from the main office at 1790 Broadway, New York. This project will be kept separate from the permanent activities of the American Social Hygiene Association, which are financed entirely by private gifts through the Community Chest and sponsored appeals, and which will go along as usual.

Marriages

William Cunningham Crittenden, Birmingham, Ala., to Miss Constance C. Glasgow of Lexington, Va., in August.

Abraham Irving Friedman, Hackensack, N. J., to Miss Helene Marion Bennett of New York, in August.

Hugh Franklin Swingle Jr., Johnson City, Tenn., to Miss Joan Dickey Lincoln of Marion, Va., August 21.

Joseph A. Ambrosino, New York, to Miss Roberta Ann Redden of Dover, N. H., in August.

Harvey James Howard, St. Louis, to Mrs. Alice Tilson Eastes of Baltimore, August 24.

Aliza Cole, Chilhowie, Va., to Mr. Robert A. Lightburn at New York, August 1.

Deaths

James King Hall ⊕ Richmond, Va.; born in Piedmont, N. C., Sept. 28, 1875; Jefferson Medical College of Philadelphia, 1904; member of the National Committee on Mental Hygiene, American Association on Mental Deficiency, Association for the Study of Internal Secretions, American Association for the Advancement of Science and the Virginia Academy of Science; past president of the American Psychiatric Association, Association of Private Psychiatric Hospitals, Richmond Academy of Medicine, Tri-State Medical Association of Virginia and the Carolinas and the Southern Psychiatric Association; in 1933-1934 vice president of the Medical Society of Virginia; specialist certified by the American Board of Psychiatry and Neurology; served as member of the board of the Central State Hospital, Petersburg, and chairman of the Governor's Board on Criminal Mental Hygiene; for many years member of the medical staff of the State Hospital, Morganton, N. C., one of the founders and medical superintendent of the Westbrook Sanatorium; associate editor of *Southern Medicine and Surgery* and *Diseases of the Nervous System*; in 1935 received the honorary degree of LL.D. from the University of North Carolina; died September 10, aged 73.

Francis Parkman Denny ⊕ Brookline, Mass.; born in Brookline, Mass., Jan. 2, 1869; Harvard Medical School, Boston, 1895; at one time on the faculty of his alma mater; for many years health officer; established a bacteriologic laboratory in the city in 1899, the first in Massachusetts outside Boston, a tuberculosis pavilion as part of the Brookline contagious disease hospital in 1914 and a dental dispensary in 1915; member of the New England Pediatric Society and of the American Public Health Association; member of the executive committee and honorary vice president of the Massachusetts Tuberculosis League; past president of the Massachusetts Public Health Association, the Norfolk District Medical Society and the Brookline Anti-Tuberculosis Society; for twenty-six years responsible for the quarterly publication of the *Brookline Health Bulletin;* during his term of office as health officer Brookline was three times the winner of a health conservation contest sponsored by the United States Chamber of Commerce; died in New London, N. H., September 6, aged 79.

Paul Scott Hansen, Santa Barbara, Calif.; born in Columbus, Ohio, Oct. 16, 1910; Northwestern University Medical School, Chicago, 1938; interned at St. Luke's Hospital in Chicago and Massachusetts General Hospital in Boston; member of the American Medical Association; certified by the National Board of Medical Examiners; specialist certified by the American Board of Internal Medicine; formerly on the faculty of the University of Pennsylvania School of Medicine in Philadelphia and the Yale University School of Medicine, New Haven; served as a captain with the 15th Evacuation Hospital in Africa, Sicily and Italy; separated from the service as a major after thirty-three months of service overseas; consultant on blood diseases at the Santa Barbara Clinic; affiliated with the Santa Barbara Cottage Hospital and the Santa Barbara General Hospital, where he died September 26, aged 37, of *poliomyelitis.*

Bert Ira Beverly ⊕ Oak Park, Ill.; born in Richfield, Ohio, June 2, 1894; Rush Medical College, Chicago, 1924; clinical associate professor of pediatrics (Rush) at the University of Illinois College of Medicine, Chicago; specialist certified by the American Board of Pediatrics; member of the American Academy of Pediatrics, serving for many years as chairman of the mental health committee; member of the Illinois State Commission for Handicapped Children; served during World War I; head of the behavior clinic at the Central Free Dispensary, Presbyterian Hospital; consultant psychiatrist at the Shriners Hospital for Crippled Children and for many years on the staff of Children's Memorial Hospital, all in Chicago; author of "In Defense of Children" and "A Psychology of Growth"; died September 27, aged 54, of rupture of the chordae tendinae.

Edwin Welles Kellogg, New York; born in 1878; New York Homeopathic Medical College and Hospital, New York, 1903; member of the American Medical Association; fellow of the American College of Surgeons; formerly on the faculty of his alma mater; an officer during World War I; served as a member of the medical practice committee which had jurisdiction over all physicians and surgeons practicing in workmen's compensation cases in New York; consulting surgeon, New York Ophthalmic Hospital; affiliated with the Doctors, Park East and Flower and Fifth Avenue hospitals; died in Washington, Conn., September 11, aged 69.

Fritz Carleton Hyde, New York; born in Grand Rapids, Mich., June 3, 1876; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1900; at one time president of the Connecticut Medical Examining Board; member of the New England Surgical Society; fellow of the American College of Surgeons; served during World War I; for many years chief of staff and chief of medical service at the Greenwich (Conn.) Hospital and consulting surgeon at the Cape Cod Hospital in Hyannis, Mass.; died in Harwichport, Mass., September 4, aged 71, of arteriosclerosis and hemiplegia.

Joseph Francis Bredeck ⊕ St. Louis; born in St. Louis, in 1890; Washington University School of Medicine, St. Louis, 1914; received the doctor of public health degree from the University of Pennsylvania in 1917; since 1933 health commissioner; instructor in clinical medicine and lecturer in public health at his alma mater; served in France during World War I; fellow of the American College of Physicians; a drive for funds to establish a public health scholarship in his honor is being organized by friends and associates; died October 4, aged 58, of heart disease.

Robert Meston Bolton, Durham, N. H.; born in Somerset, Md., May 19, 1903; George Washington University School of Medicine, Washington, D. C., 1931; member of the American Medical Association and the Medical Society of the District of Columbia; served in the medical corps of the U. S. Naval Reserve during World War II; formerly on the staffs of the Garfield, Children's, Columbia, Casualty and Doctors hospitals in Washington, D. C.; recently appointed director of the health service at the University of New Hampshire; died September 16, aged 45.

Ward Ariel Anderson, Portland, Ore.; Ohio Medical University, Columbus, 1906; on the staff of Morningside Hospital; died in Emanuel Hospital August 24, aged 71, of heart disease.

Cecil V. Bachelle ⊕ Chicago; Rush Medical College, Chicago, 1900; fellow of the American College of Surgeons; formerly on the faculty of the College of Physicians and Surgeons, School of Medicine of the University of Illinois; affiliated with Walworth County Hospital in Elkhorn, Wis., and Henrotin Hospital; died September 21, aged 73, of chronic *myocarditis.*

George Elliott Patrick Barnes, New Orleans; Tulane University of Louisiana School of Medicine, New Orleans, 1931; member of the American Medical Association; served during World War II; affiliated with Southern Baptist, Lakeshore and Mercy hospitals; died September 4, aged 43, of injuries received in an automobile accident.

Ben P. Bell, Oklahoma City; University of Oklahoma School of Medicine, Oklahoma City, 1942; member of the American Medical Association; interned at St. John's Hospital in Tulsa; served a residency at St. Elizabeths Hospital in Washington, D. C.; served in the medical corps of the U. S. Naval Reserve during World War II; affiliated with the Coyne Campbell Sanitarium; killed September 5, aged 33, when the plane he was flying crashed.

Clarence Joseph Bertaut, Chicago; St. Louis College of Physicians and Surgeons, 1920; Chicago Medical School, 1922; on the staff of the Bethany Hospital; died in Oak Park, Ill., September 14, aged 52, of coronary thrombosis.

Newton Emerson Bitzer ⊕ Lancaster, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1898; fellow of the American College of Surgeons; examiner for the draft board during World War I; served as a member of the local board of health; for many years medical director of St. Joseph's Hospital; died in Lancaster General Hospital August 15, aged 75.

Bert John Bixby, Buffalo; University of Buffalo School of Medicine, 1903; member of the American Medical Association and the National Gastroenterological Association; veteran of the Spanish-American War and World War I; served on the staff of the Millard Fillmore Hospital; died September 7, aged 72, of hypertrophic cirrhosis of the liver.

Nathan Bernard Bluestone ⊕ Yorktown Heights, N. Y.; University of Glasgow Medical Faculty, Scotland, 1933; member of the board of education; on the staffs of the Peekskill (N. Y.) Hospital and Northern Westchester Hospital in Mount Kisco; served overseas during World War II; died August 25, aged 43.

Peter Bourbaki, Kansas City, Kan.; National University of Athens School of Medicine, Greece, 1895; Loyola University School of Medicine, Chicago, 1917; served on the staffs of Bethany Hospital, Providence Hospital and St. Margaret's Hospital, where he died September 8, aged 75, of multiple myeloma.

Walter R. Brock ⊕ Sheldon, Iowa; Drake University Medical Department, Des Moines, 1894; past president of the Sioux Valley Medical Association, serving for many years as treasurer; in 1931 vice president of the Iowa State Medical Society; past president of the O'Brien County Medical Society; for many years city health officer; on the staff of Good Samaritan Hospital; died September 11, aged 78, of coronary occlusion.

Henry Alexander Brown, Los Altos, Calif.; Medico-Chirurgical College of Philadelphia, 1900; member of the American Medical Association; veteran of the Spanish-American War; fellow of the American College of Surgeons; specialist certified by the American Board of Ophthalmology; formerly on the staff of the Stanford University School of Medicine, San Francisco; died September 18, aged 77, of coronary disease.

James Mack Brown, Gadsden, Ala.; Medical College of Alabama, Mobile, 1889; member of the American Medical Association; died August 14, aged 82, of coronary thrombosis.

Richard C. Buchanan ⊕ Green Bay, Wis.; Detroit College of Medicine, 1896; fellow of the American College of Surgeons; on the staffs of St. Mary's Hospital, Bellin Memorial Hospital and St. Vincent's Hospital, where he died August 21, aged 78, of coronary thrombosis.

Charles Howard Cale, Neffs, Ohio; Starling Medical College, Columbus, 1904; member of the American Medical Association; past president of the Belmont County Medical Society; affiliated with City Hospital in Bellaire; died July 23, aged 72, of acute coronary occlusion.

William R. Camp, Fairburn, Ga.; Atlanta Medical College, 1890; member of the American Medical Association; formerly mayor and for many years on the city council; county physician; died August 25, aged 80, of carcinoma of the lung.

Thomas Francis Capeles ⊕ Haverhill, Mass.; Tufts College Medical School, Boston, 1909; specialist certified by the American Board of Ophthalmology and the American Board of Otolaryngology; member of the New England Otological and Laryngological Society; affiliated with the Massachusetts Eye and Ear Infirmary, Boston, and Hale Hospital; member and clerk of the Haverhill park board; died August 12, aged 63, of uremia and carcinoma of the prostate.

Webb Parks Chamberlain ⊕ Cleveland; Western Reserve University Medical Department, Cleveland, 1903; member of the American Academy of Ophthalmology and Otolaryngology; specialist certified by the American Board of Ophthalmology; affiliated with the Lakewood and Lutheran hospital; died July 20, aged 71, of carcinoma.

Helen E. Collins, Chicago; Hering Medical College, Chicago, 1900; died September 26, aged 78, of pneumonia.

Willis Scott Cooke, Cazenovia, N. Y.; New York University Medical College, New York, 1897; formerly member of the state compensation board; served during World War I; died in the Crouse Irving Hospital, Syracuse, September 2, aged 75, of coronary thrombosis.

Charles Campbell DeKlyn, New Rochelle, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1905; served during World War I; on the consulting staff of the New Rochelle (N. Y.) Hospital, where he died September 7, aged 66.

Lillian Elizabeth Dempsey, Vallejo, Calif.; University of Oregon Medical School, Portland, 1896; died September 19, aged 75, of cerebral hemorrhage.

Michael F. J. Donovan ⊕ Chicago; Bennett Medical College, Chicago, 1915; surgeon for the Chicago, Rock Island and Pacific Railroad; affiliated with St. George Hospital, where he died September 17, aged 65, of coronary thrombosis and diabetes mellitus.

James Maurice Downey ⊕ Brooklyn; Long Island College Hospital, Brooklyn, 1891; also a graduate in pharmacy; fellow of the American College of Surgeons; past president of the Brooklyn Surgical Society; affiliated with the Hospital of the Holy Family and St. Mary's Hospital; died September 12, aged 82, of coronary disease.

Sylvester Amos Draper, Orlando, Fla.; Medical College of Virginia, Richmond, 1900; died August 16, aged 74.

Robert Earl, St. Paul; University of Minnesota College of Medicine and Surgery, Minneapolis, 1896; member of the American Medical Association and the Western Surgical Association; fellow of the American College of Surgeons; member of the founders group of the American Board of Surgery; affiliated with the Midway and Mounds Park hospitals; died August 11, aged 65.

Gottfried Arthur Estel ⊕ North Madison, Ind.; St. Louis University School of Medicine, 1904; affiliated with the Madison State Hospital; died in Murphysboro, Ill., August 20, aged 68, of chronic endocarditis.

Marvin A. Gantt, Houston, Texas; Louisville (Ky.) Medical College, 1904; member of the American Medical Association; died recently, aged 70, of carcinoma of the liver.

William Harris Gitman, Dayton, Ohio; Université de Lausanne Faculté de Médecine, Switzerland, 1938; member of the American Medical Association; interned at the Good Samaritan Hospital; served during World War II; affiliated with the Good Samaritan, Miami Valley and St. Elizabeth hospitals; died September 3, aged 40, of coronary thrombosis.

William Christian Hager, Brooklyn; Long Island College Hospital, Brooklyn, 1896; visiting physician at the Swedish Hospital; died September 12, aged 81, of uremia.

Henry Steers Holland, New York; Columbia University College of Physicians and Surgeons, New York, 1905; member of the American Medical Association; fellow of the American Society of Anesthetists; on the staff of Sloane Hospital for Women and the Doctors Hospital; died in the Midtown Hospital August 28, aged 67, of carcinoma of the left submaxillary gland.

Otto Landman, Toledo, Ohio; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1887; fellow of the American College of Surgeons; on the staff of St. Vincent's Hospital; died July 11, aged 86, of Parkinson's disease.

Ross Simonton McElwee ⊕ Statesville, N. C.; University of Maryland School of Medicine, Baltimore, 1909; member of the House of Delegates of the American Medical Association from 1941 to 1945; member of the Radiological Society of North America; on the staff of the H. F. Long Hospital; president of the Statesville Chair Company and the Statesville Industrial Bank; died September 8, aged 68, of carcinoma.

DIED WHILE IN MILITARY SERVICE

Jack Leslie Doughtie ⊕ Lieutenant Colonel, M.C., U. S. Army, Cleburne, Texas; born in Cleburne, Sept. 26, 1912; University of Texas School of Medicine, Galveston, 1937; formerly an intern at the John Sealy Hospital in Galveston and a resident at the Brackenridge Hospital in Austin; entered the medical reserve corps of the U. S. Army in July 1940 and served until July 1941, when he entered the regular army; served a residency at the Brooke General Hospital, Fort Sam Houston, San Antonio; died in the Walter Reed General Hospital, Washington, D. C., March 22, aged 35, of heart disease.

William Wills Green Jr., Tarboro, N. C.; Duke University School of Medicine, Durham, 1944; interned at the Duke Hospital in Durham; certified by the National Board of Medical Examiners; member of the American Medical Association; captain, medical corps, Army of the United States; died March 18, 1947, aged 26, of cerebral hemorrhage.

Albert Clark Kinney Jr., Hardwick, Vt.; University of Vermont College of Medicine, Burlington, 1946; interned at the Maine General Hospital in Portland, Me.; first lieutenant, medical corps, Army of the United States; killed in Alaska Dec. 28, 1947, aged 27, while on a mission to rescue the crew of an airplane which crashed on the Seward Peninsula.

Edward George Meter Jr., Merion Station, Pa.; Universität Heidelberg Medizinische Fakultät, Baden, Germany, 1936; interned at the Fitzgerald-Mercy Hospital in Darby, Pa., served a resident fellowship in radiology at the Graduate Hospital of the University of Pennsylvania in Philadelphia; specialist certified by the American Board of Radiology; major, medical corps, Army of the United States; attached to the 183rd General Hospital, Fort Richardson, Alaska; died June 12, 1947, aged 38, of acute myocardial infarction.

Maurice Louis Silverstein, Boston; Boston University School of Medicine, 1923; member of the American Medical Association; interned at the Massachusetts Homeopathic Hospital; commissioned a captain in the medical corps, Army of the United States, Feb. 4, 1944; died in the Lovell General Hospital, Fort Devens, Mass., Feb. 16, 1946, aged 47, of tuberculous meningitis.

The Remuneration of Specialists in the National Health Service

A body known as the Spens Committee was recently appointed by the government to investigate and report on the remuneration of specialists employed under the National Health Service. They recommended that the total range of remuneration for a full time specialist should be $6,000 to $20,000, but that remuneration above $10,000 should depend on the award of special distinction. The government now announces that it has had under review the report of the Spens Committee and has decided to set up a special awards committee. It will be a national committee charged to select those specialists whose outstanding distinction merits higher financial rewards than the normal rates.

The principle of the decision cannot be gainsaid, but how is it likely to work? It is certainly a delicate operation, which is entirely new in this country, for a committee to make a survey of the specialists of the country and decide who are to be proclaimed "distinguished" and who not. Another trouble is the matter of expense, but that never seems to trouble the socialist government, who have made permanent, as far as they can, the crushing taxation of the war. As the consultations with or treatment by specialists are free to the patients, they will demand the specialists who have been dubbed "distinguished" to the neglect of the others. It is well known that many of the younger men, who are to get lower remuneration, are just as competent for many purposes as the "distinguished" ones. Under private practice the matter is easily solved. The general practitioner recommends the specialist most suitable both for the case and the patient's pocket. But under National Health Insurance he passes the unnecessary increased cost on to the taxpayer.

The Nuffield Foundation

The Nuffield Foundation, because of the munificence of the automobile magnate Lord Nuffield, has spent or promoted grants amounting to $8,500,000 for research in its first five years. In their third report, just published, the trustees welcome the increased support of the state for learning and research but think that this does not decrease the need of alternate sources of support if the democratic principle is to be upheld, that there should be room for more than one opinion and for more than one means of putting that opinion to the test. The foundation is supporting three university chairs of industrial health, one of child health and four schools of dentistry. It is also financing laboratory studies of the blood and of the physiology of learning in animals, as well as some important sociomedical inquiries. A remarkable one is into the nature and circumstances of the middle class, "the main repository not only of administrative and professional ability but also of our cultural capital." This class has in the past received far less attention than have the wage earners. The work is to be undertaken by the London School of Economics with a view to studying not only how people rise and fall in our complicated caste system but also whether the prevailing conditions of life for the middle class are becoming too difficult. The difficulty certainly is mainly due to the confiscatory prolongation of taxation on the war level to finance the socialistic measures of the labor government.

A gift of $1,800,000 has been made to the Nuffield Foundation by Captain O. Bird, who has suffered from osteoarthritis for many years, for promotion of research into the prevention and cure of rheumatism.

Rehabilitation Centers

Since the war great attention has been given to rehabilitation. It began with the treatment of those who had recovered from their wounds but has been extended to disability due to other causes. For several years a residential rehabilitation center for the reconditioning of men who have left a hospital but are not fit immediately for full time employment or vocational training has been in operation near London, at Egham, Surrey. The experiment has so justified itself that the Ministry of Labor began to make plans for other centers, but there is great difficulty in securing premises and adapting them for this purpose. The Minister of Labor has therefore decided to use government training centers temporarily.

The objects of the course at these centers are as follows: (1) to restore to fitness and confidence those who, although not in need of active medical treatment, are not fit for full time employment; (2) to discover by observation and tests and with medical advice the personal factors impeding satisfactory settlement in employment and the types of employment most likely to lead to permanent resettlement and (3) to give guidance to placement officers of the Ministry about the effects of a disability on a person's working capacity. The maximum length of the course will be twelve weeks, but it is expected that in the majority of cases a month or six weeks will be sufficient. Efforts will be made to find for the person the type of employment or training recommended by the specialist officers. Those undergoing the course will receive allowances for their support. Three centers have already been opened, and it is planned to open ten more in large towns.

What is an Accident?

What is an accident may seem to be a simple question to most persons, but the lawyers wrangle about the meaning of the term. The medicolegal correspondent of the *British Medical Journal* points out that the tendency of our highest tribunal, the House of Lords, to interpret the Workmen's Compensation Acts "beneficially" has led to decisions which have expanded the concept of injury by accident to an extent that puts a severe strain on the sense of the ordinary person. Compensation was awarded to a workman who claimed that he contracted Raynaud's disease from vibration of a rotary tool and to another who suffered from hernia alleged to be due to vibration of a pneumatic drill. The classic case, on which these decisions were based, was that of a girl who, after sustaining numerous cuts and scratches on her hands in the course of her work over a long period, became totally incapacitated as a result of blood poisoning. It was held that she was not the less entitled to compensation because her disease was due not to one definite and specified accident but to a series of accidents, each of which was specific and ascertainable, though its actual influence on the resulting illness could not be precisely fixed. But at last the House of Lords seems to have called a halt to this process of extension of the meaning of accident.

A workman contracted silicosis through prolonged work as a slate cutter. He complained compensation for injury by accident, arguing, as in the previous cases, that each particle of silica had caused a separate accident and that his condition was due to accumulation of these slight injuries. His claim was rejected on the grounds that the disease was not due to an accident as the word was used in the Act, or to a series of accidents, but was the result of a continuing process repeated from day to day. Although it is possible to analyze silicosis into a series of separate injuries caused by separate accidents, the attribution of the disease to an accidental cause is unreal. The distinction between accident and disease is well founded. No explicit formula could be adopted with safety, but there must come a time when the indefinite number of so-called accidents and the length of time over which they occurred take away the element of accident and substitute that of process. Silicosis is such and could not be said to be the result of injury by accident. The case of the girl with the scratched hands was the high water mark of cumulative injury by infinitesimal accidents.

Neurosyphilis and Penicillin

Girard, Moreau and H. Fraisse have reported to the Lyons Society of Dermatology and Syphilography their results in 19 cases of neurosyphilis treated with intramuscular injections of penicillin every three hours, or twice a day in a delaying substance. They began treatment with a dose of 30,000 units and progressed up to 300,000 units, to a total of 5,000,000 units. In tabes, results were on the whole satisfactory: fulgurating pains disappeared frequently, even in cases that had resisted all previous treatments; improvement of sphincter disorders occurred, and there was the possibility of an improvement of ataxia. In general paralysis, results were less brilliant; rather frequently, however, there was improvement of disorders affecting intellect and character, and a disappearance, after treatment, of hyperalbuminosis and hypercytosis in the cerebrospinal fluid. The serologic reaction remained positive most of the time. In dementia paralytica penicillin is to be considered rather as an adjuvant, associated with malaria therapy. The authors have noted a few reactions consisting in the aggravation of functional signs and, in 1 case, in the transitory appearance of Wernicke's aphasia, which proves that the treatment has to be used cautiously.

New Laws Concerning Venereal Disease

The new law of July 8, 1948, grants to sanitary authorities the right to demand from a person against whom exist "precise, serious and concordant presumptions" of having contaminated one or several persons with a venereal disease a medical certificate stating whether he has a contagious venereal disease or not. If this certificate seems contradictory to the epidemiologic history, a medical examination by an approved venereologist or an approved dispensary can be demanded. The new law reinforces the compulsory sanitary supervision, decreed in 1947, of every person entered in the sanitary and social registry of prostitutes. The sanitary authority is to be informed of any change of residence of any person placed under sanitary supervision, and all prosecutions for soliciting have to be reported to the Sanitary Authority in order to enable it to cause the said person to be examined. The notation in the registry of prostitutes now becomes compulsory when there is repetition of the offense or when the person suffers from a venereal disease. But the same section prohibits the inclusion in the registry of any defaulter under 18 years of age and of any under 21 on probation. Another law, of Aug. 28, 1948, divides the antivenereal dispensaries into three categories: (1) public dispensaries run by the state, (2) those run by associations recognized as of public interest and by institutions of the Social Security and (3) dispensaries run by private organizations and private persons; these can be open only after a previous agreement of the "Préfet," granted on recommendation of the district health director. Every department must have at least one hospital comprising a ward for venereal diseases. In every department, the service of the antivenereal campaign is to be under the management of a doctor in chief, appointed by the Ministry for Public Health and Population. The state shares the expense of establishing new dispensaries and for the extension of old ones. The subsidy may reach 50 per cent of the cost.

Death of Professor Lenormant

Professor C. Lenormant died at the age of 73. A descendant of intellectual ancestors, he was a brillant scholar and a disciple of Reclus, Bouilly, Gerard, Berger, Marchant and Rochard. He was a hospital surgeon at the age of 27, associate professor at the age of 30 and professor of surgical clinics at the age of 43. His works on encapsulating plastic peritonitis, volvulus of the cecum, rectal prolapse, diaphragmatic hernias, traumatic chylothorax, thymus hypertrophy and fractures of the calcaneus will long retain their value in the history of surgery. In collaboration with P. Lecene, whom he succeeded in the professorship of external pathology, he studied hemorrhagic pancreatitis, pneumococcic peritonitis, exostoses and chondromas and nonparasitic cysts of the long bones. He had been, for a time, general secretary to the Academy of Surgery. He contributed to the *Presse Médicale* and the *Journal de Chirurgie,* of which he was one of the founders. During the occupation he was a *resistant*; on his proposal, the Academy of Medicine voted a protest against the gynecologic visit, imposed on French women deported to Germany by the "Service of Compulsory Labor." It was he who wrecked the Nazi scheme to pair each of the principal French medical journals with a German review.

BRAZIL

(From Our Regular Correspondent)

São Paulo, Oct. 25, 1948.

Amebiasis and Chronic Cholecystitis

In 500 cases of intestinal amebiasis, Professor Felicio Cintra do Prado of Escola Paulista de Medicina found 11 cases in which there was a prevalence of symptoms generally attributed to disturbances of the biliary ducts. The patients showed steady or intermittent pain in the hepatic region, tenderness over the vesicular area, nausea before breakfast and dyspeptic pain caused by foods, especially fatty foods. Cholecystography and duodenal intubation did not reveal any abnormality in these patients; feces, however, contained Endameba histolytica, and the apparently vesicular symptoms disappeared with the specific antiamebic treatment. Such cases are due to general toxic manifestations acting sporadically on the vesicular functions and, perhaps, in some cases to colitis predominating on the hepatic flexure, according to Professor Prado.

Nervous Reactions to Diphenhydramine Hydrochloride

Dr. J. Pereira Jr. of Instituto Biologico of São Paulo reported recently the case of a white man aged 23 years who, after 300 mg. of diphenhydramine hydrochloride, taken over a period of three days, had from the fourth day on tendency to sneeze and a dysenteric syndrome of short duration with nausea and vomiting; on the fifth day, somnolence, confusion, hallucinations and purposeless kinetic impulses; a sallow skin; bilateral palpebral drop with temporary blindness; internal strabismus of the right eye with paralytic bilateral mydriasis; he was always apyretic and without convulsions or spasticity; deep and cutaneous reflexes were decidedly depressed, but pulse rate, blood pressure and temperature were always in normal range. In four days all signs, but the ocular, were on the wane. The latter disappeared slowly in about one and a half months, with residual hemianopsia of the left eye.

After comparison of the side and toxic effects of the drug, in the literature and in this case, with signs of local bulbar anesthesia in animals, the theory is put forward that the narcotic effects and permeability-changing properties of the drug with respect to the nervous system explain the symptoms noted, without regard to any local atropine-like action of the drug.

Correspondence

UNIVERSIDAD CATOLICA DE CHILE ESCUELA DE MEDICINA

To the Editor:—In the May Issue of The Journal an article was published on Medical Education in Latin America, by Dr. Morris Fishbein. In the paragraph devoted to Chile, he made several observations on the official medical school, which is supported by the government. With regard to our Catholic University school of Medicine, he merely names it to state that it is controlled by the official school, that it follows the French system of teaching and that it has only five years of medical studies.

In order to add some information to that already given, we wish to inform you of several facts which may be of interest.

1. The Catholic University School of Medicine has been in existence only eighteen years. It has gradually increased its courses as far as the fifth year, thus excluding only the medical specialties, because it lacks the necessary hospital facilities.

2. The admittance to the first year of premedical studies is limited to only forty students, every year selected from about two hundred applicants. A second selection takes place during this year, as only thirty are admitted to the final examination.

3. The premedical teaching, which correspond to the first two and one-half years, is principally practical, given in the different laboratories, which are properly and sufficiently equipped for the number of pupils to be trained there.

4. The medical teaching, initiated in the second half of the third year, is given in the clinical hospital, provided with one hundred and fifty beds and adequate services of a clinical laboratory, a roentgenologic laboratory and a laboratory of pathologic anatomy. The medical teaching is also fundamentally practical, and the students have to spend four hours each morning in the hospital wards, medical and surgical on alternate days, and in the afternoon, besides attending some other courses of the curriculum, they assist in the outpatient department and make rounds in the wards assigned to them.

The medical and surgical teaching is not divided into secondary courses, but is fundamentally unified.

5. There are two medical libraries, one medical in the hospital, and one premedical in the medical school. About seventy medical publications are regularly received, but the number of books available is small because of scarcity of funds.

6. The research work that is done in the different laboratories is indicated by the fact that during the last six years they have produced scientific papers, published in known North American, European and Chilean medical magazines. (We are sending a list of these papers).

7. With regard to the teaching staff, about 80 per cent are half time workers in the medical school or hospital, and 5 per cent are in full time jobs. We recognize that this is a considerable handicap and that all of these men receive insufficient salaries, but our scarcity of funds does not allow us to do better.

Finally, we want to make it clear that this type of medical teaching follows much more closely on the North American system than the French or Spanish plan, and it has been successfully applied because many of our head men have had a medical or a scientific training in different North American medical schools and hospital or scientific centers, and because some of our laboratories have benefited from funds given by North American foundations for the development of scientific research.

Joaquin Luco, M.D.,
Director of the Medical School.
The Medical Department,
Catholic University of Chile.
Ramon Ortuzar, M.D.,

CLUBFOOT IN NEWBORN INFANTS

To the Editor:—I am writing you in reference to the article in the September 4 issue of The Journal, page 19, "Cohesive Bandage for Clubfoot in Newborn Infants," by Emil D. W. Hauser, M.D., Chicago. I think it extremely unfortunate that an orthopedic surgeon with the standing of Dr. Hauser, particularly one who is so well recognized for his knowledge and skill in treatments of condition of the foot, would make such positive and misleading statements in regard to the use of plaster in the treatment of congenital clubfeet.

Whether or not plaster is the best method, or whether or not cohesive bandage is an improvement over the plaster technic, it has been well established for many years that plaster of paris casts could be applied as early as the first day with perfect safety and that correction could and should be promptly started. I think it is unfortunate that in a journal which is primarily directed toward the general practitioner statements should be made that it has been the practice to postpone the treatment of congenital clubfeet until the infant is 3 months old because of difficulties in plaster technic. Whether one uses adhesive plaster, plaster of paris, Dennis-Brown splints or cohesive plaster, it has been the practice for many years among orthopedic surgeons to start treatment within the first few days after birth.

In Dr. Hauser's desire to emphasize the improvement by the use of cohesive bandage, I am afraid he has been guilty of overstatement in regard to the difficulties and dangers of other methods.

We have been teaching our students for many years of the importance and necessity of treating these cases immediately after birth, and it seems unfortunate that the implication should be made that unless they are treated by cohesive bandage, treatment must be postponed for three months.

Don H. O'Donoghue, M.D., Chairman,
Department of Orthopedic Surgery,
University of Oklahoma School of Medicine.

To the Editor:—The article by Emil Hauser in The Journal for September 4, page 19, undoubtedly must have been read with considerable astonishment by many orthopedic surgeons.

It contains statements which most of us have not found to be true in our practice. ". . . plaster technic is extremely difficult and generally considered impossible until the infant is 3 months old. . . ." I do not know just how many newborn infants with clubfoot have been corrected by myself before they even left the nursery of the obstetrical department, but the number is considerable. ". . . it was impossible to treat newborn infants because of technical difficulties. . . ." This is a most amazing statement, and I am sure that it has amazed other orthopedic surgeons also. Personally, I have never encountered any particular difficulties in applying small plaster bandages to the tiny feet of newborn infants.

It is unfortunate that the magazine *Newsweek* picked up the article and published it, since it creates an entirely wrong impression, not unlike the articles of one rather prominent scribbler of medical potboilers.

One calls to mind the remark made by Frank Ober when one of my fellow students long ago asked him how long one should wait before beginning to correct a clubfoot. His reply was: "If it is a breech, you wait until the head's delivered."

Edward Parnall, M.D.
Albuquerque, N. M.

Note:—These letters were referred to Dr. Hauser, who writes:

To the Editor:—We are all in accord with the statement at the outset of the article, that the sooner clubfoot is treated the better. Apparently, however, our experience and observation have led to different conclusions as to the feasibility of using and maintaining plaster casts on newborn infants and up to the age of

3 months. It was because I encountered and observed difficulties in applying such casts, keeping them in place and removing them, that I felt special gratification in developing the treatment with the cohesive bandage and in sharing the results with others in the profession.

EMIL D. W. HAUSER, M.D., Chicago.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Workmen's Compensation Acts: Lead Poisoning as Probable or Possible Cause of Death.—This was a petition for a workmen's compensation award for the death of an employee. From the granting of an award to the widow, the insurance company appealed to the district court of appeal, first *district, division 2, California*.

The employee was a lead burner, and, although the primary cause of death was fibrinopurulent meningitis, an autopsy disclosed an abnormal amount of lead stored in his bones, brain and kidneys. Fibrinopurulent meningitis is a disease caused by a variety of organisms, some more virulent than others, and it was impossible in this case to determine the organism involved because the employee's body had been embalmed before the autopsy was performed.

The medical testimony disclosed a conflict as to whether the meningitis or lead poisoning caused the death of the employee, and the question presented on appeal was whether medical testimony that a disease possibly, as distinguished from probably, caused or contributed to death is sufficient to support a finding that it did.

So far as we have been able to discover, said the court, the question in this precise form has never been considered by any California appellate court. The rule appears to be consistently followed in other jurisdictions of this country where the question has arisen "that medical testimony as to the possibility of a causal relation between a given accident or injury and the subsequent death or impaired physical or mental condition of the person injured is not sufficient, standing alone, to establish such relation." In a prior California case it was said, "It is also true that to justify an award there must be an affirmative showing of a case within the statute and it must affirmatively appear that there exists a reasonable probability that the employee contracted the disease because of his employment." The appellate court admitted that medical testimony of possibility plus other evidence may be sufficient to support a conclusion of probability. The only other evidence in this case, however, was that of the physical symptoms of the employee before and during his last illness, and those symptoms were as characteristic of meningitis as of lead encephalitis. They therefore, concluded the court, furnish no independent evidence on which the commission could have relied, since the employee admittedly died of meningitis.

Accordingly the court held that the medical showing of a mere possibility that death resulted from lead poisoning was insufficient and the award of the Industrial Commission was annulled. *Travelers Insurance Company v. Industrial Accident Commission, 195 P. (2d) 48 (Calif., 1948).*

Workmen's Compensation Acts: Compensation Award as Bar to Malpractice Action. — This was an action for damages alleged to have been caused by the malpractice of the defendant physicians. The case was heard in the supreme court of New Jersey, Bergen County.

The plaintiff, while an employee of the Wright Aeronautical Corporation, received an injury to the index and second fingers of her right hand, arising out of and in the course of her employment. She was taken immediately to the defendants, the plant physicians, and received medical treatment from them for about two months. Some time after that she became dissatisfied with the manner in which the fractured bone in the finger was reduced by the defendants and had the job redone by a physician and surgeon of her own selection, whose bill for such services was paid by the employer as part of the compensation award. A subsequent application for a compensation award resulted in the granting of awards for both temporary and permanent disability, which awards were accepted by the plaintiff. The plaintiff then commenced this action for malpractice, contending that the plant physicians were negligent in the diagnosis and treatment of her injury. The defendants contended that the plaintiff, by accepting the compensation award, was barred from maintaining the present action.

Assuming that the defendants were negligent in the treatment of the plaintiff's injured fingers, that negligence, said the court, simply aggravated the original industrial injury. The employer was responsible in compensation for the whole injury. Since the ultimate disability, continued the court, is classable as resulting from the first injury, in that it came about through treatment of that injury and was directly connected therewith, the original industrial mishap and its assumed aggravation by the defendants should therefore be classified as one and the same compensable injury. The court then pointed out that the workmen's compensation act imposes liability for compensation on the employer regardless of fault and provides an exclusive remedy to employees for accidental injuries arising out of and in the course of employment. In accordance therewith, full compensation was paid by the employer and accepted by the plaintiff for the disability attributable to her original injury. She is entitled, concluded the court, to only one satisfaction for that injury. Here, at best, the injury was aggravated by the alleged negligence of the plant physicians. The remedy provided by the compensation act is exclusive, and any aggravation of the original injury not caused by an independent, intervening act is considered compensable. The plaintiff's right of action for negligence against the plant physicians was therefore barred by the acceptance of the compensation award, and the case was accordingly dismissed.—*Burns v. Vilardo, 60 A. (2d) 94 (N. J., 1948).*

Miscellany

FREEDOM TO PURSUE TRUTH EXEMPLIFIED IN DISCOVERY OF THE Rh FACTOR

Condensed from a Special Lecture in Pathology delivered at the University of London by D. F Cappell, M.D., and published in the *Glasgow Medical Journal*, August 1948.

Less than fifty years ago Landsteiner discovered the three common blood groups, A, B and O, and two years later his pupils found the fourth, rarer type, now called AB. Today a bewildering array of blood groups confronts the student, the ABO system, MN and P types, the Rh groups, the four less often detected Lutheran, Levay, Kell and Lewis red cell antigens and doubtless others which await the means of accurate detection. The ABO and Rh groups are always important clinically; the others only occasionally.

There is a lesson in the way in which these discoveries were made. The clinical conditions now recognized to be associated with Rh incompatibility had been known for many years. In 1892, Ballantyne described generalized dropsy of the fetus with all the pathognomonic features including the increased size of the placenta. Then in 1909 Buchan and Comrie described the extramedullary hemopoiesis of familial icterus gravis. Ecklin in 1919 recorded the first accurate observations on congenital hemolytic anemia. In 1932, Diamond, Blackfan and Baty correlated the pathologic findings in all three fetal disorders and described the essential unity of their pathogenesis. However, it was Parsons, Hawksley and Gittens who in 1933 first recognized the essentially hemolytic nature of these disorders and pointed out that the erythroblastosis which had misled other observers was merely a compensatory mechanism. Time has shown that they were right. In 1938, Darrow suggested that the phenomena could best be explained on the basis of an antigen-antibody reaction. In 1939, Levine and Stetson detected an irregular agglutinin in the serum of a woman who had given birth to a stillborn child and suggested that she might have been immunized by an antigen from the fetus. Thus, the problems of erythroblastosis of the newborn were widely recognized, but they had not yielded the secret of etiology.

A point of fundamental importance is that the solution of the etiology of this type of clinical mystery arose entirely as an *unexpected by-product from purely academic scientific work.* Landsteiner's fundamental observations on the blood groups originated directly from the discovery of specific biochemical differences between species when he endeavored to determine whether within one species similar, if slighter, individual differences could also be demonstrated. He was quick to see the usefulness of his discovery and to advocate the selection of donors for transfusion on the basis of the compatibility of the blood groups of donor and recipient. The discovery that blood groups existed and that they must be taken into account in blood transfusion was therefore an unexpected windfall from fundamental biologic research. Continuing the pursuit of pure knowledge on the distribution of the M agglutinogens in human and in animal erythrocytes, Landsteiner and Weiner in 1940 announced the discovery of the Rhesus factor. Once again the clinical significance of the new knowledge was rapidly recognized and, as the basis of treatment, has been the means of saving many lives.

In these days of an impending state medical service (England—Ed.) and so-called planning, scientific workers must not be too slavishly restricted to prescribed *ad hoc* lines, but must be given freedom and support to pursue truth as an end in itself. This research on blood groups corroborates what is common knowledge among men of science everywhere, but the public does not sufficiently realize how much of our heritage of benefit discovery has been a side issue, unsuspected when the work began.

Medical Motion Pictures

FILM REVIEWS

The Preparation of Diphtheria Antitoxin and Prophylactics. 16 mm., black and white, sound, 1,300 feet (1 reel), showing time thirty-five minutes. Prepared in 1944, by H. J. Parish, M.D., and A. J. Glenny, Wellcome Physiological Research Laboratories. Produced by the G. B. Instructional, Ltd. *Procurable on loan from:* Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

This film reviews and presents in logical sequence the development of diphtheria antitoxin and toxoids. It was produced in England under war time conditions. Certain principles in immunology are stressed. The producer has attempted to incorporate all phases of the problem, and, as a result, the picture is rather long and detailed. There is no mention made of the use of penicillin in the treatment of diphtheria.

The film is suitable as a supplement to lectures offered students in bacteriology, beginning classes in immunology, public health students, nurses and technicians. It is not recommended for practitioners or interns. The photography and animation are well done.

Cesarean Section—Norton Paravesical Extraperitoneal Technic with a Case History. 16 mm., color, silent, 600 feet (1 reel), showing time fifteen minutes (sound speed). Prepared in 1948 by Milton McCall, M.D., and Arthur First, M.D., *Department of Obstetrics & Gynecology,* Jefferson Medical College, Philadelphia. *Procurable on loan from* Milton McCall, M.D., 1814 Spruce Street, Philadelphia 3.

The Norton technic for cesarean section is well depicted in this motion picture. Following the dissection of the paravesical fascia, the edge of the bladder and the exposure of the lower uterine segment are clearly demonstrated.

This is a good production, and little time is wasted with unnecessary remarks. It should prove useful for teaching obstetricians, general surgeons who do cesarean operations in neglected cases and residents and interns who plan to specialize in obstetrics and gynecology.

The titles are clear and the color photography is excellent.

The Use of Digitalis in Heart Failure. 16 *mm., color,* sound, 1,200 feet (1 reel), showing time thirty-five minutes. Prepared in 1947 by the Department of Pharmacology, Cornell University Medical College, New York Hospital, New York. Produced by Transfilm, Inc., New York. Procurable on loan from: Wyeth, Incorp., 1600 Arch Street, Philadelphia 3.

This film is a combination of a lecture, straight photography and animation depicting the prognosis of cardiac failure with the use of digitalis and digitoxin as observed by the Cornell group. Some cardiologists may disagree with some of the conclusions drawn; however, this group has been a major contributor in this field, which justifies their authority in the use of this agent.

The production could be made shorter by taking out certain sequences without destroying the purpose of the film; otherwise the film is well planned. It is suitable for showing to cardiologists, general practitioners, interns and medical students. Photography is excellent.

SELECTED LIST OF MOTION PICTURES

The department of rehabilitation and physical medicine of the New York University College of Medicine has prepared a list entitled "A Selected List of Motion Pictures on Rehabilitation and Physical Medicine." It contains about seventy-five motion pictures in rehabilitation and physical medicine screened and evaluated by the staff of the department of rehabilitation and physical medicine at Bellevue Hospital. The list does not include all the films available in this field, since some were considered obsolete or of minimal value and others have not as yet been reviewed. Copies of this list may be obtained by writing directly to the New York University–Bellevue Institute of Rehabilitation and Physical Medicine, 325 East Thirty-Eighth Street, New York 16.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Effectivness of Penicillin in Treatment of Nasopharyngeal Diphtheria. E. W. Bixby.—p. 509.
Clinical Evaluation in Children of Toxicity and Efficacy of Caronamide (4-Carboxyphenylmethanesulfonanilide) for Competitive Inhibition of Penicillin Excretion. M. Rapoport, F. B. Corneal, K. H. Beyer and W. F. Verwey.—p. 514.
Myelophthisic Anemia Presenting Manifestation of Prostatic Carcinoma with Skeletal Metastases: Effect of Castration and Stilbestrol. R. R. Commons and M. B. Strauss.—p. 525.
Antihistaminic, Antianaphylactic and Antiallergic Activity of N-(a-Pyridyl)-N-(a-Thenyl)-N', N'-Dimethyl-Ethylenediamine Hydrochloride. A. S. Friedlaender and S. Friedlaerder.—p. 530.
Perforation of Infarcted Interventricular Septum: Report of Two Cases, One Diagnosed Antemortem. N. O. Fowler Jr. and R. B. Failey. —p. 534.
Use of Vitamin E in Heart Disease. S. Baer, W. I. Heine and D. B. Gelfond.—p. 542.
*Osteoporosis Occurring During Potassium Thiocyanate Therapy for Hypertensive Disease. J. J. Hinchey, E. A. Hines and R. K. Ghormley. —p. 548.
Blood Volume Changes and Available (Thiocyanate) Fluid Space in Soldiers with Chronic Wound Infections and Associated Nutritional Depletion. W. S. M. Ling and H. Sprinz—p. 555.
Roentgenologic Evidence of Biliary Regurgitation: Roentgenologic Contributions to Diagnosis of Hypoparathyroidism, Appendicitis, Mesenteric Thrombosis. H. M. Weber.—p. 568.
Pharmacodynamic Considerations of Atropine and Related Compounds. H. C. Stoll.—p. 577.

Folic Acid Therapy.—Adams and Lawrence report on administration of folic acid in a variety of hemopoietic disorders including addisonian pernicious anemia, tropical sprue, macrocytic anemia of unexplained origin, anemia of renal insufficiency, leukemia, idiopathic leukopenia, irradiation leukopenia associated with cancer and leukopenic states of Addison's disease, Felty's syndrome and thiouracil intoxication. Thirty-four cases in all have been studied. It was found that folic acid will correct the abnormal blood changes in cases of pernicious anemia in relapse, but the neurologic manifestations of pernicious anemia are not corrected by folic acid. The reticulocyte response in liver-treated patients with pernicious anemia differs from that obtained in folic acid-treated patients. It is probably unwise to combine folic acid and iron in the treatment of pernicious anemia. One case of sprue responded favorably to administration of folic acid. Not all macrocytic anemias respond to the administration of folic acid, but in cases in which there is a megaloblastic arrest in the bone marrow, favorable results can be anticipated. Folic acid did not affect the anemia associated with chronic nephritis, and it did not alter the leukopenia associated with either Addison's disease or Felty's syndrome (1 case each). The apparent effect of folic acid on the level of granulocytes in 1 case of agranulocytosis due to thiouracil was probably coincidence, for others have reported no effect. Folic acid had no effect on the leukopenia of idiopathic states, and no beneficial effect was noted in 2 cases of leukemia treated with folic acid. Folic acid did not correct the leukopenia induced by roentgen radiation.

Penicillin in Oil with Epinephrine for Gonorrhea.—Cohn and Kornblith investigated the effectiveness of a single injection of potassium penicillin in oil containing epinephrine in the treatment of gonorrhea. They found that a single injection of 150,000 units intramuscularly or subcutaneously, in a total volume of 0.5 cc., cured 97 of 100 patients. The 3 patients who did not respond to the initial injection were promptly cured with a second injection of an identical amount of penicillin. All of 19 patients who were treated with 200,000 units in 1 cc. intramuscularly were cured. Likewise all of 18 patients treated with 300,000 units in 1 cc. and all of 9 patients treated with 600,000 units in a total volume of 2 cc. responded to this form of therapy. No untoward local or systemic reactions were observed after the subcutaneous or intramuscular injection of the suspension of crystalline potassium penicillin in oil with epinephrine.

Osteoporosis Occurring During Potassium Thiocyanate Therapy of Hypertension. — Hinchey and his colleagues observed occasional instances of osteoporosis and arthralgia after extensive use of potassium thiocyanate in the treatment of hypertension. The records of 5,000 consecutive patients with hypertension who had been seen on two or more occasions at the Mayo Clinic in the period 1939 to 1944, inclusive, were reviewed. Potassium thiocyanate had been given to 360 patients of this group. Unexplained osteoporosis occurred in 7. Since 1944 there have been 4 additional patients with this syndrome. No history of trauma or injury at onset could be elicited from these patients. One or more extremities, usually the lower, were involved. Evidence at hand seems to suggest slight and prolonged interference with calcium metabolism as a possible mechanism for production of the syndrome. Adequate calcium intake should be assured for persons taking potassium thiocyanate. Use of this drug may be contraindicated in the presence of bone malacia, such as senile osteoporosis or osteitis deformans; likewise its use may be inadvisable in the presence of fracture, not as regards union of the fracture but because any interference with calcium metabolism in the presence of increased calcium requirement might precipitate osteoporosis.

Antistreptolysin "O" in Health and Respiratory Disease.—According to Rantz and his associates antistreptolysin "O" is an immune substance which neutralizes streptolysin "O" in vitro. It is contained in the gamma globulin fraction of human serum. Its concentration in the serum of healthy persons and its formation after infection in young adults by group A hemolytic streptococci has been studied. The amount of this substance in serums obtained from healthy persons varies with the geographic area of residence of the subjects and their age. Antibody levels are low through the second year of life, rise rapidly through the first decade and then decline. In studies on the mechanics of antistreptolysin response in large numbers of group A hemolytic streptococcus sore throat, it was noted that an increase in this antibody occurred regularly after infection by these organisms. The amplitude of the response varied from patient to patient, but the peak level was reached by the fourth week after the onset of acute illness in nearly all cases. No relationship between the initial antistreptolysin titer and the nature of the acute suppurative phase of hemolytic streptococcus sore throat was demonstrated, but a definite correlation between the magnitude of antistreptolysin response, severity of the initial illness and the later development of nonsuppurative complications was demonstrated. Immunologic differences were established between uncomplicated group A hemolytic streptococcus infection of the respiratory tract and that which initiates a nonsuppurative disorder. An exaggerated mean antistreptolysin response occurred in all clinical categories of the latter group. In addition, the antistreptolysin titer at the onset of the initial streptococcic illness was somewhat higher, and antibacterial precipitating antibodies were present with unusual frequency in patients who later contracted arthritis. The abnormal production of these antibodies may mirror an exaggerated immunologic hyperreactivity of human beings in whom these disease states develop.

B Vitamin Requirements with Advancing Age.—Mills observed greatly increased thiamine requirement in milligrams per kilogram of diet with advancing age in rats. Rafsky and Newman have described an apparent thiamine deficiency in aged persons on diets which are qualitatively quite adequate for young adults. Mills says that at his laboratory a group of rats has been followed from weaning time to old age, being tested periodically for their requirement of one B vitamin after another needed for optimal growth. The increase in thiamine requirement with advancing age in rats was further verified. None of the other B vitamins studied (choline, pyridoxine, riboflavin and pantothenic acid) gave evidence of similar increase in requirement with advancing age. The author concludes that these observations, in conjunction with studies on aged persons, provide reason to recommend thiamine supplementation for elderly persons.

Coronary Death in Young Soldiers.—Reich reports the occurrence of coronary death in 11 male soldiers between the ages of 22 and 38. The length of military service ranged from one month to forty-three months. Atherosclerosis was responsible for the fatal outcome in 10 cases, 2 of which revealed no thrombosis. One patient had coronary embolism with arteritis and septic thromboses of the smaller coronary branches. Overweight was a predisposing factor in 7 patients. Contrary to the classical description of onset at night, all the patients were attacked during the waking hours. In 6 the onset was unassociated with strenuous activity. Unusual prodromes due to the reflex symptoms referable to other systems, especially the gastrointestinal tract, accounted for the main difficulty in correct diagnosis. Although these patients had been examined on numerous occasions and were considered in good health, varying degrees of clinically undiagnosed cardiac enlargement were present in 6 of them at necropsy. When extra physical demands are made in war or heavy industry, it may be advisable to add electrocardiographic studies with oxygen deprivation tests to routine laboratory examinations for the earlier diagnosis of coronary insufficiency.

Fever Due to Food Allergy.—Rowe directs attention to food allergy as one cause of unexplained fever. Failure to recognize food allergy as one cause of fever accounts for some unjustifiable diagnoses of idiopathic or psychogenic fever, subclinical tuberculosis, brucellosis or other questionable infections. It has led to unnecessary operations on tonsils, appendixes, gallbladders and pelvic organs. Needless surgical operations have been performed on nasal sinuses because of the association of fever with nasal congestion, blocking or postnasal mucus, and especially with swollen membranes or opacities in the antrums or other sinuses which were not due to infection but to allergy. The author reports the case of a girl, aged 18, who had prolonged allergic fever that was preceded by lifelong anorexia, aversion for milk, and recent colonic symptoms. Because of this fever, the patient was hospitalized for four and one-half months. During this time many laboratory and clinical investigations were conducted, and at one time a presumptive diagnosis of psychogenic fever was made. The relief from her fever, from the colonic and anal symptoms and from the fatigue and the other toxic symptoms by use of the elimination diet, and their subsequent reproduction by the ingestion of milk, prove that food allergy was responsible. Her initial colonic symptoms suggested the onset of a possible chronic ulcerative colitis, which, in the writer's opinion, is frequently due to food allergy. If the allergy had not been recognized, more definite tissue changes due to chronic ulcerative colitis might have developed. The most likely explanation of allergic fever is a disturbance in the temperature-regulating center of the brain by a localized or generalized allergic reaction.

Dermatophytosis and Fungus Sensitivity.—Jaros and Kirsner present immunologic evidence bearing on the close relationship between the sensitivity to fungus extracts in patients having a fungous infection. They treated patients with epidermophytoses and epidermophytid by means of a fungus extract containing Trichophyton gypseum, Trichophyton interdigitale, Epidermophyton inguinale and Monilia albicans in a dilution of 1:5,000. Since all these fungi do not interreact, a composite mixture had to be made in order to cover the most common causative fungus factors. Thirty patients are presented who were followed for a period of about a year. All had received previous local therapy. Etiologic organisms were cultured and identified. Each patient received a dose of 0.1 cc. of the extract intradermally twice a week. This schedule was attended by good results. In extremely sensitive patients, the extract was further diluted or a smaller dose given. In those who had improved greatly the interval between injections was increased to one week. In 2 patients an attempt was made to increase the dosage in order to shorten the course of therapy. It was found that if more than 0.2 cc. was injected intradermally, local necrosis would result, with the skin over the wheal sloughing off. No serious reactions were seen after injection, although there were occasional and temporary flaring up of the lesion, local reaction at the site of injection associated with a mild lymphadenitis and pruritus. More than 80 per cent of the patients were greatly improved or cured after this desensitization.

Use of Respirator in Refractory Status Asthmaticus.—Reiser and Ferris used anesthesia and the Drinker respirator for artificial respiration in 3 patients with acute intractable asthma. Since expiration is primarily limited in asthma, it would appear that the best procedure for the maintenance of adequate ventilation would be to support this phase. This can be effectively accomplished by the use of the Drinker respirator which applies positive pressure to the chest wall and abdomen. Since the respirator also aids inspiration, inspiratory dyspnea is at the same time decreased. In each of the 3 cases, prompt and satisfactory relief of anoxemia was accomplished and maintained until bronchiolar spasm had undergone remission. One patient was treated early in the course of his attack and recovered uneventfully. The 2 others died, but the unfavorable outcome can be explained on the basis of complicating factors and need not to be regarded as indicating failure of treatment with the respirator. While no definite conclusion can be drawn from limited experience, it is felt that the rationale is sufficiently clear, and the results, so far as relief of anoxemia is concerned, are gratifying enough to warrant the use of the respirator in refractory status asthmaticus. It is of utmost importance that the therapy be instituted early in the course before irreversible changes have appeared, or other grave complications have had time to gain foothold. This maneuver is not suggested as a substitute for other well established methods of treatment, but rather as an adjunct in refractory cases.

"Guillain-Barré Syndrome."—Hand and Rudoy report 11 cases of polyneuritis observed in American soldiers abroad between the ages of 20 and 41, 10 of whom had a definite history of pharyngitis, which preceded the onset of neurologic disturbance by three to six weeks. All were characterized by diminution of motor power, reflexes and sensibility in the extremities. Accommodation and swallowing difficulties were common at the onset, and some urinary disturbances were noted. Elevation of the total protein content of the spinal fluid without increase of cells was present in every case. In 6 of the 11 patients an exacerbation of symptoms occurred after partial recovery. Two cases of polyneuritis in American civilians in New York, occurring one month after a severe sore throat in one case and in the other two months after pyodermia, had a similar course to that of the 11 soldiers. Five additional cases of polyneuritis in German prisoners of war are reported whose throat smears revealed the presence of diphtheria bacillus. In these patients the total protein of the spinal fluid was normal or only slightly elevated. Similarly in 4 additional German prisoners with polyneuritis associated with extraordinary ingestion of sulfonamide drugs over a long period there was no elevation of the total protein in the spinal fluid. Fever was not present in any of the cases in association with the neurologic disability, but was present in rare instances at the time of throat infection weeks before. Spontaneous pains or burning sensations occurred, but were not common in this series. Treatment consisted of bed rest, physical therapy from the onset of motor weakness, thiamine chloride 300 mg. daily, with a diet high in vitamins. Activity was permitted to the extent of the patient's capability. All the patients recovered and none was left with disabling residua. Minimal febrile reaction, symmetry of limb involvement and the occurrence of subjective and objective sensory changes differentiate the syndrome clinically from anterior poliomyelitis. The spinal fluid findings offer definite diagnostic evidence. Postdiphtheritic neuritis closely resembles the Guillain-Barré syndrome, as has been shown in the 5 cases of polyneuritis in the German prisoners with diphtheria bacilli. Differentiation depends on demonstration of diphtheria bacilli and on the relatively slight elevation of total protein in the spinal fluid. Etiologic relationship with throat infections such as tonsillitis, exudative pharyngitis of streptococcic or diphtheritic origin and pyemia is apparent. Sulfonamide drugs used in treatment of these primary infectious conditions may on occasion constitute the etiologic agents in the neurologic syndrome.

Meningitis Due to Pseudomonas Pyocyanea.—Weinstein and Perrin successfully treated 2 women aged 33 and 58 and a boy aged 16, who had primary meningitis due to Pseudomonas aeruginosa, with intrathecal and intramuscular streptomycin combined with sulfadiazine or sulfamerazine. In all the patients infection of the meninges occurred during the course of spinal anesthesia. The source of the organism could not be determined. The strains of Ps. aeruginosa responsible for the infection were sensitive to between 7.8 and 30 units of streptomycin per cubic centimeter and did not become resistant to the drug during treatment. Penicillin intrathecally was given a brief trial but was singularly ineffective. The sulfonamide drugs, used alone, also failed to control the meningeal infection, although temporary moderate improvement was produced by large doses. Streptomycin is indispensable for successful treatment of primary meningitis due to Ps. aeruginosa. Combined with sulfadiazine or sulfamerazine, it appears to be the treatment of choice. The total dose of streptomycin administered intrathecally varied from 1.8 Gm. to 8.1 Gm. and intramuscularly from 36.5 to 227 Gm. Two patients had from one to four relapses of the meningeal infection when treatment was stopped. These recurrences were accompanied by the presence of a variable number of red blood cells and occasionally by xanthochromia in the spinal fluid. Deafness occurred as a complication in all the patients, and 1 of them showed severe labyrinthine disturbance with complete loss of vestibular function. There was improvement in hearing in all the patients after discontinuation of the antibiotic therapy.

Penicillin in Tabes Dorsalis.—Chesney and Reynolds treated 54 patients having tabes dorsalis with penicillin. Thirty-three of these received penicillin alone; 21, penicillin concurrently with therapeutic malaria. A comparison of the results with penicillin alone and those with malaria and penicillin indicates clearcut superiority for the combined therapy. Treatment with penicillin alone appears superior to therapy of the era before penicillin only in respect to its convenience and relative lack of toxicity. Concurrent administration of penicillin and therapeutic malaria is the most effective form of therapy for tabes dorsalis presently available.

Synthetic Resin for Peptic Ulcer.—Kraemer and Siegel used "amberlite IR IV" in 60 cases of peptic ulcer and find that it is just as satisfactory as the usually employed metallic salt antacids and has few of their disadvantages. It causes neither constipation nor diarrhea. Patients have taken from 2 to 9 Gm. of the drug daily for six to eight months with no evidence of toxicity. Damage to the gastric mucosa was not noted in 3 patients in whom the stomach was resected and in 3 on whom gastroscopy was performed. It approaches the ideal antacid in that it is not absorbed from the digestive tract, has no effect on the acid-base balance and does not alkalize the urine. It neutralizes acid rapidly and promptly relieves pain. It is effective in small dosage and is inexpensive and tasteless.

Is Chronic Cystic Mastitis A Precancerous Lesion?—Reed says that since 1925 many cases of chronic cystic mastitis have been studied at Wichita hospitals. Three types of chronic cystic mastitis can be distinguished histologically: (1) simple chronic cystic mastitis, (2) chronic cystic mastitis with papillary proliferation and (3) chronic cystic mastitis with atypia. Twenty-six patients with chronic cystic mastitis who were operated on prior to 1931 were selected for follow-up study. Twenty patients had simple chronic cystic mastitis, 2 had papillary proliferation and 4 had atypia. Local excision of the involved area was performed on 23 patients, while 3 were subjected to simple mastectomy. The patients were followed for ten to seventeen years after operation, and were recently examined. One patient died of cancer of the cervix ten years after, and another of pneumonia eleven years after the operation on the breast. In neither had there been a recurrence of chronic cystic mastitis or development of cancer in the breast prior to death. One patient had two local recurrences; the lesion was excised and showed the typical picture of simple chronic cystic mastitis. During the twelve years which have followed her last operation no tumor had reappeared. The remaining 23 patients of the series are completely cured after the local excision. Carcinoma of the breast did not develop in a single instance.

Treatment of Peptic Ulcer with Enterogastrone.—Pollard and his associates treated 28 patients having peptic ulcer with enterogastrone. Twelve patients were given enterogastrone orally in doses of 8 to 16 Gm. daily for periods up to eleven months. Recurrence of typical symptoms of ulcer occurred in 2 of these patients while they were under treatment. Sixteen patients with peptic ulcer were given intramuscular injections of 200 mg. of enterogastrone daily for periods up to nine months. Three of the patients had either recurrence or persistence of symptoms while under treatment. Roentgenograms of the upper part of the gastrointestinal tract were available for 17 of the 28 patients from the start of therapy. The roentgenologic appearance of the lesion after therapy was improved in 6 patients, remained unchanged in 8 and was definitely worse in 3 patients. Single intramuscular injections of 200 and 500 mg. of enterogastrone in persons with peptic ulcer produced no changes in the volume of fasting gastric secretion, output of hydrochloride acid, pepsin concentration or gastric motility. Daily administration of enterogastrone orally or parenterally for periods up to eleven months to persons with peptic ulcer caused no significant alterations in the volume of fasting gastric secretion, volume of hydrochloric acid, pepsin concentration or type of response to a caffeine test meal. This was true whether there was evidence that the ulcer improved, remained stationary or became worse.

Sarcoma in Irradiated Bone.—Cahan and his associates point out that whereas twenty years ago radium and roentgen rays were used widely on benign and malignant tumors, either before or after operation, or both, or as the sole method of treatment, with the passage of time and the accumulation of experience the concept of the place held by irradiation in the treatment of neoplasms of bone has changed. The authors have inclined toward the belief that roentgen or radium treatment is inadvisable for benign tumors of bone. Their reasons were that surgical treatment yields more satisfactory results, that they avoid the risk of irradiating a malignant tumor under the mistaken impression that it is benign, that many of these benign lesions are either radioresistant or only slightly radioresponsive, that in children, prior to epiphysial closure, irradiation of lesions in the vicinity of growth centers may cause serious disturbances in bone growth and that an extremely serious sequel of radiation therapy is courted: there is the possibility that, after an interval of years, bone sarcoma may develop at the site of the previous irradiation. The authors summarize the literature dealing with both experimental and clinical production of bone sarcoma by irradiation and describe 11 cases in which bone sarcoma developed at a period considerably subsequent to irradiation of benign bone tumors or of normal bone.

Nocturnal Gastric Secretion.—In a previous publication Levin and his collaborators reported the results of studies on the nocturnal gastric secretion in normal persons. They now compare the data obtained in patients with active duodenal ulcer with the findings in normal subjects. They found that the volume, concentration and output of acid in the fasting nocturnal gastric secretion are usually higher in patients with duodenal ulcer than in normal persons. The volume of secretion and output of acid are usually higher during the first half of the night than during the last half. Individual variations exist. Patients with duodenal ulcer with a high volume and secretion of acid on one night in the vast majority of instances manifest a high volume and acidity on successive nights. The rate of gastric secretion is not constant, varying spontaneously from hour to hour in the same person. These variations must be taken into account in the evaluation of preparations and procedures designed to reduce gastric secretion.

Removal of Gas from the Colon by Oxygen Inhalation.—Pogrund and Steggerda point out that high blood tension of nitrogen retards the absorption of this gas from the colon, thus evolving a problem of interest to aviation physiologists; namely, the expansion of this unabsorbable gas in the intestinal tract resulting during high altitude flying. The authors studied the effect of lowering the nitrogen tension in the blood on the absorption of nitrogen from the colon by introducing 500 cc. of nitrogen into the colons of normal healthy male adult subjects. With the subjects resting, the percentage volumes of gas recovered at the end of two hours were noted, while the subjects breathed either room air (to serve as controls) or pure oxygen (to comprise the experimental study). On the basis of their observations the authors conclude that the beneficial effect of oxygen inhalation on abdominal distension is explained by the removal of nitrogen from the blood under these conditions, thereby producing a partial pressure gradient favorable for the absorption of nitrogen from the gastrointestinal tract.

Origin of Bacterial Resistance to Antibiotics.—Demerec offers evidence that bacterial resistance to penicillin and streptomycin is not induced by these compounds but originates spontaneously through genetic changes comparable to gene mutations. He describes resistance patterns observed in experiments with penicillin and streptomycin and outlines a possible mechanism responsible for resistance and for the differences between the resistance patterns observed with penicillin and those observed with streptomycin. The experiments were done in vitro. Penicillin was tested with Staphylococcus aureus, strain NRRL 313, and streptomycin was tested with the same strain of Staph. aureus and with Escherichia coli, strain B. From the knowledge gained the author concludes that in treatment with penicillin the development of highly resistant strains can be avoided by *application of penicillin in doses sufficiently large to prevent* survival of first step resistant mutants. In treatment with streptomycin, however, the development of highly resistant strains cannot be prevented; effective treatment does not eliminate all bacteria, but it probably reduces their number to a level at which the organism is able to eliminate them.

Metabolic Studies in Cushing's Syndrome.—Kepler and his co-workers report a case of adrenal cortical tumor associated with Cushing's syndrome in a woman aged 26. The patient presented hypertension and "hypokalemic," hypochloremic alkalosis. Urinary excretion of both 17-ketosteroids and estrogenic substances was increased to abnormally high levels. Remission of the symptoms followed the removal of the tumor. Recurrence of the tumor was accompanied by the reappearance of the clinical picture. Removal of the recurrent tumor was followed by a temporary and incomplete remission of symptoms. Recurrence of the tumor and the appearance of metastatic lesions in the lungs were associated with the symptoms that were present prior to the removal of the tumor. Roentgen therapy was ineffective. Necropsy revealed that the anterior lobe of the pituitary contained two small chromophobe tumors; Crooke's changes were observed to be present in the basophilic cells of the anterior lobe. The hypothalamus appeared normal. The tumor had recurred locally and had metastasized to the lungs. The contralateral adrenal cortex was atrophic. Metabolic studies were conducted before the first operation and shortly thereafter. Under the conditions employed, the over-all nitrogen balance before operation was negative. Creatinine was present in the urine. Potassium was lost from the body and sodium was retained when the potassium content of the diet was kept at a low level. Administration of potassium chloride tended to correct the alkalosis, the negative balances for potassium and nitrogen and the positive balance for sodium. After removal of the tumor, nitrogen, sodium, potassium and chloride all were retained in large amounts, and creatinuria practically disappeared. The amount and p_H of the urine decreased postoperatively. The metabolic data suggested that the functioning adrenal tumor caused loss of muscle and deposition of fat and that its removal was followed by loss of fat and deposition of muscle. The question of the adrenal versus the pituitary theory of Cushing's syndrome is still open. If the condition is characterized regularly by a high concentration of adrenotropic substance in the blood and urine, one might well conclude that among the endocrine organs the anterior lobe of the pituitary body is primarily at fault. If the administration of adrenal steroids which affect the metabolism of protein and carbohydrate, should be followed in experimental animals by the appearance of Crooke's changes or basophilic tumors or both in the anterior lobe of the pituitary body, it would seem that the adrenal cortices are primarily at fault and that the pituitary abnormalities are secondary and could be ignored therapeutically.

Factitial Thyrotoxicosis.—Skanse and Riggs report a case of factitial thyrotoxicosis in a woman aged 37 in whom hyperthyroidism developed due to clandestine ingestion of thyroid, and a second case in a woman aged 40 in whom circumstantial evidence strongly favored the same diagnosis. In both patients the clinical picture was indistinguishable from that of endogenous thyrotoxicosis. The differential diagnosis was facilitated by the use of tracer doses of radioactive iodine. In endogenous thyrotoxicosis the urinary excretion of radioactive iodine is low compared to that of euthyroid persons. In factitial thyrotoxicosis the excretion of radioactive iodine is higher than normal. Since the serum protein-bound iodine is elevated independently of the source of iodine-containing hormone, this test is not contributory to the differential diagnosis. The combination of an elevated serum protein-bound iodine and high urinary excretion of radioactive iodine is characteristic of, but is not by itself pathognomonic of, alimentary thyrotoxicosis. In a patient with endogenous thyrotoxicosis treated with either thiouracil or iodide one may find the same laboratory pattern until the disease is brought under control. Previous cholecystograms might be responsible for the fact that thyrotoxic patients occasionally have a high excretion of radioactive iodine.

Skin Lesions Caused by Beryllium Compounds.—The following types of cutaneous lesions have been observed in those who came in contact with beryllium compounds: contact dermatitis, ulcer of the skin and lesions arising spontaneously in patients with the chronic type of pulmonary disease. To these should be added subcutaneous granuloma occurring in persons who cut themselves on fluorescent lamps coated with beryllium-containing phosphor. The first of the 3 cases reported by Grier and his associates was of a boy, aged 12, who was cut on the side of the neck when he hit an old fluorescent lamp. The other 2 cases concerned men who worked in fluorescent lamp factories and who were accidentally cut with a piece of a lamp. The subcutaneous granulomas which developed in these 3 *patients represent distinct form of tissue reaction to beryllium.* Pathologically, these granulomas are similar to that seen in the cutaneous lesions which have arisen in the course of the pulmonary granulomatosis caused by beryllium. A similar epithelioid cell reaction has also been found in the lungs of workers who have died of pulmonary granulomatosis following exposure to beryllium compounds. In such cases beryllium has been detected spectroscopically in amounts of the same order of magnitude as was found in the subcutaneous granuloma of case 1. The histology of these granulomas may resemble cutaneous and subcutaneous sarcoidosis so closely that, in some instances, the diagnosis may be missed without a history of exposure to beryllium or determination of beryllium in the tissue. Usually, however, the lesions associated with beryllium show foci of necrosis of a type not seen in sarcoidosis, and the laminated inclusion bodies seem to occur in the former with greater frequency. The incidence of subcutaneous granulomas among those who cut themselves on these lamps is not known, but by analogy with pulmonary granulomatosis, which in one series occurred in 6 per cent of those exposed, it seems likely that in only a few such persons will granulomas develop.

Phenarsone Sulfoxylate and Bismuth in Neurosyphilis.—Eisenberg and Hershfield report on the new pentavalent arsenical, phenarsone sulfoxylate ("aldarsone") in the treatment of neurosyphilis in patients who had previously received various types of treatment, including long term chemotherapy, fever and penicillin, without improvement in their symptoms and spinal fluid findings. All these patients, because of physical contraindications and other reasons, were unable to receive the benefits of further fever therapy. The authors say that 100 patients with various types of neurosyphilis received 2,400 injections of phenarsone sulfoxylate and bismuth compound, concurrently, 1 Gm. of phenarsone sulfoxylate and 1 cc. of bismuth salicylate (2 Gm., equivalent to 75 mm. metallic bismuth). Both drugs were given over a period of twenty-four weeks, once a week, without interruptions. There were 41 cases of asymptomatic and 59 cases of symptomatic neurosyphilis. The Eagle-Wassermann reactions became negative in the spinal fluid in 12 of the 100 patients, and an additional 58 showed a reduction in titer of the Eagle-Wassermann reactions. Fifteen of the patients showed a negative colloidal gold curve and 51 others showed a decrease in the colloidal gold curve. No toxic reactions were noted in any of the cases during or after the treatment. The authors conclude that the concurrent administration of phenarsone sulfoxylate and bismuth is a safe ambulatory treatment of neurosyphilis.

Herniated Disk Simulating Cord Tumor.—Kennedy and his associates direct attention to the fact that herniated nucleus pulposus may simulate a tumor of the spinal cord. They report 3 patients with clinical features of a cord tumor, but operation revealed a herniated nucleus pulposus. In the first and second of the 3 patients the preoperative diagnosis was tumor of the cauda equina. Nothing in the history of the first patient suggested the possibility of a herniated nucleus pulposus. In the second case a review of the history should have suggested the correct diagnosis. The patient had pain, weakness, sensory and reflex changes which vanished in a month, only to return about one year later. In the third case the diagnosis was the same preoperatively and postoperatively, although tumor of the cord had to be seriously considered. The history of intermittent pain for five years suggested the possibility of a herniated nucleus pulposus which may have been partially and intermittently extruded.

Prevention of Chronic Bronchitis and Bronchiectasis.—A follow-up by Finke on 50 children between the ages of 2 and 15 who were hospitalized in 1945 for bronchopneumonia and treated with sulfonamide drugs and/or parenteral penicillin revealed that 16 of the patients presented symptoms and frequently definite signs of subacute or chronic bronchopulmonary infection two years later. About half of these 16 children had sought medical advice during these two years or had been hospitalized for more severe relapses. Twenty-four others of the 50 children had been affected since their hospitalization in 1945 by relatively mild but recurrent respiratory episodes diagnosed as grip and cold. Thus, only 10 children of the whole group had remained free from respiratory symptoms during the two years following their bronchopneumonia. These observations indicate the potentially recurrent and chronic character of a condition generally misinterpreted as an acute illness. The prospects for prevention of chronic bronchitis and bronchiectasis depend largely on recognition and eradication of the initial bronchopulmonary infection at the earliest possible stage. Penicillin aerosol treatment seems the best available method for achieving the latter. Observations on 15 children with subacute and chronic bronchopulmonary infection treated with penicillin aerosol showed that in patients with early infection the respiratory symptoms usually subsided within a week. Clinical findings indicative of tracheobronchitis disappeared after one to two weeks' treatment; resolution of a subacute bronchopneumonic process took place in one to two months. With continued treatment the accomplished improvement of both the respiratory infection and the general condition became more and more obvious. The follow-up method used in rheumatic fever and tuberculosis should be applied also to children with potential bronchiectasis in order to give undelayed treatment in the case of a relapse, before it adds new damage to the respiratory system. The prognosis for arrest of definitely chronic cases by penicillin aerosol therapy is less favorable, but encouraging results have been obtained by this new method even in children with pulmonary fibrosis and emphysema.

Early Whooping Cough Immunization.—The Halperns used whooping cough immunization with an alum-precipitated vaccine containing 40 billion organisms per cubic centimeter given in doses of 0.2 cc., 0.3 cc. and 0.5 cc. at monthly intervals in 175 infants of one month of age or less. The first 117 infants receiving skin and agglutination tests prior to the first injection of whooping cough vaccine served as controls. All infants had the skin and agglutination test performed three to four months after the last whooping cough injection. The use of the alum-precipitated vaccine proved to be an effective immunologic procedure as judged by clinical, serologic and skin tests. Reactions were minimal and absences uncommon. If the proper technic is used in administering the vaccine, abscess can be eliminated. The agglutinogen skin test and the rapid slide agglutination method showed a high degree of correlation. The skin test is a simple, reliable and effective method for determining immunity following immunization against pertussis.

Congenital Toxoplasmosis.—Schwartzman and his co-workers report a case of congenital toxoplasmosis in a 17 month old Negro girl. Microcephalus, chorioretinitis, diffuse cerebral calcification and mental deficiency were present. Dwarfism was noted for the first time in this condition. Blood was obtained for inoculation into mice and rabbits, but no toxoplasma was found. Spinal fluid was also injected into these animals, but again no evidence of the parasite was detected. Reactions to neutralizing antibody tests done on the infant's blood were negative. In late cases toxoplasma may not be isolated, and a negative reaction to a neutralizing antibody test after the fourth week of illness does not nullify the diagnosis. Since cases of toxoplasmosis arise as a result of placental transmission, prophylaxis would depend on the early diagnosis of the condition in the pregnant mother. The problem presenting itself is that of devising a simple diagnostic test and also of securing an effective therapy to eliminate the infection before it has produced permanent changes. The discovery of toxoplasma as a cause of mental deficiency and encephalomyelitis adds another causative agent to be considered in these conditions.

Abuse of Skin Tests in Food Allergies.—Babalian shows that the technic of scratch or intradermal tests for food allergies is based on questionable hypotheses. He discusses some of these hypotheses and shows that neither in eczematous dermatitis nor in urticarial lesions are intradermal tests of value in detecting food allergy. As a result of the mistaken confidence in these tests, disorders have been mistakenly regarded as due to food allergy, when they were due either to malnutrition, infection or contact dermatitis. Confidence in skin tests for food allergy has had the unfortunate result that food allergies are regarded as common, which in reality they are not; they are rare in adults and children after the sixth year. Skin tests are of value in other forms of allergy. The importance of contact dermatitis is recognized more and more. Many eczemas formerly regarded as caused by food are now recognized as contact dermatitis.

Subdeltoid Bursitis with Calcification.—Pelland and Hoffman advocate the surgical approach to the treatment of acute subdeltoid bursitis with calcification. The procedure employed is extremely simple, rapid and dramatic in its effect, has not been followed by recurrence and appears to avoid the development of chronicity which occasionally occurs with other methods. It consists in (1) the evacuation of the bursa through an incision not more than 3 cm. long and frequently less, and (2) the exploration of the musculotendinous rotator cuff of the shoulder through the floor of the bursa. The presence of pains and the roentgenologic demonstration of a calcification in the shoulder region are essential indications for this operation. The authors performed it in 38 cases, in 36 of which it produced complete relief. In 1 of the two failures a second operation was successful. It was performed to evacuate a calcific deposit which had been missed previously.

Excessive Hypertension of Long Duration.—Burgess points out that no previously reported studies have attempted to separate the obviously nonprogressive type of hypertension from the obviously malignant type, and to study the prognosis in the nonmalignant group. With a view to finding out what happens to patients with excessive hypertension that is not of the progressive, malignant type, patients were chosen in whom the condition had existed for at least eight years. In the group of 100 patients here reported a systolic pressure of 180 or a diastolic pressure of 100 was regarded as evidence of excessive hypertension. It was found that hypertension even of an excessive degree, that has been present eight years or more and is not associated with cardiac or renal disease, usually does not indicate a poor prognosis. The patient usually lives to within three or four years of his normal life expectancy. Such hypertension does not commonly develop into the malignant type. It is not associated with great arteriolar changes, evidenced by retinal hemorrhages or edema, or with renal damage—findings that are typical of malignant hypertension. The most frequent cause of death in these patients is cardiac failure. A cerebrovascular lesion is the most common terminal event. The younger the patient at the time when the hypertension develops, the less likely he is to live his full life span. Even in the young group (age 50 and below) the average length of life is over 15 years (about eleven years below their expectancy). This is the age group in which dorsolumbar sympathectomy is usually recommended. For the malignant type of hypertension this operation is certainly of great value in delaying the fatal issue. With fifteen years or more of life ahead of him, it is questionable whether a person with the nonprogressive, nonmalignant type of high blood pressure should be subjected to such a radical procedure. The degree of hypertension is important in relation to the diastolic pressure only. Persons with extremely high systolic pressures and relatively low diastolic pressures (the arteriosclerotic type of hypertension) survive appreciably nearer to their normal expectancy, on the average, than those with high diastolic pressures.

Splenic Rupture in Infectious Mononucleosis.—Timmes and his associates report 2 cases of infectious mononucleosis in which splenic rupture occurred. Both cases concerned 19 year old seamen. In the first case the diagnosis was not suspected preoperatively. The history of lymphadenopathy, the strongly positive heterophil antibody agglutination and the splenic disease made the diagnosis extremely probable. In the second case a tentative diagnosis of a subcapsular splenic hemorrhage was made on the basis of persistence of abdominal findings and the probability of infectious mononucleosis. In both cases the postoperative course was uneventful. The authors review 14 cases of splenic rupture in infectious mononucleosis that have been reported in the literature. They stress that with more general appreciation of the fact that in infectious mononucleosis splenic rupture may occur either spontaneously or as the result of minimal abdominal trauma three things may be accomplished. The performance of diagnostic tests for infectious mononucleosis in patients suspected of splenic rupture, and in the postoperative study of those from whom a ruptured spleen has been removed, may lead to a revision of the present estimate of the rarity of the condition. Secondly, avoidance of heavy exertion during the phase of infectious mononucleosis in which the spleen is enlarged and avoidance of repeated palpation of an enlarged spleen in patients with infectious mononucleosis may lower the incidence of this complication. Careful observation of patients with infectious mononucleosis for evidence of abdominal pain or acute blood loss may lead to more prompt surgical action, with resultant improvement in the mortality figures of this complication.

Industrial Sight Conservation.—Weltchek says that proper examination of vision for industrial purposes should include (*a*) vision at 20 feet (6.1 meters), (*b*) vision at approximately 14 inches (35.6 cm.) and (*c*) vision at working distance. The vision at working distance is by far the most important part of the examination. In many instances, vision "at distance" and the vision "at near" do not correspond to vision at working distance. In an industrial procedure where fine or even gross work is done at a distance of 20 inches (50.8 cm.) from the eye, it is useless to test vision for ordinary "near" and to attempt to correct it by the usual correction for near vision; i. e., 14 inches. Proper illumination and eye safety are also important. Five "pilot" studies in various industries throughout New Jersey are now in progress. Factual material is thus being collected for the purpose of improving present concepts and practices of industrial sight conservation.

Salmonellosis Due to Salmonella Oregon.—Fulton and Godwin feel that bacteriologic and serologic studies on patients infected with the rarer types of Salmonella are still needed. They present the case of a farmer, aged 67, who was hospitalized because of diffuse prostatic enlargement. After he had been in the hospital for more than a month, his temperature went up to 102 F. He complained of headache, cramping pain in the lower part of the abdomen and multiple watery stools.

These symptoms were accompanied by occasional bouts of nausea and vomiting. A stool culture yielded Salmonella oregon. This is the first case of Salmonella oregon identified in North Carolina, and the eleventh involving the occurrence of this organism in man. No other cases or carriers of Salmonella were detected in the patient's ward. A five day course of sulfadiazine had no apparent effect, but later the diarrhea ceased. Sulfonamide compounds apparently are not effective, and streptomycin seems to be a more promising agent. However, the mortality rate in cases of salmonellosis is low, and in view of the possibility that the organism may become resistant to streptomycin, it might be wise to hold the drug for use if and when massive invasion or septicemia occurs.

Antireticular Cytotoxic Serum in Hodgkin's Disease.—Abernethy and his associates review observations on 7 cases of Hodgkin's disease in which antireticular cytotoxic serum was administered as an adjunct to irradiation therapy. They studied the effect of the serum on the circulating blood cells, on the rate of tissue destruction, on capillary permeability and on a possible infection with Brucella. Minimal evidence suggestive of transient alteration in the reticuloendothelial system was noted; observed changes in the differential white blood cell count and in the sedimentation rate confirmed the Russian reports. Other alterations in function reported by the Russians were not confirmed, and additional objective tests to supplement the ones which they recorded failed to support their theories. The results from the use of antireticular cytotoxic serum as an adjunct to therapy in Hodgkin's disease have so far been disappointing.

Resuscitation After Exposure to Carbon Monoxide.—This report by Schwerma and his co-workers presents the results obtained when dogs were exposed in a chamber to air containing 0.3 per cent carbon monoxide from the gas main in Chicago until the first respiratory gasp occurred. At this point the animal was immediately removed from the chamber and one of six procedures was instituted. Thirty-six per cent, or 8 of 22 dogs, survived when given manual artificial respiration in air. Forty-three per cent, or 13 of 30 dogs, survived when given manual artificial respiration in 7 per cent "carbogen." Sixty-nine per cent, or 57 of 82 dogs, survived when given mechanical artificial respiration with a device providing alternating positive and negative pressure, using 100 per cent oxygen. Sixty-six per cent, or 55 of 83 dogs, survived when given mechanical artificial respiration with the same device, using 7 per cent "carbogen." Sixty-five per cent, or 13 of 20 dogs, survived when given mechanical artificial respiration with an alternating positive pressure device, using 100 per cent oxygen. Mechanically produced artificial respiration using 100 per cent oxygen or 7 per cent "carbogen" is significantly superior to that produced manually in air. Regardless of this fact, the manual method must be taught because it is always available. Three cases of pneumonia (10 per cent) occurred among the 31 survivors resuscitated by manual artificial respiration or by being placed in "fresh air." Twenty-six cases of pneumonia occurred among 125 survivors (24 per cent) which were resuscitated with positive pressure devices. This difference is not considered significant, since it could occur by chance in 15 of 100 such experiments. The incidence of pneumonia was the same whether 100 per cent oxygen or 7 per cent "carbogen" was used for resuscitation. In regard to survival and the incidence and severity of neurologic sequelae no difference was found between the use of 100 per cent oxygen and 7 per cent "carbogen" in resuscitation from carbon monoxide asphyxia.

Portacaval Shunts in Treatment of Portal Hypertension.—Linton and his associates discuss various types of portal bed block and report observations on 15 patients who have been treated by various types of shunt operations. The most common form of intrahepatic block results from portal or Laennec's cirrhosis secondary to the scar tissue replacement of the liver parenchyma. The extrahepatic portal bed block (so-called Banti's syndrome) may be either congenital or acquired. A combination of the intrahepatic and extrahepatic types may also occur. It was present in 2 of the 15 cases reviewed by the authors. Patients with portal hypertension secondary to a portal bed block, as a rule, seek medical advice because of a sudden massive hematemesis or melena. Portal hypertension should always be considered in the differential diagnosis of hematemesis or melena. Roentgenologic examination of the esophagus with barium to determine the presence or absence of varices is the most important diagnostic procedure. The portacaval shunt type of operation represents a new chapter in the treatment of portal hypertension. It apparently prevents serious hemorrhage from esophageal varices, although they may still persist, and in addition it may improve the hepatic function. Splenectomy and the suture type of end to side splenorenal anastomosis with preservation of the kidney, performed through a thoracoabdominal incision, are recommended as the most satisfactory operative procedure in cases in which the spleen has not been previously removed. Anastomosis of the superior mesenteric vein to the inferior vena cava and of the inferior mesenteric vein to the left ovarian vein has been utilized with apparent success, in 2 patients who had had the spleen previously removed. Direct anastomosis of the portal vein to the inferior vena cava may frequently be impossible due to the extreme degree of vascularity in the region of the gastrohepatic ligament. The results of various types of portacaval shunts have been more satisfactory in extrahepatic portal bed block than in the intrahepatic type.

Surgical Aspects of Hyperparathyroidism.—Black reports on 63 patients with proved hyperparathyroidism that were observed at the Mayo Clinic to the end of 1946. The disease was due to a single adenoma in 56 cases, to multiple adenomas in 3 cases and to diffuse primary hyperplasia in 4 cases. Complications of the urinary tract were more common and more important than osseous complications. Since the diagnosis can be made with certainty, exploration of the parathyroid glands is never indicated to establish the diagnosis. The treatment of hyperparathyroidism is surgical. Adenomas should be removed completely and, in cases of diffuse primary hyperplasia, the hyperplastic tissue should be excised subtotally, with preservation of 30 to 200 mg. of hyperplastic tissue. In more than 80 per cent of cases, the abnormal tissue may be found by dissection under direct vision through a cervical incision (cervical and posterior superior mediastinal dissection). A second operation, through a sternotomy incision, will be necessary in the remaining cases (anterior superior mediastinal dissection). Secondary dissection is more difficult and far less certain than primary dissection, so that every effort should be made at complete operation, both in identifying the parathyroid glands present and in designating those missing, at the first cervical dissection.

Physiologic Aspects of Vagotomy in Peptic Ulcer.—Stein and Meyer say that in June of 1946 a study of vagotomy in the treatment of peptic ulcer was started on one of the surgical services at the Cook County Hospital. Vagus section was carried out in 35 instances. Physiologic studies of the stomach were made before and after vagotomy in 30 patients. Each of the following determinations was made on a significant number of patients before and after surgery: (1) twelve hour night secretion, (2) basal secretion, (3) the effect of histamine on gastric secretion, (4) the effect of caffeine on gastric secretion, (5) the effect of atropine on basal secretion, (6) the spontaneous motility of the stomach and the effect of insulin on secretion and motility, (7) the pain threshold to electrical stimulation and (8) the production of pain by the introduction of acid into the stomach. The secretory activity of the stomach may be divided into the period of interdigestive or continuous secretion and the digestive period of secretion. The latter consists of three phases: the cephalic, the gastric and the intestinal. The cephalic gastric secretion is mediated entirely by the vagi. The gastric phase can be provoked by mechanical stimulation and secretagogues, and has been considered independent of the vagus. In view of the considerable decrease in the secretory response to histamine and caffeine after complete vagotomy, it is apparent that the gastric phase of secretion is also to some extent influenced by the vagus. The secretory response to chemical stimuli was reduced in every patient in whom the insulin test indicated that vagotomy was complete. The authors feel that the inconsistent results reported by other workers may be due to failure to distinguish between completely and incompletely vagotomized subjects. They also obtained confirmatory evidence of the reliability of the insulin test as an indication of the completeness of vagotomy. After complete vagotomy there is a considerable reduction of the night secretion and the basal secretion. The secretory response of the stomach to caffeine and histamine is greatly reduced. There are no spontaneous hunger contractions in the fundus of the stomach up to nine months after complete vagotomy. Complete vagus section in some manner interrupts a mechanism necessary for chronicity of peptic ulceration.

Cervical Cytology in Early Uterine Cancer.—Oxorn discusses the basic principles of the cytologic tests and their application in the early diagnosis of cancer of the uterus. He describes the vaginal aspiration, the cervical aspiration and the cervical spatula technic and discusses their relative merits. It is believed that the cervical spatula test is the most efficient in the diagnosis of extremely early cervical cancer. Emphasis is placed on the importance of having a central laboratory in each district where expert study of these smears may be made. Describing the glycerine mailing technic of Ayre and Dakin, the author says that after standing in the ether-alcohol fixer for one hour, or more, the slides are removed from the solution. Without permitting them to dry, one places a large drop of glycerine in the center of the secretion zone. A second, clean, slide is placed face to face with the smear, and the glycerine spreads out to cover the entire smear area, sealing it off completely. Each unit is made up of two slides: (1) the slide with the smear on it and (2) a clean slide acting as a cover slip. The slides are then placed in wooden or cardboard containers, to prevent breakage, and are mailed to the cytology laboratory. Once the slides arrive at their destination the glycerine is washed off, and the usual staining routine is carried out. Smears can be taken by every practitioner in his office. This combined with the mailing technic makes it possible for every doctor and every patient to reap the benefits of this modern diagnostic procedure. Cancer of the uterine fundus as well as cancer of the cervix can be diagnosed accurately by the cytology method These smears provide a reasonably accurate measure of endogenous body estrogen at any one time. The advantages and disadvantages of the tests are presented. It is concluded that the use of routine periodic check-ups with cytologic tests at each visit will do much to lower the present high mortality rate from uterine cancer.

Hot, Dry Climate for Arthritic Patients.—For the last six years Edström and his associates have had one ward in the rheumatologic department of the University Hospital in Lund constantly air conditioned at 32 C. and 35 per cent relative humidity. In this ward they have treated arthritic patients, each of them for about a hundred days. The peripheral circulation increased in all. Peripheral vasospasm was converted into peripheral vasodilatation. The arteriovenous anastomoses especially have been maximally dilated. The temperature of the skin, which was lower at an ordinary room temperature of 20 C. (especially in cases of rheumatoid arthritis) has been raised, particularly on hands, feet and distal part of the extremities. The relative oxygen saturation of venous blood, measured at the medial cubital vein, increased in the hot rooms, while the arteriovenous difference diminished. Cultures from the throat flora showed in most cases beta-hemolytic streptococci on admission of patients to the hot room, but only in 2 cases were such cocci detected at the end of their stay. These cocci apparently do not tolerate this dry hot climate. The most obvious effects on the clinical symptoms have been: remission of periarticular edema and capsular swelling of joints, diminished shifting pains and contractures, better appetite, improved function in cases of cardiac defects and disappearance of the blue livid coloration of skin on hands and feet. Tendency to recurrence immediately after removal back into ordinary room temperature has not been observed.

Cardiovascular Changes Following Electro-Convulsive Therapy. R. Kauntze and G. Parsons-Smith.—p. 57.

Temporal Arteritis.—The age of onset in Cole's 3 patients was between 65 and 72, and the symptoms and signs produced by involvement of the temporal arteries ran a course lasting from four to six months. All 3 showed evidence of arteriosclerosis in the radial and brachial arteries, and 2 died suddenly from cardiovascular accidents. The key to the diagnosis has been severe headaches leading to the discovery of the involvement of the temporal arteries. More cases should be published in order that the condition may be widely recognized and more may be learned about its protean manifestations. At present the general verdict is that the prognosis is good as far as the local condition in the temporal arteries is concerned, for this tends to clear up in about a year. It is not yet so clear how far extension of the process to more vital arteries may be responsible for deaths such as occurred in these patients, and a follow-up of more cases is needed.

Effects of Short Term Changes in Dietary Protein on Liver in Carbon Tetrachloride Injury.—According to Campbell and Kosterlitz the nutritional condition of an animal greatly determines its resistance to toxic halogenated hydrocarbons. In view of the fact that the protein content of the diet determines the amount of labile cytoplasm (protein plus phospholipin plus nucleic acid, PPN) present in the liver cell it was of interest to examine whether the severity of liver injury caused by a single administration of carbon tetrachloride could be correlated with the presence or absence of labile PPN. Rats were placed on a protein-free 18 per cent or 54 per cent casein diet for three days prior to a single injection of carbon tetrachloride. The damage to the liver as measured by central necrosis, hydropic degeneration and deposition of neutral lipids was least on the protein-free diet. The rats on the 18 per cent casein diet showed the highest incidence of hydropic degeneration, and those on the 54 per cent casein diet the greatest deposition of neutral lipids. On all diets there was a considerable loss of glycogen. These results are in agreement with the findings of other observers, that, if given for short periods before the administration of chloroform or carbon tetrachloride, a diet rich in carbohydrate, low in fat and protein gives the highest protection against injury to the liver. On the other hand, prolonged dietary protein deficiency leads to protein depletion, which renders the liver highly susceptible to this type of injury.

Modern Therapy of Benign Tertian Malaria.—Monk points out that the recent war gave impetus to the search for the ideal antimalarial drug. He reviews the stage at which the treatment of benign tertian malaria has arrived, discussing experiences with the following drugs: quinine, quinacrine, an acridine dye, "paludrine hydrachloride" (chlorguanide hydrochloride), chloroquine, a 4-aminoquinoline derivative, pamaquine, an 8-aminoquinoline compound, and pentaquine, an 8-aminoquinoline derivative. The ideal drug for the prevention and cure of benign tertian malaria is still to be found. Quinine therapy alone and unaided is of little value. Suppressive and curative treatment with quinacrine is likely to be superseded by more recently discovered antimalarial drugs. Chlorguanide and chloroquine are probably effective in producing complete suppression of overt attacks of malaria in once-weekly dosage. Neither is able to prevent the establishment of Plasmodium vivax in the human host even by daily dosage, but chlorguanide has some inhibitive effect on the preerythrocytic forms. Neither drug given alone is as successful as other forms of therapy in producing a low relapse rate. Pamaquine is a drug which deserves greater recognition as a safe medium for the elimination of P. vivax infections. Given as an adjuvant in any course of antimalarial therapy, it is of the greatest value in reducing the relapse rate. The toxicity of pamaquine is shown to be less formidable than is generally accepted. No treatment so far administered to a large series of patients with naturally occurring benign tertian malaria is more successful than quinine given concurrently with pamaquine. Chlorguanide given concurrently with pamaquine is equally successful. Pentaquine given concurrently with quinine is likely to prove more successful in producing a lower relapse rate than any other therapeutic regimen. The toxicity of pentaquine is approximately three quarters that of pamaquine. A thirty-one day intermittent course of quinine and pamaquine proved successful in the complete eradication of P. vivax infections in all patients followed up in a series of 45 cases. It is suggested that such a course is worth extended trials among cases of chronic relapsing malaria in a nonmalarious area.

Management of Chronic Mental Patients. A. P. Tait.—p. 459.

Personality Change After Leukotomy.—Garmany reports on 59 patients who had undergone leukotomy not less than three years previously. Leukotomy proved successful in half of the 22 patients with depression and also in half of the 10 patients with paranoid schizophrenia, but in only 1 of 15 patients with hebephrenia and in only 2 of 10 patients with catatonic schizophrenia. The author believes that no permanent personality change occurs which is ascribable to the operation alone. Restitution depends materially on the possibility of rehabilitation, particularly in the patient's own home. In depression, a good personality, free from lifelong morbid patterns of reaction, and average intelligence are essential if a good prognosis is to be given. Heavily emphasized hypochondriacal reactions or *bizarreric* are bad omens, and equally so are schizophrenic features and organic dementia. In the case of hebephrenic and catatonic reactions, it seems doubtful whether the operation is worth doing unless circumstances are quite exceptional; in paranoid schizophrenia the operation seems to offer reasonable hope if the premorbid personality was good, and particularly if passivity and catatonic features are not prominent. It is well to remember that the curative effects of leukotomy may not be permanent, and the reorganization of disease patterns shown in 3 cases in this series, after a long period of comparative fitness, may prove to be a not uncommon phenomenon with longer observation.

The Kent and Other Tests.—Rudolf points out that tests of the indefinable quality known as intelligence are legion. Many have been standardized satisfactorily; others have not. The validity of some tests is high, but results of different tests used on the same persons have seldom been published. In the comparative investigations reported in this paper a total of 1,566 persons were examined as follows: (1) 557 subjects, each tested with the Kent and the Stanford-Binet tests; (2) 409 subjects, each tested with the Kent and part I of the Farmer-Hotoph 3 (or R) given as a group test, and (3) 600 subjects, each tested with the Kent and the Progressive matrices given as a group test. On the basis of the results obtained, the author concludes that the Kent emergency test cannot be used as an alternative to the Stanford-Binet, the progressive matrices, or the Farmer-Hotoph 3 (or R) test, as it does not record similar results on the same persons.

Vaccination Against Influenza A.—Mellanby and her associates state that an attempt was made during the winter of 1946-1947 to test the value of influenza vaccination in Britain. The vaccine used was made from infected allantoic fluids inactivated with 1:2,000 formaldehyde and concentrated by the method of Francis and Salk. Prophylactic vaccination was carried out under controlled conditions during November and December, 1946, in twenty-four mental hospitals, three public schools and numerous small communities, including two preparatory schools, nursing staffs of hospitals and some patients of general practitioners. In eighteen Army training centers alternate intakes were vaccinated. Altogether some 20,000 persons were inoculated, there being about an equal number of uninoculated controls living under similar conditions. In the mental hospitals and in some small groups the incidence of influenza was so low that no conclusions about the efficacy of the vaccine could be drawn. In two out of three schools there were outbreaks of influenza. In one the incidence in the vaccinated boys was 11 per cent and in the controls 21 per cent; in the second the incidence was 11 per cent in the vaccinated and 17.3 per cent in the controls. Outbreaks of disease of the respiratory tract were observed in only three of the eighteen Army units, and one of these the disease probably was not influenzal. In the other two the incidence of influenza was 7.1 per cent in the vaccinated and 8.3 per cent in the controls—not a significant difference. The conclusion is that, in the absence of a widespread epidemic involving many units, a trial on the lines described is unlikely to give a definite answer. The results are much less encouraging than those reported in 1944 and 1946 from the United States. Recent reports from there indicate that in 1947 vaccination had little, if any, effect on the incidence of influenza. Apparently the strains of virus A causing the 1947 epidemics were antigenically rather remote from those contained in the vaccine.

Corneal Transplantations. P. B. English and J. M. White.—p. 736.

Anesthesia in Surgical Treatment of Tetralogy of Fallot.—Orton points out that in the tetralogy of Fallot cyanosis is the outstanding clinical feature. The reasons for its presence, together with its relationship to anoxia, must be considered in order that the physiologic problems that the anesthetist must solve may be understood. At his clinic premedication with morphine was used with the object of lowering the metabolic rate. Atropine was included in the premedication, in spite of its reverse action, owing to the desirability of suppressing secretions in the pharynx. Cyclopropane was administered as the main anesthetic agent, first, as it made possible the use of a high partial pressure of oxygen, and, second, as controlled respiration is easier with this drug than with ether. Curare was employed as an adjuvant with anesthesia in order to control coughing reflexes and to allow extremely light planes of anesthesia. Control of respiration was established as soon as the larynx had been intubated, and was maintained throughout. In this way adequate pulmonary ventilation was possible in the presence of an open pneumothorax. Further, it was considered that, since the respiratory center in these patients functioned in an abnormal manner, it was preferable to abolish voluntary respiration. Two cases are described in which success was achieved in establishing an artificial communication between the pulmonary and aortic circulations. Since then 9 additional patients with tetralogy of Fallot have been operated on. The method of anesthesia differed in no way from that described.

*Soy Bean Culture Medium for Vaccine Production. G. H. Ford and W. Lewin.—p. 372.
*Hiatus Hernia, Diverticula and Gall Stones: Saint's Triad. C. J. B. Muller.—p. 376.

Soya Bean Culture for Vaccine.—Ford and Lewin describe a method for the preparation of a soya bean broth, which was used for the preparation of typhoid vaccine. The vaccine thus prepared was compared with one produced on a meat medium in regard to agglutinin production in rabbits and mouse protection tests and was found not to be inferior to that produced on a meat medium.

Hiatus Hernia, Diverticula and Gallstones.—Muller says that Professor Saint of Cape Town called attention to the association of hiatus hernia, sacculi of the colon and gallstones. Its prognostic importance in avoiding unwarranted treatment, and the differential diagnosis from a host of pulmonary, cardiac and abdominal conditions makes the triad of practical as well as of academic interest. Many references are made in the literature to hiatus hernia and diverticula of the duodenum and colon, hiatus hernia and gallstones, duodenal ulcer and chronic appendicitis, but the author found no reference to the triad of hiatus hernia, diverticula of the colon and gallstones. In the course of making several hundred barium meal studies he observed 3 such cases. The author thinks that more cases of association of this triad of Saint will be found, if they are searched for.

*Action of Liver Antitoxic Principle in Hepatobiliopathies. J. Nasio.—p. 375.

Action of Liver Antitoxic Principle in Hepatobiliopathies.—Nasio studied the effects of the liver antitoxic principle on a large number of normal persons and on 450 patients with diseases of the liver and of the bile ducts who were observed, in the course of the last five years, at the Argentinean Dispensary for Diseases of the Digestive Apparatus. The liver crystalline substance used by the author was prepared by the American technic. Each cubic centimeter of the substance contains 0.0025 Gm. of the active liver principle as obtained from 50 Gm. of fresh hog's liver. The liver substance was given by intramuscular route in daily dose which varied from 2 cc. to 5 cc., in relation to the more or less acute degree of insufficiency of liver antitoxic principle. The author found that the crystalline antitoxic liver principle is of great value in the therapy of diseases of the liver and the bile ducts. It protects the liver and stimulates elimination through the bile ducts and specific antitoxic function of the liver. The therapeutic effect of the liver antitoxic principle can be evaluated clinically by the Quick test, which is performed before and on the seventh day after administration of a daily dose of 3 cc. of liver antitoxic principle. A good positive response shows by an increased elimination of 50 per cent or more of hippuric and benzoic acids of the Quick test. It indicates a good prognosis and continuation of medical treatment, whereas a negative result indicates either surgical treatment or the presence of an irreversible hepatobiliary disease.

Nederlandsch Tijdschrift v. Geneeskunde, Amsterdam

*Ascites and Hydrothorax in Presence of Tumors in Lower Abdomen: Syndrome of Meigs. G. Blomhert and Loe Ping Kian.—p. 1523.
*Sporadic Positivity of Sputum. H. C. Hallo and W. C. J. B. Hulscher.—p. 1533.

Ascites and Hydrothorax in Presence of Tumors in Lower Part of Abdomen.—Blomhert and Loe Ping Kian point out that formerly, when accumulations of fluid in abdomen or thorax accompanied a tumor in the genital apparatus, a malignant tumor with metastasis was generally thought of, and only palliative measures were taken as a rule. Meigs and Cass, in 1937, called attention to the fact that a benign tumor may cause ascites and hydrothorax and that such patients can be cured by surgical removal of the tumor. Since then the condition has been known as the syndrome of Meigs. Later studies indicated not only that benign and malignant tumors of the female genital tract may cause this accumulation of fluid in abdomen and thorax, but that this syndrome is an example of a mechanism of much more general occurrence. If certain anatomic and physiologic conditions are fulfilled, any form of ascites, presumably by means of lymphogenous transport, may be accompanied by liquid in both pleural cavities. The authors present a case history which illustrates that tumors of the ovary may be accompanied not only by ascites, but also by hydrothorax.

Sporadically Positive Sputum.—Hallo and Hulscher report that in the course of one year 16 patients were observed in a consultation office for tuberculosis in whom the sputum proved positive during a cold, although clinical and roentgenologic signs indicated that their pulmonary processes were inactive and remained so on further observation. Subsequent cultures of sputum and stomach contents appeared to be negative again. The authors point out that these patients may become the source of infection, although they are regarded as noninfectious.

Semaine des Hôpitaux de Paris

*Acute Primary Cardiac Failure in Early Infancy. R. Clément, J. Gerbeaux and R. Nebout.—p. 1915.
Subacute Infectious Dermatomyositis. R. A. Marquézy and J. Bonnette.—p. 1923.

Primary Cardiac Failure in Infancy.—Clément and his co-workers report 4 cases of acute cardiac decompensation in children between the ages of 18 months and 4 years. The clinical picture was identical in all cases. Apparently there was a violent onset of the syndrome. But in reality some accidents of the same type preceded in all cases and were followed by regression. During the first hours disturbances of digestion, particularly vomiting, were of considerable importance. Then the cardiac signs became predominant. There was dyspnea with intense tachypnea and in some instances a galloping rhythm, hepatomegaly and occasionally splenomegaly. The heart volume was enormously increased clinically as well as on roentgenologic examination. Pulmonary stasis was present at the same time. No signs of involvement of the kidneys were observed, and there was complete apyrexia. Complete recovery resulted from treatment with digitalis preparations in 2 patients. The third patient showed considerable improvement, but one year after the initial attack he continued to have attacks of the disease from time to time. The fourth patient was seen by the authors only shortly before death. Necropsy revealed interstitial myocarditis with endocardial thrombosis and mild thickening of the epicardium. The importance of the effect of large daily doses of digitalis preparations is emphasized.

Book Notices

The Biology of Melanomas. By Myron Gordon, and others. Volume IV, Special Publications of the New York Academy of Sciences. Edited by Roy Waldo Miner, Myron Gordon, and Lothar Salin. Being the results of a Conference on The Biology of Normal and Atypical Pigment Cell Growth, held by the Section of Biology of The New York Academy of Sciences November 15 and 16, 1946, New York City. Fabrikoid. Price, $5. Pp. 466, with 107 plates. New York Academy of Sciences, Central Park West at 79th St., New York 24, 1948.

This book is an excellent compilation of material presented at a conference on the "Biology of Normal and Atypical Pigment Cell Growth" held by the section of biology of the New York Academy of Sciences, Nov. 15 and 16, 1946, New York City. Each author, as an active investigator on a phase of pigment cell growth and on development of melanoma, prepared a paper or papers which served as focal points around which the discussions were conducted. These papers have been collected and published as "The Biology of Melanomas."

Thus, all phases of the subject are presented by authorities in their respective fields. The reader is presented first with developmental subjects, followed shortly by a direct introduction to the clinical aspects. Cytologic and genetic studies on the problem are rather well covered, as are the endocrinologic, physiologic and chemical sides. Of particular interest to the clinician are the presentations by Masson, Becker, Pack, MacDonald and Blum. These authors represent a vast total experience, and each has managed to write concisely and thoroughly. The result is a single handbook on melanomas, and for that reason alone is unique among similar textbooks. It should serve as an excellent starting point, or reference work, for beginner and expert alike.

The only criticism is leveled not at the content but the binding. In the text supplied the reviewer, an occasional page was incompletely attached. In general the printing of the text and the illustrations were commendable. Mention is not made of the so-called junction nevus, thought by some investigators at least to be one of the important precursors of the malignant melanoma.

Since the volume contains the points of view of so many different workers on the melanoma problem, it should prove of great interest to all physicians interested in keeping abreast of the times, and especially to those who are responsible for the treatment of benign and malignant melanomas.

Diagnostic Procedures for Virus and Rickettsial Diseases. Thomas Francis, Jr., M.D., Chairman, Committee on Diagnostic Procedures for Virus and Rickettsial Diseases, American Public Health Association. Fabrikoid. Price, $4. Pp. 347, with 20 illustrations. American Public Health Association, 1790 Broadway, New York 19, 1948.

This volume was brought out in recognition of the need for collecting in one source the methodology basic to the laboratory diagnosis of viral and rickettsial diseases. Although designed primarily as a ready reference work for the laboratory worker, it contains much practical information with which the physician should be familiar if he is to keep abreast of the rapid advances being made in this field.

The book represents "a trial flight of a limited nature," and the method of presentation is a part of the experiment. As is pointed out in the preface, there is much repetition as concerns technics; the methods of inoculating embryonated eggs, the technics of the neutralization and the complement fixation tests are described in greater or lesser detail in a number of chapters. While such repetitive description is, for various reasons, perhaps desirable, the apparently myriad modifications of basic methods are confusing to the reader unacquainted with virology. A general chapter on the fundamental technics of egg work, the neutralization and the complement fixation tests would probably have been useful as a background. The inclusion of some discussion of filtration and centrifugation, as used in routine work, and a brief description of tissue culture methods would appear desirable.

Fifteen chapters are devoted to the viral diseases, covering those diseases in which a diagnosis by laboratory methods is possible, if not always feasible. In the latter category is poliomyelitis, whose diagnosis requires monkeys and specially equipped research laboratories—since this is beyond the reach of most institutions, the chapter on poliomyelitis (22 pages) might be considered too long in relation to some others, but actually is a fairly concise, and valuable, summary of current methods. The chapter on yellow fever, comprising 21 pages, is devoted in large part (12 pages) to a detailed description of the neutralization tests for this disease; a condensed version would have served as well and permitted amplification of some of the other methods. On the whole, the various diseases covered are adequately treated from the diagnostic standpoint.

In any routine diagnostic laboratory, certain practical considerations are highly important in its operation, and these, while not necessarily treated academically, have not always been given their proper perspective. For example, isolation of viral or rickettsial agents is primarily a concomitant of investigative work; from the standpoint of a laboratory concerned primarily with diagnosis, isolation of an agent is warranted only under special circumstances, since its recovery seldom provides information which cannot be obtained more simply and with less expense by serologic methods. Similarly, the dictum that serum after collection should immediately be frozen on solid carbon dioxide and sent to the laboratory packed in this refrigerant is susceptible of fulfilment only by those research laboratories which collect their own field material; a laboratory dealing with hundreds or thousands of physicians for obvious reasons finds such a procedure impractical of achievement. Storage of serums at below freezing temperatures is also a factor in any laboratory with a large diagnostic load.

The rickettsial diseases are covered in two chapters comprising a total of 34 pages. One chapter deals with the isolation and identification of the rickettsial agents; the other with serologic procedures for the diagnosis of rickettsial diseases. The treatment is clear and succinct, and the two chapters, while brief, are an excellent collation of material widely scattered in the literature of this group of diseases.

Comparative Physiology. By Bradley T. Scheer, Ph.D., Assistant Professor of Biochemistry, University of Southern California, Los Angeles. Cloth. Price, $6. Pp. 563, with 72 illustrations. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16; Chapman & Hall, Ltd., 37-39 Essex St., Strand, London, W. C. 2, 1948.

This new book, written as a textbook for an advanced university course in comparative physiology, will interest the student of mammalian physiology, collecting, as it does, the scattered literature on the physiology of the so-called lower animals.

After an opening chapter on the biochemical and physiologic processes generally thought to be common to all animals, the author surveys the animal kingdom from protozoa through vertebrates, taking up, in turn, the protozoa, the multicellular acelomate animals (the sponges, coelenterates, flatworms and roundworms), the Mollusca and the Annelida. There follow two chapters on the Arthropoda—the first dealing with the Crustacea in general and Limulus, the horse shoe crab in particular, and the second dealing with the insects. One chapter is devoted to the Echinodermata and two to the Vertebrata.

Within each chapter the physiology of each of these groups of animals is taken up under such headings as nutrition, feeding, digestion, circulation, respiration, metabolism, excretion, regulation of the internal environment, neuromuscular systems, central nervous systems, locomotions, sense organs and behavior.

At the end of each chapter, and in a final concluding chapter, there are summaries in which the salient features of each phylum are discussed. Particular attention is paid to the important ecologic and evolutionary developments within each phylum.

This arrangement of material enables the author to summarize the existing information and thus present a uniform picture of the physiology of each animal type. It points up the utility of particular physiologic adjustments in terms of the ecologic environment and of the behavior of the animal. Finally, it enables the author to interpret, by comparative methods, the physiologic as well as the morphologic changes which have occurred during the course of evolution.

Much of the latter interpretation is put forth frankly as hypothesis, in the hope that further experimental work will be stimulated. It is clear from a reading of the book that such further work is vitally needed. Virtually no information of a physiologic nature is available about many animal types. Thus, although ten different phyla are discussed, almost a third of the book is devoted to one class, the Vertebrata.

There is an appendix giving a broad classification of animals, a species index and a subject index. Although there are over eight hundred references, there is no author index.

Hipófisis y crecimiento (estudio experimental). Por Héctor E. J. Houssay. Paper. Pp. 293, with 68 illustrations. El Ateneo. Córdoba 2099, Buenos Aires, 1947.

This is an interesting and valuable monograph from the pen of the son of Dr. Bernardo Houssay, who is so well known to the world of science. He was helped by his mother, also a physician. He first reviews the effects of hypophysectomy on the growth of animals, mainly puppies. The failures in growth seem to be due particularly to an insufficiency of function in the pars distalis. The defective growth was not modified by the daily ingestion of fresh beef hypophysis, but it was corrected by the injection of extracts of the anterior hypophysis. Houssay described the appearance of the puppies which failed to grow. He studied the defective calcification of their bones. Much of the failure to grow shows in the cartilage. There is a tendency to retain the first temporary teeth. There is a tendency also to adiposity. Sometimes there is infiltration of fat into the liver. The skin may be thick and infiltrated. The hair remains infantile. There may be some failure of development of erythrocytes and hemoglobin. There are, of course, marked alterations in the development of the endocrine glands. The thyroid gland is small, pale and undeveloped. The ovaries and testicles are small. Parts of the adrenals are atrophic. The basal metabolic rate is low. The metabolism of protein is deficient, and this has much to do with the failure in growth. The excretion of nitrogen, creatinine and phosphates is low. There are decided changes in the metabolism of carbohydrates. The blood sugar falls rapidly during fasting, and the animals are highly sensitive to insulin or phlorizin. Occasionally there is transient polyuria. The blood calcium is normal. The serum potassium tends to be low. The animals tend to be apathetic, slow, timid and foolish. They are abnormally sensitive to infection. Often they lose their appetite.

There is a chapter on the effects of hypophysial disease in man, and there is a large bibliography.

The Digestive Tract in Roentgenology. By Jacob Buckstein, M.D., Assistant Professor of Clinical Medicine, Cornell University Medical College, New York. Fabrikoid. Price, $16. Pp. 889, with 1030 illustrations. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1948.

This revised edition of a well known textbook presents many additional roentgenographic data on the gastrointestinal tract and associated structures. The book is well written and contains many studies of extreme interest to the radiologist and gastroenterologist. Each section contains a brief review of the normal roentgenologic anatomy as well as roentgenographic technic. Case histories accompany the illustrations, giving pertinent clinical differential points in a brief but adequate summary.

The reproductions of the roentgenograms have been done unusually well and are very clear. Many photographs of specimens are included to complete the case studies and to permit a more thorough correlation of the pathology and the roentgenographic appearance. The reproductions demonstrate the roentgenographic appearance of many phases of both the common and the unusual disease conditions of the gastrointestinal tract.

The roentgenograms illustrate almost all the lesions encountered in the alimentary tract in the adult. The author, however, has neglected to include a study of the postoperative appearance of the colon and esophagus, which may be an extremely difficult problem to evaluate from a roentgenographic standpoint. The studies of the gastrointestinal tract of the infant include the more common lesions encountered, but they are covered in a rather sketchy fashion. Many of the problems encountered in the study of the gastrointestinal tract of the infant and child are omitted completely.

The section on cholangiography again emphasizes the value of the procedure along with valuable notes on the proper technic. The small intestinal lesions are thoroughly covered. The studies presented are adequate, but improvement could be accomplished by the reproduction of spot film roentgenograms for study of the changes noted at the fluoroscopic examination.

Most of the diagnostic procedures are covered well, and the author does an excellent job of covering the multitude of pathologic changes encountered in the gastrointestinal tract. The material is presented in a clear and concise manner which makes for easy reading.

Gardiner's Handbook of Skin Disease. Revised by John Kinnear, O.B.E., T.D., M.D., Physician for Diseases of the Skin, Dundee Royal Infirmary, Dundee. Fifth edition. Cloth. Price, $4.50. Pp. 250, with 100 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

The reader will find this book interesting but not of great practical value. The interest lies in the author's descriptive writing and in his broad concept of dermatology, both of which will appeal to the practitioner rather than to the undergraduate student. As in most handbooks which try to cover a vast field in small space, the descriptions and discussions are much too brief and there are no references to pertinent literature. Emphasis is placed on the common dermatoses, and many of the newer developments in dermatology have been included in this edition, but the author's methods of treatment differ somewhat from those practiced in this country. The book does have the virtue of being a personal work in every sense, reflecting the author's views and experience both in civilian and military practice. As such, it should be a worth while addition to any one's dermatologic library.

The Clinical Picture of Thyrotoxicosis. By Peter McEwan, M.A., M.B., Ch.B. Cloth. Price, 15s. Pp. 127, with illustrations. Oliver & Boyd, Ltd., Tweeddale Court, 14 High St., Edinburgh 1, 1948.

This small volume represents the effort of a Yorkshire surgeon to portray the clinical picture of thyrotoxicosis from a "practical" point of view. It is highly personalized, and is based on the author's experience with about two thousand thyroidectomies over a period of twenty-five years. It contains twenty-five sections dealing with such aspects of thyrotoxicosis as the classical signs and symptoms, the cardiac state, the basal metabolic rate, ocular phenomena, thyrotoxicosis and pregnancy, the thyrotoxic crisis, differential diagnostic problems, and general considerations of surgical treatment and the use of thiouracil and related compounds. The twenty-fourth section is devoted to an attempt to analyze and interpret the mortality statistics for thyroid disease from the office of the Registrar-General for England and Wales from 1913 through 1945.

Unfortunately this effort possesses many faults and few virtues. The author's treatment of his subject is based almost entirely on personal impressions which are submitted with practically no statistical data for support. There is no discussion of pathology or pathologic physiology, and the bibliography is scant, with little reference to the important advances in thyroid disease made by American investigators. The author's case reports are so sketchily presented and poorly documented that no critical evaluation of them is possible. Some of his statements are remarkable, and certain controversial points are treated dogmatically; thus, he recommends thyroidectomy for all pregnant thyrotoxic patients, and gives quinidine a blanket endorsement in the treatment of postoperative thyrotoxic auricular fibrillation. He has entirely abandoned the use of basal metabolism determination in diagnosis. He condemns the use of iodine for differential diagnosis. He states that he has never seen coexistent thyrotoxicosis and active pulmonary tuberculosis. On page 28 he states, "The irregular pulse carries with it, in my experience, no special risk"; on page 117, "It is justifiable to infer that auricular fibrillation is a serious complication of thyrotoxicosis."

There is no discussion of the management or of the differential diagnosis of thyrotoxic heart failure, and no consideration of diabetes, avitaminosis or hepatic damage in thyrotoxicosis.

An unjustifiable attempt is made to create specific symptom patterns for certain occasional complaints or manifestations which are by no means characteristic of thyrotoxicosis. Thus, there are descriptions of the typical headache, the voice changes, abdominal, extremity and back pains, and urinary symptoms which are alleged to be frequent components of a specific thyrotoxic symptom complex. With due allowance for geographic variations in the thyrotoxic syndrome as it exists in England and the United States, it will be difficult to agree with many of the author's impressions and conclusions, and his book cannot be considered as an important contribution to the literature of thyroid disease.

The Sulphonamides and Allied Compounds. By Elmore H. Northey, Ph.D., Administrative Director, Stamford Research Laboratories, American Cyanamid Company, Stamford, Conn. American Chemical Society Monograph Series. Cloth. Price, $12.50. Pp. 660, with 8 illustrations. Reinhold Pub. Corp., 330 W. 42nd St., New York 18, 1948.

The information contained in the monograph makes available to the medical profession an accurate digest of the work done in a large and important chemotherapeutic field. It also permits a proper evaluation of that work and points out certain areas in which additional research may be profitable.

The monograph gives a fairly complete survey of the experimental work in the field of sulfonamides and related compounds. The book is divided into twelve chapters, seven of which are devoted to the chemistry and pharmacology of simple and complex sulfanilamide derivatives and of sulfones and related compounds. Most of the sulfonamides and sulfones which have been prepared and tested are arranged in convenient tables which list their activities with respect to various organisms and give appropriate references. The compiled material is grouped into 323 tables and contains 2668 references.

The volume also includes chapters on the experimental method used in the evaluation of chemotherapeutic activity, the relationship of structure to activity, theories concerning the mechanism of the action of sulfonamides and sulfones and a clinical evaluation of the sulfonamide drugs.

Foundations of Neuropsychiatry. By Stanley Cobb, A.B., M.D., Bullard Professor of Neuropathology, Harvard Medical School, Boston. Fourth edition of the work formerly known as A Preface to Nervous Disease. Cloth. Price, $2.50. Pp. 260, with 13 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

Any book that reaches a fourth edition must be able to satisfy a need in American medicine. That certainly is true of Dr. Cobb's, "Foundations of Neuropsychiatry." In simple language he covers the basic fundamentals that a student of the nervous system needs to know. If there is any criticism, it is that not enough of the psychologic foundations of psychiatry itself are included. However, for the audience toward which this book is directed it is exceedingly satisfactory.

Practical Bacteriology, Hematology, and Parasitology. By E. R. Stitt, M.D., Ph.M., Sc.D., Paul W. Clough, M.D., Physician-in-Charge of the Diagnostic Clinic, Johns Hopkins Hospital, Baltimore, Sara E. Branham, M.D., Ph.D., Sc.D., Senior Bacteriologist, National Institute of Health, and others. Tenth edition. Fabrikoid. Price, $10. Pp. 991, with 765 illustrations. The Blakiston Co., 1012 Walnut St., Philadelphia 5; Toronto 2, 1948.

Fortunately, the original author is still living to enjoy the popularity of this book, although it first appeared some forty years ago. Each of the many editions has given more space to the interpretation and diagnostic significance of laboratory procedures. The various sections of the book have been revised, and some sections have been entirely rewritten. The chapter on examination of the cerebrospinal fluid has been extensively revised, and a new method of preparing colloidal gold solution now in use in the Naval Medical School laboratories is included. Dr. Reuben Kahn has reviewed the section dealing with the Kahn flocculation test. Dr. John Kolmer reviewed the technic of the Kolmer complement fixation test. The chapter on filtrable viruses has been rewritten by Dr. Paul W. Clough and new material added, particularly on poliomyelitis, influenza, infectious hepatitis, the encephalitides and primary atypical pneumonia. The section on rickettsial diseases was written by Dr. Norman H. Topping and includes descriptions of Q fever and scrub typhus. Some material in the previous edition has been omitted from this one to make room for recent advances in this field. In this way, it has been possible to keep the size of the book about the same.

Dermatologic Therapy in General Practice. By Marion B. Sulzberger, M.D., Professor of Clinical Dermatology and Syphilology and Director, Department of Dematology and Syphilology, New York Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital, New York, and Jack Wolf, M.D., Attending Dermatologist and Syphilologist and Chief of Service, New York Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital. Third edition. Cloth. Price, $7.75. Pp. 663, with 66 illustrations. Year Book Publishers, Inc., 304 S. Dearborn St., Chicago 4, 1948.

This third edition brings up to date the important advances in dermatologic and antisyphilitic therapy. It is written primarily for the general practitioner and contains information which, if wisely used, will enable him adequately to treat most of the common dermatoses. In a logical and straightforward manner the principles of therapy are discussed. Thus, before specific measures are mentioned, the first chapters are devoted to general principles of topical medication and physical therapy. The authors make an excellent attempt to enable the reader to understand the reasons for using each type of local medication so that it may be applied with an intelligent understanding for the needs of dermatologic patients. Whole chapters are devoted to the diagnosis and treatment of such disorders as: the eczematous dermatoses, urticaria, atopic eczema, fungus diseases, acne vulgaris, the pyodermas, seborrheic dermatitis, parasitic diseases and new growths. The chapters on syphilis deal with the clinical features of the disease as well as newer methods of treatment. This book is not one for reference only but for the daily use of all who feel the need to be better informed about the management of dermatologic patients.

Industrial Psychology. By John Tiffin, Ph.D., Professor of Industrial Psychology, Purdue University, Lafayette, Indiana. Second edition. Cloth. Price, $5.35. Pp. 553, with 140 illustrations. Prentice-Hall, Inc., 70 Fifth Ave., New York 11, 1947.

One of the major functions of the physician in industry is to match the requirements of jobs with the physical, mental and emotional abilities of employees. Industrial psychology deals essentially with the temperamental adaptations and aptitudes of persons for jobs. Tiffin's current revision is an excellent compilation of present uses of psychology in employment procedure and in the larger problems of industrial human relations. Every chapter contains much new material. The physician in industry will profit by his discussions of the technics of interviewing, employee testing, job analysis and evaluation, training methods and of the factors governing efficiency, productive work, safety and morale.

Manual técnico de hemoterapia para médicos generales y estudiantes. Por el Dr. Augusto M. Romero Alvarez, jefe del banco de sangre regional del oeste (Instituto de cirugía de la Provincia de Buenos Aires, Haedo, F. C. O.). Paper. Pp. 103, with 23 illustrations. Productos Roche S. A., Buenos Aires, [1948].

This is a handy booklet, well illustrated and of practical value for all physicians who from time to time want to give transfusions. The author states that the first physician to give a transfusion of citrated blood was Dr. Luis Agote of Buenos Aires. This was given on Nov. 9, 1914. The first man to show that one should transfuse only human blood into man was Dr. Blundell. He wrote in 1828. This is a handy little book of 103 pages and, if translated, might well be popular in this country.

Hawaii Diet Manual, Hawaii Dietetic Association. Compiled by Diet Therapy Committee. Boards. Loose-leaf. Price, $5. Pp. 192. Hawaii Dietetic Association, Honolulu, 1947.

This book is a guide for diet therapy in the territory of Hawaii with modifications of standard procedure suited to the locality. Also listed are diets peculiar to national groups found in Hawaii. This enables the therapist to prescribe an effective diet with due consideration for the patient's customs and food preferences. This work will undoubtedly find wide use in Hawaii by the physicians, dietitians, nurses and other interested professional groups working there.

Pædiatrics for Nurses. By Arthur G. Watkins, M.D., F.R.C.P., Physician in Children's Diseases, Cardiff Royal Infirmary, Cardiff. Cloth. Price, $3.50. Pp. 192, with 22 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

This is an excellent small monograph of pediatrics. The material is well organized and presented in an interesting manner. Schools of nursing will find it a good text to use.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

INDICATIONS FOR DIGITALIS

To the Editor:—Is digitalis (any form) indicated or advisable in the following conditions: (1) paroxysmal auricular tachycardia (to avoid future attacks); (2) when electrocardiograph evidence is present of strain of the left and/or the right side of the heart with hypertension (diastolic) but with no definite clinical evidence of failure other than dyspnea; (3) when systolic pressure is high, diastolic is normal, with respiratory distress and numerous dry rales of the chest but with normal circulation time? There is no other evidence of failure.

Anthony M. Susinno, M.D., Palisades Park, N. J.

Answer.—In simple auricular or atrioventricular paroxysmal tachycardia in which attacks occur frequently (once per week or more often, for example) digitalization by any method sometimes greatly reduces the frequency of the seizures. There is no objection to its use for this purpose if it is effective and if the repeated attacks make the patient particularly uncomfortable. In paroxysmal auricular fibrillation or flutter in which the attacks are frequent, digitalization may not reduce the number of the attacks but it usually conspicuously reduces the ventricular rate during them and thus reduces or prevents the symptoms which they produce. Quinidine may also be tried in any of these circumstances; it is particularly effective in paroxysmal ventricular tachycardia, in which the administration of digitalis is usually inadvisable.

No type of change in the form of the electrocardiogram can be regarded under any circumstances as an indication for the administration of digitalis. The electrocardiographic changes referred to as indicative of strain of right or left side of the heart are not, by themselves, a reason for giving this drug, regardless of the level of the blood pressure. Dyspnea, when there are strong reasons for believing that it is of cardiac origin, is an indication for giving digitalis. In most cases, however, dyspnea which is brought about by cardiac weakness increases rather rapidly in severity. The complaint of shortness of breath is so common and arises in so many different ways that it should be ascribed to beginning heart failure only after careful investigation.

Respiratory distress with dry rales is more often due to infection of the respiratory tract or bronchial spasm than to cardiac failure alone. In some patients with pulmonary congestion of cardiac origin a kind of asthmatic bronchitis develops which is rather persistent and tends to clear up as the cardiac condition improves. This clinical syndrome is much less serious than respiratory distress with distinctly moist rales, but it may be helped by the administration of digitalis and aminophylline. Epinephrine may give relief but should not ordinarily be used in cases of the kind referred to.

ERYTHROBLASTOSIS

To the Editor:—I have a 29 year old white patient, who had one pregnancy three years ago; a normal full term male infant was delivered uneventfully. She is Rh negative and her husband is Rh positive. She is now two and one-half months pregnant. History of an abortion is absent. What course should be pursued in caring for her?

M.D., Tennessee.

Answer.—The pregnant woman should be tested immediately for Rh antibodies. If the result of the test is negative, it should be repeated at frequent intervals throughout the pregnancy. There is a relation between the time of appearance of Rh antibodies in pregnancy and the severity of disease in the fetus and infant. The height of the titer has a similar significance. On the other hand, finding of antibodies during the first trimester suggests strongly that they are due to the immunizing action of a preceding pregnancy. In such case the interpretation is made more difficult. A history of a previous transfusion of Rh-positive blood makes the prognosis worse.

The parents of the husband and the first child should be tested, and if any of them is found Rh negative, heterozygosity of the husband is established. That offers a good chance (up to 50 per cent) of an Rh-negative infant, not subject to fetal erythroblastosis due to Rh incompatibility. Heterozygosity of the husband is not excluded even if his parents are Rh positive. If the husband is Rh_1 (CDe), testing his blood with the rare anti-hr′ (anti-c) serum may be another means of establishing heterozygosity. He is heterozygous Rh positive if he is hr′ positive. He is homozygous Rh positive if he is hr′ negative and all his children will be Rh positive and more likely to be affected by erythroblastosis. If antibody tests during pregnancy suggest the possibility of disease in the fetus, Rh-negative blood of suitable blood group should be made available at the time of delivery to permit prompt transfusion if signs of disease are present.

The mother does not require any special care, because her well-being is not affected by the process of Rh sensitization. If she were in need of a transfusion, only Rh-negative blood must be used.

The answer to the question regarding the mother's chances of successful termination of this pregnancy depends partly on the circumstances discussed previously. On the basis of available statistical data in the absence of a previous history of erythroblastotic children the chances are about 96 in a hundred that the child will not be affected.

BISMUTH SALICYLATE

To the Editor:—What information can you give me as to the toxic effects of prolonged intramuscular injection of salicylate in oil, at a dosage of 2 cc. per week? How long may such a dose safely be given? Are there any references regarding this medication in the treatment of psoriasis?

M.D., New York.

Answer.—Presumably from the fact that it is administered intramuscularly and in oil, the query refers to bismuth salicylate. The usual practice is to administer insoluble bismuth in courses of ten to fifteen weekly injections, followed by a rest period of one month. Some physicians administer it regularly without rest periods for a year or longer, provided, of course, that there is no evidence of harm from its use. Whenever bismuth is used, the urine should be examined at frequent intervals for evidence of renal damage and the gums and tongue should be examined for evidence of blue lines. Like other heavy metals, the drug may also produce toxic reactions in skin, liver, nervous system and hemopoietic system and such local reactions as abscess formation or arterial emboli. Bismuth compound, like numerous other preparations, has been used for the treatment of psoriasis, but has no special virtue.

SULFUR DIOXIDE POISONING

To the Editor:—Please furnish information on sulfur dioxide inhalation and poisoning. What are the lethal dose, toxicity and symptoms caused by inhalation, complications and disability?

M. J. Stec, M.D., Scranton, Pa.

Answer.—Sulfur dioxide is one of the more active irritant gasses and probably produces greater pain than almost any other industrial gas. Irritation begins at about the level of 10 parts per million. Exposure at any higher level over long periods will lead to physiologic response. At and above 500 parts per million even short exposures are dangerous. On its reaching mucous membranes the moisture there present combines with the sulfur dioxide, suggesting that the ultimate action is that of the sulfur acids. In gross concentrations, spasm of the laryngeal area somewhat effectively bars off the entry of the gas and gives rise to the term "irrespirable." It thus comes about that the tissues of the upper respiratory tract may be more involved than the lungs themselves. From lower and commoner concentrations, there may promptly arise inflammation of all membranes, violent coughing and sneezing, pharyngitis, laryngitis, bronchitis or pneumonitis with or without pulmonary edema. Bronchial pneumonia may arise. Among those long exposed there may appear digestive disturbances, impaired senses of smell and taste, excessive urinary acidity, increased fatigability and dyspnea. Action is not limited to the respiratory tract and may involve the eyes. The skin is little damaged, but sulfur dioxide in water may provoke dermatitis; a chronic state has been described resembling furunculosis. The action of sulfur dioxide is not persistent, so that a true chronic state does not arise except that chronic exposure perpetuates acute manifestations. After cessation of exposure all manifestations tend to disappear. However, on rare occasions it is possibly true that a condition of allergy, or akin to allergy, develops to the end that subsequent trivial exposures excite responses out of proportion to those expectable.

In the use of sulfur dioxide as a liquid, as in refrigeration, minor leaks may lead to sulfur dioxide spurts, with rapid and painful freezing of eyeballs. Contrary to some common belief, sulfur dioxide involvement of the lung does not predispose to, or accelerate, tuberculosis. Workers using this gas apparently acquire a fair degree of tolerance. Actually a lack of response may result merely from the coating of the respiratory passages by a layer of tenacious secretion.

SUBACUTE COLITIS

To the Editor:—A white woman, aged 38, has been suffering from diarrhea, epigastric pain and low grade fever for the past five months. There are six to ten stools almost every day. (Only occasionally are there one to two stools in twenty-four hours.) Sometimes the stools are normal in shape and appearance: often there is mucus, and some stools appear purulent. These, microscopically, are practically pure pus, mostly polymorphonuclear leukocytes. Very rarely is there occult blood. The epigastric pain occurs almost daily, sometimes radiating to one or both shoulders. Often the pain is apparently entirely thoracic. The pain is always colicky and may last for several hours. The temperature ranges from 99 to 101 F. Proctoscopic examination on two occasions did not reveal any abnormality, nor did barium enema. Barium compound orally showed irritability of the bulb of duodenum. Standard therapy for peptic ulcer has had no effect on symptoms. Examinations of stool did not show parasites or amebas. The white blood cell count is 12,000, and the sedimentation rate varies from 25 to 40 in one hour. Antispasmodics (belladonna, papaverine) and usual gastric "sedative powders" have been ineffectual. A series of eight colonic irrigations had been undergone and to the naked eye produced much mucus, pus and, on two occasions, what the therapist called "gravel." A consultant made the diagnosis of "irritable bowel" and recommended the antispasmodics and colonic irrigations, as mentioned. While this diagnosis seemed untenable in view of the fever and purulent stools, his advice was carried out, with no effect on symptoms. A cholecystectomy was done four years ago (because of gallstones) and the health has been excellent until the present illness. The history strongly suggested ulcerative colitis to me, but this cannot be demonstrated proctoscopically or roentgenologically. What further studies are indicated? Is the use of penicillin or the sulfonamide compounds indicated on an empiric basis? If so, which is preferable? If penicillin is advised, what dosage is recommended?

M.D., New York.

Answer.—The accurate diagnosis of chronic diarrhea, fever and abdominal pain occasionally is very difficult and accomplished only after prolonged observation and study. Since regional enteritis may cause colicky abdominal pain, diarrhea, fever, leukocytosis, an increased sedimentation rate and blood in the feces, further effort should be made to visualize the small bowel by barium enema and by serial roentgenograms after the oral ingestion of barium compound. Additional information regarding the physical findings, including the pelvic and rectal examinations, would be helpful. A mass in the lower part of the abdomen or high in the pelvis, for example, would support the diagnosis of regional enteritis. Repeated cultures should be made of the feces for pathogenic bacteria, including Salmonella and dysentery organisms, to exclude some type of enteric infection. Cultures of the blood and urine and the various serum agglutination reactions are indicated in view of the unexplained fever. Subphrenic, hepatic or perinephric abscess might be considered, as well as a pelvic abscess discharging into the rectum. The radiation of pain to the shoulders suggests diaphragmatic irritation. Tumors of the gastrointestinal tract or neoplasms arising in the pelvis and involving the bowel sometimes manifest themselves primarily by fever. The various diagnostic procedures should be repeated, especially the roentgen examinations of the small intestine and colon and the proctoscopic examination at intervals. The most likely diagnosis with the evidence offered is regional enteritis or colitis.

Management, in the absence of a specific etiologic factor, is symptomatic. The use of a bland, low residue, nonlaxative diet is indicated. Antispasmodics and sedatives, such as phenobarbital, ¼ to ½ grain (15 to 30 mg.), and extract of belladonna, ⅛ grain (8 mg.), four times daily may be helpful. Colonic irrigations are not indicated. Sulfonamide compounds and penicillin should be withheld until a specific indication arises. More definitive therapy depends on more precise diagnosis.

COCCIDIOIDOMYCOSIS

To the Editor:—Is there any specific treatment for coccidioidomycosis? Is serum for the coccidioidin skin test available?

Erich Seligmann, M.D., Whitehall, N. Y.

Answer.—1. Specific treatment for coccidioidomycosis is lacking. The object of treatment in the primary and disseminated forms is to assist the patient in focalizing his lesions. This is best accomplished by bed rest, adequate diet and symptomatic treatment during the stage of activity of the disease. Activity is indicated by fever, elevated erythrocyte sedimentation rate, rising titer of complement-fixing antibodies and progression or instability of the pulmonary lesions as determined by serial roentgenograms. All drugs used thus far, including the sulfonamide compounds, penicillin and streptomycin, have been ineffective. Vaccine treatment as recommended by Jacobson and immunotransfusion have not been generally accepted as influencing the course of the disease. Of the benign pulmonary residues, such as nodules and cavitation, only the latter may rarely require treatment and then only for severe or recurrent hemoptysis. Pneumothorax, phrenicolysis and immobilization of the thorax with weighted bags have been used. Such measures are difficult to evaluate because of the natural tendency to spontaneous healing, even after long periods. It is doubtful whether more radical procedures, such as used in the treatment of tuberculous cavitation, are ever justifiable.

2. Material for the coccidioidin skin test is not available commercially. Technical difficulties in production and a restricted market have delayed or prevented pharmaceutic houses from producing coccidioidin commercially. Teaching institutions or Veterans' Administration hospitals may have available a small supply of coccidioidin.

SPEECH DELAY

To the Editor:—I have a patient, 7½ years old, who cannot talk. The boy is able to make sounds and can laugh. Occasionally he will say a word. *His parents have taken him to* Children's Hospital *and to a speech* specialist in Boston. The answer received is that there is nothing that can be done, but that the boy will speak in time. I have not found any abnormal condition. Is there any way in which this boy can be tested to find out whether he will ever speak? Please suggest a method of handling this boy.

Robert H. Goldman, M.D., Leominster, Mass.

Answer.—Delayed speech may be due to mental retardation or it may be due to lack of hearing to such a degree that the child cannot learn speech or it may be due to neither of these causes, in which case it is described as motor speech delay or delay in learning to speak. Children of 7 sometimes do not speak, though later they learn to speak clearly. There are clinics in Boston in which these conditions are recognized, and adequate treatment is planned wherever possible. One of these clinics is at the Children's Hospital; another is the Language Clinic at the Massachusetts General Hospital. Either of these clinics could give the doctor and the family involved good advice. The condition is often baffling.

HISTOPLASMOSIS

To the Editor:—I examined a white woman aged 35 years and her daughter aged 6. In 1943 histoplasmosis organisms were found in large quantities in the spinal fluid of the child and in the blood of the mother. An encephalogram showed dilatation of the lateral and third ventricles of the child. The mother was advised to have no more children and underwent a sterilization operation. In the child an amentia with athetoid quadriplegia has developed. The mother has remained in good health for the past five years. There have been no clinical efforts to determine the presence or absence of the infection in mother or child since 1943. Your opinion is requested as to the advisability of the mother's submission to any type of clinical test for the presence or absence of her infection. If she still carries the fungus, is there any effective treatment?

M.D., Mississippi.

Answer.—Infection with Histoplasma capsulatum has been observed only once before to give rise to clinical disease in members of the same family. McLeod and associates reported its occurrence in siblings (*J. Pediat.* **28**:275, 1946). The apparent simultaneous involvement of a mother and her child is, therefore, unique so far as is known. Knowledge of the epidemiology of histoplasmosis is incomplete, and it is suggested that details of these cases be reported for their possible bearing on this aspect of the problem.

It would be most important to establish whether or not these patients still harbor the organism. H. capsulatum may be isolated by various cultural methods (Parsons, R. J., and Zarafonetis, C. J. D.: *Arch. Int. Med.* **75**:1 [Jan.] 1945). Sources of inoculum include the blood, bone marrow, spinal fluid, sputum and biopsy material from lymph nodes or superficial ulcerations. Blood agar slants (incubated at 37.5 C.) and Sabouraud's mediums (incubated at room temperature) are commonly used for cultivation of the organism. Yeastlike growth occurs on the former, while the latter yields the characteristic mycelial phase.

Microscopic examination of sections of biopsy material may reveal encapsulated intracellular organisms. Their presence cannot be considered diagnostic, however, since there are other organisms which at times are morphologically indistinguishable from H. capsulatum in tissue sections. The diagnosis of histoplasmosis can, therefore, be established with certainty only by strain isolation.

Additional diagnostic aid may be forthcoming from serologic tests for histoplasmosis. Complement fixation (Salvin, S. B.: *Proc. Soc. Exper. Biol. & Med.* **66**:342, 1947) and precipitin (Pates, A. L.: *Science*, to be published) reactions have been obtained in tests on serums from patients and animals infected with the causative agent. These tests are, however, still in the experimental phase.

Cutaneous tests with histoplasmin antigens will contribute nothing toward establishing the presence or absence of active infection in these patients. A brief discussion of the diagnostic value of histoplasmin cutaneous tests may be found in this department of The Journal, Oct. 25, 1947, page 543. In the same reference are listed the various therapeutic agents which have been tried, generally without success, in the treatment of histoplasmosis. In addition, J. H. Seabury (unpublished work) has used "promin" (sodium p,-p'-diaminodiphenylsulfone-N,N'-didextrose sulfonate) in the treatment of 2 patients with histoplasmosis. "Promin" therapy has also been undertaken in experimentally infected dogs. Preliminary results appear encouraging, and further studies are under way. Details of the "promin" treatment schedules employed by Dr. Seabury may be obtained by an inquiry addressed to him at the Louisiana State University School of Medicine, New Orleans.

NEUROSIS

To the Editor:—A white man aged 28 years had complained for many years of a peculiar skin sensation which he is unable to describe exactly. The nature of his complaint—which is not a real pruritus, though he uses the word "itching" occasionally—is best described as the patient's being "skin conscious." His skin is at times so sensitive that he becomes irritated when anybody, even his young wife or baby, touches him. He feels best with all clothing removed. Neurologically he was found to be normal. Tests of spinal fluid and blood serum were negative in result. Clinical studies showed at some time the following abnormalities: (1) prostatitis, chronic, which responded to treatment and did not recur; (2) moderately irritable colon; (3) allergy to mushroom, peas, currants, raisins, blackberries, cinnamon, thyme and hops; (4) moderate hyperacidity with loose bowel movements and occasional diarrhea; a complete blood cell count (eighteen months previously) showed 90 per cent hemoglobin and 3,900,000 red blood cells without poikylocytosis and anisacytosis. After several months of liver therapy, the blood was normal; the condition of the skin remained the same. Other treatment consisted of foreign protein, auto hemotherapy, diets, large doses of vitamins A and B, vitamin B complex, ultraviolet radiation, "bellergal" (a proprietary compound of belladona alkaloids, ergotamine tartrate and phenobarbital), "belladenal" (a mixture of belladonna alkaloids and phenobarbital), calcium gluconate, sodium nicotinate, galvanic baths, anti-histaminics and histamine desensitization. A psychiatrist diagnosed conversion syndrome (guilt complex —a brother was killed by gas). The patient termed the treatment unsuccessful and stopped the sessions with the psychiatrist after five sessions. Do you believe this to be a psychosomatic case? If not, what other diagnosis and treatment should be considered? M.D., New York.

Answer.—It would seem that this patient's complaints are entirely psychosomatic in nature. All investigations have failed to establish an organic cause and the usual treatment measures have been used to no avail. Since a diagnosis of conversion syndrome has been made in his case, he should be encouraged to cooperate with his psychiatrist in an attempt to solve the problem.

CIGARET HABIT

To the Editor:—A patient is desirous of discontinuing smoking of cigarets. He is of a nervous disposition and thinks that it would be an easier task if some medical aid could be given to him. How can I be of help to this man? M.D., Indiana.

Answer.—The patient who wishes to discontinue the smoking of cigarets may secure instruction and support from reading accounts of successful ex-smokers (Furnas, J. C.: So You're Going to Stop Smoking, New York, Simon & Schuster, 1938). Rinsing the mouth or swabbing the throat with 0.5 per cent silver nitrate, causing distaste on smoking, has been used. Acute symptoms of deprivation or nicotine withdrawal, with tremors and nervousness, suffered by some smokers immediately on cessation of smoking may be lessened by taking candy or otherwise raising the blood sugar and compensating for the lack of habitual adrenal stimulation from nicotine (Cannon, W. B., and others: A Note on the Effect of Nicotine Injection on Adrenal Secretion, *J. Pharmacol. & Exper. Therap.* **3**:379, 1911). The conditioned reflex, or habitual handling of cigarets, may be bridged by chewing gum.

SUSPENSORIES

To the Editor:—What deleterious effects result from continued use of a supporter or a suspensory on testicular function, (*a*) general and (*b*) spermatogenic? M.D., Pennsylvania.

Answer.—Continued use of a supporter or a suspensory should not have deleterious effects on testicular function, either general or spermatogenic. The only exception to this statement would be in an unusual instance in which the use of such a support would cause constriction of the spermatic cord with interference of the normal blood supply of the testes. Such a condition would be intolerable to the patient, and the supporter would be discarded.

PLASTIC REPAIR OF FALLOPIAN TUBES

To the Editor:—A patient, 30 years of age, married ten years, was single when she gave birth to healthy twins. To prevent a recurrence she went to a hospital and had both tubes tied. She now would like to have another child and was told by a physician that an operation can be done to open the tubes and restore normal conditions. Her periods occur regularly but with much pain, which estrogens have not relieved. She also has spastic attacks of angina for relief of which injections of ½ grain (30 mg.) of morphine had to be used. I have not found an answer in any book, of which I have many.

M.D., Washington, D. C.

Answer.—Yes, the patency of the tubes may be restored by a surgical operation, thereby permitting normal intrauterine gestations. This case should be a favorable one for operation, because in all probability there is no infection in the tubes. However, after plastic operations on the tubes there is a relatively high incidence of tubal pregnancies.

PELVIC FRACTURE

To the Editor:—A severe pelvic fracture occurred involving all four pubic rami in a girl 6 years of age. The fractures are healing satisfactorily but are close to growth centers. Will future growth be disturbed so that the pelvic outlet may be distorted? It is important that this possibility be estimated accurately, as litigation is involved.

Ernest E. Myers, M.D., Lexington, Ky.

Answer.—As a rule, fractures of the pelvis even with some distortion do not cause dystocia. In this small child, if the fracture planes did not pass through the epiphysial areas probably growth disturbance will not result. Weight bearing and jumping, with severe jar of the pelvis, should be guarded against in the convalescence until complete bony union of the fracture is developed. Follow-up roentgenograms will show whether growth centers tend to close prematurely. Cesarean section may solve childbearing problems if they arise.

ACNE

To the Editor:—Is penicillin of value in acne simplex or acne vulgaris and, if so, which preparation and dosage are advisable?

M.D., New York.

Answer.—Penicillin apparently has no value in the treatment of simple acne. During the war it was given an extensive trial among service men in the South Pacific area who were incapacitated by severe acne, but with discouraging results.

VISUAL TESTS

To the Editor:—In *The Journal*, April 24, page 1118, the query of Dr. Joseph Bogan appears to have been misunderstood. The reference here, I believe, is to visual values as ordinarily expressed in the standard Snellen symbols and their equivalents denoted in the less conventional method as routinely employed, for instance, by the Naval examiner.

Answering the last part of the query first, to find the equivalent value of any Snellen notation in either method one has simply to determine the value of the unknown, or x. To illustrate:

$$20/25 = x/20$$
$$25x = 400$$
$$x = 16$$

Therefore 16/20 is the equivalent of 20/25. Conversely,

$$16/20 = 20/x$$
$$16x = 400$$
$$x = 25$$

Therefore 20/25 is the equivalent of 16/20. Proceeding in this manner, any equivalent value for a Snellen symbol as expressed in either method will naturally evolve. This will provide the information sought in the first part of Dr. Bogan's query.

It should be borne in mind, however, that this happy parallelism of visual values in the two methods does not go on indefinitely. Using 20 feet for the denominator of necessity restricts the scope of this method, inasmuch as one is now working with values contained within certain prescribed limits; that is, each is an integral unit of the whole, which, in this case, is 20 feet, or a total of 20 foot units (the range then being 20 to 1); hence, to go beyond 1/20 (equivalent 20/400) one would have to alter the original designation and revert to a unity the denominator of which is no longer 20 feet. Accordingly, it is clear that such a method of expressing visual values has its limitations, applying as it does to those persons who are capable of qualitative visual acuteness, and so in this sense is suitable only to a more or less selective group.

Finally, to answer the second part of Dr. Bogan's query, it will suffice to say that in the method using 20 feet for the numerator the test of vision is usually carried out with the examinee at the fixed distance of 20 feet from the chart. In the second method, the examinee approaches the test chart placed 20 feet away, and the distance from the chart when the 20 foot type read by the normal eye at this distance is seen becomes the numerator of the fraction indicating his visual acuity; to wit, 20/20, 12/20, 6/20 and so on to 1/20. EMBOLISM AND THROMBOSIS IN CORONARY HEART DISEASE

Chairman's Address

ALVIN G. FOORD, M.D.
Pasadena, Calif.

The problem of embolism and peripheral venous thrombosis has always been a major one in the treatment of heart disease and particularly of coronary heart disease. This is due to the prevalence of mural thrombi in the chambers of the heart, which may serve as a source of emboli, and to the occurrence of peripheral venous thrombi, especially in the legs. Several articles on the subject have appeared in the literature of the last few years, a splendid summary of which is given by Hellerstein and Martin,[1] who also give their own observations in 160 cases of myocardial infarction occurring in a total of 2,000 autopsies at the University Hospitals in Cleveland. In 45 per cent of the cases in their series there were emboli or thrombi in other parts of the body, a total of one hundred and eleven peripheral thromboembolic lesions being found. In 12 per cent of the cases these were the main cause of death, and in another 15 per cent they were contributory causes of death. In a series of 1,146 autopsied cases collected by the aforementioned authors from the literature up to 1947, the location of thromboembolic lesions following myocardial infarction was: lung, 23.5 per cent; brain, 7.7 per cent; extremities, 5.5 per cent; kidney, 14.4 per cent; spleen, 8.8 per cent, and mesenteric vessels, 1.9 per cent. These figures include all the lesions encountered and do not, of course, represent the number of patients involved, since many showed embolism in more than one organ. Of these, pulmonary embolism is the commonest serious complication of cardiac infarction and in the foregoing summary was the chief cause of death in 10.6 per cent of autopsied cases.

Also in 1947, Mintz and Katz,[2] in a clinical analysis of 572 cases of recent myocardial infarction, found a total incidence of 52 cases of thromboembolism, of which 28 were pulmonic and 13 cerebral. In a series, as yet unpublished, of 1,000 cases of recent myocardial infarction at the Los Angeles County Hospital, Edmondson[3] observed a total of three hundred and twenty-eight manifest embolisms in some part of the body outside of the heart, and of these one hundred and sixty-one were in the lungs, forty-eight in the brain, ten in the mesenteric vessels and twenty-eight in the extremities.

Most of the preceding autopsy material was reported from major cities and included a considerable percentage of patients from public hospitals. With the idea in mind of summarizing the material of a smaller hospital, in a relatively small city, nearly all of the patients of which were private, the following study was made of the autopsy records of the Huntington Memorial Hospital. The autopsy percentage has remained about 65 per cent over the course of years. Since the city of Pasadena has a large proportion of persons of middle age and older, the problem of coronary heart disease is a major one. A review is made of a total of 3,900 autopsies done from January 1931 to May 1948. Of these 727 were in newborn or stillborn infants, leaving 3,173 in older than newborn subjects. Few children or youths were included, and the vast majority of the patients autopsied were over 50 years of age. Most of the patients were born in the Middle West or the East.

The cause of coronary occlusion was, of course, arteriosclerosis, with or without thrombosis, in nearly all of the cases. Two cases of embolism with infarction were encountered. One arose from acute vegetative aortic endocarditis, and a septic embolus in the left circumflex artery lead to infarction plus suppuration with rupture of the heart. The other was a case of infarction due to a bland embolus in the right coronary artery arising from nonbacterial thrombotic endocarditis of the mitral valve, or possibly from a small thrombus in the left auricle, in an emaciated man of 60 with a squamous cell carcinoma of the upper lobe bronchus of the right lung with thoracic lymph node and adrenal metastases.

One case with rupture of the heart following infarction resulted from splitting of the media and hemorrhage within the wall of a nonsclerotic left descending coronary artery. The lesion was identical to splitting of the media in dissecting aneurysms of the aorta. One other case was of an infant of 4 weeks with generalized medial calcification in the arteries, especially the coronary arteries, accompanied with pronounced intimal fibrosis and complete occlusion of the left circumflex artery and recent necrosis of much of the myocardium. A review of this condition was given by Baggenstoss and Keith[4] and by Field.[5] My co-workers and I had

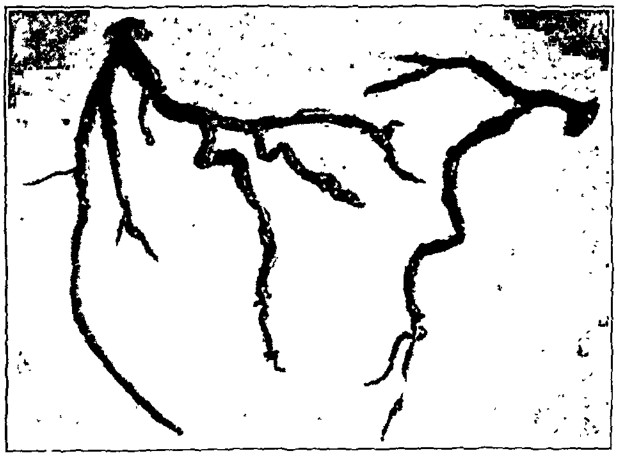
no cases of occlusion of the orifices of the arteries by syphilis. This occurred in 0.8 per cent of cases of coronary obstruction reported by Wartman and Hellerstein.[6] Although these same authors, in a series of 247 cases, observed narrowing and/or occlusion due to rheumatic arteritis in 2 cases, periarteritis nodosa in 7 cases and endarteritis obliterans in 4 cases, none of these conditions was encountered in our material.

Much of the literature on coronary occlusion is based on gross appearance of the arteries involved. It is obvious, however, that necrotic plaques or hemorrhages in plaques may appear grossly like thrombi, and organized canalized thrombi may be called simple narrowing without study under the microscope. Also, it is impossible to cut gross calcified coronary arteries with a knife or scissors without tearing the vessels. Dislodgement of thrombi and distortion is produced, so that accurate observations cannot be made. To avoid these pitfalls we have in the last ten years adopted the policy of removing the coronary arteries in toto (figure), with their mouths in the aorta included, whenever palpation reveals the presence of calcium. These are fixed in formaldehyde solution for two days after the fat is clipped away and then decalcified in a mixture of equal parts of formic acid and 20 per cent sodium citrate for two to three days. When decalcified they are sectioned transversely at narrow intervals of 2 to 3 mm. and described. Representative slices are then embedded for preparation of slides for microscopic study. In this manner one is able to approximate or equal the results obtained by injection methods, as popularized by Schlesinger[7] and lately by Salans and Tweed[8] and Ravin and Geever.[9] With the described technic the myocardium is not disturbed as by the injection process, and microscopic study of blocks taken from various portions can be done on material unchanged by delay and injection fluid. Since using this technic we feel that we can tell rather accurately what has gone on in a coronary artery.



Coronary arteries removed in toto. Transverse sections are made after fixation and decalcification.

Our cases in which death was due to arteriosclerosis fall into four groups: *A*, 315 cases of recent fatal coronary heart disease, including 223 cases of infarction following recent coronary thrombosis, 41 cases of recent infarction without demonstrable thrombosis and 51 cases of recent thrombosis in which death occurred too soon for gross or microscopic evidence of infarction to be seen (women 101, men 214), *B*, 107 cases without recent thrombosis or infarction, but with old infarcts, with death due to cardiac decompensation (women 30, men 77), *C*, 34 cases in which there was neither old nor recent thrombosis but in which death was due to cardiac decompensation, with advanced narrowing of the coronary arteries (women 11, men 33) and *D*, 175 cases with advanced narrowing of the coronaries with or without old infarcts, in which death was due to some other, unrelated, condition without cardiac decompensation (women 53, men 122).

Table 1.—*Age and Sex Grouping in Cases of Coronary Disease*

Group Age.	20 29	30 39	40 49	50 59	60 69	70 79	80 89	90 99	Total	Women
A........	1	1	29	55	106	92	30	1	315	101
B........	0	2	4	11	34	47	9	0	107	30
C........	0	1	1	8	6	11	7	0	34	11
Total......	1	4	34	74	146	150	46	1	456	142

The combined group of 631 cases represents 20 per cent of the cases in which autopsy was done, exclusive of stillborn and newborn infants. Fully an equal number showed moderate degrees of sclerosis, but were not included because the degree of sclerosis had not exceeded 60 per cent of normal diameter in one or more arteries. In Wartman and Hellerstein's series of 2,000 necropsies the coronary arteries were significantly diseased in 25 per cent. If this is true, as it probably is, in other places, the magnitude of the coronary arterial problem is certainly manifest.

The age and sex of the patients in the first three groups are given in table 1. The age of those in group D is of little significance because death resulted from a variety of conditions, including various infections, ruptured aneurysms, malignant conditions and blood dyscrasias. Fully 65 per cent of the patients who died of their coronary disease were between 60 and 80 years of age. The youngest patient was 22 and the oldest 92 years of age. Women comprised 31 per cent, a somewhat higher incidence than in most series. Table 2 shows the arteries involved in group A, i. e., patients who died in the acute phase of the disease. Massive anterior infarction was observed in the 7 cases in which the left main coronary artery was thrombosed. Of interest is the fact that 23 patients had had recent thrombosis of two coronary arteries, and 2 showed all three major arteries thrombosed; 264 patients showed

recent infarction. Evidence of old disease was manifested in the 315 patients in this group, since 143 showed evidence of old fibrosed infarcts and 117 showed organized thrombi in one or more coronary arteries. Ten of these showed cardiac aneurysm formation, and in 2 of these calcification was seen. One patient showed organized thrombi in all three major arteries and recent fatal thrombus in the left circumflex coronary artery. In 22 cases 2 major arteries showed organized thrombi. In this group thirty-two ruptures with cardiac tamponade were present, an incidence of 12.5 per cent in the cases with recent infarcts. In 2 cases there was rupture of the posterior papillary muscle and in 1 rupture of the interventricular septum.

In group B, which includes 107 cases in which there were old infarcts without recent thrombosis or infarction, in 56 there was an organized thrombus in only one coronary artery, in 20 in two major arteries and in 4 in all three major trunks. In this group cardiac aneurysms were observed in 10 cases, in 4 of which there was calcification in the scar.

The location of mural thrombi is given in table 3. As is to be expected, the vast majority were located in the left ventricle. A few of these were large enough to fill fully a third or a half of the ventricular cavity. Most of those in the right ventricle overlay areas of infarction of the muscle, chiefly in right coronary thrombosis.

Table 3.—*Mural Thrombi; Location*

Group	Left Ventricle	Left Auricle	Right Ventricle	Left Auricle	Hearts Involved	Total Cases	Percentage with Thrombi
A..............	124	13	18	15	138	315	44
B..............	36	4	3	14	42	107	39

LOCALIZATION OF EMBOLIC LESIONS

Table 4 shows the number and location of embolic lesions in groups A and B. In group C there were only 2 cases, 1 with a small infarct in the kidney and lung and the other with a small kidney infarct. In one third of the cases in group A and 36.4 per cent of group B there were one or more embolic localizations. In a total of 106 cases there were emboli in one hundred and sixty-one localizations.

Under the classification of "pulmonary major" are included those cases in which there was obvious embarrassment of pulmonary circulation either by a long large commonly coiled embolus in one or more major arteries (27 cases) or multiple smaller emboli in many branches of several lobes, with or without infarct formation (10 cases). If both lungs were involved, the case is credited only as 1 in the tabulation. None of the emboli occluding the main pulmonary trunks were of cardiac origin, but the emboli in 3 of the cases with multiple small occlusions were possibly derived from right auricular or ventricular thrombi. Demonstration of origin from iliac or femoral veins was possible in only 5 cases, since we were unable, because of autopsy restrictions, to dissect the veins below the thighs.

A total of 6 cases showed embolism of a main renal artery which may well have hastened death. Likewise, in 1 case embolism of the splenic artery with diffuse early infarction of the spleen may have played a major role in the death of the patient.

In 1 patient a large embolus plugged the bifurcation of the aorta and propagation thrombus extended to the level of the renal arteries. Gangrene had occurred up past the waist line. In another patient the right branch of the hepatic artery was occluded and early infarction of part of the right lobe of the liver was present.

It is difficult to evaluate the cerebral lesions, since most of the cases showed pronounced cerebral arteriosclerosis. The condition in 4 cases was probably thrombotic rather than embolic. In these no mural endocardial thrombus was found. All of the mesenteric and iliofemoral arterial occlusions were embolic, and a possible source from a thrombus in the left side of the heart was demonstrated. One man with femoral embolism and gangrene died of tetanus, the portal of entry being the necrotic great toe.

Table 4.—*Localisation of Embolic Lesions in Cases With and Without Intracardiac Thrombi*

Location	Group A With Thrombi	Group A Without Thrombi	Group A Total	Group B With Thrombi	Group B Without Thrombi	Group B Total

Total cases in series	138	177	315	142	65	107

In some cases in which there were small or medium-sized infarcts of the kidney or spleen, no mural endocardial thrombus could be found. However, it is conceivable that a small thrombus may dislodge and leave no trace in the endocardial surface from which it separates.

The incidence of thromboses in the systemic veins which we were able to investigate was not very high. Had complete dissection of the upper and lower extremities been possible in light of the work of others, especially Hunter,[10] the incidence would probably have been much higher. Table 5 shows that periprostatic venous thrombi are the most commonly found. More iliofemoral thromboses were observed in the patients of group B, who had suffered longer from their infarction.

SUMMARY AND CONCLUSION

The incidence of coronary heart disease observed in a small private hospital is reviewed. In fully 20 per cent of the cases in which autopsy was done in a seventeen year period, there was advanced disease of

---

10. Hunter, W. C.; Sneedon, V. D.; Robertson, T. D., and Snyder, G. A.: Thrombosis of the Deep Veins of the Leg, Arch. Int. Med. 68: 1-17 (July) 1941.

the coronary arteries, and 14.4 per cent of the patients died primarily with heart failure as a result.

Mural endocardial thrombi were present in 180 out of 422 cases in which there was old or recent cardiac infarction and in which death occurred primarily of coronary heart disease. Embolic lesions were observed in 25 per cent of cases of the same group. Pulmonary embolism leads the list by far. Measures such as anticoagulant therapy and passive or active motion should be directed toward this serious complication.

EPILEPSY IN CHILDHOOD

Newer Methods of Diagnosis and Treatment

M. G. PETERMAN, M.D.
Milwaukee

Recent publicity to the laity by well meaning persons concerning the advances in the diagnosis and treatment of epilepsy has evoked some unfortunate reactions. Parents in desperate search of the "miracle treatment" have been given false hopes and dissatisfaction with usually adequate treatment or the best treatment available. The family physician who treats most of the cases of epilepsy and usually sees them first has properly resented the challenge to his familiarity with the recent developments in the study of the disease. Advertisements of "83 per cent improvement" in epilepsy and of "the hopeful disorder" offer false encouragement and lead to cruel disillusionment even though they quote learned authorities. For these reasons I have considered it timely to restate known facts concerning the cause of epilepsy and to review the advances in diagnosis and treatment with the newer drugs.

Our first duty to our patients and to the public is an honest statement of fact and a frank presentation of the prognosis. If "epilepsy can be licked" we are not yet ready for the knockout blow. Spontaneous regression of petit mal epilepsy in children is rare in my experience, and anticipation of this solution does not justify postponement of adequate treatment. The petit mal of childhood tends to become grand mal later in life.[1]

Epilepsy, like diabetes, is a chronic inherited disease which is present even before the child is born. Except when some unknown metabolic disorder supervenes the clinical manifestations may never develop, but the defective gene will be transmitted regardless.[2]

While we search for new anticonvulsants we must recognize the fact that our only hope for the elimination of epilepsy and the other inherited diseases lies in eugenics.

CAUSE

Since it has recently been stated that no progress was made in the medical treatment of epilepsy from 1912 to 1937,[3] it seems appropriate to review some of the literature which has apparently been overlooked.

The first progress in the study of the convulsive disorders began with a classification of the causes of convulsions in children.[4] This made possible the diagnosis of epilepsy by exclusion.[5] The next advance was made in the study of the metabolic changes which precipitate convulsions in the potentially epileptic child and the dietary adjustments which prevent convulsions. The beneficial effects of fasting and purging have been known since antiquity,[6] but their mechanism has never been satisfactorily established.[7] The favorable effects of dietary ketosis have been well studied and effectively demonstrated but not explained.[8] Ketosis or acidosis produced by drugs is not effective. Recent studies indicate that glycerol may reenforce the ketogenic diet.

The increased incidence of epilepsy is due to better and earlier recognition of convulsive disorders resulting from an increased interest in the subject. Another factor may well be the increased use of refined and processed foods. Last year it was demonstrated that the feeding of wheat gluten or "agenized" flour, bleached with nitrogen trichloride, produced clinical epilepsy in monkeys, dogs and cats even to the reproduction of the typical electroencephalographic patterns.[10] Fortunately this condition has not been reproduced in man. Undoubtedly there are other factors or substances removed or added in the processing of natural foods which may insidiously precipitate or activate convulsions, especially in those persons with inherited potential cerebral defects. It is interesting to note Elvehjem's deductions on the biochemistry of foods.[11] The ketogenic diet practically prohibits the use of white flour.[12]

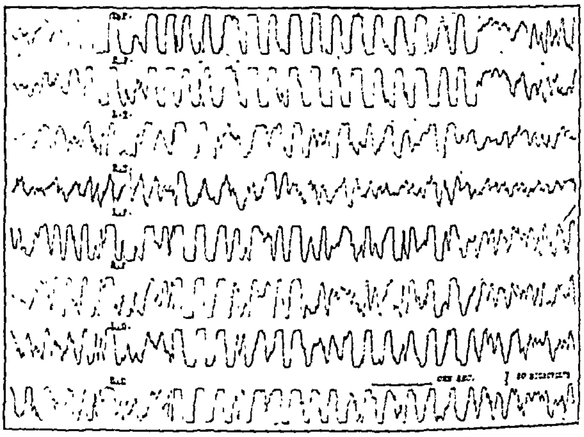

Fig. 1.—J. M., boy aged 8½, with petit mal.

DIAGNOSIS

The third and the greatest advance in the study of epilepsy was made by Hans Berger in 1929, when he introduced the electroencephalograph.[13] Berger established for the first time the fact that convulsive disorders have definite and distinctive brain wave pat-

terns. This establishes that the disease has an organic basis. Berger demonstrated various types of cerebral dysrhythmia. With this remarkable apparatus it has thus been possible to establish the hereditary transmission of this disease through tracings on parents and relatives (figs. 1, 2, 3, 4, 5, 6 and 7). The electrogram is also of great value in localizing superficial brain tumors and encephalitis. Most of the progress in electroencephalography has been made by the Gibbses. These indefatigable pioneers in this new field have provided us with our present knowledge of the subject.[14] Their identification of the various manifestations of epilepsy give us a basis for more specific treatment. The electrogram also provides the only objective evidence for a true evaluation of treatment[15] (figs. 8 and 9).

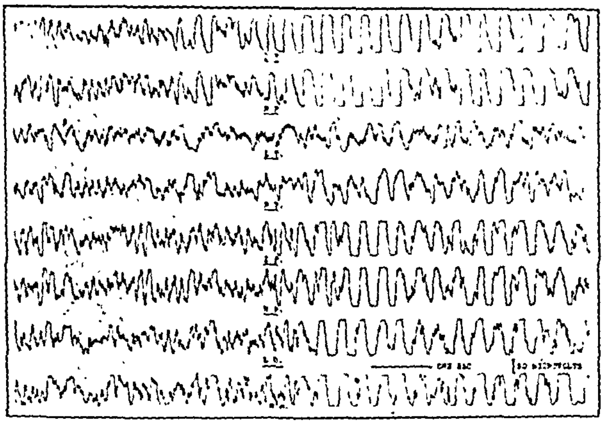

Fig. 2.—E. M., sister of J. M.; aged 13 years; abnormal record with slow waves.

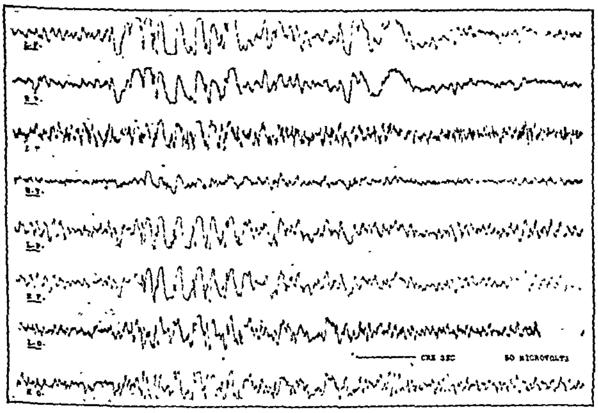

Fig. 3.—Mother of J. M., aged 42 years; undiagnosed epilepsy; admits convulsions.

The drug treatment of convulsive disorders is purely symptomatic. Whether the patient who is clinically free of seizures under drug therapy still has his potential disease can be determined only with an electrogram. This is the only basis available at present for making the crucial decision for the termination of treatment (figs. 10, 11 and 12). With the drugs available today it is extremely important to determine whether the clinical petit mal seizure is only that or whether it is akinetic epilepsy and also whether there is a grand mal or other component in the background. It is just as important to determine whether there is a cerebral focus and whether there are psychomotor seizures. Phenobarbital will control most grand mal convulsions but it has no effect on petit mal or psychomotor epilepsy.[16] Trimethadione ("tridione") will control about one third of the petit mal seizures, but it will precipitate the most severe grand mal seizures in the patient who has this type of epilepsy.[15] It has no effect on psychomotor seizures.[16]

Gibbs and Fuster have recently reported a study of 500 cases of clinical epilepsy. Seizure discharges were obtained on sleep electrograms in 82 per cent of their cases. Psychomotor epileptics showed seizure discharges in 95 per cent of the sleep tracings.[16] Sleep also tends to produce grand mal components in epileptics who have only petit mal patterns when awake. The value of a positive electrogram is unequivocal.

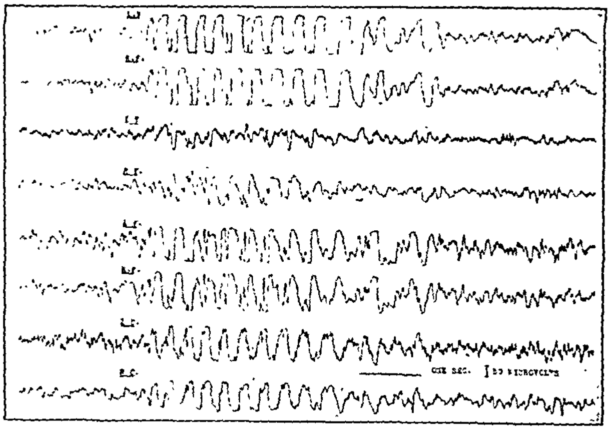

Fig. 4.—S. T., aged 13 years; spike wave components and a slow record; idiopathic epilepsy.

I should like here to reaffirm my earlier conclusion that the most reliable and positive means for making a diagnosis of epilepsy is an adequate and complete history together with a description of the seizure.[1] However, such a diagnosis is presumptive and is made on subjective evidence. Most parents choose to challenge and even reject the first diagnosis of epilepsy. They are entitled then to confirmation of the diagnosis by the objective evidence of the electrogram before accepting so serious a diagnosis and before undertaking

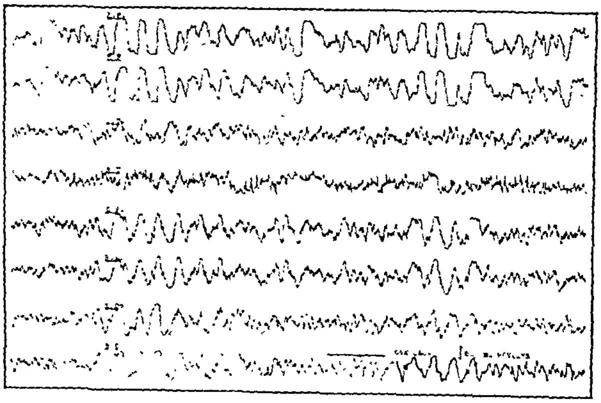

Fig. 5.—Mother of S. T.; has "spells," not diagnosed; abnormal record.

a prolonged or indefinitely long treatment. However, it would be medieval medicine to wait for recurring convulsions before making a diagnosis of epilepsy or to dismiss one convulsion as unimportant.

Most parents attribute the convulsions to head injuries, emotional disturbances or fainting spells. A careful history will often reveal that the injury itself was due to a seizure which had not been previously recognized (fig. 13). So-called fainting spells must be carefully investigated. It is essential that an electrogram be obtained before a diagnosis is made. Rook did two hundred and ninety-nine electrograms on patients with syncope and found that a large number pointed to epilepsy.[17]

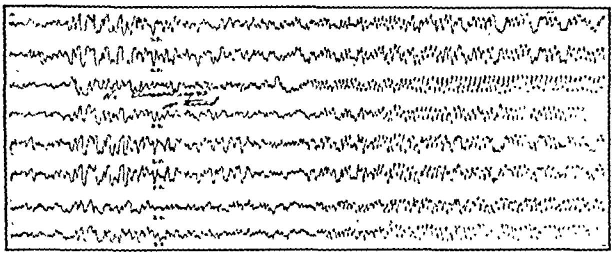

Fig. 6.—E. H., aged 13 years; idiopathic epilepsy; clinical seizures.

The serious behavior problems in children, particularly those which recur regularly with no apparent cause, demand a careful study. The basis for some of these disorders is psychomotor epilepsy or attacks of psychic equivalents of epilepsy.[18] Such a diagnosis may not be suspected until an electrogram reveals the characteristic pattern (figs. 14 and 15). While the typical psychomotor pattern of the electrogram is not often found before six years of age, these children with behavior problems often give a history of problem parents or relatives who show abnormal electrograms.[19] The children also show abnormal patterns before typical psychomotor patterns develop (figs. 16 and 17).

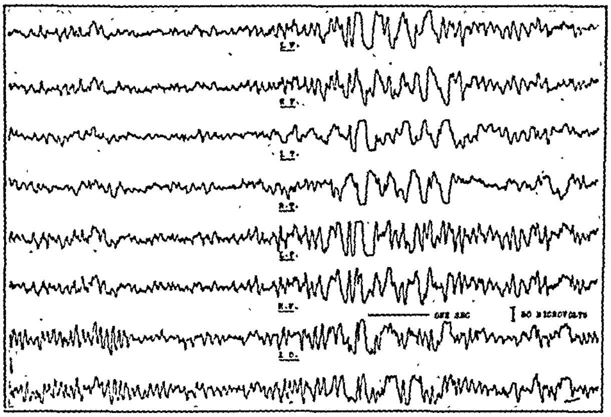

Fig. 7.—The grandmother of E. H., "had epilepsy."

INFANTILE CONVULSIONS

Less than 2 per cent of children admitted to the Milwaukee Children's Hospital for the usual children's diseases have convulsions.[20] Obviously, then, the child who has a convulsion whenever his body temperature reaches a certain level must have a basic potential convulsive disorder. I have made a study of 55 children in private practice who had so-called fever convulsions on first examination. Since 1941 it has been possible to obtain electrograms on 34 of these children in my office. Only five of these tracings could be considered normal. Whenever possible repeat electrograms were made on those patients with normal records. Thirty-five of these patients have been subsequently given a diagnosis of epilepsy. This establishes my previous statement that every convulsion in a child who does not have encephalitis, meningitis or poisoning must be considered seriously as the possible forerunner of a chronic convulsive disorder.[21] This finding agrees with the conclusions (figs. 18, 19 and 20), of M. Lennox.[22] Certainly every such case warrants an electrogram.

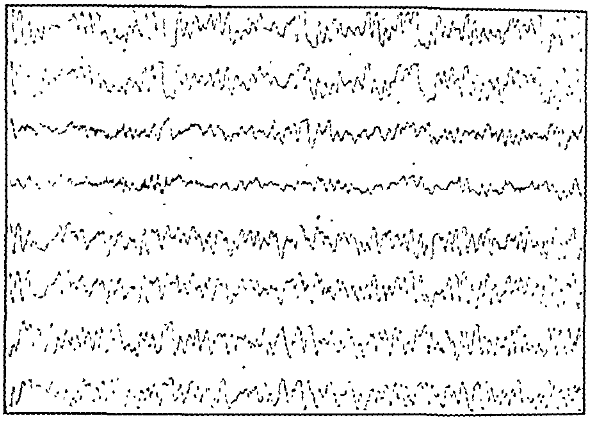

Fig. 8.—J. M. after three months' treatment on the ketogenic diet; record much improved.

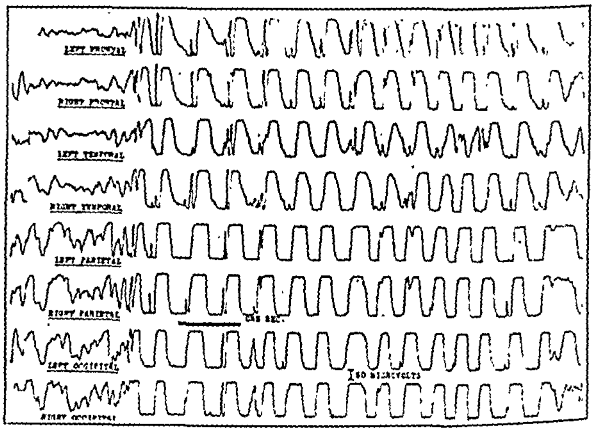

Fig. 9.—C. F., aged 7 years; petit mal.

Twenty per cent of my private epileptic patients gave a history of early convulsions. Osler stated that 40 per cent of epileptic persons gave a history of infantile convulsions.[23] Still reported that in 28 per cent of those with a history of infantile convulsions epilepsy developed.[24] Livingston and co-workers recently reported that 94 of 800 children in the epilepsy clinic at Johns Hopkins Hospital had "febrile convulsions."[25]

Of these, 49 per cent recovered. However, since "recovery" is based on clinical evidence or questionaires, the value of this information is questionable. No electroencephalographic studies are mentioned. Many of these patients may still be potential epileptics. Patrick and Levy reported that 20 per cent of their epileptic patients gave an early history of infantile convulsions.[26]

TREATMENT

The treatment of idiopathic epilepsy must be based on sound diagnosis, not only of the disease but also of the type. For this the electroencephalograph is an invaluable aid and may provide the only evidence of progress or control.

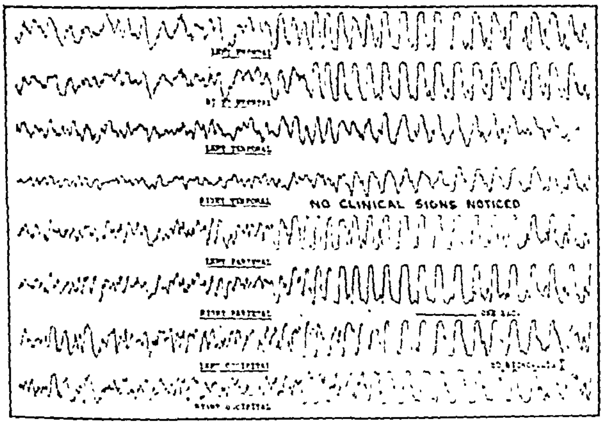

Fig. 10.—M. S., aged 26; idiopathic epilepsy, grand mal; "free of seizures" for six and one-half years; hyperventilation produced subclinical grand mal.

PETIT MAL

Petit mal epilepsy is a serious disease which produces a typical electroencephalographic pattern.[27] In my private series about one third of the epileptic patients have petit mal and half of these also have grand mal components or potentials. In most of the others grand mal develops later.[28] Hence, it is essential to know which phase of the disease demands first consideration.[29] Since subclinical seizures continue during sleep or may even be more frequent during sleep, it is essential to provide therapy during sleep as well as while the patient is awake. Until the introduction of trimethadione[30] there was no drug which had a definite effect on petit mal.[31] The claims of cures of petit mal with diphenylhydantoin sodium ("dilantin")[32] (even up to 75 per cent)[33] were not substantiated.[34] Lennox's claim of priority in the use of caffeine[35] in petit mal is not valid. Treatment with caffeine was reported by Stargardter (1921)[36] and Karger (1924).[37] Penfield and Erickson (1941) reviewed the reports on caffeine.[38] The results have not been satisfactory.[39]

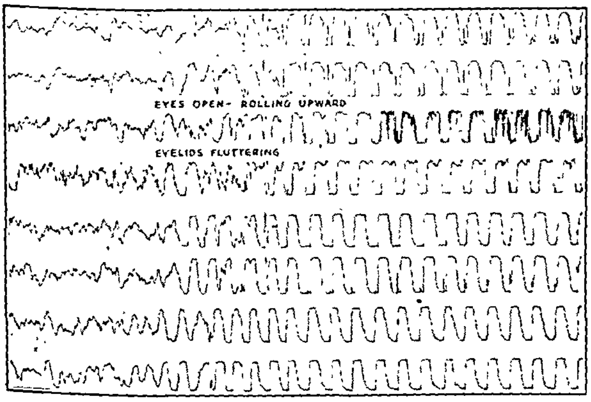

Fig. 11.—C. F., reported free but still has seizures.

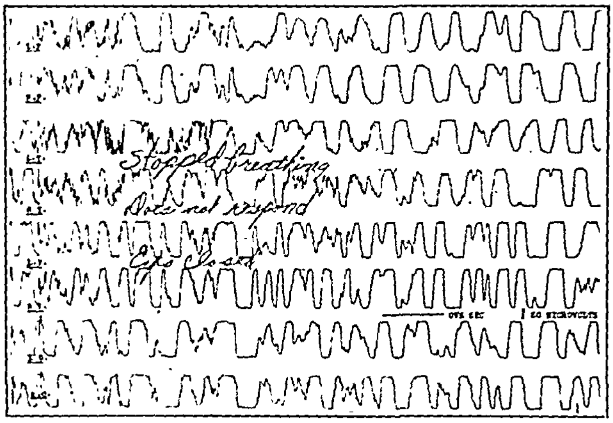

Fig. 12.—P. P., aged 16 years; mother says "free of seizures"; clinical seizure still on record.

Trimethadione will control about one third of the cases of uncomplicated petit mal,[40] but it will precipitate grand mal seizures in potential cases.[15] Trimethadione has also caused at least 4 deaths by depression of the bone marrow.[41]

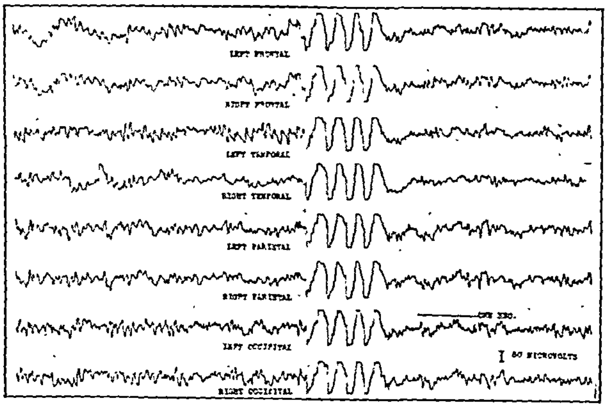

Fig. 13.—D. K. fell down steps and cannot recall why; she had dizzy spells, but no clinical seizures were recognized; 3 per second high voltage slow waves; diagnosis; idiopathic epilepsy.

"Paradione" is a new drug[42] introduced in 1946.[43] It is 3, 5-dimethyl-5-ethyloxazolidine-2, 4-dione and differs from trimethadione only in the substitution of an ethyl for a methyl group on carbon 5. It is an oily liquid, slightly soluble in water but quite soluble in alcohol. It has been used to treat petit mal which has not responded to trimethadione. Because of its composition, "paradione" may also cause bone marrow depression in susceptible patients; therefore, blood counts must be made weekly when patients are given either drug. It is also advisable to supplement both drugs with phenobarbital.

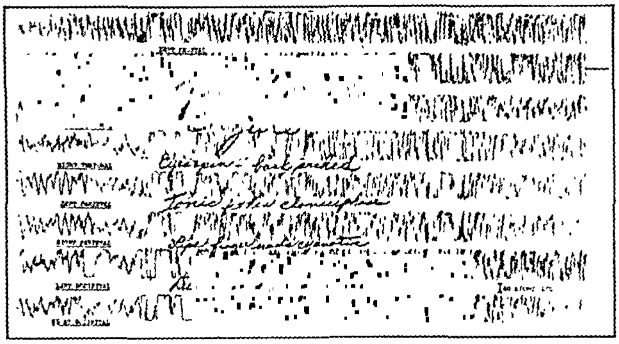

Fig. 14.—R. P., a behavior problem; grand mal seizure.

In February, 1947, I reported on a new drug, "thyphenytoin."[15] This drug,[44] sodium 5, 5-phenylthienylhydantoin, was first prepared in 1941. The anticonvulsant properties were demonstrated in cats by the electroshock method. The acute toxicity was found to be 226.6 plus or minus 5.78 mg. per kilogram of body weight. This drug is approximately one half as toxic as diphenylhydantoin sodium. No clinical manifestations of toxicity were noted and no tissue damage was demonstrated on microscopic study. There was no liver damage found. Preliminary observations were made on patients in 1942. The results were most effective in petit mal.[15]

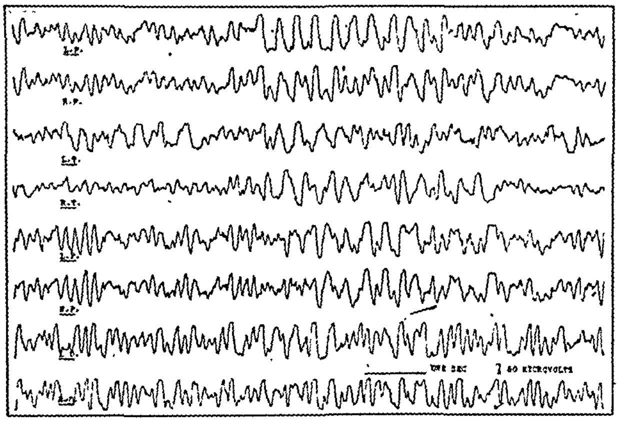

Fig. 15.—R. P., behavior problem; abnormal interval record on treatment.

Seventy-three children with convulsions have now been treated with this drug for two years. Most of these are private patients under close supervision. Of these, 30 had grand mal, 9 had petit mal and 8 had both. One patient had akinetic epilepsy (or nodding spasms), 3 had chronic encephalitis, 16 had cerebral birth injury residues and the others had various organic lesions.

The results of treatment with "thyphenytoin" in adequate dosage are as follows: of 30 patients with grand mal 20 have been improved, 8 unimproved and 2 had reactions to the drug. Of 9 patients with petit mal 7 have been improved and 2 unimproved. Two patients not improved on "thyphenytoin" have been free on trimethadione. One of these, already mentioned, contracted anemia and was again placed on "thyphenytoin." The seizures have now been under control for twelve months. In 8 cases of combined epilepsy 4 have been improved and 4 unimproved. Six cases of cerebral birth residual with convulsions were improved and 4 not improved. The results of treatment of seizures due to various organic lesions were not striking.

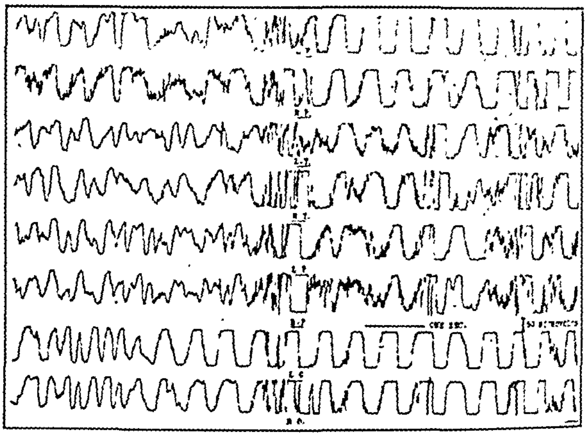

Fig. 16.—L. K., aged 6 years; behavior problem; episodes recurring frequently with normal intervals; abnormal record.

"Thyphenytoin" was given in a dosage of 0.13 Gm. two or three times a day. This dosage was increased when necessary to 0.39 Gm. three or four times a day. When the latter dosage did not control seizures the drug was supplemented in petit mal with trimethadione or in grand mal or combined epilepsy with phenobarbital. (If the capsule cannot be given by mouth, it may be punctured and inserted into the rectum.) Except for the 2 cases mentioned which responded to trimethadione after "thyphenytoin" failed to control petit mal seizures, the addition of trimethadione to "thyphenytoin" did not influence the results. Phenobarbital is an effective supplement to "thyphenytoin" in grand mal. Smaller doses of phenobarbital are required when "thyphenytoin" is used.

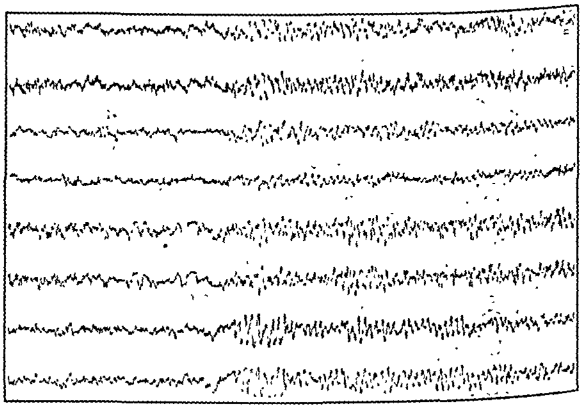

Fig. 17.—Mother of L. K., aged 23 years; a low voltage, fast record.

[42] Furnished by Abbott Laboratories, North Chicago, Ill.

[43] Lennox, W. G.: A. Research Nerv. & Ment. Dis., Proc. 26: 425, 1947.

[44] Furnished by Eli Lilly & Company, Research Laboratories, Indianapolis.

The side reactions to "thyphenytoin" were as follows: In 2 patients hypertrophy of the gums developed; in 4 ataxia, disequilibrium and incoordination, and in 2 a drug rash. All reactions except the hypertrophy of the gums subsided promptly on withdrawal of the drug. The blood counts were not altered in any case.

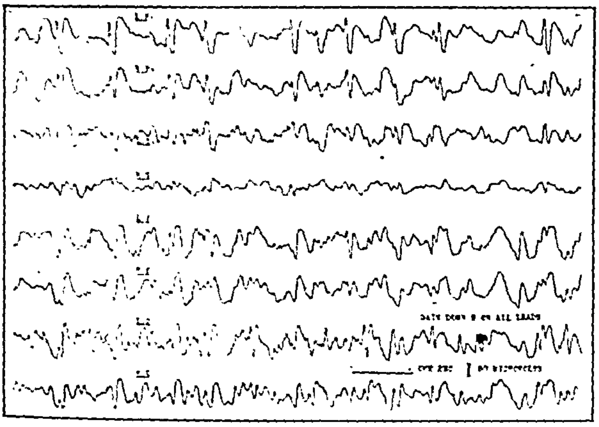

Fig. 18.—J. W., aged 6 years, with "febrile convulsions"—actually, internal hydrocephalus and multiple congenital anomalies; petit mal variant.

GRAND MAL

The exaggerated claims for the effectiveness of diphenylhydantoin sodium[45] have not been substantiated in children.[46] This drug is a useful addition to the list of anticonvulsants and occasionally it may control major seizures which have not responded to phenobarbital, but the incidence of undesirable side effects is far greater.[47] Irreversible hypertrophy of the gums, vertigo and disorientation are far more frequent and much more undesirable than are the occasional reactions of drowsiness encountered with large doses of phenobarbital. Phenobarbital remains the most effective and satisfactory drug available for the treatment of major convulsions. While the manufacturers of diphenylhydantoin sodium have recently stated that "no other modern anticonvulsant has received the universal acclaim comparable to that accorded 'dilantin'," they have introduced a new combination of phenobarbital with diphenylhydantoin sodium as a useful therapeutic agent for control of epilepsy. Beckman stated that reactions to diphenylhydantoin sodium have been reported as from 36 per cent to 100 per cent by various authors, and Ritchie and Kolb reported a death from its use.[47] Beckman also stated, "As a matter of fact, most men find that even in treatment of adults 'dilantin' is best employed in combination with phenobarbital."[47]

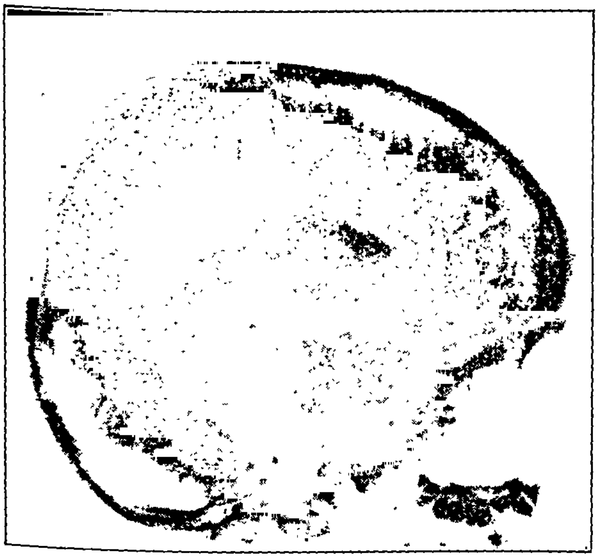

Fig. 19.—J. W., pneumogram shows unexpected internal hydrocephalus.

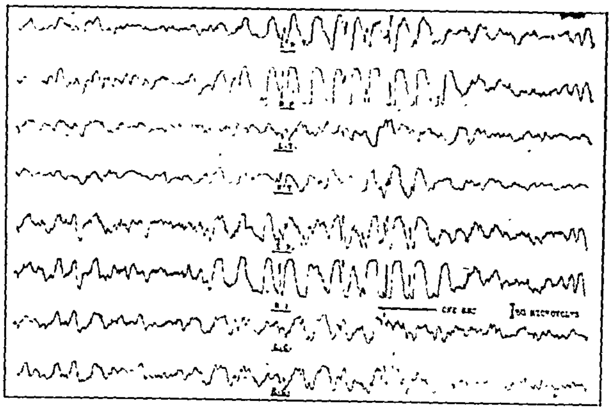

Fig. 20.—C. R., aged 12 years, with "febrile convulsions"; slow record with spikes; a brain hemorrhage residual.

Recognizing the superiority of barbiturates in the treatment of major convulsions, one of the major drug manufacturers has prepared a new barbiturate, "AN_{23}." This preparation is 5, 5-diethyl, 1-methylbarbituric acid.[47a] It is very slightly soluble in water and unstable in alkali. It has hypnotic properties similar to phenobarbital and may be tried when there is some indication to replace phenobarbital. The dosage is the same. Over 100 convulsive patients have been treated with this drug. Of these, 51 have been treated for one year. Of the epileptic patients, 14 with grand mal have been improved, 5 not improved and 2 had reactions which required change of drug. One with petit mal has been improved; 2 with combined petit and grand mal have been improved and 2 not improved. Two with myoclonic and 1 with akinetic epilepsy have been improved. Six with cerebral birth injury residues have been improved and 8 not improved. Four with

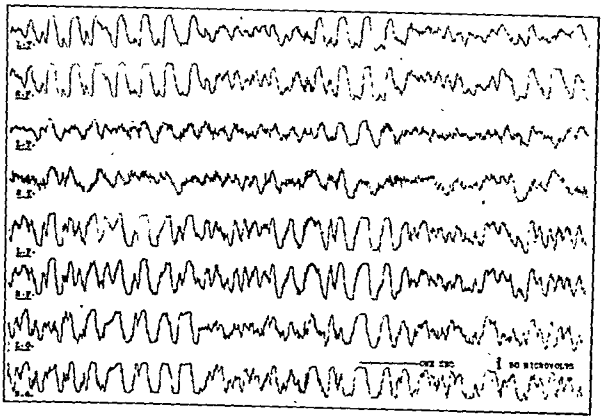

Fig. 21.—Abnormal slow record; 3 per second in father of epileptic boy.

[45] Merritt, H. H., and Putnam, T. J.: Sodium Diphethyl Hydantoinate in Treatment of Convulsive Disorders, J. A. M. A. **111**: 1068 (Sept. 17) 1938. Merritt, H. H.: Wisconsin M. J. **47**: 463, 1948.

[46] Peterman, M. G.: South. M. J. **41**: 62 (Jan.) 1948.

[47] Beckman, H.: Treatment in General Practice, ed. 5, Philadelphia, W. B. Saunders Company, 1945.

[47a] Supplied by Abbott Laboratories, N. Chicago, Ill.

miscellaneous organic convulsive disorders have been improved and 3 not improved.

In common with other investigators in the field of convulsive disorders, I have welcomed and tried every new anticonvulsant recommended by reputable colleagues. Of course, the new drugs are first given the most critical tests in the most resistant cases. A new drug always offers new hopes, particularly for patients who have not had satisfactory relief. Any new anticonvulsant with a definite superiority does not require advertising to prove its advantages. Thus I have used diphenylhydantoin sodium ("dilantin") since its introduction in 1937 and methylphenylethyl hydantoin ("mesantoin") since 1945. The results have not been equal to those with phenobarbital.

I have over 400 epileptic children in my private practice now. Every patient is given an electrogram on first examination in my office. A negative record is always repeated as often as necessary or possible until the diagnosis is confirmed. Repeat electrograms are made as often as possible to check the progress of treatment. Older patients free of seizures are recalled whenever possible to check their status (fig. 19). Some of the unusual findings are presented in the figures.

Of the patients treated over one year 123 are on the ketogenic diet. Forty-five with grand mal are improved; 10 not improved. Twenty-seven with petit mal are improved and 6 not improved. Twenty-seven with combined grand and petit mal are improved and 8 not improved.

Eighty-two patients are on phenobarbital. Fifty with grand mal are improved; 9 not improved. Two with petit mal are improved and 4 not improved. Thirteen with combined epilepsy are improved and 4 not improved.

Twenty-five patients refractory to other treatment are on diphenylhydantoin sodium. Four with grand mal are improved; 3 not improved. Three with petit mal are improved and 2 not improved. Of the patients with combined epilepsy 4 are improved and 9 not improved.

The type of treatment indicated must be determined for every individual case. It depends on the type of convulsions present and their probable cause. The diagnosis of idiopathic epilepsy must be qualified by the type of seizures manifested. My results of treatment are in essential agreement with those of Keith.[48]

SUMMARY

Every child with a convulsive disorder demands the most complete history and study possible. This should include determinations of blood sugar, calcium and phosphorus. Whenever possible one or several electrograms should be done to establish the diagnosis and determine the type of epilepsy. Sleep tracings are preferable.

The control of convulsions requires years or a lifetime use of anticonvulsant drugs.

The most effective treatment for all types of idiopathic epilepsy is the ketogenic diet. Fifty per cent of all epilepsies in children may be controlled with the diet. All treatment of epilepsy with drugs is symptomatic and should be considered only if the diet is impractical or impossible. Treatment with drugs at best is a temporization with a chronic hereditary disease.

If the ketogenic diet is impractical or impossible, the most effective treatment of petit mal seizures may be accomplished with "thyphenytoin," "paradione" or trimethadione. Only "thyphenytoin" will help control grand mal. Trimethadione and "paradione" require the supplementary use of phenobarbital to prevent major seizures.

The most effective and least expensive drug for the control of major seizures is phenobarbital. This drug is universally available and has the lowest incidence of undesirable side effects of any of the anticonvulsants. All anticonvulsants should be administered throughout the twenty-four hours.

At the present time our only hope for the elimination of epilepsy lies in the limitation of the progeny of epileptic parents.

411 East Madison Street (2).

ABSTRACT OF DISCUSSION

Dr. W. Ambrose McGee, Richmond, Va.: Whenever epilepsy is mentioned, the name Peterman stands out like Joslin in diabetes. He has been an advocate of the ketogenic diet and has achieved results with that part of his epileptic therapy. Like many difficult routines of therapy, that diet is hard to follow rigidly, and cooperation is difficult—hence the many adverse reports. The electroencephalograph offers much in the diagnosis and treatment of epilepsy. Not only does it establish a distinct brain wave pattern and puts the disease on an organic base, but it is a great help in revealing hereditary transmission. Recently Dees and Lowenbach showed the electroencephalogram to be abnormal in a high percentage of allergic children, regardless of whether the allergy is complicated by behavior problems or convulsive disorders. The irregular brain waves are predominately occipital in half of the cases of allergy studied. Such occipital dysrhythmia appears twice as often in those children with positive histories of allergy as in those with negative histories. The same percentage of occipital dysrhythmia occurred in children with allergy complicated by convulsions and behavior problems as in those with allergy only. Such was not true in normal nonallergic children's electroencephalograms, or in nonallergic children with convulsive disorders or behavior problems compared with the allergic group. Before the day of the electroencephalogram it was my privilege to see 3 children who had epileptiform convulsions and who were also allergic. On a restricted diet, based on history and positive reactions to intradermal tests, and in 2 instances by the simultaneous use of an antigen, the 3 children ceased having convulsions and personality problems; they have developed into healthy children over a period of eight to ten years.

Dr. Frederic A. Gibbs, Chicago: Dr. Peterman is pessimistic. I might agree with him that we are not ready for the "knock-out blow" against epilepsy, but the only way that we can find out is to try the new remedies on a large scale. No one can deny that phenobarbital, diphenylhydantoin sodium and methylphenylethyl hydantoin ("mesantoin") are powerful agents against grand mal, or that trimethadione and "paradione" are powerful against petit mal. Dr. Peterman has told you of his good results with trimethadione. What these will do to the total clinical problem of epilepsy will only appear when they come into general use. These drugs are no harder to use than many you are using every day. Epilepsy is too common a disorder to be treated entirely by subspecialists. You should refer only complicated and resistant cases. Arguments as to which antiepileptic drug is the best are meaningless; it is clear that one type of drug can relieve one type of seizure and make another worse; it is also clear that patients with apparently similar clinical and electroencephalographic disturbances can respond differently to different drugs. For the patients' sake we cannot discard any remedies of known value, and all should be tried before a case is abandoned. To deny that a new day has dawned for the epileptic is to forget the ignorance that so recently surrounded the problem and the brightness of the present illumination. It now seems unnecessary and even cruel to place major emphasis on hereditary factors. There are, of course, rare cases in which hereditary factors are paramount, but even in so-called idiopathic epilepsy the hereditary factor is in general no greater than in diabetes. Lennox's studies on identical twins have shown that what is usually inherited is not epilepsy, but a weakness which must be activated (if seizures are to develop) by some type of brain injury. An ever increasing army of persons will thank God and you, their doctors, for the advances that have been made against epilepsy. Each new drug adds new recruits. If Dr. Peterman wishes to be gloomy, that is his right. I only hope he will continue his contributions in spite of his pessimism.

PRESENT STATUS OF NARCOTIC ADDICTION

With Particular Reference to Medical Indications and Comparative Addiction Liability of the Newer and Older Analgesic Drugs

VICTOR H. VOGEL, M.D.
HARRIS ISBELL, M.D.
and
KENNETH W. CHAPMAN, M.D.
Lexington, Ky.

When the Harrison Narcotic Act was passed in 1914 there were perhaps 150,000 to 200,000 narcotic addicts, mostly women, in the United States.[1] Now, according to a recent estimate by Mr. H. J. Anslinger, Commissioner of Narcotics,[2] there is about 1 addict per 3,000 of population, or a total of approximately 48,000, mostly men. This reduction in addiction has been largely due to the vigorous enforcement of the Harrison Narcotic Act and to federal facilities for the treatment of addicts. Compared with the problems arising from the abuse of drugs such as the barbiturates and alcohol, narcotic addiction is not a great public health hazard. However, to the person and his family, narcotic addiction is a tragedy which often brings about complete ruin. Without the preventive influence of legal control and the treatment of identified addicts, narcotic addiction would spread somewhat like the infectious diseases which are public health problems.

If one listens to the inveterate narcotic addict, the question immediately arises as to why addiction should be controlled and discouraged, since the addict describes "God's medicine" as the agent which makes him at ease, contented, ambitious and of such improved efficiency that he can compete on normal terms with his fellowman. This effect is not seen in the majority of cases. After mentioning the exceptional persons who may adapt to life's difficulties better with narcotic drugs, Kolb said of morphine and morphine-like drugs[3]:

> . . . when taken in large doses, [they] sap the physical and mental energy; lethargy is produced, ambition is lessened, and the pleasurable feeling already described—that all is well—makes the addicts contented. These various effects cause them to pay less attention to work than formerly; consequently, they tend to become idlers by this means alone. Those who depend upon the illegitimate traffic are sometimes unable to work because of discomfort and weakness due to insufficient narcotics, and at other times they stay away from their work in order to look for the drug. There are cases . . . who have gone to distant cities regularly to get an ounce of heroin or morphine, and others who have lost as many as a dozen jobs through neglecting work to meet their peddlers, or through lying in bed in the morning instead of going to work because the dose that would have put energy into them was not available. Often, when these cases secure a supply, after their short periods of deprivation, they take more than is actually necessary to keep them comfortable. The result is that they alternate between physical and mental irritability and physical and mental lethargy. Both extremes make for emaciation, physical inefficiency, and unusual mental reactions.
>
> The dreamy satisfaction and the pleasurable physical thrill produced by opium in many addicts in their early experiences with it are of themselves forms of dissipation that tend to cause moral deterioration. Addicts, as a rule, are compelled to associate with persons of low moral character in order to continue their addiction. Financial embarrassment resulting from idleness or the high price of peddled narcotics impels them to beg money from their friends, obtain it from members of their families by subterfuge, or steal, in order to supply themselves with drugs; they suffer in manliness through feeling what they often consider the just contempt of the public; they suffer through their constant fear of arrest, or because of a term in the penitentiary served for having narcotics in their possession. This train of events brings about unfavorable character changes and gradual moral deterioration, and converts what might have been fairly useful citizens into outcasts, idlers, or dependents.

In spite of the fact that there is no consistent organic damage seen in the body following prolonged and excessive use of narcotic drugs, character deterioration is real and great, as evidenced by the deliberate policy of the Japanese in the late war to make addicts of large segments of the alien populations under their control.

DEFINITION OF DRUG ADDICTION

Drug addiction may be defined as a state in which a person has lost the power of self control with reference to a drug and abuses the drug to such an extent that the person or society is harmed. In the United States, only derivatives of opium (including morphine, heroin, dihydromorphinone hydrochloride ["dilaudid hydrochloride"], codeine and metopon), the morphine-like synthetic drugs (including meperidine hydrochloride ["demerol hydrochloride"], methadon [amidone, "dolophine," 10820] and isomethadon), cocaine and marihuana are under control of the Harrison Narcotic Act and similar acts. There are other drugs which, according to our definition, are addicting, including the barbiturates, bromides, alcohol, peyote (mescaline) and amphetamine, but none of these are subject to legal control. However, users of peyote are eligible for treatment at the federal hospitals for drug addicts.

Himmelsbach and Small[4] described addiction to opium and similar drugs as embracing three intimately related but distinct phenomena: (1) tolerance, (2) physical dependence and (3) habituation.

Tolerance is defined as a diminishing effect on repetition of the same dose of the drug or, conversely, a necessity to increase the dose to obtain an effect equivalent to the original dose when the drug is administered repeatedly over a period of time. Physical dependence refers to an altered physiologic state, brought about by the repeated administration of a drug over a long period of time, which necessitates the continued use of the drug to prevent the appearance of the characteristic illness which is termed an abstinence syndrome. Habituation refers to emotional or psychologic dependence on the drug—the substitution of the drug for other types of adaptive behavior. Habituation is closely related to a drug's euphoric effect, i. e., relief of pain or emotional discomfort.[3]

The comparative importance of these three qualities in the total picture of addiction is still a matter of dispute. The role of tolerance in addiction is obscure and difficult to evaluate. Tolerance, however, has been shown to develop to all morphine-like drugs. It is empirically included as one of the qualities of the addicting drug. Physical dependence has been regarded by many persons, particularly by pharmacologists, as the primary and only distinguishing characteristic of an addicting drug. Other persons, particularly psychiatrists, regard emotional dependence or habituation as the all-important factor in addiction. Some have gone so far as to claim that withdrawal symptoms are psychic and not of physiologic origin. A view intermediate between these two extremes is probably correct. Both physical and emotional dependence are important in addiction to morphine. Wikler [5] has shown that physical dependence on morphine and methadon develops in the isolated segments of the spinal cord in chronic spinal dogs, and also that physical dependence occurs in chronic decorticated dogs. Wikler's observation proves beyond doubt that physical dependence is a real physiologic entity and is not psychic in origin. On the other hand, physical dependence does not explain why addicts begin the use of drugs, continually increase the dose and number of doses until they are dependent. Nor does physical dependence explain why so many addicts repeatedly relapse to the use of drugs long after the withdrawal illness has subsided. Some addicts begin to use drugs for the alleviation of pain caused by organic lesions; others take up the habit to relieve emotional tension; all continue to use the drug because they enjoy the sensation it produces when taken in amounts beyond that necessary to alleviate or to prevent the appearance of the withdrawal illness.

Barbiturates fulfil all three criteria of addiction: tolerance is developed; habituation is developed; physical dependence, although not seen as consistently as with morphine, has been repeatedly observed among our patients who have used barbiturates alone or with morphine. If barbiturates are withdrawn abruptly from patients who have been taking 12 grains (0.78 Gm.) or more daily for several weeks, convulsions may develop in three to four days and acute psychotic reactions may be seen after seven to ten days. Both of these conditions can be avoided by gradual reduction of the daily dose of barbiturates over a period of three weeks.

Bromide addicts show habituation but not physical dependence, as demonstrated by the fact that withdrawal is best accomplished abruptly and by elimination procedures. Tolerance to bromides is doubtful.

Amphetamine fulfils the most important qualification, that of habituation, but neither physical dependence nor tolerance develops. The best treatment is abrupt withdrawal of the drug.

Cocaine produces habituation but does not induce physical dependence or tolerance. Cocaine, when taken intravenously, produces an orgastic sensation, and addicts repeat their doses at very short intervals in order to experience this feeling of ecstasy as often as possible. As the dose is repeated, the toxic effects of cocaine accumulate and the users have hallucinations and paranoid delusions, which may be dangerous. The toxic effects of cocaine are so unpleasant that there are few pure cocaine addicts in the United States. Ordinarily the drug is used in conjunction with some physiologic antidote, particularly morphine.

Marihuana causes a mild form of intoxication which is popular among maladjusted adolescents and others, including musicians. Neither tolerance nor physical dependence develops with this drug.[6] The greatest danger of smoking marihuana appears to be possible precipitation of disturbed behavior in persons with incipient psychoses.[6c]

With alcohol, tolerance and habituation definitely develop. It is possible that delirium tremens, alcoholic "epilepsy" and other phenomena sometimes attributed to toxic effects of alcohol represent abstinence syndromes based on physical dependence on this drug.

ETIOLOGIC ASPECTS

Drug addiction should be regarded as a symptom of a basic underlying personality maladjustment. These personality disorders run the gamut of the standard psychiatric nomenclature from the simple anxiety states to the major psychoses. A vast majority of narcotic drug addict patients are fundamentally emotionally immature childlike persons, who have never made a proper adaptation to the problems of living. Many of our patients are former alcoholic addicts who found that narcotic drugs relieved their inner emotional tension as effectively as alcohol but, at the same time, did not produce obvious signs of intoxication. After changing from alcohol to narcotic drugs, alcoholic addicts may be able, for a period of time, to deceive themselves and their associates into believing that they are making a satisfactory adjustment.

The kinds of personality disorders which underlie drug addiction have been well described by Kolb[7] and by Felix,[8] who lists four general personality types.

The first group is made up of normal persons accidentally addicted. It consists of patients who in the course of an illness have received drugs over an extended period of time and, following relief of their ailments, have continued the use of drugs. These persons are frequently termed "accidental" or "medical" addicts. Such persons are regarded by some authors as constituting a special group of addicts who are different from those persons who began the use of drugs as a result of association with persons who were already addicted. In our experience, all "medical" addicts have some fundamental emotional problem which causes them to continue the use of drugs beyond the period of medical need. There is, then, no basic difference between "medical" and "nonmedical" addicts except in the mode of the original contact with drugs. In persons with stable personalities, social pressure, conscience and a well balanced emotional makeup negate the pleasure produced by drugs sufficiently to prevent their continued use.

The second group consists of persons with all kinds of psychoneurotic disorders who, as Felix [8a] said, take drugs to relieve whatever symptoms they may have. The manifestation of the neurosis may be anxiety, an obsession or compulsion or any of the great group of psychosomatic disorders.

The third and largest group consists of psychopathic persons, who ordinarily become addicted through contact and association with persons already addicted. They are generally emotionally undeveloped aggressive hostile persons who take drugs merely for pleasure arising from the unconscious relief of inner tension, as shown by this statement of an addict:

> I was always getting into trouble before I got on drugs—never could seem to get comfortable; I had to go somewhere and do something all the time. I was always in trouble with the law. Some fellows told me about drugs and how good they made you feel, and I tried them. From then on I was content as long as I had my drugs—I didn't care to do anything but to sit around, talk to my friends occasionally, listen to the radio, and only be concerned with the problem of getting money for drugs. This I usually did by picking pockets or other such petty stuff.

The fourth and smallest group is characterized by drug addiction with psychosis. The persons in this group, many of whom have borderline mental illness and sometimes frank mental illness, are seemingly able to make a better adjustment while taking drugs. Sometimes it is difficult to establish the diagnosis and not until drugs are withheld does the psychosis become apparent.

There is a category of patients not included in the aforementioned groups. Kolb [7] originally listed these as patients with psychopathic diathesis. While it is true that some of these exhibit much of the overt behavior pattern of psychopathic persons, when studied carefully they usually fall into a milder behavior or character disorder group, which has characteristics of both the psychoneurotic and the psychopathic groups. Included are persons with severe dependency problems, withdrawn schizoid types, emotionally immature adults, as well as those suffering with the milder degrees of maladjustment and inadaptiveness to the complications of living. Felix [8a] stated that most of the persons falling into this group were making a marginal adjustment to life before becoming acquainted with narcotics. After their first few experiences with narcotics they felt an exhilaration and a sense of relief comparable to the solution of a difficult problem or the shaking off of a heavy responsibility. Many of them also felt an increase in efficiency which, in some cases, appeared to have been actual improvement.

In general, persons who never have been able to make a satisfactory adjustment to life, whose adaptive patterns of behavior have been inadequate, frequently find in morphine, much as the tired business man finds in the preprandial cocktail, a means of return to "normal." This is a false situation which may be recognized by the tired business man but is not recognized by the drug addict. Our studies indicate that patients who have made a marginal degree of emotional adjustment to life, and then have begun to use drugs, lose some of their normal adaptive patterns of adjustment. This regression in personality represents the greatest danger of drug addiction.

DIAGNOSIS OF OPIATE ADDICTION

The diagnosis of addiction is usually made by the patient's statement that he is addicted to and needs drugs. At times, however, addicts attempt to conceal their addiction and the diagnosis may be difficult. There are no pathognomonic physical signs of addiction, but emaciation, needlemarks and abscess scars are suggestive. In some instances, none of these signs may be present. Miosis is not a reliable sign, as partial tolerance to the pupillary constriction caused by morphine develops during addiction. Signs of intoxication, such as ataxia and slurred speech, are seldom present unless the addicts are taking barbiturates or some other sedative drug in addition to morphine. Meperidine hydrochloride addicts are likely to show pronounced dilatation of the pupils and muscular twitching. Laboratory tests for the presence of morphine or other drugs in the urine furnish almost absolute evidence that the patient is receiving drugs, but these tests are difficult to carry out and ordinarily are not available. In questionable cases, the only possible method of diagnosis may be isolation of the patient from the source of drugs and observation for signs of abstinence.

The signs of abstinence have been delineated best by Himmelsbach and his co-workers.[9] One must always distinguish between the true signs of abstinence and signs which are attributable to anxiety reaction or symptoms which are feigned in an effort to obtain drugs. If morphine is abruptly withdrawn from a patient who has been receiving as much as 4 to 6 grains (0.26 to 0.39 Gm.) daily for a period of thirty days or more, few signs are seen in the first eight to sixteen hours of abstinence. The patient is likely to go into a restless tossing sleep which lasts several hours. About fourteen hours after the last dose of the drug, yawning, rhinorrhea, sweating and lacrimation are noticed. These mild signs increase in intensity during the first twenty-four hours of abstinence; thereafter they become constant. At this time, dilatation of the pupils and recurring waves of gooseflesh appear. One must observe patients carefully in order to detect these signs.

TABLE 1.—*Simple Clinical System for Evaluating Intensity of Abstinence Syndrome*

Mild (+)	Moderate (++)
Yawning	Gooseflesh
Lacrimation	Dilated pupils
Rhinorrhea	Anorexia
Perspiration	Muscle tremor
Pronounced (+++)	Severe (++++)
Insomnia	Emesis
Restlessness	Diarrhea
Hyperpnea	Weight loss
Elevation of blood pressure	(5 pounds [2.3 Kg.] in 24 hours)

About thirty-six hours after the last dose, uncontrollable twitching of the muscles occurs (the origin of the term "kicking the habit"). Severe cramps develop in the legs, abdomen and back; anorexia and insomnia become prominent; vomiting and diarrhea are frequently seen. Rectal temperature rises about 2 degrees (F.); respiratory rate rises to 25 to 30 per minute; systolic blood pressure is usually elevated about 15 mm. of mercury; caloric intake is sharply reduced; weight loss averages 5 or 6 pounds (2.3 or 2.7 Kg.) a day. These acute signs and symptoms reach their height forty-eight hours after the last dose of morphine is taken and remain at a peak until seventy-two hours have passed. They then gradually subside over the course of the next five to ten days. Insomnia and changes in pulse rate, body temperature and the hematocrit reading can be detected for as long as three to four months after withdrawal. A simple clinical method for grading the intensity of abstinence is shown in table 1.

A Critical Review of the Withdrawal Treatments with Method for Evaluating Abstinence Symptoms, Supplement 128 to the Public Health Reports, United States Treasury Department, Public Health Service, 1938, p. 1. (*c*) Himmelsbach, C. K.: Studies of Certain Addiction Characteristics of (a) Dihydromorphine ("Pa[illegible] [illegible] ("Desomorphone"), (c) D[illegible] (d) Methyldihydromorphinc [illegible] Therap. **67**: 239 (Oct.) 1939.

The intensity of abstinence from morphine is dependent more on the dose the addict has been receiving than on any other single factor.[10] Mild grades of abstinence may be detected in former morphine addicts after the administration of as little as 20 mg. (⅓ grain) of morphine four times daily for thirty days. Grades *of abstinence which are as intense as any that can be* developed with any drug for any period of time can be produced by the administration of 60 to 90 mg. (1 to 1½ grains) of morphine four times daily for thirty days.

The picture of abstinence from heroin, dihydromorphinone hydrochloride[11] and metopon[9c] is qualitatively *similar to that of morphine, and the intensity is as* great, except in the case of metopon. Abstinence from these drugs comes on more rapidly than does abstinence from morphine and subsides somewhat more quickly. Abstinence from codeine,[12] while very definite, is less intense than abstinence from morphine, comes on more slowly and subsides more slowly. Abstinence from meperidine hydrochloride ("demerol hydrochloride")[13] is also milder, comes on more rapidly and subsides somewhat more rapidly than the illness from withdrawal of morphine. Abstinence from methadon[14] comes on rather slowly, is mild in intensity and subsides slowly. Abstinence from methadon is qualitatively different from abstinence from morphine in that few of the signs of autonomic dysfunction, which are so prominent following withdrawal of morphine, are seen after withdrawal of methadon. The comparative intensity of abstinence following withdrawal of morphine, codeine, meperidine hydrochloride and methadon is shown in figure 1.

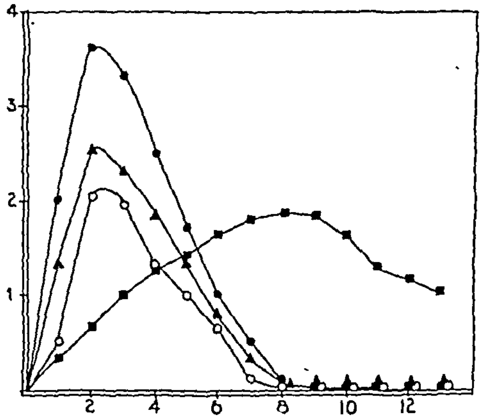

Fig. 1.—Comparative intensity of abstinence from various drugs. The solid circles indicate abstinence from morphine, the open circles abstinence from codeine, the triangles abstinence from meperidine hydrochloride and the squares abstinence from methadon. The vertical line of figure shows the intensity of abstinence (clinical grades), and the horizontal row of figures shows the number of days of abstinence.

Experience is of the utmost importance in diagnosing and treating drug addiction. The factors which have operated to induce addiction must be remembered. The problems which have arisen during the course of a person's becoming addicted to the drug, such as the legal and emotional aspects and other psychiatric and social implications, must be developed in the addiction history and evaluated before the individual addict can be fully understood.

TREATMENT OF DRUG ADDICTION

Withdrawal of drugs from narcotic addicts on an outpatient or office basis should not be undertaken; it almost surely will fail. Withdrawal in any environment except that of a well managed institution under the control of persons trained in treatment of addiction is difficult to accomplish. In the treatment of addiction, *short hospitalization for withdrawal without* a prolonged period of institutional rehabilitation is as futile as simple detoxification for chronic alcoholism. Men and women addicted to the drugs controlled by the Harrison Narcotic Act, as amended, are eligible for treatment as federal prisoners, as federal probationers or as voluntary patients at the Lexington and Fort Worth hospitals. Applicants for voluntary treatment should write to the Surgeon General of the United States Public Health Service, Washington, D. C. Voluntary patients are asked to pay $1 per day toward the cost of their treatment, but this may be waived if the patient is unable to pay. Women are treated only at the Lexing*ton hospital. Since the great majority of addicts are in an impecunious condition, the two Public Health* Service hospitals offer the only opportunity of successful treatment for most addicts.

Although withdrawal is the least important part of the treatment of drug addiction, it should be accomplished in the quickest, smoothest and most humane maner possible, so as to establish good rapport between *patient and physician on which to base subsequent* psychotherapy and rehabilitation.

A large number of methods of withdrawing morphine from addicted patients have been advocated over the years past. Some of these methods of treatment have been illogical, and some have even been more dangerous than abrupt withdrawal of morphine.[9b] We are referring to the purgation, the blister, the scopolamine hydrobromide, atropine, insulin and heavy sedation treatments.

Wieder[15] recently conducted carefully controlled experiments on the effect of insulin on the withdrawal syndrome, since favorable reports on this treatment had appeared in the literature. He observed that insulin *did not allay the withdrawal picture and, in one or two* instances, seemed to make it worse.

Until the discovery of methadon, rapid reduction of the intake of morphine over a period of about ten days has been the most satisfactory method of treatment in our hands. In recent years, it has rarely been necessary to give more than 30 mg. (½ grain) of morphine *every six hours to prevent the appearance of signs of* abstinence in the first two days of withdrawal; usually 15 mg. (¼ grain) of morphine every six hours suffices for this purpose. The dosage of morphine is reduced rapidly at the beginning of withdrawal and more slowly near the end of the withdrawal period. It is unnecessary to substitute codeine for morphine.

Since the introduction of methadon and its acceptability as a physiologic and psychologic substitute for morphine, we have used it extensively in withdrawing morphine from addicts by shifting to methadon which is then withdrawn gradually. Ordinarily one *can substitute* one-fourth the amount of methadon by weight for the dose of morphine the addict has been receiving without signs of abstinence appearing. Since methadon is a slowly acting cumulative drug, it is started in doses of 10 to 20 mg. (1/6 to 1/3 grain) three times daily twenty-four hours before morphine is discontinued. The dose of methadon is then reduced rapidly over the course of the next ten days. Signs of abstinence still will be observed but are not as pronounced as the signs seen during gradual reduction of morphine (fig. 2). Since drug addicts do not like to bear even minimal discomfort, they may complain bitterly during methadon reduction and may refuse to continue treatment, as they often do during morphine reduction.

[15] Wieder, H.: Objective Evaluation of Insulin Therapy of the Morphine Abstinence Syndrome, to be published.

Adjunctive therapy to either the morphine reduction or the substitution and reduction of methadon treatments includes use of small doses of sedative drugs. It is important not to use large doses of sedative drugs in treating physical dependence since excessive sedation seems to accentuate the development of emotional upsets during withdrawal. Furthermore, the use of sedative drugs prolongs emotional dependence on drug therapy. Flow baths are helpful in relieving excessive nervousness. A generous intake of fluids and an abundant diet should be supplied. In cases of addiction which are complicated by serious debilitating organic disease, the withdrawal period should be extended for as much as several months. The chief complication which has to be dealt with in the withdrawal of morphine in current circumstances is the presence of simultaneous barbiturate addiction. Anxiety and hysterical reactions and attempts at malingering occur frequently during withdrawal and must be handled by appropriate psychotherapeutic technics as they arise. As regards major psychotic reactions, in a series of 400 narcotic addicts observed, only 1 became definitely psychotic during withdrawal.[16]

Prefrontal lobotomy may be useful in the treatment of narcotic addiction so far as it relieves intractable pain.

The patient should remain in an institution for a minimum period of four to six months, so that there will be sufficient time to relieve the patient of any physical ailments and give him an opportunity to develop habits of living, eating, playing and working without drugs. During this period, every effort should be made to help him discover the source of his emotional difficulty and develop some insight into his problems.

Unfortunately, only about 25 per cent of our patients are able to benefit by other than coercive treatment. The remainder are persons whose characters have been so disordered from childhood that they have never been able to grow up and make mature adjustments or establish the proper relationship with other persons. Voluntary patients frequently leave the hospital prematurely and against medical advice, so that, in the present state of our knowledge, we are not able to do much for these persons.

PROPER USE OF NARCOTIC DRUGS

Analgesic Effect.—Since the presence of severe pain which cannot be relieved by simpler means is the major indication for the administration of any of the potent analgesic drugs, an understanding of the mechanism of relief of pain with these drugs is important in their use. Wolff and his collaborators[17] have developed a theory of analgesia which states that the pain-relieving effects of the opiates, or similar drugs, are due to a combination of three factors: (1) elevation of the threshold for perception of pain, (2) an alteration of the emotional reaction to pain and (3) the production of sedation and sleep. Elevation of the pain threshold and the production of sedation and sleep appear to be less important than alteration of the emotional reaction to pain. If morphine is given after the experimental production of pain in human subjects, the pain threshold is not elevated and yet the pain is relieved.[17] Since most patients who receive morphine have experienced pain prior to administration of the drug, elevation of the pain threshold is probably of minor importance in clinical practice. Relief of pain is not necessarily associated with the production of sedation and sleep. The barbiturates, though powerful sedative and hypnotic drugs, are not effective analgesics. Most of the pain-relieving action of the powerful analgesics must, therefore, be ascribed to a rather specific alteration in the emotional reaction to pain. A person with severe pain who receives a dose of morphine, or some other potent analgesic drug, may continue to perceive the pain, but, since the pain seems to have lost its dangerous quality, the patient disregards it and, under the hypnotic influence of the drug, drifts off to sleep. It seems reasonable to assume that the alteration of the emotional reaction to pain by the analgesic drugs may be associated with the euphoria produced by these compounds. The exact sites and mechanism of action of these drugs within the central nervous system are not yet understood, but the fact that patients who have had prefrontal lobotomy for the relief of pain continue to perceive pain, but are not disturbed by it, suggests that the important effect of altering the reaction to pain may be mediated through an action on the cortex of the frontal lobe.

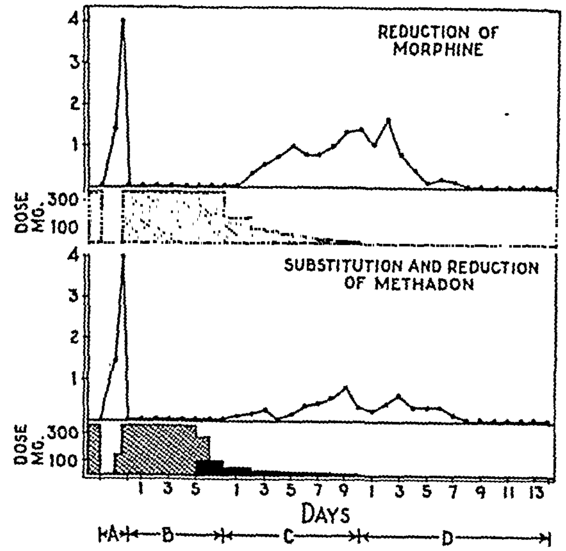

Fig. 2.—Graph of treatment of physical dependence on morphine by substitution and reduction of methadon as compared to reduction of morphine. The points shown represent the average intensity of abstinence (grades 1, 2, 3 and 4 in vertical column at left) in 10 patients who were addicted to 360 mg. (6 grains) of morphine daily. In the first experiment, 5 patients were withdrawn by simple reduction of morphine and 5 patients were withdrawn by substitution of methadon for morphine, followed by reduction of methadon. After fourteen days of total abstinence all 10 subjects were readdicted to morphine and, when withdrawal was again carried out, the 5 men who were originally withdrawn by reduction of morphine were withdrawn by substitution and reduction of methadon, and *vice versa*. Period *A:* preliminary thirty-six hour withdrawal of morphine for proof and assessment of intensity of physical dependence. Period *B:* restabilization on morphine. In the methadon graph, substitution of 90 mg. (1½ grains) of methadon for 360 mg. (6 grains) of morphine was effected on the sixth and seventh days. Period *C:* reduction of morphine or methadon. Period *D:* total abstinence from drugs.

[16] Pfeffer, A. Z.: Psychosis During Withdrawal of Morphine, Arch. Neurol. & Psychiat. **58**: 221 (Aug.) 1947.

[17] Wolff, H. G.; Hardy, J. D., and Goodell, H.: Studies on Pain: Measurement of the Effect of Morphine, Codeine and Other Opiates on the Pain Threshold and an Analysis of Their Relation to the Pain Experience, J. Clin. Investigation **19**: 659 (July) 1940.

The comparative efficacy of the three new analgesics, metopon, meperidine hydrochloride and methadon and of morphine in altering the factors concerned in analgesia is shown in table 2.

With the exception of the elevation of the pain threshold, which has been measured, the comparisons represent the personal opinions of the authors, and were assigned on the basis of experience with all the drugs.

Morphine.—Morphine is the most familiar drug used for the relief of severe grades of pain. The conditions which produce pain of such intensity as to require morphine cover the entire field of medical practice, are well known to physicians and need not be recapitulated here. It is more important to remember that the physician must be careful in using morphine, or any equivalent drug, in situations in which the patient's complaints are out of proportion with the cause of the pain. Such patients usually require reassurance and emotional support rather than drug therapy. Morphine is contraindicated in acute abdominal pain until a definite diagnosis has been established and specific treatment begun. It should not be used in the treatment of head injuries or in any condition associated with increased intracranial pressure. Morphine is also used to relieve severe dyspnea due to cardiac disease or pulmonary disease, but the drug is almost always contraindicated in bronchial asthma. Morphine remains the best drug for allaying fear prior to operative procedures. Morphine should never be used primarily for its sedative action, since less dangerous drugs are available for this purpose.

Table 2.—*Comparative Efficacy of Single Doses of New Drugs in Altering Various Factors Concerned in Analgesia* *

Drug	Dose (Mg.)	Elevation of Pain Threshold	Alteration of Reaction to Pain	Sedation	Duration of Clinical Relief of Pain-Hours
Morphine	10	2	2	1	4
Metopon	6	1	1	3	4
Meperidine hydrochloride	100	4	3	2	3
Methadon	5-10	3	4	4	4-10
Codeine	30	5	5	5	4

* The figure 1 indicates the most effective of the 4 drugs in producing the effect noted; the figure 4 indicates the least effective of the 4 drugs.

The chief disadvantages of morphine are the production of vomiting, the depression of respiration, the induction of spasm of smooth muscle and the rapid development of addiction under conditions of chronic use. Despite these disadvantages, morphine, because of its cheapness, reliability and rapidity of action, remains the drug of choice for conditions requiring relief of severe pain for periods of less than two weeks. If pain relief is required over a longer period, metopon and methadon are more suitable drugs.

Codeine.—Codeine is used for grades of pain which cannot be relieved by antipyretic drugs, but which are not severe enough to require morphine or an equivalent drug. As with morphine, care should be taken not to use codeine for patients who are overreacting emotionally to minor pathologic disturbances. The administration of codeine should be stopped when the need for it has passed, since it possesses definite, though low grade, addiction liability. The second indication for the administration of codeine is the presence of severe cough, but the use of the drug for this purpose should be carefully limited.[18] Coughing serves a useful purpose and should be interfered with only when the cough is so distressing and so constant that the patient is disturbed and weakened. It should be prescribed only after other measures have failed. One should remember that, in conditions in which cough is due to irritation of the mucous membranes of the pharynx or larger air passages, inhalations of medical steam and the use of lozenges or syrups containing volatile oils with local anesthetic properties are more effective than the use of codeine.

Metopon.—Metopon is as effective by mouth as when administered hypodermically. Tolerance develops more slowly to metopon [19] than to morphine, and, when given orally, metopon produces less sedation and less mental confusion and is not as nauseating as morphine.[19] After tolerance is developed to metopon, the full analgesic potency of the drug is restored by a short period of withdrawal.[20] Metopon is regarded as an excellent drug for oral use in the relief of chronic pain. It is difficult to manufacture; it is rather expensive, and the amount available probably will always be limited. Its total addiction liability probably equals that of morphine.

Meperidine Hydrochloride.—Meperidine hydrochloride is a synthetic piperidine derivative which has been widely used in medical practice since 1941. It is not as effective an analgesic as are morphine, metopon and methadon, but has the advantage of possessing a spasmolytic action on the smooth muscle of the intestine of human beings [21] and the ureter.[22] However, the drug has recently been shown to increase intrabiliary pressure.[23] The drug is less likely to produce nausea and vomiting than is morphine and is said to produce less respiratory depression. It is particularly useful in the relief of pain associated with spasm of smooth muscle (except in biliary colic) and can be used in persons who are intolerant to morphine. The addiction liability of meperidine hydrochloride is rather high—reports in the lay press notwithstanding. Many cases of both "primary" and "secondary" addiction to this drug have been seen.[24]

Methadon.—Methadon is a synthetic heptanone derivative which is very morphine-like in its pharmacologic actions. In human beings it has most of the disadvantages of morphine. It produces constitpation, nausea, vomiting, itching of the skin and respiratory depression.[14] It is not well tolerated by mouth and causes more local reaction than morphine when injected subcutaneously. Methadon is a slowly acting cumulative drug and may not, in a single dose, provide adequate pain relief. Due to its slowness of action and to the low degree of sedation obtained with single doses, it is not suitable for preoperative medication or for conditions requiring rapid pain relief. In repeated dosage, methadon has a powerful cumulative sedative action, so that patients who are receiving the drug at short intervals must be carefully observed for evidence of excessive drowsiness. It is, however, an excellent drug for the relief of chronic pain, because tolerance develops to its analgesic actions more slowly than does tolerance to the analgesic action of morphine and the degree of physical dependence on methadon is less than that of physical dependence on morphine.

The total addiction liability of methadon is almost equal to that of morphine, although its physical dependence liability is less.[14] The euphoric effect of methadon in the addict (and undoubtedly in the addiction-prone person) is equal to that of morphine, so that its habituation liability is high. The comparative addiction liabilities of the commonly used analgesic drugs are shown in table 3.

PREVENTION OF ABUSE OF NARCOTIC DRUGS

In general, there are two approaches to the prevention of drug addiction. The first line of effort is the long range program envisaged under the National Mental Health Act. The basic problem in preventing drug addiction is, of course, the development of a people so emotionally sound and well integrated that they will have no need for chemical aids to adaptive behavior. Such proper personality integrations, which can be achieved only through well adjusted parents, normal environment and proper schooling in social behavior, would do much to prevent drug addiction. The high incidence of emotional instability in our times, as reflected by the large numbers of noncombat psychiatric casualties during the war and the increasing use of alcohol, indicates that we have a long way to go in helping persons to adjust to life in our increasingly complex society.

The second approach to the prevention of drug addiction, and the point of immediate attack, is to separate effectively the addiction-prone person, or the ex-addict, from narcotic drugs. The Harrison Narcotic Act, with its legal prohibitions and penalties, its vigilance in preventing the introduction of contraband narcotics into the market and its careful control over use of narcotics, has had a progressive influence on the reduction and prevention of narcotic addiction. In addition to the Harrison Narcotic Act, the Geneva Convention of the League of Nations has operated to reduce worldwide production and refining of opium.

Although accidental addiction by medical use occurs occasionally, the great majority of patients become addicted under the influence of other addicts, and the efforts of the Public Health Service hospitals for the treatment of narcotic addicts at Fort Worth, Tex., and Lexington, Ky., prevent addiction so far as they cure persons who would otherwise become foci of "infection." The hospital at Lexington alone has treated slightly more than 11,000 patients since 1935. Follow-up reports indicate that over 16 per cent of these patients have remained abstinent over a seven year period, and probably at least an additional 20 per cent have remained abstinent for extended periods of time.

Physicians should keep the danger of addiction to analgesic drugs in mind and should exercise caution in prescribing them. These drugs should never be used when other drugs or other measures will suffice. The dosage should be held to the minimum compatible with adequate pain relief, and the interval between doses should be as great as possible. The drugs should be discontinued as soon as the need for pain relief has passed. They should never be used primarily for their sedative actions. In chronic cases, they should be administered orally whenever possible. Self medication with a hypodermic should not be allowed. The drugs should not be given intravenously unless the need for rapid pain relief is great, since this method produces maximum euphoria and carries an increased risk of addiction. The drugs should not be administered to persons with known neurotic personalities unless definite indications for the use of a potent analgesic are present. Narcotic drugs should never be used for the relief of symptoms due to alcoholic excess, since alcoholic persons are very addiction-prone. Analgesic drugs should rarely, or never, be used in the treatment of asthma, since asthmatic persons are very susceptible to addiction. It is significant that in many cases of morphine addiction and several of the cases of primary addiction to meperidine hydrochloride observed at Lexington addiction resulted from its use for the relief of asthma.

Suggestions are made from time to time that clinics should be established where known addicts would be given drugs free, or sold drugs at minimum cost, for the continued support of their addiction. The proponents of this plan believe that addiction is incurable or that treatment is inhumane and that if addicts are given the minimum amounts of drugs necessary to maintain their addiction lawlessness attendant on contraband traffic in narcotic drugs would be eliminated. This reasoning is unrealistic, as has been shown by several attempts in this country and abroad that have failed. Addicts on such "rations" connive to get more than their allotted amount of drugs, so that they can increase their dosage and continue to obtain a euphoric effect. They may sell, or give away, part of the extra supply so obtained to persons who are not addicted. This creates new addicts who are potential customers for the contraband market and thus increases the problem which the ration plan is supposed to abolish. Furthermore, many addicts can be treated and learn to live a useful effective life instead of one of personal neglect, indolence and semisomnolence which is so typical of the addict. Addiction is 'infectious," and treatment, rather than support of addiction, is necessary to minimize its spread.

Table 3.—*Comparative Addiction Liability of Analgesic Drugs* *

Drug	Physical Dependence Liability	Habituation Liability	Total
Morphine	4	4	8
Dihydromorphinone hydrochloride	4	4	8
[illegible]	3	4	7
[illegible]	2	3	5
[illegible]	1	4	5
Codeine	2	1	3

* Comparative addiction liability of analgesic drugs. The numeral 4 indicates that the particular drug has the greatest liability of all the drugs with respect to the particular addiction characteristic shown; the numeral 1 indicates the lowest liability; the sum of the two characteristics gives the total addition liability, the highest possible addiction liability score being 8 and the lowest 0.

SUMMARY

Because of vigorous enforcement of the Harrison Narcotic Act and to treatment of addicts in federal facilities the total number of narcotic drug addicts in the United States has declined from 150,000 to 200,000 in 1914 to approximately 48,000 at the present time.

Drug addiction is a state in which a person has lost the power of self control with reference to a drug and abuses the use of the drug to such an extent that the person or society is harmed. The drugs to which addiction commonly occurs in the United States are opium and the opium alkaloids, the synthetic morphine-like analgesics, the barbiturates, bromides, alcohol, marihuana, cocaine, amphetamine and, rarely, peyote. The characteristics of addiction to these drugs are discussed.

Drug addiction is primarily a psychiatric problem and should be regarded as a symptom of a basic underlying personality maladjustment. The common personality types of drug addicts are described. The diagnosis of narcotic addiction is usually easy, but may be difficult. Isolation of the patient and observation for signs of abstinence is, at times, the only conclusive means of diagnosis.

Withdrawal of drugs is the first and the least important step in the treatment of narcotic addiction. Withdrawal of morphine is best achieved by a ten day reduction of morphine or by substitution and reduction of methadon. Institutional therapy is necessary for the successful treatment of addiction. A minimum period of treatment of four to six months is essential. The patient's entire personality must be reoriented by appropriate psychotherapeutic technics.

The pharmacologic characteristics, the advantages and disadvantages, and the comparative addiction liabilities of the older and newer analgesic drugs are discussed. The prevention of drug addiction involves the development of an emotionally sound people through the program of the National Mental Health Act, the reduction of the illegitimate use of narcotics by the control measures provided for under the Harrison Narcotic Act, the isolation and treatment of addicts, which prevents them from spreading addiction, and proper cautious use of addicting drugs by physicians.

EXTRAOCULAR MALIGNANT MELANOBLASTOMA

A Clinical Study

MARION S. DeWEESE, M.D.
Ann Arbor, Mich.

The treatment of malignant melanoblastomas presents a discouraging and difficult problem. The mortality rate is notoriously high and the results of treatment uniformly poor.

The physician who seeks to increase his knowledge of the melanotic tumors is confronted by a large volume of interesting but confusing literature. We have learned a great deal about these tumors through clinical experience. An enormous amount of investigation has also been carried out in regard to the related developmental, cytologic, genetic, endocrinologic, chemical and physical aspects of pigment cell activity. So urgent was the need for correlating this basic knowledge that a conference was recently held to discuss all the various aspects of the "Biology of Normal and Atypical Pigment Cell Growth."[1] This historic meeting, in which many of the pioneers and leaders of current thought in this field participated, stands as a milestone in efforts to understand and combat these complex lesions.

It befalls us as clinicians to interpret and apply this basic knowledge as it becomes available to us. We are in turn obligated to keep our therapeutic results under constant surveillance. This study was undertaken in order that the experience of University Hospital with extraocular malignant melanoblastomas during recent years could be evaluated and recorded.

BASIC CHARACTERISTICS OF MELANOBLASTOMAS

In general one may say that malignant melanoblastomas usually arise in benign pigmented nevi or moles of the skin, of the meninges or within the eye. The latter site has been excluded from this study by definition. Fortunately the incidence of malignant degeneration in benign nevi is not great. Whereas most persons have a variable number of nevi on their cutaneous surfaces, malignant melanoblastomas account for less than 1 per cent of all malignant tumors.[2]

Nevi are now generally considered to be of neurogenic or ectodermal origin. This concept was first proposed by Soldan in 1899, but it remained for Masson to present decisive evidence in its support in 1926.[3] As such these lesions are closely related to other tumors of neurogenic origin, notably the neurofibromas.

There are two types of normal cells which may contain the pigment "melanin," melanoblasts and melanophores. Only the melanoblasts have the power actively to synthesize the pigment, and it is these or related nevus cells which undergo malignant transformation to melanoblastomas. Normal melanoblasts contain an intracellular oxidase, known as "dopa" oxidase, which acts on a precursor chromogen, or melanogen, to produce melanin. This can be demonstrated in the laboratory by substituting 3, 4-dihydroxyphenylalanine for the melanogen, the so-called "dopa reaction" of Bloch. Melanin itself can in turn be identified by various silver impregnation technics.

If all melanoblasts contained an identifiable amount of melanin the microscopic diagnosis of the melanoblastomas would be relatively easy. Unfortunately, many of the most malignant ones are amelonotic and their identification rests on histologic characteristics alone. This is extremely difficult, as they may closely resemble poorly differentiated neoplasms of other types. Likewise, it is difficult, and unreliable, to estimate the degree of malignancy and prognosis of malignant melanoblastomas on their histologic appearance.

These tumors may metastasize by way of the lymphatics or directly through the blood stream. This becomes of importance in planning therapy, as dissections of regional lymph nodes are of no avail in those lesions which may already have invaded the blood stream and are worth while only if a significant number metastasize initially to the lymph nodes alone.

The term "malignant melanoblastoma" is used to avoid ambiguity. It includes those lesions which are variously described as malignant melanoma, melanocarcinoma or melanosarcoma.

CLINICAL MATERIAL

The records were selected of the 130 patients examined or treated in University Hospital from 1931 to 1946 with the presumptive diagnosis of malignant melanoblastoma of extraocular origin. After careful scrutiny only 93 were considered to have had true malignant melanoblastomas. Seven others had lesions which histologically were considered to be benign forms of melanoblastoma, and this was confirmed by their subsequent benign courses. Twenty-seven patients had

highly malignant poorly differentiated lesions with histologic characteristics suggesting that they may have been amelanotic malignant melanoblastomas. A positive diagnosis of melanoblastoma was not justified, however, and so they were excluded from the study. Three patients were in the prepubertal age group.

PREPUBERTAL MELANOMA

The opinion has become prevalent in recent years that true malignant melanoblastoma rarely exists before the age of puberty.[4] Although lesions at this age frequently demonstrate histologic characteristics indistinguishable from malignant melanoblastoma, careful follow-up studies after adequate excision reveal that metastases seldom occur. Under the stimulus of the endocrinal changes incident to puberty or later pregnancy these lesions, if untreated, may become highly malignant and rapidly fatal.

Three patients in this series fell within the prepubertal age group. These children were 1, 2 and 7 years of age. The lesions in all resembled typical nevi and showed some clinical evidence of activity as manifested by recent increase in size or tendency to bleed. All presented histologic characteristics indistinguishable from malignant melanoblastoma and had been so diagnosed initially. These patients all survive at the present time after intervals of two years and four months, six years and three months, and twelve years and ten months, respectively. In none has evidence developed of metastases.

GROSS APPEARANCE OF INITIAL LESIONS

We are all aware of the potential danger of malignant degeneration in the typical deeply pigmented blue-black mole. The members of the profession and the public have been repeatedly warned to view such lesions with alarm. Although a majority of these melanoblastomas were found to have arisen in lesions that were clinically recognizable as "moles," they were of variable degrees of pigmentation, and many were but lightly pigmented (table 1).

Table 1.—*Initial Description of Lesion*

Typical pigmented mole		53
Origin undetermined or uncertain		13
Atypical cutaneous lesion		27
Granuloma	1	
Pimple	2	
Nonpigmented tumor	7	
Whitehead	1	
Swelling	1	
Chronic irritation	1	
Papilloma	3	
Blood blister	1	
Wart	2	
Post-traumatic growth or ulcer	5	
Ulcer in pigmented scar	1	
Nonpigmented nodule or lump	2	
Total		93

A significant number, 29 per cent, of the malignant lesions had their origin in cutaneous tumors which had not been clinically recognized as nevi or as being potentially dangerous by either the patient or his physician. Doubtless many of these were true nevi, but they were sufficiently atypical to defy recognition. Many had been subjected to treatment by various forms of cautery without previous biopsy and with uniformly disastrous results.

These atypical lesions were frequently amelanotic. They were variously described as being "blood blisters," "hard nodules," "persistent pimples," "warts," "nonpigmented papillomas" or "pigmented scars from previous trauma." Particularly insidious in onset were five ulcerating or fungating lesions of the feet which were attributed to trauma in that they were first noticed after injury and had failed to heal. None of the patients had been previously aware of the presence of a pigmented mole on the foot. All were beyond hope of cure when the diagnosis of melanoblastoma was finally made by histologic study.

Table 2.—*Anatomic Distribution and Curability*

	Total Number	Number "Curable"
1. Head, face and neck	29	13
2 Lower extremities	24	11
3. Trunk	18	6
4. Undetermined or uncertain	13	0
5. Upper extremities	7	2
6. External genitalia	2	2
7. Meninges	0	0
Total	93	34

The only safe course is to regard any tumor of the skin of uncertain causation, regardless of the degree of pigmentation, as potentially malignant if it is subjected to repeated trauma, and to remove it prophylactically by wide surgical excision. This is doubly imperative if the lesion shows signs of clinical activity as manifested by rapid increase in size or degree of pigmentation, signs of inflammation, persistent ulceration, or bleeding. So far as is feasible, it is advisable to accomplish excision during the prepubertal age period. All lesions so removed should be examined microscopically by a competent pathologist; only he can authoritatively pass judgment as to the "safety" of a lesion. If microscopic evidence of malignant melanoblastoma does exist, the patient should be advised to have more radical surgical treatment immediately.

The prophylactic removal of nevi by cautery has a twofold danger and should be discouraged. Not only may incomplete removal stimulate more rapid dissemination of an early malignant lesion, but coagulation of the tissue renders microscopic examination difficult and unreliable. Wide surgical excision with the scalpel circumvents both of these dangers.

ANATOMIC DISTRIBUTION OF INITIAL LESIONS

Primary lesions were most frequently found arising on head, face or neck (table 2). Lesions of the lower extremities and of the trunk were next most common. Malignant melanoblastomas of the upper extremities and of the external genitalia were relatively uncommon. There were no proved lesions of the meninges in this series.

The primary site could not be identified with certainty in 13 patients despite careful clinical search. Autopsies were performed on several without disclosing the primary site. One of these lesions was thought clinically to have arisen in the rectum. There is controversy at present as to whether malignant melanoblastomas can arise within the gastrointestinal tract, and so that lesion was considered to be of uncertain origin. Most of these patients had extensive metastases when first seen.

---

[4] Pack, G. T.: Prepubertal Melanoma of Skin, Surg., Gynec. & Obst. 86: 374, 1948.

CURABILITY

A discouraging finding in this study is the fact that only 34 patients (36.5 per cent) had lesions which were still accessible to surgical treatment when first examined by associates and me (table 2). Although the prognosis of many of those considered curable was also admittedly poor because of the presence of recurrent local lesions, cutaneous metastases or metastases to regional lymph nodes, they presented no evidence of generalized metastases. This finding is appalling, especially when one considers that for the most part melanoblastomas arise on the surface of the skin where they invite constant inspection. Yet the incidence of incurability ranks with that of carcinoma of the lung or stomach, the early diagnosis of which is understandably difficult.

TABLE 3.—*Survival Related to Anatomic Distribution*

	No. of Patients	5 Year Arrests		Living at Present	
		No.	Per Cent	No.	Per Cent
Head, face and neck	22	3	13.6	0	0
Trunk	11	2	18.2	2	18.2
Upper extremity	7	2	28.6	0	0
Lower extremity	14	8	57.1	2	14.3
Primary undetermined	9	1	11.1	1	11.1
Total	63	16	25.4	5	7.0

RESULTS OF THERAPY

During the period covered by this study the treatment of malignant melanoblastoma in this hospital was relatively conservative. It consisted for the most part of wide surgical excision of the primary lesion and dissection of regional lymph nodes only if palpable metastases were present. Prophylactic dissections of nodes were sporadically recommended but apparently not forcibly enough, as they were frequently refused by the patients, being actually performed on only three occasions.

Prior to 1942 a total of 63 patients with proved malignant melanoblastomas were examined (table 3). Many of these were beyond hope of cure when first seen. Sixteen patients survived five years or longer, a five year arrest rate of 25.4 per cent. Only 5 of these patients, all of whom had early lesions when treated, remain alive at the present time. Ten died of known metastatic melanoblastoma between their fifth and tenth postoperative years (table 4). One patient died without proved metastases, although autopsy was not done and there was some question as to whether visceral metastases might have been present. There were no ten year arrests.

The known survival rate beyond the five year period is therefore only 7.9 per cent. despite five year arrests of 25.4 per cent. De Cholnoky [5] found the average five year arrest rate of various authors to be 19.2 per cent. Pack,[6] a strong advocate of radical therapy, reported a five year survival rate of 18 per cent for primary lesions without metastases to nodes and 15 per cent for malignant melanoblastoma metastatic to regional lymph nodes. Since the adoption of a radical surgical approach his incidence of five year arrests has improved 600 per cent.

The series of patients in this hospital is too small from which to draw general conclusions regarding the relative prognosis for cure of lesions arising in the various anatomic areas. There are too many variable factors involved to make such a comparison justifiable. It is apparent, however (table 3), that lesions of head, face and neck showed the lowest incidence of five year survivals. Lesions of the lower extremities appeared to offer the best hope for prolonged survival. This is in variance with other reported series.

This tendency was also reflected in the fact that of the patients dying of metastatic melanoblastoma, those with lesions of head, face and neck survived an average of 26.6 months, while those with lesions of the lower extremities survived an average of 44.2 months. If credence is given to this observation it is possibly related to the rich blood supply of the head region, rendering early blood stream metastases more likely. One might also expect prophylactic dissections of lymph nodes to be less effective in lesions of this area than in those of the extremities.

In this hospital dissections of regional lymph nodes performed after metastases to nodes had become palpable proved to be of little therapeutic value. Ten patients were so treated. Seven died within an average time of 19.3 months; the longest survival was 59.3 months. Three patients were still alive without further evidence of metastases at the time of the completion of this study. The average survival of these at that time was only eleven months, however, and the maximum survival only fourteen months.

PRINCIPLES OF THERAPY

The only hope at present for improving the survival rate of patients with malignant melanoblastomas lies in earlier and more radical surgical therapy. Handley[7] first proposed in 1907 that these lesions be attacked radically, in a manner similar to that employed in the treatment of carcinoma of the breast, by wide local excision of the primary lesion and dissection of regional lymph nodes. This principle has not been universally accepted. Because of the frequency of early bloodborne metastases many surgeons have felt that prophylactic dissections of lymph nodes are futile and have omitted that procedure.

TABLE 4.—*Length of Survival—Initial Diagnosis Until Death from Melanoblastoma in Lesions of Known Origin*

Years	Number
0-1	19
1-2	15
2-3	17
3-4	4
4-5	2
5-6	3
6-7	2
7-8	2
8-9	2
9-10	1

Recently Pack and his associates [8] have popularized *the principle of "excision and dissection in continuity."* This entails the removal of the local lesion by wide excision, sacrificing a wide area of normal skin surrounding it and an even wider area of deep fascia, along which lymphatic metastases are known to permeate. At the same operation the regional lymph nodes are dissected out, as well as a wide area of intervening fascia and subcutaneous tissue. If the operation is properly carried out a rotation flap or a split thickness skin graft is usually necessary to cover the local defect.

[8] Pack, G. T.; Scharnagel, I., and Marfet, M.: The Principle of Excision and Dissection in Continuity for Primary and Metastatic Melanoma of Skin, Surgery **17**: 849, 1945.

Unfortunately, the greatest number of melanoblastomas are not adaptable to this ideal plan of therapy because of their anatomic location; the primary lesions are too far removed from the regional lymph nodes to make it feasible. In these more peripheral lesions if there are no demonstrable metastases the initial procedure recommended is that of wide excision of the primary lesion, or amputation of the digit if it should arise on a finger or toe. After a suitable "filtering out" period of approximately six weeks, during which time free tumor cells may have an opportunity to become entrapped in the regional lymph nodes, a prophylactic radical dissection of regional lymph nodes should be done. Many lesions arise in anatomic areas in which there is probable lymphatic drainage to several divergent groups of nodes. Dissections of these multiple groups of nodes should be accomplished in such cases.

The greatest problem arises in those patients who already have local recurrences, regional cutaneous metastases or metastases to regional lymph nodes when first examined by the surgeon. In such patients the lymphatics are in all probability extensively invaded by malignant cells. The experience in this hospital with dissections of lymph nodes at such a late date has been discouraging. Pack and his associates[9] have recently proposed attacking such lesions by radical amputation. They are of the opinion that interscapulothoracic amputations should be done for these advanced lesions arising in the upper extremities and hip joint disarticulation, or occasionally hemipelvectomy, for those of the lower extremities. Thorough dissections of lymph nodes are done at the same time. In this hospital so radical procedures have not been used in the past, and patients with this type of neoplasm have been found to be rather resistant to acceptance of even less radical procedures. It is my opinion, however, that such a radical plan of attack is justified by the high mortality rate and offers the only hope at present for improving the admittedly poor results in advanced lesions.

Prepubertal melanomas are effectively treated by simple excision. Prophylactic dissections of nodes are not indicated, but the child should be observed periodically as a precautionary measure.

Malignant melanoblastomas are uniformly radioresistant. Roentgen therapy has no place in their treatment.

SUMMARY

A brief summary of the experience of the surgical staff of the University of Michigan Hospital with the management of malignant melanoblastomas during the years 1931 to 1946 has been presented. The five year arrest rate was 25.4 per cent. All but 7.9 per cent have succumbed of metastases ultimately. There have been no ten year arrests.

The chief hope at present for more effective control of these lesions lies in more vigorous prophylaxis. Any tumor of the skin regardless of color the origin of which is not obvious should be widely excised surgically and examined histologically. This is especially true if the lesion is subjected to repeated trauma or shows clinical evidence of change.

The present concepts of surgical management of malignant melanoblastomas of extraocular origin have been outlined and more radical surgical intervention has been encouraged.

ABSTRACT OF DISCUSSION

Dr. S. William Becker, Chicago: The question of the origin of melanoma from nevi is not yet answered. Deland and Holmes (Malignant Melanoma, *New Eng. J. Med.* **220:** 651, 1939) found that melanomas originated in nevi in only 18 per cent of their cases. Miescher (Die Entstehung der bösartigen Melanome der Haut, *Virchow's Arch. f. path. Anat.* **264:**85, 1927) found such an origin in 25 per cent of instances. In my own series, study of which has not yet been completed, the incidence will be probably less than 25 per cent. Serial sections would be required for accurate determination. The melanoma may outgrow the original nevus so that the latter is not identified on routine section. Negroes rarely have pigmented nevi, but melanoma of the feet is not so uncommon in Africa. Assumption that a preexisting brown lesion is a mole is only valid if it has been present since early in life. If it has been present only a few months or years, it is more apt to be lentigo maligna, which is really early malignant melanoma. Biopsies should be made of all such lesions for accurate diagnosis. It is no longer advisable to watch tumors, but all or part of the tissue should be removed for biopsy. Part of a tumor may easily be removed by means of the cutaneous punch. Since the average person has eighteen to twenty nevi, it is not feasible to remove all of them prophylactically. However, lesions in areas subject to irritation, or those which are growing or becoming darker should be excised and subjected to biopsy. As soon as diagnosis of melanoma has been made, the areas should be widely and deeply excised, along with the regional lymph nodes, regardless of whether they are enlarged. It is only in this way that the high mortality figures can be reduced.

Dr. Marion S. DeWeese, Ann Arbor, Mich.: My interest in these lesions is primarily from the standpoint of the surgeon, and surgical therapy, though the best treatment at present, is unsatisfactory for the late lesions. In the series at the University Hospital only 36.5 per cent were amenable to any form of surgical therapy when they came to us. The best one had to offer them was in most cases a mutilating operation with no promise of cure. The logical group on which to focus attention is the 63.5 per cent who are incurable. The logical time to attack them is before they have reached such an advanced stage, and the logical person to do that is the family physician, who sees his patients continuously from infancy on. Only by his awareness of the danger involved, his advice to the patients and subsequent treatment can this high mortality rate be further reduced. The fact that a number of these highly malignant tumors are being reached at a curable stage bespeaks a good job for the general practitioner. With his increased vigilance, results should be even better.

Narcolepsy.—The term "narcolepsy" was introduced in 1880 by Gelineau to describe a "rare neurosis characterized by an invincible need for sleep, ordinarily of short duration, occurring at longer or shorter intervals of time, often several times a day, forcing the subject to fall to the ground, or lie down in order to avoid falling." Reports by others pointed out that, in addition to the attacks of sleep, patients sometimes fell, without disturbance of consciousness, as a result of sudden loss of muscle tone, which appeared during a spontaneous burst of emotion, usually associated with vigorous laughter. This sudden loss of muscle tone, called "cataplexy," is sometimes found in persons who have never had an attack of sleep, and the contrary is equally true. The one term "narcolepsy" now has come to include both varieties of symptoms.—Barker, Wayne, M.D., Tr. Psychosomatic Medicine, July-August 1948.

ORALLY ADMINISTERED PENICILLIN IN PATIENTS WITH RHEUMATIC FEVER

BENEDICT F. MASSELL, M.D.
JAMES W. DOW, M.D.
and
T. DUCKETT JONES, M.D.
Boston

In a previously reported study conducted from November 1945 to June 1946 on the wards of the House of the Good Samaritan penicillin was administered intramuscularly to all patients with rheumatic fever found to have throat cultures which were positive for the hemolytic streptococcus.[1] This study, which was made with a view to reducing the spread of hemolytic streptococci from one patient to another, was partially successful in that of a total of 20 cases, hemolytic streptococci were eliminated permanently from the throat cultures in 17. Furthermore, only one of the three strains which could not be completely eradicated belonged to serologic group A.

The studies which are the basis of the present report were a continuation and extension of the previous studies and were carried out from July 1946 through June 1947. Our objectives were as follows: (1) to determine whether orally as well as intramuscularly administered penicillin could be effective in reducing the hemolytic streptococcus carrier rate among ward patients; (2) to determine whether such reduction in carrier rate together with prompt penicillin therapy of patients acquiring hemolytic streptococcus infection would reduce the spread of infection among ward patients; (3) to determine whether hemolytic streptococci could be eradicated from patients' throats by relatively infrequent doses of orally administered penicillin and in this indirect manner to gain information as to whether penicillin might be practicable for the prevention of hemolytic streptococcus infection and hence for the prevention of rheumatic fever and (4) to determine whether the prompt treatment of hemolytic streptococcus infections would influence the immune response and prevent recurrences of rheumatic fever.

In the course of these studies we had the opportunity to make some limited observations on the efficacy of the oral administration of penicillin as a prophylactic measure against hemolytic streptococcus infections, and we shall include these observations in the present report.

METHODS OF STUDY

Observations were confined chiefly to patients on the wards of the House of the Good Samaritan, most of whom were ill or had been recently ill with active rheumatic fever. The ages of the patients varied from 3 to 17 years and averaged 9.9 years.

Cultures were made from the throats of all patients at least three times weekly. On newly admitted patients, on patients found to be carriers or suspected of having hemolytic streptococcus infection and in certain other circumstances the frequency of the throat cultures was increased to once every day, and sometimes several cultures were taken in one day. Throat culture swabs were planted and streaked directly on blood agar plates containing 5 per cent horse blood. Positive cultures were classified from plus 1 to plus 4 according to the heaviness of growth of hemolytic streptococci on the culture medium.

Strains were isolated from the blood agar plates of all positive cultures for serologic grouping and typing by the Lancefield precipitin technic[2] and for the determination of penicillin bacteriostatic sensitivity. The penicillin sensitivity tests were always controlled with a stock strain of hemolytic streptococcus the sensitivity of which remained constant at 0.03 unit.

Serum was obtained for antistreptolysin 0 determinations on all patients every two weeks, and the tests were performed by a modification of the method of Hodge and Swift.[3] Penicillin blood levels were not observed sufficiently often to be worthy of inclusion in this report.

Patients referred to the House of the Good Samaritan were admitted to a special isolation wing of the hospital and were not placed with other patients in the open wards until it was evident that their throat cultures were consistently negative for hemolytic streptococci. Patients found on admission to be harboring hemolytic streptococci in their throats were treated as carriers in a manner outlined in a subsequent paragraph. Patients whose throat cultures changed abruptly from consistently negative to strongly positive were considered to have a hemolytic streptococcus infection and were treated in a manner also outlined in a subsequent paragraph. If symptoms and signs of infection were associated with the change in culture, the infection was designated as being clinical. If the culture change occurred without associated symptoms and signs, the infection was called subclinical. Patients having or suspected of having hemolytic streptococcus infections of the respiratory tract were transferred to the isolation wing of the hospital until their cultures again became negative.

TABLE 1.—*Penicillin Sensitivity of 34 Strains of Hemolytic Streptococci*

0.006	1
0.008	5
0 01	8
0.02	15
0.03	3
0 04	1
5.0-.0.0	1

* Sensitivity is defined as the number of units of penicillin per cubic centimeter of broth which prevents multiplication of the organisms.

Patients in whom positive cultures continued during or reappeared after penicillin therapy were designated persistent or recurrent carriers.

Penicillin was usually administered by mouth in the form of 50,000 or 100,000 unit buffered tablets[4] and was always given at least one hour before meals and two to four hours after meals. Patients receiving penicillin were not allowed to have food between meals.

Hemolytic streptococcus carriers were usually treated with either 100,000 units of penicillin three times daily (total of 300,000 units per day) or with 200,000 units three times daily (total of 600,000 units per day). In several instances carriers were given 200,000 units five times daily (total of 1,000,000 units per day). A few

patients at the beginning of the study were given the antibiotic for fourteen days, but in most instances therapy was continued for exactly ten days.

Patients with hemolytic streptococcus infections (clinical or subclinical) were treated with 200,000 units of penicillin five times daily (total of 1,000,000 units per day) for ten days. The first dose each day was given about 6 a. m. and the last dose about 11 p. m. or midnight.

When frequent throat cultures remained consistently negative for hemolytic streptococci during a three week period following the discontinuation of penicillin, therapy was considered to have eradicated the organisms completely from the throat.

From patients who experienced fever, with or without symptoms or signs of pharyngitis or tonsillitis, cultures were made several times or more over a period of a few hours, and they were then treated orally with penicillin in the manner already described for hemolytic streptococcus infections. If subsequent evaluation of the culture results indicated that the infection was nonstreptococcic, penicillin therapy was discontinued; if, however, it became apparent that the infection was due to the hemolytic streptococcus, therapy was continued for a total of ten days. In this way it was often possible to treat hemolytic streptococcus infections within twenty-four hours of their onset.

In an attempt to reduce further the spread of hemolytic streptococcus infection, cultures from all physicians, nurses and other personnel who came in contact with the patients were secured at fairly frequent intervals, and those found to be harboring hemolytic streptococci in their throats were treated orally with penicillin. In many instances there was reason to believe that the outlined plan of therapy was not adhered to closely, and for this reason observations on this group were not satisfactory and have not been included in this report.

RESULTS

1. *Effect of Orally Administered Penicillin on the Carriage of Hemolytic Streptococci.*—Observations concerning the effect of orally administered penicillin on the presence of hemolytic streptococci in the throat were made on a total of 37 patients. Of these 21 were classified as carriers, 9 as having clinical hemolytic streptococcus infection and 7 as having subclinical hemolytic streptococcus infection.

Table 2.—*Cultures Positive for Hemolytic Streptococci Prior to and During Oral Penicillin Therapy**

	Total Cultures	Positive for Hemolytic Streptococci	
		Number	Percentage
Prior to therapy	229	183	80
During first 24 hours	33	8	24.2
During second 24 hours	34	2	5.9
Between third and last day	235	5	2.1

* Exclusive of non-group-A strain with penicillin sensitivity of 5 to 10 units.

The organisms obtained from 3 patients grew so poorly, when transferred from the original blood agar throat culture plates, that they could not be isolated, and hence, in these instances, data regarding penicillin sensitivity, serologic grouping and serologic typing could not be obtained. The penicillin sensitivities of the isolated strains in the remaining 34 cases are recorded in table 1. The sensitivities of all strains fell within the range of 0.006 and 0.04 unit except that of one non-group-A strain which had a sensitivity of between 5 and 10 units. All of the isolated strains were found to be group A except for the penicillin-resistant strain and one other strain which had a sensitivity of 0.02 unit.

In table 2 there are presented data concerning the proportion of all throat cultures found to be positive for hemolytic streptococci prior to penicillin therapy, during the first day of therapy, during the second day of therapy and during the period between the third and the last day of therapy. The table is a summary of the results of throat cultures on all patients exclusive of the one found to be harboring the resistant non-group-A strain of hemolytic streptococcus and has been compiled without consideration of variation in penicillin dosage. It is evident that prior to treatment with penicillin, 80 per cent of 229 throat cultures obtained from 36 patients revealed the presence of hemolytic streptococci. Within twenty-four hours after treatment with penicillin was begun the incidence of positive cultures dropped to 24.2 per cent; within the next twenty-four hours to 5.9 per cent, and during the remaining period of therapy to 2.1 per cent.

Table 3.—*Patients with Positive Cultures Prior to, During and After Oral Penicillin Therapy**

	Number of Patients
Prior to therapy	36
During period between third and last day of therapy	4
During a three week period following discontinuation of therapy	8

* Exclusive of 1 patient harboring a non-group-A strain with a penicillin sensitivity of 5 to 10 units.

Table 3 presents the same data used in table 2 but has been compiled in terms of total patients and also includes information concerning the throat culture findings during the three week period following discontinuation of penicillin therapy. It is evident that permanent clearing of hemolytic streptococci from the throat was effected in 28 patients, or 77.7 per cent, while failure to bring about permanent eradication of the organisms occurred in 8 patients, or 22.3 per cent.

It is of interest that of the 4 patients who showed one or more positive cultures during the period between the third and the last day of treatment, only 2 were among those who had positive cultures after therapy. Thus in 6 patients, even though the hemolytic streptococci were suppressed during therapy sufficiently to produce negative cultures, the organisms reappeared in the throat after penicillin was discontinued. The time after therapy at which positive cultures were first detected in these 6 patients was as follows: first day in 1 patient, fourth day in 2 patients, sixth day in 2 patients and twelfth day in 1 patient.

The question arises whether the organisms isolated after the discontinuation of therapy were the same as those present prior to the administration of penicillin or whether they were due to reinfection with a new strain. In 2 instances, by serologic typing the strains before and after treatment were identified as being the same. In one of these patients the streptococcus was of type 3 and in the other it was of type 28. In the remaining cases the strains before and after treatment could not be typed with the available serums, and hence they could not be identified.

Relation of Results to Penicillin Dosage and Age of the Patient: The age of the 28 patients whose throat cultures were successfully cleared of streptococci ranged from 3 to 17 years and averaged 8.9 years, while that of the 8 patients in whom permanent eradication of the organisms failed ranged from 4 to 17 years and averaged 12 years. Data relating results of therapy to the daily dose of penicillin are presented in table 4. From the information in this table and from the age data it can be calculated that the daily dose of penicillin per year of age for the successfully treated patients averaged 83,100 units, while that for the unsuccessfully treated patients averaged 59,300 units. These figures seem to suggest that the somewhat larger oral doses of penicillin were more effective than the smaller doses in eradicating hemolytic streptococci from the throat, but actually the relatively small number of patients involved in this study precludes attaching any great significance to the apparent differences.

Table 4.—*Relation of Results of Therapy to Daily Dose of Oral Penicillin*

Penicillin Dosage Units per Day	Number of Patients Treated	Patients with Positive Cultures After Therapy	
		Number	Percentage
800,000	8	1	12.5
600,000	10	4	40.0
1,000,000	18	3	16.7
Total	36	8	22.2

Relation of Results to Serologic Group and Type: As previously stated, the hemolytic streptococcus isolated from the throat of 1 patient classified as a carrier was found to be a non-group-A organism with a penicillin sensitivity of between 5 and 10 units. In this patient, whose data have been excluded from most of the tables, it was not surprising to find that the organism persisted in the throat even during the period that penicillin was being administered orally in a dosage of 1,000,000 units per day. In one other patient there was likewise isolated a non-group-A strain which, however, had a sensitivity of only 0.02 unit. This organism, which disappeared from the throat during oral therapy with 1,000,000 units of penicillin per day, was among the 8 instances in which streptococci reappeared after the discontinuation of treatment. In 3 patients, as has also been previously stated, it was not possible to isolate the hemolytic streptococcus for further study. All the hemolytic streptococci cultured from the remaining 32 patients belonged to group A.

Of the 32 isolated group A strains, only 10 could be typed, whereas 22 could not be typed with the available precipitin serums. The serologic group, type and penicillin sensitivity of the 25 strains permanently eradicated by penicillin therapy are summarized in table 5; comparable data for the strains which reappeared after discontinuation of treatment, exclusive of the single non-group-A strain, are given in table 6. Although the small number of cases precludes the drawing of statistically significant conclusions, the data suggest that the effectiveness of therapy does not bear any relation to serologic type or to penicillin sensitivity within the range of 0.006 and 0.04 unit.

Relation of Results to Presence of Tonsils: Tonsillectomy had been performed some time prior to this study on 12 of the 36 patients whose data have been used for table 3, but tonsils were still present in the remaining 24. Among the 24 individuals with tonsils, hemolytic streptococci persisted or reappeared after the discontinuation of penicillin in 7 (29 per cent); among the 12 patients without tonsils, failure to eradicate completely the organism occurred in only 1 (8.3 per cent). These data suggest that when tonsils are present it may be more difficult to clear the throat completely of hemolytic streptococci with oral penicillin than when tonsils are absent.

Comparison of Effectiveness of Orally Administered and Intramuscularly Administered Penicillin: In the initial study already referred to, observations were made on the effect of intramuscularly administered penicillin on the presence of hemolytic streptococci in throat cultures. For comparison of the effectiveness of intramuscularly administered and orally administered penicillin, observations have been restricted to patients from whose throats there were isolated organisms which were group A and which had a penicillin sensitivity within the range of 0.006 and 0.4 unit. Data falling into this category are available on a total of 16 intramuscularly treated patient and 32 orally treated patients. In most instances the intramuscular penicillin was given in 10,000 unit doses every two hours, totaling 120,000 units per day for a ten day period. The dosage schedule for the orally administered penicillin has already been described.

Among the 16 patients treated intramuscularly with penicillin permanent eradication of hemolytic streptococci was accomplished in 15, or 94 per cent; among the 32 orally treated patients, hemolytic streptococci were effectively removed from the throats in 25, or 78.1 per cent. These figures suggest that, with the doses used, orally administered penicillin is not quite so effective as intramuscular penicillin for the romoval of hemolytic streptococci from the throat, but, as in the case of other factors already evaluated, the number of patients involved is too small and the number of other variables too great for the drawing of statistically significant conclusions. In this connection it should be pointed out that in 2 patients in whom orally administered penicillin failed to eliminate hemolytic streptococci a second ten day course of treatment with intramuscular penicillin (150,000 units per day in one and 200,000 units per day in the other) also failed.

Table 5.—*Serologic Group, Type and Penicillin Sensitivity of 25 Strains of Streptococci Completely Eradicated by Oral Penicillin*

Penicillin Sensitivity	Group A Strains,* Types †								Total
	X †	1	3	5	19	22	28	30

* There were no non-group-A strains.
† X is used to designate group A strains which could not be typed with the available serums.
‡ Figures in the body of the table indicate number of strains.

Penicillin Resistance: Penicillin sensitivity was determined for 5 of the strains which recurred following the discontinuation of oral therapy. The data in table 7, which shows the sensitivities of these 5 strains before and after treatment, indicate that no detectable increase in resistance occurred as the result of exposure of the organisms to penicillin for ten days.

Response to Second Course of Therapy: Six of the patients in whose throats hemolytic streptococci persisted or reappeared after discontinuation of a ten day course of oral penicillin were treated again. In 3 the second course was successful, and in 3 it was unsuccessful. One patient treated originally with 300,000 units per day and another treated with 600,000 units per day were completely cleared of hemolytic streptococci by a second oral course of 1,000,000 units per day. A third patient originally treated with 1,000,000 units per day also responded to a second course of 1,000,000 units per day. A second course of 1,000,000 units orally per day in one instance and 150,000 units intramuscularly per day in another instance failed to eradicate the streptococci from the throats of 2 patients originally treated orally with 600,000 units per day. Finally in a patient originally treated with 1,000,000 units per day by mouth a second course of 200,000 units intramuscularly also failed.

2. *Effect on Incidence of Streptococcic Infection.*—Since November 1945 penicillin has been given intramuscularly or orally to all patients on the wards of the House of the Good Samaritan found to be carrying hemolytic streptococci in their throats and to all patients contracting hemolytic streptococcus infection. Because of this treatment the average streptococcus carrier rate among the patients has been considerably reduced. It is our impression that since the institution of this routine procedure the general incidence of hemolytic streptococcus infection has also decreased in comparison with the incidence during previous years, but the number of patients observed has been too small and the period of observation (November 1945 to June 1947) has been too short to determine accurately whether our impression is correct. In spite of the lack of sufficient data for statistically accurate conclusions, certain facts seem to be clear; namely: (*a*) Hemolytic streptococcus infections were not eliminated entirely and continued to occur sporadically and in small outbreaks. (*b*) During outbreaks the prompt isolation and penicillin treatment of patients with hemolytic streptococcus infection did not completely prevent the development of new cases. (*c*) The eradication of hemolytic streptococcus carriers among patients did not completely abolish all sources of infection. Although personnel occasionally were suspected of having introduced hemolytic streptococcus infection into the hospital, patients' visitors seemed to be a likely source of infection and one which was difficult to control.

When there has been an opportunity to accumulate further observations on the occurrence of streptococcus infections among the ward patients at the House of the Good Samaritan, it will be of interest to compare the seasonal incidence of these infections with that which occurred prior to the routine use of penicillin beginning in November 1945.

3. *Practical Use of Penicillin as a Prophylactic Agent.*—The data presented in table 3 indicate that hemolytic streptococci can be completely cleared from the throat by oral administration of penicillin in about three fourths of patients found to be harboring the organisms. Even in those patients in whom the streptococci are not permanently eradicated, the organisms are greatly suppressed, so that cultures usually fail to reveal their presence during the period that penicillin is being administered (table 2). Even doses of 100,000 units or 200,000 units given as infrequently as three times daily seem to be rather effective in this respect.

It seems reasonable to infer that a procedure which will greatly check or eradicate hemolytic streptococci which already have gained a foothold in the pharyngeal mucosa will also prevent the implantation of new strains which have not yet obtained such a foothold but to which the patient may be exposed. If this inference is correct, one would expect that penicillin administered orally in doses of 100,000 to 200,000 units, three times daily, might be effective as a prophylactic agent against the development of hemolytic streptococcus infections and hence might be effective in preventing recurrences of rheumatic fever.

An opportunity to test this hypothesis in a somewhat limited way occurred when a small outbreak of hemolytic streptococcus infections developed among the patients at the House of the Good Samaritan in December 1946. In spite of the prompt isolation and prompt treatment of each patient with penicillin as soon as illness was detected, 8 cases of pharyngitis or tonsillitis due to hemolytic streptococcus occurred in rapid succession within the seven day period from December 10 to December 17. In an attempt to stop the spread of infection, all visitors were barred from the hospital, no new patients were admitted for about two weeks and, starting on December 18, 100,000 units of penicillin were given orally three times daily to all the 45 patients on the wards of the hospital and continued for ten full days (December 18 to December 28). During this entire period of prophylactic oral administration of penicillin no new cases of infection occurred, and daily throat cultures on all patients were consistently negative for hemolytic streptococci, except in 1 patient. This 1 exceptional patient had been carrying in her throat for several months a non-group-A streptococcus which was relatively resistant to penicillin (sensitivity of 0.10 unit) and which had failed to disappear in a previous attempt to eradicate it with intramuscular administration of penicillin. This patient continued to harbor the same organism during and after the prophylactic regimen.

Table 7.—*Penicillin Sensitivity Before and After Penicillin Therapy of 5 Strains of Streptococci Which Could Not Be Completely Eradicated*

Penicillin Sensitivity Before Therapy	Penicillin Sensitivity After Therapy
0.008	0.008
0.01	0.02
0.02	0.01
0.02	0.02
0.02	0.02

After discontinuation of the mass oral administration of penicillin no further clinical streptococcic infections occurred over a period of four months, though 7 instances of sporadic mild subclinical infection did occur on the following dates: January 1, January 5, February 16, March 13, April 7, April 24 and April 28, 1947.

Because none of the organisms isolated between Dec. 10, 1946 and April 28, 1947 could be typed with available precipitin serum, it unfortunately was not possible to trace the original source of the outbreak or to determine whether all infections were caused by a single strain of group A streptococcus.

Although the observations reported here are too limited for irrefutable conclusions, they strongly suggest that the administration of as little as 100,000 units of penicillin by mouth three times daily is an effective method of preventing the spread of hemolytic streptococcus infections. Other factors which, of course, may also have influenced the abrupt cessation of new cases of infection were the barring of visitors and the stopping of new admissions.

4. *The Effect of Prompt Penicillin Treatment of Hemolytic Streptococcus Infections on the Immune Response and on Recurrences of Rheumatic Fever.*—Our previously reported study on intramuscular administration of penicillin included 2 cases of clinical infection with group A streptococcus treated with 10,000 units of penicillin intramuscularly every two hours (120,000 units daily) for ten days. In the present study we have treated 8 additional clinical infections with group A hemolytic streptococcus and 5 subclinical infections with group A hemolytic streptococcus with 1,000,000 units of oral penicillin daily for ten days. It is of interest that none of the infections of the respiratory tract were followed by recurrences of rheumatic fever even though it is general experience that among subjects with rheumatic fever recurrences of the disease follow infections with hemolytic streptococcus in about 50 per cent of instances.[5]

Also of interest is the response of the antistreptolysin titer following streptococcus infection. None of the patients with subclinical infection showed a rise in titer. Among the 10 patients with clinical streptococcus infection a significant rise in titer (two tubes or more) occurred in 3 and no rise, or at the most a one tube rise, occurred in 7.

COMMENT AND CONCLUSIONS

These observations indicate that when hemolytic streptococci are present in the throat they are almost completely suppressed during the oral administration of penicillin in daily doses of 300,000 to 1,000,000 units per day and that they can be completely eradicated in about 75 per cent of patients provided that the penicillin sensitivities of the organism lie within the usual range of 0.006 and 0.04 unit.

With the data available to us the reason for failure to effect complete eradication in about one quarter of the patients could not be entirely explained on the bases of the patients' ages, penicillin dosages, variations in penicillin sensitivity of the organisms within the range of 0.006 and 0.04 unit, or serologic type of the bacterial strains. Although observations on blood levels of penicillin have not been included in this study, failure of absorption of the orally ingested penicillin would not seem to explain the persistence of hemolytic streptococci in the throat in all instances; for in 2 patients in whom orally administered penicillin had failed, a second course of intramuscularly administered penicillin likewise failed to eradicate the organisms. The presence of tonsils may be one of the factors which prevent penicillin therapy from being effective in some cases. Many more observations will be necessary in order to determine with statistical accuracy the role which these various factors may play in the results of treatment.

It is evident that reduction in the hemolytic streptococcus carrier rate by penicillin therapy and prompt treatment of hemolytic streptococcus infections with penicillin do not completely prevent the occurrence of new hemolytic streptococcus infections among ward patients. Although it is our impression that these procedures lower the incidence of such infections, further observations will be required to determine whether these impressions are correct.

The decided suppression of hemolytic streptococci in the throat flora during the administration of 100,000 units or 200,000 units of penicillin only three times a day would seem to indicate that similar doses of the antibiotic would also prevent the implantation of the organisms in the throat and, therefore, that use of penicillin might be practicable in the prevention of hemolytic streptococcus infections and hence in rheumatic fever prophylaxis. Confirmation of this conclusion is suggested by the observation that an outbreak of hemolytic streptococcus infection among ward patients seemed to be checked abruptly by the mass administration of penicillin in doses of 100,000 units three times daily for ten days, although it is possible that the barring of visitors and the discontinuation of new admissions may have also played an important role.

Except for its present high cost, which prevents its extensive use, oral penicillin, as a prophylactic agent, would seem to have considerable advantage over the sulfonamide drugs, which are potentially toxic as well as less effective antistreptococcic agents. Although allergic (serum-sickness-like) reactions occurred in a few of our patients given penicillin orally, they did not constitute an important problem. No other kinds of toxic reactions were observed.

A possible drawback to the oral use of penicillin for rheumatic fever prophylaxis is the danger of producing resistant strains of hemolytic streptococci or of nonhemolytic (viridans) streptococci in instances when therapy fails to eliminate these organisms completely from the throat. The development of penicillin-resistant nonhemolytic streptococci would seem to be especially undesirable because of the possibility that such resistant organisms might subsequently become the cause of bacterial endocarditis that might not be amenable to penicillin therapy. Although reports have appeared which suggest that the risk of developing penicillin-resistant strains is real,[6] these observations were made in patients receiving relatively small oral doses of penicillin (50,000 units twice daily). The need of further studies of this phenomenon in patients receiving penicillin orally in doses of 300,000 units or more per day would seem to be indicated.

Observations of the effect of orally administered penicillin on hemolytic streptococci in the throat flora offer a relatively simple method for determining what dosage schedule of this antibiotic may be most effective, and at the same time practical, for rheumatic fever prophylaxis.

Prior to our use of penicillin, recurrences of rheumatic fever followed hemolytic streptococcus infections among patients at the House of the Good Samaritan in approximately 50 per cent of instances. Therefore, the absence of such recurrences after ten clinical and five subclinical infections with group A hemolytic streptococcus treated promptly with intramuscular penicillin or large doses of the oral preparation has been an unusual experience for us. Our own limited observations, as well as the more extensive observations of others,[7] indicating that prompt penicillin therapy of hemolytic streptococcus infection interferes with the immune response, suggest that such treatment may wipe out the organisms from the throat before their toxins can be produced and disseminated in an appreciable quantity and offer a rational basis for understanding why rheumatic fever recurrences might be prevented.

---

[5] It is also general experience that the prompt treatment of hemolytic streptococcus infections with sulfonamide drugs will not reduce the incidence of subsequent recurrences of rheumatic fever.

[6] Kuttner, A. G.: Experience with Oral Penicillin in Rheumatic Fever, read before the New York Rheumatism Association, New York, April 10, 1948. Milzer, A.; Kohn, K. H., and MacLean, H.: Oral Prophylaxis of Rheumatic Fever with Penicillin: Resistant Hemolytic Streptococci, J. A. M. A. **136**: 536-538 (Feb. 21) 1948.

However, in view of the fact that occasional strains of hemolytic streptococci seem unable to produce rheumatic fever,[8] and especially in view of the fact that the strains of hemolytic streptococcus isolated by us in the December 1946 outbreak could not be typed,[9] we are not willing to conclude that failure of rheumatic fever to develop was due to penicillin therapy. These observations, nevertheless, are sufficiently suggestive to indicate the importance of collecting further data.

SUMMARY

Orally administered penicillin in doses of 300,000 to 1,000,000 units per day for ten days suppressed hemolytic streptococci in the throats of all but 2.1 per cent of patients with rheumatic fever during therapy and completely eradicated the organisms in 77.7 per cent.

The reduction in streptococcus carrier rate by penicillin and the prompt treatment of hemolytic streptococcus infections with penicillin did not completely prevent the spread of streptococcus infections among ward patients.

The suppression of hemolytic streptococci in the throat by doses of 100,000 units to 200,000 units of penicillin as infrequently as three times daily offers indirect evidence that a similar dosage schedule of the antibiotic might be practicable for the prevention of hemolytic streptococcus infections and hence for rheumatic fever prophylaxis.

Of ten clinical and five subclinical hemolytic streptococcus infections in patients with rheumatic fever who were promptly treated with penicillin, there were no recurrences of rheumatic fever.

ABSTRACT OF DISCUSSION

Dr. Wesley W. Spink, Minneapolis: It has now been well established that penicillin is the most effective therapeutic agent for infections due to beta hemolytic streptococci. In the treatment of infections of the upper respiratory tract, including scarlet fever, caused by hemolytic streptococci it is necessary to continue the administration of penicillin for at least four or five days, or relapses may occur. Hamburger and his associates have shown that the most dangerous carriers of hemolytic streptococci are persons having the organisms in nasal cultures. Parenteral administration of penicillin for several days will eradicate hemolytic streptococci from the nasopharynx of these persons. Most workers are now agreed that Lancefield group A hemolytic streptococci frequently cause infections of the upper respiratory tract which precipitate initial and recurrent attacks of rheumatic fever. Once the tissues have been invaded by these streptococci, sulfonamide drugs or penicillin will not prevent the subsequent development of rheumatic fever. The objective in prophylaxis is to prevent the streptococci from localizing and multiplying in the tissues. This can be accomplished in children by the daily administration of small doses of a sulfonamide compound. Unfortunately, sulfonamide prophylaxis for streptococcic infections of the upper respiratory tract has resulted in the appearance of sulfonamide-resistant strains of streptococci. Dr. Massell and his group have pointed out that this acquisition of resistant strains has not been observed with small oral doses of penicillin. Obviously, further studies are needed to substantiate this point, but if penicillin does not induce the appearance of resistant strains of streptococci, penicillin should replace the routine use of the sulfonamide compounds. One feature of oral therapy with penicillin that has disturbed me in adults is the severe type of reactions simulating serum sickness that have been observed. These reactions are quite incapacitating and may persist for several days. Dr. Massell stated that in his group such reactions were seen but that they were not serious. In the treatment of carriers of streptococci, Dr. Massell administered penicillin orally three times a day. If a prophylactic program is to be carried out daily all the year round, the program should be inexpensive and efficient. Tablets of penicillin are more expensive than sulfonamide compounds. Prophylactic programs for rheumatic fever have been successful when a sulfonamide tablet has been given twice a day. It is a distinct disadvantage to have to administer a tablet three times a day. Further studies should be carried out to determine whether penicillin is not just as effective when one or, at the most, two doses are given a day.

Dr. Walter Bauer, Boston: I am sure that many of the members of this audience would appreciate it if Dr. Massell would tell us what the ideal prophylactic treatment is for a patient with rheumatic disease. What treatment would he advise to keep to a minimum recurring streptococcic infections and thereby limit rheumatic recurrences?

Dr. Benedict F. Massell, Boston: I would agree with Dr. Spink's statement that penicillin therapy of streptococcic infection should be continued for a sufficiently long period in order to prevent a flare-up of the infection, but in our experience a sufficiently long period would seem to be closer to ten days than to five days. I likewise would agree that Hamburger's observations on the relation of nasal carriage to spread of streptococcic infection indicate a need for studying nose as well as throat cultures in closed populations. In dealing with the problem of spread of infection among patients in a hospital such as the Good Samaritan, attention must be given not only to the patients themselves but also to the hospital personnel and to the patients' visitors. The introduction of infection by visitors is especially difficult to control. As Dr. Spink has pointed out, prompt sulfonamide therapy of streptococcic infections among rheumatic-susceptible subjects will not prevent recurrences of rheumatic fever. But our observations, although in need of considerable extension before being accepted, suggest that perhaps penicillin therapy may be effective. Dr. Spink's own observation, that prompt treatment of streptococcic infection with penicillin interferes with the development of immune bodies, offers a rational basis for believing that penicillin therapy holds some promise as a possible method for reducing the incidence of rheumatic fever. The danger of producing penicillin-resistant bacterial strains by the prolonged prophylactic administration of oral penicillin, as indicated by Dr. Spink's remarks, is important and deserves careful consideration and further study. It is conceivable that hemolytic streptococci, suppressed but not completely eradicated by penicillin given over a period of months, might become resistant to the antibiotic. Such resistant organisms probably would not endanger the person harboring them, but they would constitute a definite danger to other persons, especially persons susceptible to rheumatic fever, to whom they might spread. On the other hand the development of resistant viridans and nonhemolytic streptococci would be a potential risk to the patient himself, for, as pointed out by Dr. Ann Kuttner at a recent meeting of the New York Rheumatism Association, should one of these resistant strains invade the blood stream and lodge on a damaged valve, the resulting bacterial endocarditis might not be amenable to penicillin therapy. Allergic reactions with involvement of the joints and fever occurred infrequently. Their chief importance concerns their possible confusion with recurrences of rheumatic fever. Urticaria, which is associated with penicillin reactions but not with rheumatic fever, is the distinguishing feature.

HISTIDINE AND ASCORBIC ACID TREATMENT OF ARTERIOSCLEROSIS OBLITERANS

With Radioactive Isotope Estimations of Circulatory Effects

MORRIS T. FRIEDELL, M.D.
EDGAR F. DRUCKER, M.D.
and
WILLIAM J. PICKETT, M.D.
Chicago

A better understanding of the role of the sympathetic nervous system, antisympathetic drugs, antibiotics and refrigeration has converted the emergency amputation to an elective procedure. The surgeon, confronted with a gangrenous extremity, now has several aids that he may use to save the patient's life and to conserve tissue formerly sacrificed. Increasing interest in the conservative management of certain sequelae of vascular disease is evidenced by such recent reports as those of Wirtschafter and Widmann.[1] This report contains our experience with the use of histidine and ascorbic acid in the conservative treatment of one type of peripheral vascular disease as first suggested by Wirtschafter and Widmann.

Holtz[2] advanced the theory that histamine was formed in vitro and in vivo by the action of ascorbic acid with histidine. Block and Pinösch[3] found that there was an increase of histamine in the lungs of guinea pigs following administration of histidine and ascorbic acid. There is not a complete unanimity on these observations. It must be borne in mind that microbiologic surveys are notoriously erratic and determinations of histamine content are difficult. Histidine is an essential amino acid and apparently is unstable.

SELECTION OF PATIENTS

Our study comprises a group of 25 patients with impairment of circulation of the lower extremities because of arteriosclerosis. All had been admitted to the surgical service of the Cook County Hospital for amputation. Patients with uncontrolled diabetes, cardiac decompensation, severe renal disease and other serious complications not related to the diseased extremities were excluded. The patients selected represented a group who failed to respond to other conservative measures, such as sympathetic block, rest in bed and use of ordinary vasodilatants. So far as was feasible, only patients with a preponderance of complaints confined to one extremity were selected.

PHYSICAL EXAMINATION

Among the significant symptoms, we looked for diurnal pain, nocturnal pain, paresthesias and intermittent claudication. These patients spent most of their time with their feet dangling from the bed in an attempt to obtain dependent relief. The peripheral pulsations were always sought for, and none of these patients had pulsations palpable below the popliteal fossa. In only 20 per cent (5) of the patients were popliteal pulsations noted. Other signs recorded were dependent rubor, reactive hyperemia and cellulitis, atrophy of the skin and nails, ulcerations and gangrene.

METHOD OF STUDY

Some of these patients were treated with histidine and ascorbic acid after the technic described by Wirtschafter; others were treated with the oral preparation of histidine. Fresh l-histidine monochloride[4] was made available by the manufacturer in two forms for this trial. A solution in ampules of 5 cc. of 4 per cent strength in water and a capsule of 0.5 Gm. of the substance were provided. Thirteen patients received only oral therapy; 12 patients were given only parenteral therapy. The oral dosage of histidine consisted of 4 capsules three times a day, and 400 mg. of ascorbic acid three times daily at intervals different from those of the histidine. Parenteral therapy consisted of the injection of the contents of 1 ampule every six hours. These patients received 100 mg. of sodium ascorbate subcutaneously with each injection of histidine and 600 mg. of ascorbic acid orally per day. No other therapy was directed to the peripheral disease except for dry dressings where needed. A minimum duration of treatment of ten days was assigned for each patient. Daily recordings of changes in symptoms and signs were made. Skin temperature readings, oscillometric studies and examination for peripheral pulsations were frequently repeated. Radioactive isotopes (P^{32}) were used to determine improvement in circulation. Oscillometric indexes were, therefore, low or nil. In fact, there were *no significant changes in these measurements* in any one patient. Too much importance cannot be attached to this mechanism of investigation. Skin temperature readings ("dermalor") were likewise not informative and are not included in the results. The best criteria for results were clinical.

TABLE 1.—*Patients with Symptoms and Relief from Oral Medication*

Symptoms	Number	Relieved
Diurnal pain	10	4
Nocturnal pain	11	5
Claudication	2	2
Paresthesias	9	5

RESULTS FROM ORAL THERAPY

There were 12 male patients and 1 female patient given oral therapy. They varied in age from 64 to 81 years. The average age was 71.6 years. Two patients had diabetes mellitus controlled by dietary measures. The symptoms manifested in this group of cases are tabulated in table 1, together with the results from oral therapy. The effect on ulceration, reactive hyperemia and cellulitis and gangrene is shown in table 2. Less than half of the patients had good relief from pain. Only 2 patients were ambulatory when

treatment was begun, and both of these had claudication. Both claimed relief from histidine therapy and were able to walk better. Occasionally relief from pain was striking and enabled the patients to sleep without narcotics for the first time in weeks. (Many of the patients were definitely senile. Once relieved of pain, they needed considerable prodding to recall their recent bitter complaints. In 1 patient with palpable popliteal pulsation there was definite return of the dorsalis pedis and posterior tibial pulsations. This patient became ambulatory, and we feel that amputation was averted. In the remaining patients the pulsations and oscillometric readings remained unchanged. The effect on gangrene resulted in rapid demarcation in 3 of 8 patients and continued extension in 5 cases. One patient died suddenly four days after onset of treatment in spite of beginning improvement and demarcation of gangrene. This patient was extremely toxic on admission, and medication was discontinued because of obviously imminent demise. None of the patients in the entire series manifested any toxic symptoms from the treatment.

RESULTS WITH PARENTERAL THERAPY

There were 9 men and 3 women in the group receiving parenteral therapy. They varied in age from 50 to 81 years. The average age was 64.4 years. The symptoms manifested in this group of cases and the results from injected histidine are shown in table 3. Results in patients with objective observations of gangrene, reactive hyperemia and cellulitis are shown in table 4. Relief from pain was much more noticeable in this group, although improvement in physical observations was about the same as in the group receiving oral therapy. This suggests that therapy should be started with parenteral medication and that after pain is relieved oral therapy might be sufficient. There were no untoward effects from administration of the drug, and no deaths occurred in this group of patients.

Table 2.—*Results of Oral Therapy in Patients with Objective Findings of Gangrene and Reactive Hyperemia and Cellulitis*

Paresthesias..................................	10	9
Claudication..................................	2	2

END RESULTS

As the first four tables reveal, eleven amputations were necessary in the 25 cases. Of these, seven were supracondylar and four were conservative amputations, implying local excision of the gangrenous and sloughing portions of the foot. Supracondylar amputation is the method of choice at Cook County Hospital. At present, there is little indication that below the knee stumps are either safe or practical in the presence of arteriosclerosis. Therefore, unless amputation can be confined to the phalanges and heads of the metatarsals, it is felt that supracondylar amputation is the most practical procedure. In those patients in whom conservative procedures were attempted, open stumps were left which continued to stay clean and healthy and healed by secondary intention long after treatment was stopped.

Site	Number	Result
Gangrene of toes only.................	5	Local amputation 4 No amputation 1
Gangrene of foot......................	6	Supracondylar amputation 4 Died 2

Six patients were discharged as improved, and 6 were discharged without demonstrable improvement in objective observations. Some of these had relief of pain, as did some who subsequently underwent amputation. One patient underwent amputation on the sixth day because of obvious extension of the gangrenous process. An extremely ill man, aged 70, died on the fourth day of treatment. One patient died several weeks after treatment; she had refused amputation and further treatment seemed unavailing.

OTHER CONSIDERATIONS

Nutritional factors must be considered in this type of study where an amino acid and a vitamin are the only form of therapy. Serum protein levels were determined on the first and tenth day of treatment in those patients receiving parenteral treatment. Many of these patients were debilitated, but had apparently been on the standard hospital diet for some time and received all the necessary dietary essentials. Thus, in the second group of patients, serum protein levels of over 7 Gm. per hundred cubic centimeters were found in 3 patients, from 6.5 to 7 Gm. in 7 patients and below 6.5 Gm. in 2 patients. The lowest reading was 5.9 Gm. per hundred cubic centimeters. This latter reading was of a patient who had undergone amputation on the sixth day of treatment. Nutritional factors are, beyond a doubt, of extreme importance, but their relationship to the peripheral vascular factor is obscure. After ten days of parenteral therapy there was little change in the serum protein levels and no correlation to the end results.

ISOTOPE STUDIES

A sterile 10 cc. solution of disodium phosphate ($Na_2H_2PO_4$) containing 200 microcuries of radioactive phosphorus (P^{32}) was injected into the cubital vein of patients. A Geiger-Müller probe was applied to the sole of the foot, and the minute by minute increase in count was recorded by a scaling unit. A similar procedure had been carried out on approximately 150 patients without any demonstrable ill effects. The radioactive phosphorus is retained in the body for several weeks and is apparently distributed freely throughout the body. The total dosage from the quantity of radioactivity to which the body is exposed is negligible. Smith and Quimby[5] have reported similar studies with radioactive sodium. We used radioactive sodium in a few patients. The results were similar to those with phosphorus, and we feel that the latter is more desirable from the point of view of safety and availability. We have observed that the number of counts obtained from the extremity ceases to increase about thirty minutes after injection of the radioactive substance. For statistical purposes 1,200 counts are deemed sufficient to eliminate significant errors. Therefore, prior to beginning treatment we injected into some of these patients a measured dose (200 microcuries) of P^{32} and compared the time differences to obtain 1,280 (20 by 64) counts from similar areas on the sole of each foot. This was done in 11 of the patients who underwent parenteral therapy (the twelfth had had a previous amputation). After ten days of treatment an additional 200 microcuries was injected and the extremities recompared. It was felt that some actual indication of alteration in circulation of the two extremities could be demonstrated. We have observed that often in arteriosclerotic disease there is a greater rate of deposition of P^{32} in the tissues than in the normal condition. If this rate can be reduced it may indicate that circulation has been restored to a closer to normal state. The increase in concentration of P^{32} in arteriosclerosis we attribute to capillary stasis. A comprehensive analysis of P^{32} studies in circulatory disease is now in preparation.

TABLE 7.—*Summary of Observations in 11 Cases*

			Seconds per 20 Counts (Scale of 64)						
			Before		After				
Case No.	Age	Sex	Affected Side	Nonaffected Side	Affected Side	Nonaffected Side	Gangrene	Cellulitis	Disposition
1	56	F	61.4	80.4	31.4	34.8	None	None	Not improved; pain continues; moderate night pain
2	62	F	43.8	52.0	39.6	38.4	None	Present	Discharged as improved
3	75	M	26.0	40.2	20.0	30.0	None	Present	Discharged as improved
4	65	M	56.8	79.1	38.5	38.1	None	None	Objectively not improved; pain relieved
5	69	M	30.0	72.2	17.4	40.0	Toe III	Present	Pain relieved; discharged without operation
6	71	M	34.0	44.4	29.2	32.8	T II and T IV	Present	Conservative amputation, improved
7	57	M	38.6	39.8	23.4	30.8	None	None	Discharged as improved
8	50	F	93.4	61.0	57.2 ?	52.2 ?	None	None	Discharged as improved
9	65	M	87.2	63.8	74.0	42.8	Foot	Present	Improved; conservative amputation; some night pain
10	68	M	520.0	136.0	....	....	Extensive	Present	Supracondylar amputation
11	81	M	430.0	63.6	....	....	Extensive	Present	Supracondylar amputation sixth day

The results, while not altogether conclusive, are demonstrated in tables 7 and 8. It must be remembered that a measurable amount of radioactivity persists for more than ten days when P^{32} (half life of 14.3 days) is used. Therefore, before and after readings quantitative comparisons cannot be made, but only the relative concentrations in both extremities can be assessed simultaneously. Cases 1 to 6 in table 7 reveal that the affected side had a greater concentration of radioactivity than the nonaffected side prior to the institution of therapy. In the table this is recorded as a shorter time (in seconds) necessary to receive 1,280 pulses from the Geiger-Müller tube applied to the sole of the foot of the affected side than from the nonaffected side. After ten days of parenteral treatment with histidine and ascorbic acid it is shown that concentration of newly injected P^{32} was equal in both extremities in 4 patients and significantly higher in the affected side in only 2 persons. In this group of 6 patients, 5 were discharged without surgical treatment and 1 had a conservative amputation.

Case 7 in table 7 reveals equal concentration of radioactivity in both lower extremities (soles of feet) with an increase in concentration following treatment on the affected side. This patient also had a good result.

Cases 8, 9, 10 and 11 revealed a lower concentration of radioactivity on the affected side. Three of the patients had extensive gangrene, 2 requiring supracondylar amputation. One patient was able to undergo conservative operation after treatment, and we feel that this was attributable to the use of histidine and ascorbic acid. In this group 1 patient (case 8) had a definite trend to equalization of circulation, and she was discharged without surgical treatment. (Table 8 summarizes results of P^{32} studies.)

TABLE 8.—*Observations of Radioactivity*

	Before Treatment	Results After Treatment (10 Days)
Radioactivity greater on affected side..	6	1 conservative amputation
Radioactivity equal in both feet........	1	Good
Radioactivity less on affected side....	4	3 amputations

SUMMARY

Twenty-five patients were treated with histidine and ascorbic acid. These patients had been admitted either with gangrenous changes in the lower extremities or with symptoms and signs indicating imminent gangrene. All were admitted to the surgical services as candidates for amputation, with a diagnosis of arteriosclerosis obliterans. For purposes of comparison patients were selected with the majority of symptoms and signs in one lower extremity. The results are summarized in tables 1 through 6. In addition to standard clinical and laboratory evaluation, 11 of the 12 patients treated parenterally were subjected to critical studies of circulation with radioactive phosphorus as an indicator. The observations are listed in tables 7 and 8.

---

[5] Smith, B. S., and Quimby, E. H.: The Use of Radioactive Sodium as a Tracer in the Study of Peripheral Vascular Disease, Radiology **45**: 335, 1945.

CONCLUSION

1. Parenteral administration of histidine and ascorbic acid relieves pain of arteriosclerosis obliterans in a majority of cases. From this point of view it is superior to oral administration.
2. Parenteral or oral administration of histidine and ascorbic acid will improve the objective signs of arteriosclerosis obliterans in selected cases. The two routes appear to be equally effective in this regard.
3. Histidine and ascorbic acid may hasten demarcation of gangrene but will not restore gangrenous tissue to viability.
4. Studies of circulation with radioactive phosphorus in these cases indicate that histidine and ascorbic acid may equalize the circulation in the extremities and return the circulatory function toward a normal state. It is also shown that in nongangrenous phases of arteriosclerosis obliterans relative hyperemia (capillary stasis) of the affected extremity exists. Histidine and ascorbic acid have a beneficial effect in some cases, as shown by equalization of the rate of deposition of P^{32} in both extremities.
5. When concentration of radioactive phosphorus in the affected extremity is relatively poor, conservative measures are useless. A rational method of treatment of arteriosclerosis obliterans is suggested with initial therapy consisting of parenterally administered histidine and ascorbic acid until relief of pain is obtained, with subsequent maintenance of orally administered histidine and ascorbic acid.
7. Conservative amputation may be attempted in adequately treated patients with satisfactory results. Supracondylar amputation is preferred when more than the heads of the metatarsals are to be sacrificed.

Clinical Notes, Suggestions and New Instruments

FLUORESCEIN: AN ADJUNCT IN SURGERY OF EXTRAHEPATIC BILIARY PASSAGES

A Preliminary Report

GERALD J. MENAKER, M.D.
and
MORRIS L. PARKER, M.D.
Chicago

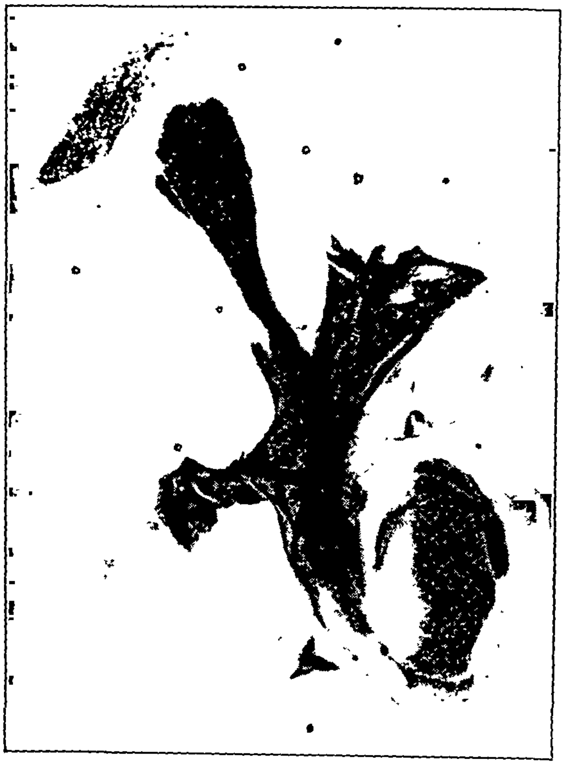
In surgical treatment of the biliary tract the surgeon is often faced with three major problems: first, anatomic anomalies which occur rather frequently in this system, affecting particularly the cystic duct; second, distortion of the external biliary passages by inflammatory processes and adhesions, causing poor visualization of the ducts, and, finally, the absence or atresia of the extrahepatic biliary ducts, which is most difficult and presents the most distressing problem of all.

Immediate cholangiography and dissection are the only aids which the surgeon possesses in the operating room. Dissection may be unsuccessful and dangerous, while cholangiography requires special equipment, is time consuming and is often of little assistance because of the difficulty in application and lack of information as to the third dimension.

We believe that we have found a method which obviates these difficulties and have established a procedure which may be an invaluable adjunct in this type of surgical procedure.

We have been able to demonstrate clinically and experimentally that fluorescein is excreted and concentrated in the bile to such an extent that under ultraviolet rays the hepatic and extrahepatic bile ducts appear in striking and contrasting yellow. Also, on section of the liver, large bile channels can be seen. These, we believe, can be cannulated, and this may prove to be the method of choice in surgical treatment for agenesis or stricture of the bile ducts. The timing of injection and observations is important and has been experimentally and clinically established. Chemical studies confirm the extreme usefulness of the concentrating power of the liver with respect to fluorescein. The phenomenon of concentration in the bile is illustrated in the accompanying photograph. The solution used is 5 per cent solution of fluorescein in 5 per cent sodium bicarbonate. Various dosages are being experimented with, and quantitative determinations are being made on liver bile in both dogs and human beings. We have been able to visualize clearly the biliary passages in human beings in the operating room.

The use of fluorescein diluted by the blood stream has been described by Lange[1] and his associates, and Crismon[2] in a series of articles published since 1942. However, its application due to its concentration in bile has not been described. In the Department of Surgery and Gastrointestinal Research of the Medical Research Institute of Michael Reese Hospital it has also been shown by urologists[3] that it may be possible to use fluorescein for visualization of the ureter in view of the fact that fluorescein is also excreted in the urine.



Liver and extrahepatic bile passages visualized after fluorescein injection, showing also open cut section of the liver.

It is our impression that on completion of this work we will have a valuable adjunct in surgical treatment of the biliary system and possibly also the ureters, a procedure which is innocuous and simple in application.

From the Department of Surgery and Gastrointestinal Research of the Medical Research Institute of Michael Reese Hospital, Chicago.

COMPLETE HEART BLOCK IN PREGNANCY

JOHN B. FERSHTAND, M.D.
and
G. HERBERT BEAVERS Jr., M.D.
Fort Worth, Texas

Complete heart block is one of the least frequent observations in all patients with cardiovascular disease. Since its commonest cause is arteriosclerosis most patients with this condition are beyond the childbearing period. The combination of complete heart block and pregnancy is, therefore, rather rare. Diddle[1] reviewed the literature to 1941 and could find only 21 authenticated cases. To these he added his own. Since then there have been reports by Yepez,[2] Quentin,[3] Mitchell and his co-workers[4] and Barton and LaDue,[5] making, with this presentation, a total of 27 patients in whom pregnancy has been complicated by this serious disturbance of cardiac rhythm. This is the first such case observed in this hospital in 15,708 deliveries over a ten year period.

REPORT OF A CASE

The patient, Mrs. E. F. H., a 34 year old white woman, was first seen by us on March 16, 1946, then in the seventh month of her second pregnancy. A prior pregnancy, in 1945, had terminated with a spontaneous miscarriage at three months. She had been under the care of an internist since the third month of this pregnancy; he had made a diagnosis of double mitral disease of rheumatic origin and aside from a palpable liver had noted no signs of decompensation. He did, however, express the belief that there had been some progressive cardiac enlargement during his period of observation and just prior to the long train trip to this city, had digitalized her and placed her on a maintenance dosage of digitalis. The electrocardiogram taken by him on November 9 is shown in figure 1. Because of the electrocardiographic pattern he thought that in addition to her mitral disease she also had an interventricular septal defect.

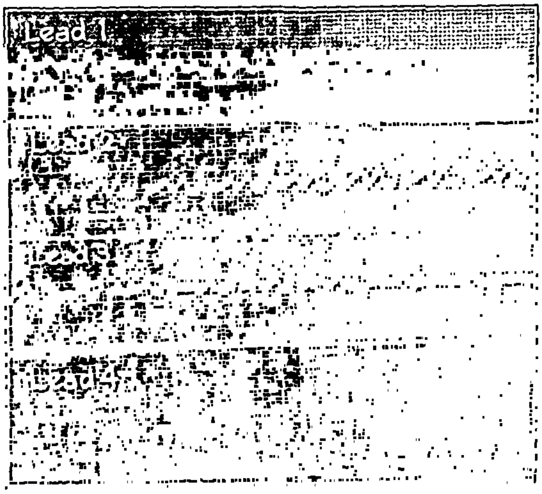

Fig. 1.—Electrocardiogram of Nov. 9, 1946—rate 100 per minute; normal sinus rhythm; PR 0.22 of a second; QRS 0.12 of a second; QRS notched and slurred in all leads. Interpretation: first degree heart block and interventricular conduction defect.

Her past history revealed that she was known to have had a cardiac disease since she was 12 years old, because of which she had avoided any strenuous exertion for many years. There was no history of rheumatic fever. She had been warned against pregnancy but was adamant in her intent to have a baby.

Physical examination revealed no evidence of any distress. Slight dyspnea on exertion was, she stated, no greater than that she had experienced for several years. There was no increase in venous pressure. There were no abnormal pulmonary observations. The heart was moderately enlarged, the point of maximal impulse being in the sixth interspace just outside the midclavicular line. There was also some increase in percussion dulness to the left in the third and fourth interspaces. The rate was 84, and the rhythm was regular. Murmurs at the apex were typical of rheumatic mitral stenosis and insufficiency. A rougher systolic murmur was heard loudest in the fourth and fifth left interspaces adjoining the sternum. The second pulmonic sound was decidedly accentuated and split. Blood pressure was 124 systolic and 80 diastolic. A sharp soft nontender liver edge was just palpable.

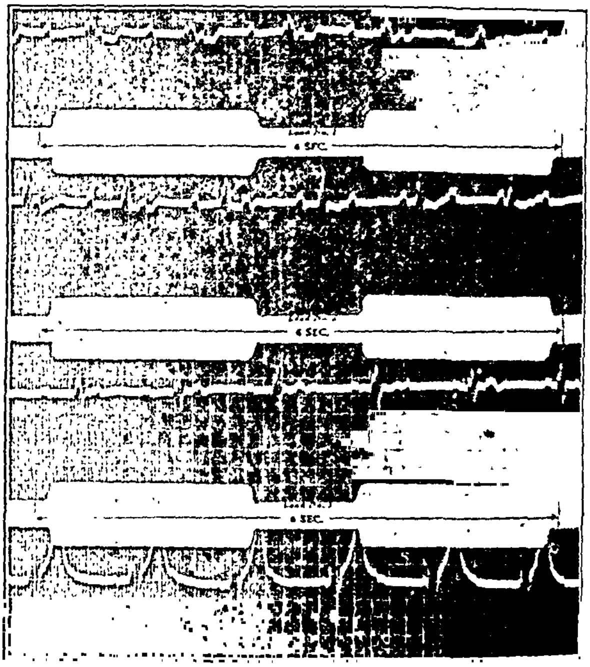

Fig. 2.—Electrocardiogram of March 26, 1946—auricular rate 110; ventricular rate 55; QRS 0.12 of a second. Interpretation: complete heart block; interventricular conduction defect.

On March 26, she returned complaining of fatigue and palpitation, which she stated had been present for the past forty-eight hours. During this period she had without instruction increased the dosage of digitalis from 1½ to 4½ grains (0.1 to 0.29 Gm.) a day. The cardiac rate was noted to be apparently regular at 58. The first sound at the apex and base were explosive in character, followed immediately by a long systolic murmur. The diastolic murmur was still present at the apex. Blood pressure was 120 systolic and 76 diastolic. An electrocardiogram (fig. 2) showed complete heart block, with ventricular complexes that were almost identical with those of the tracing taken November 9. Because of the possibility of a transient complete block having resulted from overdose of digitalis, the use of this drug was discontinued and she was advised to remain in bed. Except for minor complaints which were attributed to anxiety, she had no further symptoms during the remainder of her pregnancy. Bed rest was, however, continued, and no further digitalis therapy was considered necessary. Her heart rate continued at from 48 to 52, and the blood pressure and physical observations were essentially unchanged. An electrocardiogram May 12 showed a persistence of the complete block with a decrease in voltage of the ventricular complexes in the limb leads and an occasional ectopic beat from a focus in the other ventricle.

Delivery by section had been decided on, and on May 14 the operation was performed under ethylene and pentobarbital sodium ("nembutal") anesthesia. No difficulties were encountered, and a normal female child breathed immediately. A continuous electrocardiogram (fig. 3) was taken on lead 2

during operation. This showed a two to one block, with prolongation of the auriculoventricular and interventricular conduction time and no significant changes in the rate or in the appearance of the various complexes at any time during the delivery.

Postoperatively she continued to do well, and another tracing the morning following operation showed alteration between a two to one and complete block and two types of sinus rhythm: one with an auriculoventricular conduction time of 0.28 of a second followed by an almost normal ventricular complex and the other with an auriculoventricular conduction time of 0.34 of a second followed by a notched widened ventricular complex. Fairly large doses of atropine were then given in the hopes of restoring a normal rhythm, but without apparent effect.

The tracing taken May 26 showed a persistence of the two to one block. She was allowed out of bed the following day and had a chill and temperature rise to 101.5 F., which we ascribed to pyuria. On examination that evening the liver edge, which had been palpable 2 to 3 cm. below the costal margin, was felt about 8 cm. below the costal margin in the midclavicular line and was rather tender. We decided to digitalize her, and she was then given a maintenance dosage of a 1½ grain (0.1 Gm.) a day for the remainder of our observation.

On May 27, a roentgenogram showed about 50 per cent generalized cardiac enlargement, with prominence of the pulmonary artery suggestive of mitral stenosis. Activity was gradually resumed, and she was discharged from the hospital June 4. Electrocardiograms taken June 25 and September 5 again revealed complete heart block. She was last seen by us on Dec. 13, 1946, still symptom free, with limited activity, and another electrocardiogram was identical with that of September 5. The liver edge was palpable 6 cm. below the costal margin, soft and slightly tender. She was continuing to take digitalis, 1½ grains (0.1 Gm.) daily. Her child was well. At no time had she experienced any symptoms resembling those of a Stokes-Adams attack.

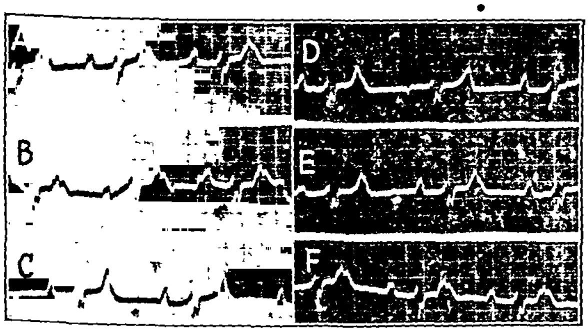

Fig. 3.—Electrocardiogram of May 14, 1946 (continuous tracing taken in lead 2 during cesarean delivery)—two to one block. *A*, 7: 50 a. m., patient completely anesthetized. *B*, 7: 53 a. m., abdominal wall opened. *C*, 7: 58 a. m., uterus opened. *D*, 8: 01 a. m., child delivered. *E*, 8: 03 a. m., placenta delivered. *F*, 8: 08 a. m., uterus closed.

COMMENT

In our opinion this patient had a combination of rheumatic mitral disease and a congenital interventricular septal defect. It is impossible to state which lesion produced the complete heart block. Evidence of damage to the bundle of His was present in the tracing taken November 9. Further injury to this organ was probably caused by ischemia secondary to added heart strain as the pregnancy progressed, and various stages of relative anoxemia of the bundle of His probably produced the variations observed in the degree of block. The patient reported by Sigler[6] showed somewhat similar changes.

The absence of any significant changes in the electrocardiographic pattern during this delivery contrasts with a series of tracings taken by Scholder[7] during a similar delivery. His records showed extrasystoles from several foci, ventricular tachycardia and auricular flutter. The anesthetic used in his case was cyclopropane. It seems likely that the arrhythmias were due to the cyclopropane, as we have seen auricular fibrillation, paroxysmal tachycardia and cardiac standstill following its use. We believe that it is definitely contradicted as an anesthetic in patients with cardiac disease, particularly so if there is a history of any arrhythmia.

SUMMARY AND CONCLUSION

A case of complete heart block in pregnancy is presented. The block developed in the seventh month of pregnancy and continued sixteen months post partum. The child was well as of the time of writing. A review of the literature reveals that complete heart block when asymptomatic and not accompanied with other serious cardiac disorders is of little or no significance during pregnancy or labor.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

MANNITOL HEXANITRATE (See New and Nonofficial Remedies 1947, p. 254).
The following dosage form has been accepted:

Cole Chemical Co., St. Louis 8
Tablets Mannitol Hexanitrate: 32 mg.

PENICILLIN (See New and Nonofficial Remedies 1947, p. 144).
The following dosage form has been accepted:

R. E. Dwight & Company, Des Moines 9, Iowa
Crystalline Penicillin G Potassium: 100,000, 200,000, 500,000 and 1,000,000 unit vials

Chas. Pfizer & Co., Inc., Brooklyn 6
Crystalline Procaine Penicillin G: Bulk. 500,000,000 units, 500 mg. vials.

Crystalline Procaine Penicillin G in Oil: 300,000 units per cc. in sesame oil, 10 cc. vials.

STREPTOMYCIN (See New and Nonofficial Remedies 1947, p. 150).
The following dosage form has been accepted:

Premo Pharmaceutical Labs., Inc., South Hackensack, N. J.
Streptomycin Calcium Chloride Complex: Vials containing streptomycin calcium chloride complex equivalent to 1 Gm. of streptomycin base.

SULFAMERAZINE-U. S. P. (See New and Nonofficial Remedies 1947, p. 125).
The following dosage form has been accepted:

S. E. Massengill Co., Bristol, Tenn.
Tablets Sulfamerazine: 0.5 Gm.

DIPHENHYDRAMINE HYDROCHLORIDE (See New and Nonofficial Remedies 1947, p. 20).
The following additional dosage form has been accepted:

Parke, Davis & Co., Detroit 32
Kapseals Benadryl Hydrochloride: 25 mg.
U. S. Trademark 416,252.

ESTROGENIC SUBSTANCES (WATER SOLUBLE) (See New and Nonofficial Remedies 1947, p. 346).
The following additional dosage form has been accepted:

Ayerst, McKenna & Harrison, Ltd., New York
Tablets Premarin: 0.3 mg.
U. S. Trademark 397,925.

SATURDAY, DECEMBER 4, 1948

SURVEY OF MEDICAL EDUCATION

Elsewhere in this issue is an announcement of the appointment of the director of the survey of medical education which is being conducted by the Committee to Survey Medical Education under the joint sponsorship of the Council on Medical Education and Hospitals of the American Medical Association and the Association of American Medical Colleges. The survey will begin Jan. 1, 1949, and will extend over a period of three years. At its completion, a detailed report of the Committee's findings and recommendations will be published.

One of the important forces that have raised medical education in this country to its present high level has been the capacity of the medical profession and medical educators to indulge in self criticism and to exercise self regulation. It may be expected that the present survey will follow the tradition of previous surveys by emphasizing the deficiencies rather than the accomplishments of our present form of medical education. Such an approach will contribute most to further advances.

Almost fifteen years have elapsed since the last complete survey of medical education in this country. In the interval there have been important advances in medical science and in the understanding of the nature of disease. Equally significant changes have occurred in the conditions of medical practice and the needs of society. Other problems have been created for the medical schools by the impact of war and the period of inflation that has followed the war. A consideration of all these factors makes it clear that the time is appropriate for a thorough reevaluation of the structure and conduct of medical education. It is fortunate that the survey is to be conducted by a group that understands the basic problems of the medical schools and that at the same time is prepared to point to the need for change in the present methods of training physicians.

This study will be the third major survey of medical education in the past forty years. The beneficial effects on the quality of medical education and medical care of the surveys conducted by Abraham Flexner and H. G. Weiskotten are well known. It may be predicted that the constructive criticisms and suggestions that will be incorporated in the final report of the present survey will have an equally far reaching influence on the course of medicine in this country.

VITAMIN A AND ASCORBIC ACID

For a long time after the discovery of the various vitamins, the idea of specificity played a prominent part in their characterization. Such descriptive names as "antineuritic factor," "antidermatitis vitamin," "anti-infective factor" and "growth vitamin" were given to indicate the precise biologic deviation from normal resulting from the appropriate deficiency in the diet. The fact that these descriptive names have largely disappeared from the vocabulary of careful workers in the field of nutritional biochemistry means that the earlier concepts of specificity have undergone modification in the light of improvement in the technics of conducting nutrition experiments. Furthermore, the foregoing trend implies a new concept of coordination or interdependence of action among the vitamins.

A recent contribution[1] emphasizes anew the connection between vitamin A and ascorbic acid; the Yale workers point out that typical signs of vitamin C deficiency (bleeding of the lacrimal glands, red and swollen gums, swelling of the joints) appear under conditions of lack of vitamin A in the rat, a species ordinarily not requiring ascorbic acid in the ration. Vitamin C added to the A-deficient diet corrects the scorbutic symptoms. Others have noted similar relations between the two dietary factors. Thus Burn and co-workers[2] observed histologic changes highly suggestive of scurvy occurring in molars of adult rats which had been maintained on a diet with minimal vitamin A. In other experiments,[3] similar dental changes produced in rats following vitamin A restriction led to the statement that in vitamin A deficiency the rat loses the capacity to synthesize ascorbic acid. Likewise, it has been shown in calves[4] that after withdrawal of vitamin A from the ration the level of ascorbic acid decreases not only in the blood but also in the cerebrospinal fluid and that the characteristic increase in cerebrospinal fluid pressure is roughly inversely proportional to the drop in vitamin C concentration therein.

There are numerous reports of the influence of ascorbic acid on the metabolism of the aromatic amino acids from protein. Incomplete oxidation products of tyrosine and phenylalanine have been demonstrated in the urine of scorbutic guinea pigs[5] and in the urine of premature infants not consuming vitamin C.[6] In each case the metabolic abnormality is rectified by administration of ascorbic acid. Indeed, it has been shown that slices of guinea pig liver will or will not oxidize tyrosine depending on whether or not the guinea pig was on a vitamin C–containing ration.[7] That this function of ascorbic acid may be the connection in the interrelationship of this vitamin with vitamin A is suggested by Mayer and Krehl,[8] who observed that the first signs of vitamin A deficiency in rats were those of scurvy and that in the absence of added ascorbic acid the increase in dietary protein resulted in exaggeration of the symptoms of vitamin A deficiency. As vitamin C is involved in protein metabolism (through its effect on tyrosine and phenylalanine metabolism), intensifying the need for ascorbic acid may result in more pronounced evidence of lack of vitamin A.

[4] Boyer, P. D.; Phillips, P. H.; Pounden, W. C.; Jensen, C. W.; Rupel, I. W., and Nesbit, M. E.: J. Nutrition **23**: 525, 1942.

The interrelation of the vitamins becomes more reasonable as progressively more information is secured regarding the complexity of the vital equilibriums and the importance of chemical compounds that formerly were thought to be more or less accidental. The profound significance of relatively simple compounds of phosphorus in the metabolism of the major foodstuffs is a case in point. The dictum of the earlier students of nutrition, namely, to eat a broad variety of foods, receives increasing experimental support as time goes on.

DDT TOXICITY

In animals the toxicity of ingested substances frequently depends on the composition of the concurrent diet. Thus a diet high in protein has been found to protect animals against such toxic agents as arsphenamine, chloroform and selenized wheat.[1] Dietary fats augment the toxicity of chloronitrobenzene and dinitrotoluene.[2]

The widespread use of DDT (dichlorodiphenyltrichloroethane) as an insecticide has thus led Sauberlich and Baumann,[3] of the College of Agriculture, University of Wisconsin, to study the effects of proteins and fats on the toxicity of ingested DDT. In preliminary tests, DDT was incorporated in their routine laboratory diet and fed to young mice and rats in graded concentrations ranging from 0.01 to 0.15 per cent. At a concentration of 0.01 per cent, the mice survived for nine weeks. At 0.05 per cent, they died within two weeks. At intermediate concentrations (e. g., 0.03 to 0.04 per cent) half of the animals lived for four weeks. Rats responded like mice to DDT, though higher concentrations were necessary before deaths resulted in a comparative period. In rats, 0.15 per cent DDT was about as toxic as 0.04 per cent in the mouse. Since mice consume two to three times as much food per unit of body weight as rats, the amount of ingested DDT per unit of body weight to produce lethal effects was approximately equal in the two animal species.

The symptoms of toxicity were similar in rats and mice. These were characterized by hyperexcitability, followed by a jerking or retraction of the head. This soon developed into general tremors. These increased in severity until there were complete loss of control, convulsions and death. There was no appreciable reduction in growth rate until the tremors became so severe as to interfere with feeding.

To test the effects of variations in the amount of dietary proteins and fats, groups of rats or mice were fed modifications of a basic laboratory diet to which 0.03 to 0.04 per cent DDT for mice or 0.15 per cent DDT for rats had been added. This basic diet consisted of 20 Gm. crude casein, 69 Gm. dextrin, 5 Gm. corn oil, 2 Gm. "celluflour" (cellulose) and 4 Gm. Wesson's salts,[4] plus adequate amounts of 9 synthetic vitamins.

In a typical test three groups of young mice were fed rations containing 20 per cent protein but with varying amounts of corn oil. To each of these ratios 0.03 per cent DDT was added. Fifty per cent of the group fed 5 per cent corn oil died by the end of six weeks. One hundred per cent of the group in which the amount of corn oil was reduced to 0.5 per cent were alive at the end of this period. In the group in which the corn oil had been increased to 15 per cent, 100 per cent died. Reducing the percentage of corn oil thus saved the lives of half of the group. Increasing its percentage caused the death of twice the control number. Similar results were obtained in experiments in which butter, lard or other fats were substituted for corn oil, and with rats tested with larger doses of DDT.

Just the opposite results were obtained in groups of mice fed varying amounts of protein. Reducing the protein to 10 per cent doubled DDT toxicity. Increasing the protein to 50 per cent rendered DDT relatively nontoxic.

The Wisconsin biochemists believe that the greater sensitivity of mice and rats fed DDT in high fat diets is due primarily to the greater efficiency of absorption of fat-soluble DDT. A theory has not yet been suggested to account for the antitoxic (anti-DDT) action of protein.

Current Comment

OSTEOPATHS LOSE KANSAS CASE

The three judge federal court convened at the request of four Kansas osteopaths in a unanimous decision Nov. 16, 1948, upheld the constitutionality of the Kansas osteopathic act. In doing so, the court gave full recognition to the right of the state to confine osteopaths to manipulative therapy and to deny to them the right to "use or administer medicinal therapeutics or operative surgery with instruments." The court pointed out that prior to and since the enactment of the osteopathic act in 1913 "the science of osteopathy has been and is now based upon the concept that the curative powers for bodily disease, infirmity or disability, are within the body itself, and if the structural integrity of the body is maintained, the natural cures will combat the disability; that the art and science of osteopathy lies in detecting and correcting structural derangements in the body by manipulative therapy." In Kansas, the court said, "the osteopathic profession is classified and regulated as a drugless and knifeless healing art or science." An appeal from this decision may be taken direct to the United States Supreme Court.

CICATRIZING ENTERITIS (REGIONAL ILEITIS) AS A PATHOLOGIC ENTITY

The term "cicatrizing enteritis" is used by Warren and Sommers instead of "regional ileitis" in their analysis[1] of the pathologic features in 120 unselected cases. This analysis is coupled with a comprehensive review (206 items) of the corresponding literature, especially on the developmental stage of the disease. In cicatrizing or regional enteritis the terminal part of the ileum in the young adult is most often affected; hence the term regional ileitis was used by Crohn, Ginzburg and Oppenheimer in their classical description in 1932,[2] but as the jejunum, upper ileum, appendix, cecum or colon may be involved, the word "enteritis" is obviously more appropriate. Warren and Somers characterize the gross lesions as a sharply demarcated induration and edema of a part of the intestine and its mesentery, with enlargement of regional lymph nodes. The microscopic appearances indicate that swelling and proliferation of the lymphatic endothelium in the intestinal wall and in lymph nodes occlude the lymphatics with resulting edema; also that granulomatous tissue with multinuclear cells and gradual hyalinization develops in the intestinal wall, the mesentery, the lymph nodes and the liver. In the later stages a subacute and chronic inflammatory process with fibrosis and muscular hyperplasia develops in the affected enteric wall. Hitherto all efforts to explain the causation of regional enteritis have failed. An etiologic agent has not been found in the lesions. Tuberculosis has been definitely excluded. But, while the cause remains unknown, there seems to be no reason to question the conclusion that the structural changes establish regional enteritis as a pathologic entity.

NECROSIS OF THE LIVER IN TRANSFUSION FOR ERYTHROBLASTOSIS

In the treatment of erythroblastosis fetalis by exchange transfusion the blood of the infant is replaced by compatible citrated blood of a donor. The amount of blood transfused varies from 500 to 1,000 cc., and a 90 per cent exchange of blood can be made in about ninety minutes. The report by Rosenblatt[1] of massive necrosis of the liver in 3 infants with erythroblastosis who *died after this exchange transfusion* raises the question of the safety of the exchange-transfusion as now practiced. In the Rosenblatt cases the clinical record and blood tests of each mother indicated fetal erythroblastosis and cesarean sections were made before term. The infants promptly received compatible exchange transfusions but died in two to five days, all with acute, massive necrosis of the liver. In 2 there were also focal necroses in the adrenals. The cause of the necrosis is not explained. Nothing is said about any bacteriologic examinations in the cases. Rosenblatt suggests that a combination of factors may have been responsible: the presence of erythroblastosis, excessive amounts of sodium citrate or calcium gluconate in the transfused blood and undue speed of transfusion. He also suggests that heparinized blood be used in order to avoid the use of sodium citrate or of calcium gluconate. The possibility of acute infection or microbic intoxication in exchange transfusion must not be overlooked.

SPECIALISTS IN RURAL AREAS

A general practitioner after certification as a specialist in internal medicine began specializing in a midwestern village with a population of 700 near the community in which he was born.[1] His principal interest was in cardiovascular disease, and he had been successful in the care of patients suffering from brucellosis. The hospitals nearest to this village were 12 miles away. The nearest specialist in his field and the nearest good clinical laboratories were 50 miles away. He established his own laboratory and has two full time technicians who do all but the most complicated tests. The county is a prosperous agricultural area with a population of 30,000. The surrounding counties from which patients might come increase the total population to 100,000. He settled in this village because he knew and liked the people and, most important, he wanted to live there. His practice, he reports, has been satisfactory from financial and professional points of view. He owns his home and office, and his family is now well established in the community. The most undesirable feature, he says, has been professional isolation. There are numerous *communities in rural areas in the United States* which need specialists and which could provide the local requirements for the successful practice of a specialty. Some of these towns now have hospitals, and, as the hospital program progresses, many more towns will have well equipped hospitals.

ORGANIZATION SECTION

Official Notes

SURVEY OF MEDICAL EDUCATION

The Committee to Survey Medical Education has announced the appointment of Dr. John E. Deitrick of New York as full time director of the survey of medical education that is being sponsored by the Council on Medical Education and Hospitals of the American Medical Association and the Association of American Medical Colleges. Dr. Deitrick graduated from the Johns Hopkins University School of Medicine in 1933. He interned at John Hopkins Hospital and served as resident in medicine at the New York Hospital. He has been a member of the faculty of the Cornell University Medical College since 1934 and is now associate professor of medicine and medical direc'or and director of post graduate instruction of the Second (Cornell) Medical Division, Bellevue Hospital, New York.

Dr. Deitrick will assume his duties as director of the Survey of Medical Education on Jan. 1, 1949. His office will be in the headquarters building of the American Medical Association, 535 North Dearborn Street, Chicago.

The seven members of the Committee to Survey Medical Education are Alan Valentine, chairman, Drs. Arthur C. Bachmeyer, Herman G. Weiskotten, Joseph C. Hinsey, Victor Johnson, Dean F. Smiley, ex officio, and Donald G. Anderson, ex officio, secretary. The committee has stated that the objective of the survey will be:

"To evaluate the present programs and determine the future responsibilities of medical education in its broadest aspects for the purpose of:

"1. Improving medical education to better meet the overall needs of the American people, for the prevention of disease, the restoration as far as possible to health to all those who have suffered ill health or injury, and for the maintenance of the best standards of physical and mental health of all the people.

"2. Assessing the degree to which medical schools are meeting the needs of the country for physicians.

"3. Promoting the advancement of knowledge in the field of medical science.

"4. Better informing the public concerning the nature, content and purposes of medical education."

It is planned to devote three years to the conduct of the survey. At its completion a comprehensive and detailed report of the committee's findings and recommendations will be published.

1949 NBC NETWORK BROADCASTS

The network program on the National Broadcasting Company will be resumed in a new form during the first week of January, 1949. The precise date and time will be announced when available. This will be the seventeenth continuous year of broadcasting on the network of the National Broadcasting Company. The first two years were devoted to talks by Drs. Morris Fishbein and W. W. Bauer. The next fourteen years were devoted to dramatizing the health message, this being the first nationwide network health program and the longest in continuity. The 1949 format will be entirely new.

The Bureau of Health Education has communicated with state medical societies and offered each of them an opportunity to participate in one of the network broadcasts on a sharing basis, three medical societies to a broadcast. Each medical society is asked to announce in three minutes of radio time its outstanding contribution to public health, medical care, research or other phases of public service. Interspersed among these participating programs will be dramatized programs on important advances in medical service and medical progress. One or more programs will be devoted to participation by medical schools on the same basis as state society participation described above.

In response to a listeners' survey, which indicated that a thirty minute dramatization might be longer than necessary, the new program format calls for fifteen minutes each week. Arrangements have been made for eighteen weeks, subject to possible extension.

Miss Judith C. Waller, Director of Public Service, Central Division, National Broadcasting Company, and W. W. Bauer, M.D., Director of the Bureau of Health Education, are the general supervisors of the broadcasts.

DIABETES WEEK BROADCAST

The American Medical Association will cooperate with the American Diabetes Association in a special broadcast over the network of the National Broadcasting Company, Saturday, Dec. 11, 1948, at 4:30 p.m., eastern standard time (3:30 p.m. central standard time; 2:30 p.m., mountain standard time; 1:30 p.m., Pacific standard time).

The program will be entitled "Calling Unknown Diabetics" with special reference to finding persons with undiscovered and potential diabetes in order to bring them under medical treatment. The program will be a closing feature of National Diabetes Week, in which many publicity mediums will be employed toward the identification of persons potentially diabetic.

The program will consist of a brief dramatic opening followed by switches to various parts of the country to pick up five speakers: Elliott P. Joslin, M.D., from Boston, Charles H. Best, M.D., from Toronto, Lester J. Palmer, M.D., from Seattle, Howard F. Root, M.D., from Boston, and a diabetic patient from New York. It will also include a dramatic presentation of the problems involved in the discovery and treatment of diabetes.

The script is being written by William J. Murphy, and the production director will be Homer Heck.

REVIEWS OF MEDICAL MOTION PICTURES

The Committee on Medical Motion Pictures has prepared a booklet containing all of the medical motion picture reviews published in THE JOURNAL, through Jan. 17, 1948. The purpose of these reviews is to provide a brief description and evaluation of motion pictures which are available to the medical profession. Each film is reviewed and commented on by competent authorities. This is not a list of films approved by the American Medical Association. One copy has been mailed to the secretary of each county and state medical society. Additional copies are available on request.

Nov. 29, 1948.

State Health Officers Take Broad Range of Action

At its annual meeting in Washington November 14-17, the Association of State and Territorial Health Officers adopted resolutions and committee reports covering a wide range of subjects. No action was taken, however, on national health insurance, following Federal Security Administrator Oscar R. Ewing's address to the group in which he called on the Association and its members to help assume leadership in educating the public on "the most comprehensive program of health that has ever been offered to the people of the United States."

The Association went on record favoring: expansion of local public health services throughout the country, assisted financially with federal funds; establishment of a Department of Health, Education and Welfare in the federal government and absorption by the U. S. Public Health Service of health programs currently conducted by the Children's Bureau; a survey of premarital blood test laws in the various states with the view of formulating a uniform bill applicable to all; drafting by the U. S. Public Health Service of a long range plan for recruitment of public health personnel, "a matter of prime importance in meeting the critical public health problems now confronting the nation and [which] is vitally related to the problem of national security"; appointment of state health officers, or their representatives, as chiefs of medical and hospital services in the prospective civil defense organizations in the various states; amendment of the Hill-Burton Hospital Survey and Construction Act to authorize higher appropriations for hospital construction and for administration of hospital construction programs; establishment of closer relations between state health departments and the American Heart Association and American Diabetes Association, and establishment of the proposed Public Health Conference on Records and Statistics.

Dr. R. H. Hutcheson, Tennessee State Commissioner of Health, was elected president of the Association of State and Territorial Health Officers, succeeding Dr. Vlado A. Getting, Massachusetts Commissioner of Public Health. Dr. Wilton L. Halverson, California State Director of Public Health, was elected vice president.

Pharmaceutical Survey Report Published

Findings and recommendations of the Pharmaceutical Survey, launched in the spring of 1946 under auspices of the American Council on Education, were published November 22 in the form of a 50 page printed report. Among highlights of the report are: a recommendation that pharmaceutical industry and commerce increase financial support of education in this professional field; emphasis of the desirability of teaching pharmacy students how to work most efficiently with members of other health professions, "to furnish accurate, objective and scientific information to physicians and members of other health professions concerning drugs and their action"; recommendations designed to achieve more accurate records on manpower strength of pharmacists in the United States and to lead to reexamination and reaccrediting of training institutions.

"During recent years," said the report, "the leading manufacturers and distributors of pharmaceutical products have been disposed to provide considerable financial assistance to institutions devoted to medical education and research. . . . The creation and operation of the American Foundation for Pharmaceutical Education is convincing evidence that these same representatives of pharmaceutical industry and commerce have not neglected to include pharmacy within the range of their helpfulness. Nevertheless, when the amount of the grants made during the past five years to medicine is compared to the grants made to pharmacy, the question is raised as to whether pharmacy has been the recipient of its rightful proportion of such grants. Certainly the manufacturers and distributors of medicinals have a vested interest in the character and the performances of the trained pharmacists who are their most important connecting link with the consuming public."

Copies of the report may be purchased from American Council on Education, 744 Jackson Place, Washington, D. C.

Sanitary Engineering Activities Reorganized

Designed to decompartmentalize sanitary engineering functions of the U. S. Public Health Service and bring them into closer integration with medical and public health activities, a reorganization plan has been completed and placed in effect. Assistant Surgeon General Mark D. Hollis is in charge of the new office, which consists of three divisions: water pollution control, sanitation and environmental health. Their heads, respectively, are Carl E. Schwob, C. H. Atkins and Vernon G. Mackenzie. Sole medical officer in the new administrative setup is Dr. E. G. Williams, head of the radiologic health unit, which is responsible directly to Mr. Hollis.

Child Research Institute Bill Being Drafted

A provisional draft of legislation which would add a Child Research Institute to the federal health and welfare establishment will be presented for discussion at a conference sponsored by the American Parents Committee and to be held in Washington November 23. Other topics on the agenda include national health insurance, local public health services legislation, school health servcies and federal aid to education.

Robert R. Sears, head of the University of Iowa Child Welfare Station, is chairman of the committee which is drafting the child research bill for submission to the assembly. Present plans are to have the legislation introduced soon after the Eighty-First Congress is convened.

Radiologists Hear Dr. Brailsford

Dr. James F. Brailsford, one of England's best known radiologists, addressed the radiology section of the Medical Society of the District of Columbia on October 28. His subject was "The Effects of Trauma on Bones and Joints." Accompanied by Mrs. Brailsford, the founder and first president of the British Association of Radiologists (now the Faculty of Radiologists) is on a lecture tour of the United States.

General Hume Lectures in Chile

Brig. Gen. Edgar Erskine Hume of the Army Medical Corps arrived in Chile late in November on a State Department mission to lecture on social medicine and public health at the University of Chile. On November 19 he opened a new 120 bed tuberculosis hospital named in memory of Franklin D. Roosevelt. Located 25 miles (40 kilometers) from Santiago, it was erected jointly by the Chilean government and Institute of Inter-American Affairs at a cost of $300,000.

Chiropractic Lobbyist Changes Affiliation

The Secretary of the Senate has been informed by Emmett J. Murphy, of Washington, that his registration under the federal lobbying law should be modified to show that he now represents the National Chiropractic Association as public relations director. Formerly he was registered as an employee of the National Chiropractic Insurance Company.

Crude Death Rate Drops to 10.0 per Thousand

For the first nine months of 1948, the nation's crude death rate was 10.0 deaths per thousand estimated population, according to the National Office of Vital Statistics (U. S. Public Health Service). The corresponding rate for the corresponding period of 1947 was 10.2. The rate was 10.1 for the calendar year 1947 and 10.0 for 1946. Among the states, Vermont had the highest crude death rate in 1947—12.0.

Coming Medical Meetings

American Academy of Allergy, Atlantic City, Chalfonte-Haddon Hall, Dec. 6-8. Dr. Theodore L. Squier, 425 E. Wisconsin Ave., Milwaukee 2, Secretary.

American Academy of Dermatology and Syphilology, Chicago, Palmer House, Dec. 5-9. Dr. Earl D. Osborne, 471 Delaware Ave., Buffalo, Secretary.

American Society of Tropical Medicine, New Orleans, Roosevelt Hotel, Dec. 5-9. Dr. Frederick J. Brady, National Institute of Health, Bethesda 14, Maryland, Secretary.

Association for Research in Nervous and Mental Diseases, New York, Waldorf-Astoria Hotel, Dec. 10-11. Dr. Clarence C. Hare, 700 W. 168th St., New York 32, Secretary.

Eastern Section, American Federation for Clinical Research, Philadelphia, Temple University School of Medicine, Dec. 4 Dr. J. Edward Berk, Temple University School of Medicine, Philadelphia, Chairman.

Puerto Rico, Medical Association of, Santurce, Dec. 10-12. Dr. J. Basora Defillo, Box 3866, Santurce, Secretary.

Radiological Society of North America, San Francisco, Dec. 5-10. Dr. Donald S. Childs, 607 Medical Arts Bldg., Syracuse 2, N. Y., Secretary.

Southern Psychiatric Association, Dallas, Texas, Hotel Adolphus, Dec. 6-7. Dr. Newdigate M. Owensby, 384 Peachtree St. N.E., Atlanta, Ga., Secretary.

Southern Surgical Association, White Sulphur Springs, W. Va., Dec. 7-9. Dr. Alfred Blalock, Johns Hopkins Hospital, Baltimore 5, Secretary.

Western Surgical Association, St. Louis, Dec. 2-4. Dr. Warren H. Cole, 1853 W. Polk St., Chicago 12, Secretary.

GOVERNMENT SERVICES

ARMY

ANNUAL MEETING OF LIBRARY CONSULTANTS

The fifth annual meeting of the Association of Honorary Consultants to the Army Medical Library was held on October 22 in Washington, D. C. Dr. Chauncey D. Leake, president of the association, opened the meeting, and Col. Joseph H. McNinch, director of the library, presented greetings from the Surgeon General. Reports of committee meetings held the previous day were made by Dr. Robert M. Stecher, chairman of the acquisition committee; Dr. Henry R. Viets, chairman, committee on historical medicine, and Col. Harold W. Jones, acting chairman, committee on grants and endowments. In the absence of Dr. George W. Calver, acting chairman of the building committee, his report was presented by Dr. Leake.

Papers by Mr. Ralph R. Shaw, Librarian of the Department of Agriculture, Col. Joseph H. McNinch, and Dr. Sanford V. Larkey, Librarian of the Welch Medical Library of Johns Hopkins University, developed the problem of indexing medical literature and its relation to the Army Medical Library. Dr. Larkey outlined in detail the scope of the exploratory project to be conducted under his direction.

At the luncheon the relation of the Army Medical Library and the Library of Congress classifications was discussed by Mr. Ralph R. Shaw, Miss Mary Louise Marshall, Colonel McNinch and Major Frank B. Rogers of the Army Medical Library, and Dr. Luther R. Evans, Dr. Frederick H. Wagman and Mr. David J. Haykin of the Library of Congress. Before the afternoon session Major Rogers spoke on "A Classification for the Army Medical Library" and Mr. Joseph A. Groesbeck on "Medical Literature in Japan."

A resolution was adopted to extend the sympathy of the members of the association to the family of Col. Richard P. Strong, honorary consultant to the Army Medical Library, who died on July 4.

On the recommendation of the nominating committee, Dr. Morris Fishbein was elected for a second four-year term on the executive committee and Colonel McNinch was elected secretary of the association. The office formerly known as secretary-treasurer was separated into secretary and treasurer, and Colonel Jones will continue as treasurer.

At the dinner on Friday evening, Dr. Leake acted as toastmaster. Addresses were made by Brigadier General George E. Armstrong, Deputy Surgeon General of the Army; Dr. John F. Fulton, former president of the Association of Honorary Consultants to the Army Medical Library, and Brigadier General Edgar Erskine Hume, Army General Staff. A motion picture, "The Mayo Clinic Library, An Introduction to Its Use," was then shown by Mr. Thomas E. Keys.

NAVY

CERTIFICATE OF APPRECIATION

The University of California School of Public Health was awarded a certificate of achievement by the Bureau of Medicine and Surgery in a ceremony on the campus October 21 in appreciation of the school's training of sanitation officers for the Navy. Dr. Walter Mangold, associate professor of public health, received a certificate of appreciation for his work in behalf of the training program which was set up by the school during the war, 160 men graduating from the course. Dr. A. P. Krueger, U.S.N.R., professor of bacteriology, was instrumental in establishing the curriculum.

POSTGRADUATE TRAINING

The following medical officers have been nominated for postgraduate training: Comdr. Bernard I. Kahn of Ardmore, Okla., to a fellowship in psychiatry at Langley Porter Clinic, San Francisco; Lieut. Comdr. James A. Addison of Shreveport, La., to a residency in general practice at the Naval Hospital, Chelsea, Mass.; Lieut. Comdr. August R. Buerkle of Pittsburgh to a residency in orthopedic surgery at the New York Orthopedic Dispensary and Hospital of Columbia University Medical Center, and Lieut. Comdr. Bruce L. Canaga Jr. of Berkeley, Calif., to instruction in internal medicine at Northwestern University Medical School, Chicago. Commander Wallace E. Allen, of Modesto, Calif., has been nominated to take postgraduate training in a residency in otolaryngology at the Naval Hospital, Pensacola, Fla.

PERSONALS

Lieutenants (jg) Lewis B. Clayton of Fort Lauderdale, Fla., and Claude A. Hendrix of Jeffersonville, Ind., have accepted appointments in the reserve medical corps and have been ordered to their first active duty as interns.

Lieutenant Commander Warner D. Bundens Jr., of Mickleton, N. J., has transferred from an active reserve status to the Regular Navy Medical Corps.

AIR FORCE

SURVEY OF EDUCATIONAL PROGRAM

The Committee on Medical Sciences of the National Research and Development Board arrived at the School of Aviation Medicine, Randolph Field, Texas, November 1 to confer on research activities and projects. After a conference with the faculty, the group made a survey of the educational program and research facilities of the school and will submit a report to the Air Surgeon, the commanding general, Air University, and the National Research and Development Board. The delegation comprised Dr. Francis G. Blake of Yale University, chairman of the group; Dr. John A. Lockwood, professor of surgery, Yale University, and consultant to the Secretary of War; Dr. Lowell T. Coggeshall, research division, Rockefeller Foundation, and Dr. Joseph F. Sadusk Jr., consultant to the Surgeon General in epidemic diseases and former executive officer, United States of America Typhus Commission. Brigadier General George E. Armstrong, Deputy Surgeon General, accompanied the group. The Air Surgeon was represented by Brigadier General John M. Hargreaves, M.C., and Colonel William J. Kennard, M.C. Navy personnel included Captain W. P. Dana, M.C., Captain Christopher C. Shaw, M.C., and Commander Earle C. Metcalfe, M.C.

DISCUSSION OF AVIATORS' VISION PROBLEMS

Civilian ophthalmologists, physicists, lighting experts and psychologists met November 11-12 with ophthalmologic specialists of the Armed Forces Medical Service at the School of Aviation Medicine, Randolph Field, Texas, to discuss vision problems encountered by aviators. A report of a five year study of ocular fatigue was presented by Dr. Conrad Berens, New York, in conjunction with S. B. Sells, Ph.D., of the psychology department of the School of Aviation Medicine. Discussed also was the result of research at the school on visibility of aircraft insignia, runway markings, motion parallax as a factor of depth perception and color saturation threshold meter. Among those attending the conference were Donald G. Marquis, Ph.D., executive secretary of N. R. C. Vision Committee; Louise Sloan Rowland, Ph.D., Wilmer Institute, Johns Hopkins; H. Richard Blackwell, Ann Arbor, Mich.; Henry A. Inus, Medical Science Division, Office of Naval Research; Dr. Richard G. Scobee, Director of Graduate Training in Ophthalmology, Washington University, St. Louis; Brian O'Brien, Ph.D., director, Institute of Optics, Rochester, N. Y., and E. O. Hulburt, Ph.D., Naval Research Laboratory, Washington, D. C.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

Los Angeles Postgraduate Lectures.—A series of lectures is being given under the auspices of the Los Angeles City Health Department to be administered by the Department of Infectious Diseases of the Medical School of the University of California, Los Angeles, and the University Extension. There will be no enrollment fee. Remaining lectures on the series are as follows:

Dec. 9, Albert G. Bower and Louis J. Fisher, Glendale, Diphtheria; *Differential Diagnosis of Infectious Mononucleosis, Septic Sore Throat* and Vincent's Angina.
Dec. 16, Evelynne G. Knouf, San Marino, Enteric Infections; Typhoid Fever and Bacillary Dysentery.
Jan. 6, Charles M. Carpenter, Rochester, N. Y., and Leon Rosove, Santa Monica, Brucellosis.
Jan. 13, William P. Frank, Alhambra, and Charles M. Carpenter, Los Angeles, Pertussis; Influenzal Meningitis.
Jan. 20, Thomas Francis Jr., Ann Arbor, Mich., Influenza.
Jan. 27, William J. Mitchell, Alhambra, Measles, Mumps and Chickenpox—*Diagnosis, Treatment and Complications.*
Feb 3, Albert G. Bower, Glendale, and Norman B. Nelson, Los Angeles, Poliomyelitis.

COLORADO

University to Cooperate with Surrounding States.—The University of Colorado, Denver, has initiated steps which will make it possible to concentrate all its teaching and service activities in the field of health and also for the medical center to cooperate with surrounding states in activities having to do with education in this field. In line with the necessary administrative reorganization, Dr. Ward Darley Jr., has been appointed executive dean of health sciences and services, and has resigned as dean of the school of medicine. He will continue as director of the medical center. Robert C. Lewis, Ph.D., Denver, has been appointed acting dean of the school of medicine; Dr. Robert S. Liggett will continue as assistant dean. Dr. George A. W. Currie, Picton, Ontario, Canada, has been appointed administrator of hospitals replacing Mr. Robert C. Kniffen, who has recently been appointed superintendent of New Britain General Hospital, New Britain, Conn.

ILLINOIS

Report on Cancer Diagnostic Clinics.—During the two year period ending June 30, 1948, a total of 4,907 residents of Illinois entered state-aided cancer diagnostic clinics for examination, according to the State Department of Public Health. In this group, 2,004 "proved" cases of cancer were discovered. The state department provides financial assistance to nineteen cancer diagnostic clinics in Illinois. Plans have been approved for a clinic at Aledo on completion of a new hospital there. In addition to free examination service to patients referred by physicians, each of these clinics maintains a free tissue diagnostic service for those who cannot afford the cost. During the two years 3,634 tissue examinations were made. Deaths from cancer in Illinois during the first eight months of this year numbered 9,047.

Chicago

Prize for Research at Cook County Hospital.—The Maurice Lamm Blatt Memorial Fund has announced a prize of $250 for original research done by an intern or resident of the Cook County Hospital or a former intern or resident who has been out of the hospital for not more than five years. All communications should be addressed to the Maurice Lamm Blatt Memorial Fund, Children's Division, Cook County Hospital, Chicago 12.

Annual Meeting of Institute of Medicine.—The annual meeting of the Institute of Medicine of Chicago will be held in the Gold Room of the Congress Hotel December 7, when Dr. Dallas B. Phemister, professor and chairman of the department of surgery emeritus, University of Chicago, will deliver the presidential address on "The Institute of Medicine and the Medical Profession." Mr. Alfred T. Carton, a citizen fellow of the institute, will speak on "The Institute of Medicine and the Community."

Visiting Lecturers.—At the meeting of the Chicago Medical Society November 17, 8 p. m., Dr. R. Arnold Griswold, head of the department of surgery of the University of Louisville School of Medicine, Louisville, Ky., spoke on "Pericardiectomy for the Relief of Constrictive Pericarditis." Dr. Isadore S. Ravdin, professor of surgery at the University of Pennsylvania School of Medicine, Philadelphia, lectured on "General Direction in Which Surgical Science Has Been Going in the Last Ten Years."

Cancer Society Aids Betatron Project.—The American Cancer Society, Inc., has awarded a $20,000 grant to the University of Illinois College of Medicine to implement the school's new betatron project. The grant will be used for the purchase and manufacture of accessory instruments required for accurate operation of the betatron, which will be used for measuring the intensity and quality of roentgen ray beams and for setting up safety devices to protect operators of the betatron. The research studies will be conducted by the department of radiology under the supervision of Dr. Roger A. Harvey.

Illinois Eye and Ear Infirmary Remodeled.—Physical improvements costing almost $100,000 are nearing completion at the Illinois Eye and Ear Infirmary. The improvements have been made by the State Department of Public Welfare to make possible the handling of an increasing number of patients and to provide facilities for an expanding teaching program. More than 87,000 patient visits were made last year to the infirmary, which is staffed by the University of Illinois College of Medicine. Recent improvements include a new suite of operating rooms, two each in the eye, and ear-nose-throat departments. New examination, treatment and waiting rooms have been added as well as laboratories.

INDIANA

Personal.—A community party for Dr. Stanton E. Gordin, Connersville, was held October 15 in the Alquina gymnasium, on his completion of fifty-two years of practice. Persons from surrounding communities attended and took part in the program.

Organize Rheumatism Association.—The Indiana Rheumatism Association has recently been organized in Indianapolis to stimulate interest of physicians and laymen in rheumatic diseases. At the inaugural meeting Dr. James S. Browning, Indianapolis, was elected president and Dr. John S. Schechter, Indianapolis, secretary-treasurer. Physicians of Indiana are invited to make application for membership.

Dermato-Syphilology Foundation Lectures.—A series of meetings in Indianapolis is extending through next May 4 have been scheduled by the Alembert Winthrop Brayton Foundation for Research in Dermato-Syphilology. Dr. Nelson P. Anderson, Los Angeles, opened the series October 20, and was followed by Dr. Arthur C. Curtis, Ann Arbor, Mich., and Dr. Harold Cole, Cleveland. The remaining lectures are as follows: On December 10, Drs. J. Lamar Callaway, Durham, N. C.; Sture Johnson, Madison, Wis., and George M. Lewis, New York, will be at Indianapolis General Hospital for clinical work and discussion. On January 21 and 22 Dr. Donald M. Pillsbury, Philadelphia, will lecture at the university and conduct clinical work at the hospital. Dr. Hamilton Montgomery, Rochester, Minn., will conduct clinics at the hospital February 21. Dr. Francis E. Senear, Chicago, will be at the hospital March 3. A joint meeting of the hospital's department of dermatosyphilology and the Cincinnati Dermatological Society will be held April 6. At the last foundation meeting May 4, Dr. Clinton W. Lane of St. Louis will attend an all day session at the hospital.

MASSACHUSETTS

Biology and Food Technology Laboratory.—A new laboratory building for biology and technology is a part of the $20,000,000 development program announced November 20 by the Massachusetts Institute of Technology, Cambridge. About half of the amount is to be assigned as endowment and unrestricted funds, and the balance will be used for new facilities and equipment. The laboratory will house in a single building the institute's work in biology, nutritional biochemistry and food technology. Under the present conditions various groups contributing to the institute's program in biology and food technology are separated by long distances, and some of the units are housed in temporary facilities inadequate for this type of work.

MISSOURI

Graduate Courses in Pulmonary Diseases.—A graduate course in pulmonary diseases sponsored by the American Trudeau Society in cooperation with the St. Louis University School of Medicine will be given at the University January 17-19. The course has been planned for physicians in general practice. Out of state members of the faculty are Dr. Julius L. Wilson, Tulane University of Louisiana School of Medicine, New Orleans, and Dr. Carl Muschenheim, Cornell University Medical College, New York. Registration is limited and the tuition is $25 payable at time of application. Inquiries should be addressed to the Executive Secretary, Missouri Section, American Trudeau Society, 411 North 10th St., St. Louis 1.

Narcotic Violation.—Dr. William P. Dysart, Columbia, pleaded guilty to violation of the Federal Narcotic Code in the U. S. District Court, Kansas City, and on September 18 sentence was suspended and he was placed on probation for a period of five years, during which he is not to practice his profession.

NEW YORK

Personals.—Dr. Harry A. Pattison, director of the Potts Memorial Institute at Livingston, delivered a group of lectures on "Rehabilitation of the Tuberculous" at Mexico City during the first ten days of November. Doctor Pattison went to Mexico City at the invitation of the Sociedad Mexicana de Estudios sobre Tuberculosis.——Dr. Robert H. Lowe, assistant medical director at Rochester General Hospital, has been appointed director to replace Dr. Frank C. Sutton, who resigned. Dr. Lowe is a graduate of the University of Vermont College of Medicine, Burlington, 1938. He has a master's degree in hospital administration.

Graduate Program.—The Medical Society of the State of New York, in cooperation with the New York State Department of Health, has arranged a program for the Nassau County Medical Society to be given on Thursday afternoons at 4 o'clock at the Nassau Hospital Auditorium, Mineola, as follows:

Dec. 16, William A. Brumfield, Albany, Modern Treatment of Syphilis.
Jan. 27, Richard S. Gubner, Brooklyn, Newer Concepts and Therapy of Hypertension.
Feb. 3, Arthur W. Grace, Brooklyn, Common Parasitic Infections Encountered in General Practice.
Feb. 10, Nathaniel T. Kwit, New York, Management of the Failing Heart.
Feb. 17, Lloyd F. Craver, New York, What Can the General Practitioner Do About Lowering Cancer Mortality?

New York City

Apprehend Shellfish Bootleggers.—Seafaring inspectors of the Bureau of Food and Drugs, Department of Health, who daily pilot rowboats to isolated coves and sandbars in the waters surrounding New York City, have apprehended 619 shellfish "bootleggers" since the beginning of the year and condemned 9,474 pounds of clams, mussels and oysters in their possession. By increasing the number of these inspectors, the bureau has reduced sharply cases of typhoid, dysentery and other intestinal diseases. Only 1 case of typhoid was traced to the eating of unapproved shellfish this year as compared with 690 cases in 1933.

Dr. Blatteis Honored. — Associates and friends of Dr. Simon R. Blatteis, Brooklyn, gave a dinner in his honor at the Waldorf-Astoria celebrating the golden anniversary of his entering the practice of medicine. Dr. Blatteis, a graduate of Bellevue Hospital Medical College, served as pathologist in chief for the New York Department of Health from 1906 to 1918. From 1935 to 1941 he was physician in chief at Jewish Hospital. He served on the staff of New York University Medical College from 1909 to 1940, first as lecturer in medicine, then as clinical professor of medicine. He was named emeritus professor of clinical medicine at the Long Island College of Medicine in 1941, having served on the faculty since 1924.

Lectures in Pathology and Bacteriology. — The Mount Sinai Hospital is sponsoring lectures on "Recent Advances in Pathology and Bacteriology" on Wednesday evenings at 8:30 in the Blumenthal Auditorium. The program is as follows:

Dec. 22, William E. Ehrich, Philadelphia, Functional Significance of Various Leukocytes.
Jan. 12, Paul R. Cannon, Chicago, Changing Aspects of Protein Metabolism.
Jan. 26, William F. Petersen, Chicago, Functional Pathology and the Environmental State.
Feb. 9, Richard H. Follis Jr., Baltimore, Nutrition and Bone Disease.
Feb. 23, Harry Most, New York, Recent Advances in the Epidemiology, Diagnosis and Treatment of Amebiasis.
March 2, Tracy B. Mallory, Boston, Systemic Pathology Consequent to Traumatic Shock.
March 16, Harry Eagle, Bethesda, Md., Mode of Action of Penicillin in Relation to Its Therapeutic Use.
March 30, B. Black-Schaffer, Durham, N. C., Clinical Implications of the Shwartzman Phenomenon.
April 6, Joseph H. Globus, Morphology of Brain Tumors in Relation to Prognosis.

NORTH CAROLINA

Community Built Hospital Opened.—The Valley Clinic and Hospital at Bat Cave, built as a community project to serve the mountain area of Rutherford, Polk and Henderson counties, was dedicated October 10. Built at an actual cash outlay of $11,442 in an abandoned brick school building, the hospital has an estimated value of $65,000. Material was donated, labor was given and supplies provided through a ladies auxiliary and the Hendersonville Elks Lodge. The twelve bed hospital is equipped to do general medical care, surgery and obstetric care. It will have a staff of eight persons. Dr. George F. Bond, a graduate of McGill University Faculty of Medicine, Montreal, Canada, 1945, led in the construction of the hospital.

PENNSYLVANIA

State Medical Election.—At the recent centennial meeting of the Medical Society of the State of Pennsylvania, Dr. Gilson C. Engel, Philadelphia, was installed as president, and Dr. E. Robert Samuel, Mt. Carmel, was chosen president-elect. Dr. Walter F. Donaldson, Pittsburgh, continues as secretary.

Philadelphia

Cancer Program for General Practitioners.—The Committee on Cancer Control of the Philadelphia County Medical Society in cooperation with the Philadelphia Chapter of the American Academy of General Practice is arranging an all day program on cancer detection and control at the society building December 9. Office diagnostic procedures will be stressed, and a panel discussion will be presented of cases representing special types of malignant growths.

Pittsburgh

Dr. Hetherington Goes to Maryland.—Dr. Leon H. Hetherington, assistant professor of medicine at the University of Pittsburgh School of Medicine, has been appointed chief of the division of tuberculosis services of the Maryland State Department of Health. Dr. Hetherington will take over direction of Maryland's four tuberculosis sanatoriums. He is a graduate of the University of Pennsylvania School of Medicine, Philadelphia, 1930, and has been associated with the Tuberculosis League Hospital, Pittsburgh, Pennsylvania State Tuberculosis Sanatorium at Cresson, Western State Psychiatric Hospital, Pittsburgh, and, most lately, with the Veterans Hospital at Butler, Pa., as chief physician for tuberculosis services. Maryland's tuberculosis sanatoriums have been under the direction of the Maryland State Health Department for more than a year, following the retirement of Dr. Victor F. Cullen, Baltimore.

WISCONSIN

Hospital News.—A new 250 bed diagnostic and treatment building is being erected as an addition to the Winnebago State Hospital facilities, Winnebago, to be built at an approximate cost of $3,000,000. It is being constructed under the federal hospital act.

State Medical Election.—The State Medical Society of Wisconsin at its meeting early in October installed Dr. Karl H. Doege of Marshfield as president, and chose Dr. John W. Truitt, Milwaukee, as president-elect. Drs. Stephen E. Gavin, Fond du Lac, and James C. Sargent, Milwaukee, were reelected to serve as delegates to the American Medical Association, with Drs. Lien O. Simenstad, Osceola, and Dexter H. Witte, Milwaukee, reelected alternates.

PUERTO RICO

Annual Meeting of Puerto Rico Medical Association.—The annual meeting of the Asociación Médica de Puerto Rico will be held December 8-12 in Santurce, under the presidency of Dr. Manuel A. Astor, Santurce. Guest speakers include:

Herman G. Weiskotten, Syracuse, N. Y., Financial Support of Medical Schools.
Irving S. Wright, New York, Modern Treatment of Coronary Thrombosis with Myocardial Infarct Including Use of Anticoagulants.
Zacharias T. Bercovitz, New York, Controlled Clinical Experimental Studies in Treatment of Chronic Duodenal Ulcer.
Stanton M. Hardy, New York, Review of Therapeutic Trials of New Chemotherapeutic Compounds.
Leo Meyer, New York, Recent Advances in Hematology.
Louis M. Rousselot, New York, Surgery in Carcinoma of Pancreas.
Oswald S. Lowsley, New York, Prostatectomy.
Bertha A. Klien, Chicago, The Eyeground in Diagnosis of Hypertensive and Renal Disease.
Vane M. Hoge, Washington, D. C., Objectives of the National Hospital Program.
Raymond Hussey, Detroit, Medical Relations in Workmen's Compensation Practice.
John B. Youmans, Chicago, Nutrition and Anemia.
Arthur T. Hertig, Boston, Earliest Stages of Normal and Abnormal Human Development and Their Relation to Fertility and Infertility.
Hobart A. Reimann, Philadelphia, Histoplasmosis: A "New" Disease.
Isaac Costero, México, D. F., Siphilitic Miocarditis.
Donald A. Covalt, New York, Rehabilitation of the Hemiplegic.
Richard K. Richards, Chicago, Progress in the Drug Therapy of Epilepsy.
Abel Gonzalez, Ciudad Trujillo, R. D., Primary Benign Tumor of the Ureter.
N. Puente Duany, Habana, Cuba, Pigmented Basal Epithelioma.

The annual banquet will be held December 12 at the Condado Beach Hotel.

GENERAL

Society Elections.—At the recent meeting of the Central Association of Obstetricians and Gynecologists, Drs. George A. Kamperman, Detroit, became president; Dr. Lawrence M. Randall, Rochester, Minn., was made president-elect; Dr. John I. Brewer, Chicago, was elected secretary-treasurer, and Dr. Harold L. Gainey, Kansas City, assistant secretary.

Assistant Director of the Baruch Committee.—The Administrative Board of the Baruch Committee on Physical Medicine, as of October 27, appointed Dr. Arthur L. Watkins of Massachusetts General Hospital, Boston, assistant director of the Baruch Committee on Physical Medicine. The committee has available additional funds for fellowships in physical medicine, application to be made to the Baruch Committee on Physical Medicine, 597 Madison Avenue, New York 22.

Dr. Papanicolaou Awarded Borden Prize.—Dr. George N. Papanicolaou, New York, received the Borden Prize for outstanding contribution by a faculty member of an American medical college in the field of medical science. Presentation was made at the annual meeting of the Association of American Medical Colleges at White Sulphur Springs, W. Va. Dr. Papanicolaou, a member of the faculty of Cornell University Medical College, New York, since 1914 and now professor of clinical anatomy, won the award for work in developing tests for early detection of cancer.

Southern Psychiatric Association.—The Annual meeting of the Southern Psychiatric Association will be held at the Hotel Adolphus, Dallas, Texas, December 6-7 under the presidency of Dr. Guy F. Witt, Dallas. Guest lecturers include:

George L. Carlisle, Dallas, Minor Psychiatry from the Viewpoint of the Internist.

Ozro T. Woods, Dallas, *Subject to be announced.*

Mr. Arden E. Hardgrove, Louisville, Ky., Financing and Organization of a Psychiatric Department in a General Hospital.

The annual dinner will take place December 6 at 8 p. m.

Report of Nutrition Foundation.—Grants amounting to $185,600 have been made by the Nutrition Foundation, Inc., which was created by the food industry to develop fundamental research in the science of nutrition. Ten new grants were approved at the recent annual meeting of the foundation, and sixteen renewals were made. Among the largest of these, $4,400 went to the University of Chicago for study of enzymatic oxidation of fatty acids in animal tissues; Stanford University, $3,600 annually for three years to study the metabolism of nucleic acids, and the University of Pennsylvania, $3,000 annually for three years to study the significance of nutritional deficiencies in pregnancy.

Nobel Prize Winners.—Paul Müller, Ph.D., of Basle, Switzerland, has been awarded the Nobel Prize in medicine for having discovered the insect-killing power of DDT. While the compound was first synthesized in 1874 by Othmar Zeidler, a German chemist, Müller, a scientist with the J. R. Geigy Company of Switzerland, discovered that a small amount of DDT when combined with a carrier was an effective insecticide.

Professor Arne V. K. Tiselius, a biochemist on the faculty of Upsala University, Stockholm, won the chemistry prize for the invention of two simple and inexpensive instruments known as "Tiselius Apparatus," which have important uses in medicine, biology, industry and chemistry. The apparatus are used for separating the components of a protein compound. Each award is worth $44,000.

Postgraduate Fellowships Available.—The National Foundation for Infantile Paralysis has available postgraduate fellowships in research in virology, orthopedic surgery, pediatrics, epidemiology and neurology. The fellowships are intended to emphasize advanced training in the basic sciences and experience in research, which need not be related to poliomyelitis. Clinical fellowships in physical medicine are also open to physicians who wish to prepare for eligibility for certification by the American Board of Physical Medicine. In the field of public health, fellowships are available for one year of postgraduate study leading to a Master of Public Health degree at a school of public health approved by the American Public Health Association. Application may be made to the National Foundation for Infantile Paralysis, 120 Broadway, New York 5. Selection of candidates will be made on a competitive basis and will be based on the individual need of each applicant.

Vaccination Requirements for Air Travelers to Australia.—According to the U. S. Public Health Service, the Commonwealth Quarantine Act has been amended to provide that all persons arriving by air in Australia must produce a valid vaccination certificate or be vaccinated at the first port of entry and be subjected to surveillance or other restrictions considered necessary. All aliens who apply for visas for Australia and who are to travel by air must produce certificates of vaccination before visas are granted. The Australian Department of Health requires that certificates must (1) be issued or endorsed by a medical officer of a Department of Health of the country to which the certificate was issued; (2) be issued in respect of a vaccination within three years before date of arrival in Australia; (3) indicate that the reaction to the vaccination has been examined by a medical officer; (4) indicate which of the following types of reaction was shown by the examination: (*a*) primary jennerian reaction or typical primary reaction; (*b*) accelerated reaction (vaccinoid); (*c*) reaction of immunity. A certificate stating "No Reaction" will not be accepted.

World Federation for Mental Health.—Representatives of nearly all fifty-five nations of the Third Congress on Mental Health met in London in August and formed the World Federation for Mental Health. Its membership will be composed of professional organizations related to or concerned with mental health. There will be only one voting delegate for each country, regardless of the number of member societies or associations of that country in the federation. All member associations, however, will send representatives as observers to the annual meeting. Officers elected are Dr. J. R. Rees, president, and Dr. Andre Repond of Switzerland, vice president, who will become president. The honorary treasurer is Dr. Frank Fremont-Smith, New York, and the honorary secretary is Dr. Kenneth Soddy, who will have an office at 19 Manchester Street, London W 1, England. The executive board, which includes representatives of all six continents, is made up of Dr. J. D. M. Griffin, Canada; Miss K. Hesselgren, Sweden; Dr. M. K. el Kholy, Egypt; Dr. E. Krapf, Argentina; Dr. K. R. Masani, India; Dr. D. Odlum, Great Britain; Dr. Y. Porcher, France; Professor H. Roxo, Brazil; Dr. H. C. Rumke, Holland; Dr. J. Russell, New Zealand; Dr. George S. Stevenson, United States, and Professor J. Stuchlik, Czechoslovakia. The executive board elected Professor H. C. Rumke of Utrecht as chairman. The world federation offers a means for transnational collaboration on the problems of mental health. Also, through consultative status with various United Nations agencies, such as the World Health Organization and UNESCO, the World Federation may be able to provide a channel to two way communication between the United Nations and the agencies, associations and professions in different countries. This is one reason for asking the various professional associations in the United States to become members of this world federation, as they will soon be invited to do. For information address Nina Ridenour, executive officer, International Committee for Mental Hygiene, 1790 Broadway, New York 19.

CORRECTION

Tachycardia.—In the Buenos Aires letter, in the item "Persistent Paroxysmal Ventricular Tachycardia" THE JOURNAL, Sept. 25, 1948, page 309, the first word, line 8, column 1, should be "delayed" instead of "increased."

Marriages

FRANCIS HANSELL WATT, Thomasville, Ga., to DR. HENRIETTA H. HICKS in Greenwich, Conn.; September 4.

JAMES WALLACE MANKIN to Dr. Dorothea Rights Phipps, both of Atlanta, Ga., in Tampa, Fla., recently.

JAMES JOHNSTON HICKS, Birmingham, Ala., to Miss Joan Ludington Barber at Enterprise, September 21.

SAMUEL WALTHALL BUDD JR., Richmond, Va., to Miss Emilie Grace Mueller of Baltimore, September 18.

JOSEPH F. SCHNEIDER, Fargo, N. D., to Miss Anna E. Anderson of Moorhead, Minn., June 29.

WALTER EUGENE VOGT JR., Jamaica, N. Y., to Miss Marian Ehler in Champaign, Ill., September 18.

SUMNER HOLTZ, Haverhill, Mass., to Miss Barbara Kamberg of Webster Groves, Mo., September 3.

BENJAMIN E. DANIEL, Claxton, Ga., to Miss Frances Ann DeVane at Miami, Fla., September 19.

HERBERT N. HULTGREN, San Francisco, to Miss Barbara Brooke of Pasadena, August 7.

CATHERINE J. CAPORALE, to Robert Goodwin, D.D.S., both of New York, September 11.

DAVID S. MCKEE, Bristol, Va., to Miss Dorothy Nettles at Atlanta, Ga., September 17.

SEYMOUR W. MEYER to Miss Beth Resnick, both of Brooklyn, August 29.

Deaths

Edward Rhodes Stitt ✠ Rear Admiral, U. S. Navy, retired, Washington, D. C., died at the Naval Medical Center, Bethesda, Md., November 13, aged 81. Admiral Stitt was born in Charlotte, N. C., July 22, 1867. He graduated from the University of Pennsylvania Department of Medicine, Philadelphia, in 1889, in which year he was commissioned an assistant surgeon in the medical corps of the U. S. Navy. In 1900 he became a surgeon, in 1917 a medical director with the rank of rear admiral and in 1920 he was appointed surgeon general of the navy, which post he held for two four year terms. His first few years in the navy were spent in routine assignments ashore and afloat, but in 1902 he was selected as instructor of tropical medicine and bacteriology at the newly established Naval Medical School in Washington. He served two tours of duty at the Naval Hospital in Canacao, P. I., first in 1905-1906 as executive officer and later from 1909 to 1911 as medical officer in command, Except for these periods of overseas duty and several months in 1905 spent under the instruction of Sir Patrick Manson at the London School of Tropical Medicine, Dr. Stitt was a teacher at the Naval Medical School, where from 1916 to 1920 he was commanding officer. During World War I he had charge of the laboratory services at various naval stations and hospitals. He served as professor of tropical medicine at the George Washington University, Georgetown University in Washington and associate professor of medical zoology at the University of the Philippines. He lectured on tropical medicine at Jefferson Medical College in Philadelphia. From 1928 until his retirement in 1931 after forty-two years of service, he was inspector of medical department activities in the San Diego Naval District. In 1941 he became consultant on tropical medicine to the Secretary of War. Admiral Stitt was an honorary fellow of the American College of Surgeons, a member of the American Association of Immunologists, Association of American Physicians, American College of Physicians, American Public Health Association, Southern Medical Association and the Royal Society of Medicine. He was past president of the American Society of Tropical Medicine, the National Board of Medical Examiners, of which he had been a member from 1915 to 1929, and a member of the Federal Board of Hospitalization, the executive and central committees of the American Red Cross and president of the board of visitors, St. Elizabeth's Hospital. He was awarded the Theobald Smith Gold Medal of George Washington University, Washington, by the American Academy of Tropical Medicine and in 1942 the Gorgas Medal by the Association of Military Surgeons of the United States, which he had served as president. In 1945 the Richard Pearson Strong Medal and an honorarium of $500 for outstanding service in the field of tropical medicine were presented to him by the American Foundation for Tropical Medicine. The tenth edition of his book, "Practical Bacteriology, Hematology and Parasitology," just off the press, was reviewed in The Journal last week. He was the author also of another well known book, "Diagnostics and Treatment of Tropical Diseases." Admiral Stitt was given honorary degrees of LL.D. from the University of South Carolina, 1917, and the University of Michigan, 1921; Sc.D., Jefferson Medical College, Philadelphia, 1920; Ph.M., Philadelphia College of Pharmacy and Science, 1921, and Sc.D., University of Pennsylvania, 1924. He was awarded the Navy Cross for his service during World War I.

Edward Roland Snader ⊕ Philadelphia; born in Philadelphia Nov. 1, 1895; Hahnemann Medical College and Hospital of Philadelphia, 1921; clinical professor of medicine at his alma mater; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; member of the National Gastroenterological Association; formerly member of the Council of the American Diabetes Association; affiliated with the J. Crozier Homeopathic Hospital, Chester, Allentown (Pa.) State Hospital, William McKinley Memorial Hospital in Trenton, N. J., and Chester County Hospital, West Chester; chief of the metabolic clinic at Hahnemann Hospital; died in Ruperts Islands, Quebec, August 7, aged 52, of coronary disease.

Hulett Judson Wyckoff ⊕ Seattle; born in Arkansas City, Kan., March 7, 1889; Northwestern University Medical School, Chicago, 1916; specialist certified by the American Board of Orthopaedic Surgery, Inc.; member of the American Orthopaedic Association and of the American Academy of Orthopaedic Surgeons; fellow of the American College of Surgeons; served overseas during World War I; on the staffs of the Children's Orthopedic, Seattle General, and Maynard hospitals, and the Firland Sanatorium; active in the work of the Washington State Spastic Children Society; died in Swedish Hospital September 2, aged 59, of carcinoma of the bladder.

Thomas Whitson Rhodes, Ossining, N. Y.; born in Tennessee in 1885; University of the South Medical Department, Sewanee, Tenn., 1908; formerly connected with the New York State Department of Health, health officer of the Quincy, Ill., public health district and health officer of East Liverpool, Ohio; at one time assistant director of the Person-Chatham-Orange health district in North Carolina; served during World Wars I and II; resident physician at Pendleton (Ind.) Reformatory; formerly resident physician at the Elmira Reformatory in Elmira, N. Y.; died in Robert Long Hospital in Indianapolis August 9, aged 63, of internal hemorrhage.

Charles Girault Andrews, San Diego; Memphis (Tenn.) Hospital Medical College, 1902; formerly affiliated with the Indian Service; died September 1, aged 70, of bronchopneumonia.

August Harvey Bauer, Chicago; Rush Medical College, Chicago, 1910; member of the American Medical Association; died September 3, aged 65, of carcinoma of the liver.

Ralph Emerson Bowers, Elizabethton, Tenn.; University of Texas Medical Branch, Galveston, 1948; intern at the Cincinnati General Hospital; died in Asheville, N. C., August 21, aged 26.

Don Ludlow Braddy, Adel, Iowa; State University of Iowa College of Medicine, Iowa City, 1924; died in Veterans Administration Hospital, Des Moines, August 25, aged 49, of cerebral accident.

Fred Braginton ⊕ Hammond, Ind.; Loyola University School of Medicine, Chicago, 1919; an Associate Fellow of the American Medical Association; died in St. Margaret Hospital September 2, aged 86, of cardiac decompensation.

Rome Albert Brock, Athens, Tenn.; Tennessee Medical College, Knoxville, 1901; member of the American Medical Association; for many years county physician; formerly secretary of the McMinn County Medical Society; died recently, aged 71, of pneumonia and chronic nephritis.

Harry Rising Enlow, Chicago; Rush Medical College, Chicago, 1907; died September 21, aged 69, of cardiovascular renal disease.

Walter Blaine Felger, Alhambra, Calif.; Emory University School of Medicine, Atlanta, 1925; died in Denver September 19, aged 58, of leukemia.

Edward James Joseph Finnerty, Eldridge, Calif.; University of Toronto Faculty of Medicine, Toronto, Canada, 1911; affiliated with Sonoma State Home; died recently, aged 59, of coronary occlusion.

Moses Alexander Foil, Mount Pleasant, N. C.; Jefferson Medical College of Philadelphia, 1891; died September 13, aged 85, of hypertensive cardiovascular disease.

Alfred Ludwell Hammer, McGaheysville, Va.; University College of Medicine, Richmond, 1905; member of the associate staff of Rockingham Memorial Hospital in Harrisonburg; died August 19, aged 68, of heart disease.

George Joseph Hanley, Minneapolis; Bellevue Hospital Medical College, New York, 1887; died in Bethesda Hospital, St. Paul, September 16, aged 88, of bronchopneumonia and arteriosclerosis.

George A. Harris, Valley, Neb.; John A. Creighton Medical College, Omaha, 1895; served during World War I; division surgeon for the Union Pacific Railroad for many years; died in Methodist Hospital, Omaha, September 23, aged 77, of cirrhosis of the liver.

William E. Helm, Chicago; National Medical University, Chicago, 1903; died September 29, aged 69, of coronary thrombosis and hypertension.

Russell Brooks Howard ⊕ Louisville, Ky.; University of Louisville School of Medicine, 1927; formerly health officer of Carter County, Tenn.; served during World War II; on the staff of St. Anthony's Hospital; died in St. Joseph's Hospital, Denver, August 15, aged 45, of mesenteric thrombosis.

Elbert Archer Jones, Waban, Mass.; New York Homeopathic Medical College and Hospital, New York, 1892; died August 26, aged 77, of coronary sclerosis.

Edward Winfield Miskall ⊕ East Liverpool, Ohio; Ohio State University College of Medicine, Columbus, 1926; fellow of the American College of Physicians; specialist certified by the American Board of Internal Medicine; past president of the Columbiana County Medical Society; consulting cardiologist of City Hospital, Salem, and on the staff of East Liverpool City Hospital; died August 13, aged 48, of coronary thrombosis.

Marion Rudolph Mobley Jr., Florence, S. C.; Vanderbilt University School of Medicine, Nashville, Tenn., 1944; member of the American Medical Association; on staff of McLeod Infirmary, where he died September 12, aged 26, of acute hepatic insufficiency.

Howard Nelson Moses, Salina, Kan.; Rush Medical College, Chicago, 1899; formerly secretary of the Saline County Medical Society; served during World War I; affiliated with Asbury Hospital; died at St. Luke's Hospital, Kansas City, Mo., September 10, aged 74, of coronary thrombosis.

William Breen Prout ⊕ West Englewood, N. J.; Columbia University College of Physicians and Surgeons, New York, 1923; for many years police surgeon in Teaneck, where he was school physician and head of the child welfare station; on the staffs of the Holy Name Hospital in Teaneck and the Englewood (N. J.) Hospital; died in New York Hospital August 20, aged 50, of pulmonary embolism.

Henry Benjamin Raman, Springfield, Ill.; University of Illinois College of Medicine, Chicago, 1916; served overseas during World War I; on the staff of St. John's Hospital; died September 2, aged 61, of heart disease.

Charles Franklin Rendel, Mexico, Ind.; Medical College of Indiana, Indianapolis, 1905; member of the American Medical Association; died September 1, aged 73, of coronary occlusion.

Eugene Alfred Riccio, Chicago; Marquette University School of Medicine, Milwaukee, 1928; affiliated with St. Anne's and Mother Cabrini hospitals; died in Cicero, Ill., October 3, aged 45, of coronary thrombosis.

Eden T. Riley, Greensburg, Ind.; Medical College of Ohio, Cincinnati, 1895; member of the American Medical Association; served as a member of the city board of health and as county health officer; died recently, aged 80, of pneumonia and diabetes mellitus.

Arthur Jay Roberts ⊕ Detroit; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1885; an Affiliate Fellow of the American Medical Association; past president of the Jackson County (Mich.) Medical Society; died in Jennings Hospital August 27, aged 89, of lobar pneumonia.

Edward Barker Ross Jr., Clarksville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1912; affiliated with Clarksville Hospital; died August 16, aged 59, of carcinoma of the liver.

Miles Jerome Scott, Batavia, Ohio; University of Cincinnati College of Medicine, 1925; formerly medical director of the Hamilton County Home and Chronic Disease Hospital in Cincinnati; died in Christ Hospital August 14, aged 49, of a skull fracture received in a fall.

Wilmarth Young Seymour, Augusta, Ga.; Yale University School of Medicine, New Haven, Conn., 1913; member of the American Psychiatric Association; an officer during World War I; served on the staffs of various Veterans Administration hospitals; died in Veterans Administration Hospital August 12, aged 69, of arteriosclerosis.

John Samuel Shaffer, Montgomery, W. Va.; Miami Medical College, Cincinnati, 1902; member of the American Medical Association; served during World War I; a member of the Ohio National Guard during the Spanish-American War; died September 12, aged 75, of cystitis and pneumonia.

Edith Estella Shears, Lakeville, Conn.; Cornell University Medical College, New York, 1900; for many years affiliated with the New York Infirmary in New York; died August 17, aged 82, of cerebral hemorrhage.

Moriss Waldmar Sherwood ⊕ Milwaukee; George Washington University School of Medicine, Washington, D. C., 1914; served in the medical corps of the U. S. Naval Reserve during World War II; for many years member of the city safety commission; affiliated with West Side Hospital and Mount Sinai Hospital, where he died August 15, aged 60, of carcinoma of the lung.

Ferdinand Jacob Endres Smith ⊕ Milford, Iowa; State University of Iowa College of Medicine, Iowa City, 1887; an Affiliate Fellow of the American Medical Association; died August 27, aged 86, of cerebral hemorrhage.

Lon Eliab Stage, Bliss, N. Y.; University of Buffalo School of Medicine, 1893; member of the American Medical Association; served during World War I; health officer of the town of Eagle; affiliated with Wyoming County Community Hospital, Warsaw, August 21, aged 79, of coronary thrombosis.

Alexander McLaren Stewart, Naples, N. Y.; Syracuse University College of Medicine, 1903; member of the American Medical Association; served as coroner, health officer and as a member of the school board; affiliated with the Frederick Ferris Thompson Hospital in Canandaigua; died in Canandaigua August 28, aged 73, of arteriosclerosis.

George Elmer Strahler ⊕ Dayton, Ohio; Indiana University School of Medicine, Indianapolis, 1909; died in the Miami Valley Hospital August 26, aged 63, of coronary thrombosis.

Newton Harrell Strickland Jr., Nashville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1945; interned and served a residency at Gorgas Hospital in Ancon, Canal Zone; member of the American Medical Association; served during World War II; on the staff of the Veterans Administration Hospital, where he died August 23, aged 26, of poliomyelitis.

Fred Welch Tavenner, Gas City, Ind.; Indiana University School of Medicine, Indianapolis, 1924; member of the American Medical Association and of the American Association of Industrial Physicians and Surgeons; served during World War I; died recently, aged 57, of coronary occlusion and adenocarcinoma of bladder

Richard W. Taylor ⊕ Villa Grove, Ill.; Chicago College of Medicine and Surgery, 1914; for many years county coroner and district surgeon for the Chicago and Eastern Illinois Railroad; died August 19, aged 69, of coronary occlusion.

Walter Albert Taylor, Trenton, N. J.; Jefferson Medical College of Philadelphia, 1904; member of the American Medical Association; served during World War I; on the staff of Mercer Hospital, where he died August 21, aged 68, of sarcoma of the hip.

James Walter Thomas ⊕ Lincoln, Neb.; John A. Creighton Medical College, Omaha, 1910; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; served during World War I; on the staffs of Bryan Memorial, St. Elizabeth and Nebraska Orthopedic hospitals; died in La Jolla, Calif., August 23, aged 60, of angina pectoris.

Stanley Bishop Thomas, Brooklyn; McGill University Faculty of Medicine, Montreal, Quebec, Canada, 1903; member of the American Medical Association; fellow of the American College of Surgeons; served during World War I; for many years on the staff of St. John's Hospital, where he died September 6, aged 70, of cerebral hemorrhage.

William Osgood Tuck, Plymouth, Ill.; Chicago Medical College, 1891; died in St. Francis Hospital, Macomb, August 21, aged 82, of arteriosclerosis.

Samuel O. Turbett, Detroit; the Hahnemann Medical College and Hospital, Chicago, 1888; died August 18, aged 85, of arteriosclerosis.

Clarence Walthall Twitty ⊕ Newton, Ga.; Atlanta School of Medicine, 1912; died in the Piedmont Hospital, Atlanta, July 20, aged 69, of aneurysm of the basilar artery.

Natividad Villalobos, Mandaluyong, Rizal, P. I.; University of Santo Tomas College of Medicine and Surgery, Manila, 1933; affiliated with National Psychopathic Hospital; died August 28, aged 39, of heart failure, following a severe attack of asthma.

Milton Emanuel Wagner, McClure, Pa.; Medico-Chirurgical College of Philadelphia, 1906; died September 2, aged 68, of cardiorenal disease.

Eugene Henry Walet ⊕ New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1896; past president, vice president and secretary of the Orleans Parish Medical Society, serving as a member of the board in 1904, 1908 and 1913; formerly on the faculty of the Loyola Post-Graduate School of Medicine; affiliated with Touro Infirmary, Charity Hospital and Hotel Dieu; died August 10, aged 77, of carcinoma of the colon.

Robert B. Watts, Wellington, Mo.; Kansas City Medical College, 1894; member of the American Medical Association; died September 25, aged 84, of coronary thrombosis.

William P. S. Webb, Rockingham, N. C.; Medical College of the State of South Carolina, Charleston, 1897; member of the American Medical Association; died in Moore County Hospital, Pinehurst, September 6, aged 73, of heart disease.

William Everett Whiteside ⊕ Parsons, W. Va.; Hospital College of Medicine, Louisville, Ky., 1906; served during World War I; past president of the Barbour-Randolph-Tucker Counties Medical Society; died August 30, aged 72, of heart disease.

David Hudson Wright ⊕ Berry, Ala.; Vanderbilt University School of Medicine, Nashville, 1908; died in Jefferson Hospital, Birmingham, August 24, aged 67, of coronary occlusion.

Excessive Demands on the National Health Service

The British Medical Association has taken the unusual course of announcing in the newspapers that it is gravely disturbed by reports reaching it from all parts of the country to the effect of the new Health Service on the work and income of doctors. As a result of the Act, many doctors are overwhelmed with work because of the greatly increased public demand. In spite of being fully occupied, many doctors find it impossible to meet their commitments. The British Medical Association is preparing a report on the whole position for presentation to the Ministry of Health. An official of the association has stated in the press: "What will happen in the winter should there be an epidemic of any sort? The feeling of the profession is that if this was the case doctors would not be able to give either the time or adequate treatment to patients. Mr. Bevan has appealed twice in public speeches recently for the public to use the new Health Service with reasonable discretion." Mr. Bevan might be told that the root of the evil in his promise to the public of so many good things to be had without any payment. A charge, even a small one, according to people's means, would be more effective than any appeal by him. A concrete example of what occurs under the free National Health Service was recently given in the medical press. A woman quite legitimately brought her infant for treatment. When that treatment was completed she turned and said: "Doctor, now that I am here I think that I should like a bottle of medicine for myself."

In other directions the demands on the National Health Service are proving excessive. A man who has a tooth beginning to be carious and requiring filling is told by the dentist that he cannot have an appointment for 3 weeks. Millions of spectacles—more than can be supplied—are in demand because they can be had for nothing. The same applies to hearing aids and trusses and other appliances which are free to all.

The Doctors' First Payment from the National Health Service

The doctors have received their first quarterly payments in respect to the National Health Service with some disappointment, as they are less than was expected. It was arranged that doctors should be paid at the capitation rate of $4.50 per annum for each person who signed on their lists. This would have given a quarterly rate of over $1, but in most districts the payment was distinctly less. For this several explanations were given. In the first place, the first four days of July were not included, as they came before the day appointed for the inauguration of the service. In the second place, the executive councils, being still doubtful of their final commitments, erred on the side of caution in making their first payments. A more serious disappointment, because it is not a matter of finance which can be adjusted in later payments, is that doctors who before July 5 had a high proportion of private patients have suffered a severe loss, as the number of persons joining the scheme is greater and therefore the number remaining as possible private patients is fewer than was expected. The service has been accepted by many who previously paid doctors' bills and were looked on as a permanent clientele.

Another trouble is the basic salary of $1,200, which was proposed by the Minister of Health but rejected by the British Medical Association, as the thin end of the wedge for converting doctors into salaried officials. It was finally agreed that the basic salary should be paid only to doctors who asked for it and who would, therefore, receive a lower capitation fee. It now turns out that more doctors are asking for it than are being allowed it. It comes out of the local pool from which capitation fees are paid. The more doctors with small practices (for whom it is intended), the less the capitation fees left for those paid entirely by them.

The Secretary-General of the Norwegian Medical Association

About 95 per cent of all the doctors in Norway are members of the Norwegian Medical Association. Its sustained and vigilant defence of the interests of the medical profession has wrung from an opponent the reluctant admission that it is "the strongest trades union in the country." In 1925 Dr. Jörgen H. Berner, who was born in 1883, was appointed secretary-general of the association. He retires at the end of 1948, having reached the age limit, and having seen the membership of the association rise from about 1,300 to about 2,900. A watchdog in his position has to bark often and bite when necessary. The Germans, when they occupied Norway in 1940, hoped to find in Dr. Berner a tail-wagging watchdog. Dr. Berner's tail refused to wag. So he was clapped into prison for six weeks. A brief spell of liberty, and he was again in prison, this time for thirteen months, evidently incurable from the German point of view. Dr. Berner's interest in the history of medicine has found expression in his study of legislation against infectious diseases in Norway in the past—a work for which he was awarded the King's Gold Medal in 1922. Dr. Odd Bjercke, who succeeds Dr. Berner on Jan. 1, 1949, was born in 1909. With a background of general practice, or organization and administration (he has been chairman of the Association of Junior Doctors and a member of the secretariat of the Government's central health service) he can surely be relied on to bark on the right occasions and bite when necessary.

A Geographic Survey of Gastroduodenal Ulcer

On October 13, at the University of Oslo, Dr. Kaare Schanke successfully defended his M.D. thesis of 203 printed pages. It bears the title: "The Behavior of Gastric and Duodenal Ulcer in a Fishing District in the North of Norway." This study was planned in 1939 and its execution was started in the summer of 1940 with the object of analyzing the ulcer material of the Stokmarknes Hospital in the North of Norway in the last prewar decade. During Christmas of 1940 the hospital archives were entirely destroyed by fire. Was this destruction a loss or a gain? At all events, Dr. Schanke was undaunted, and between July 1, 1941, and Dec. 31, 1944, he made a careful clinical study of practically all the cases of gastroduodenal ulcer in a district of more than 40,000 inhabitants in this period. His 178 male and 54 female cases convinced him that (1) the ulcer rate is remarkably high among the fisher folk in the North of Norway and (2) gastric ulcer is far more common than duodenal ulcer in this area, whereas the reverse is the case in most other areas including the United States, where duodenal ulcer has been found to be twelve to thirteen times as common as gastric ulcer. Why this difference? Dr. Schanke has no crisp and ready made answer to this question or to many others, and his honesty in this respect must lead to the impression among some at least of his readers that our attitude toward gastroduodenal ulcer today is as groping as it was toward phthisis before the discovery of the tubercle bacillus.

Correspondence

SULFONAMIDE COMBINATIONS

To the Editor:—Our experience with combined sulfonamide therapy leads us to believe that Drs. Garb and Janoff, in their letter of October 2, underestimated the advantages of this method of administering sulfonamide compounds. During the past three years we have compared a sulfadiazine-sulfamerazine combination and several triple sulfonamide combinations with sulfadiazine alone with or without sodium bicarbonate. A definite reduction in the frequency with which sulfonamide crystals were encountered in urine occurred when the double combination replaced sulfadiazine. When triple combinations were used, crystals of sulfonamide drug were seldom encountered. Administered in this form, the triple combinations were as effective as sodium bicarbonate used in amounts sufficient (12 to 24 Gm. daily) to raise the p_H of urine to 7.1 or higher. In earlier studies p_H 7.1 was found to represent the critical p_H of urine above which sulfonamide crystals seldom occurred. Administration of sodium bicarbonate in these amounts does not appear to be deleterious in most patients, but may cause gastrointestinal irritation and, more serious, may have undesirable effects in patients with diminished renal or cardiac reserve. Large amounts of alkali lower the blood levels of sulfonamide compound, and for these and other reasons it is important to have available an alternative.

Garb and Janoff, in computing the gain in solubility derived from a sulfadiazine-sulfamerazine combination, use for purposes of calculation an output of 6 Gm. of acetylated sulfonamide compound. This is an exceedingly high figure. When 6 Gm. of sulfadiazine or sulfamerazine is administered only two thirds, roughly, reappears in the urine. Most of the remainder is not absorbed from the gastrointestinal tract, although a little may may be converted to nonreacting products in the body. Of the 4 Gm. absorbed, only 10 to 50 per cent is acetylated, so that the total amount of acetylated sulfadiazine will vary roughly between 0.4 and 2.0 Gm. daily. If from these amounts one subtracts the 0.57 Gm. calculated by Garb and Janoff to represent the gain in solubility at p_H 5.5 achieved by addition of sulfamerazine, the solubility is now sufficient to maintain all of the acetylated sulfonamide compound in solution at the lower output range, and to decrease markedly the supersaturation at the higher outputs. Addition of a third sulfonamide compound to the combination will further the gains by at least one half.

If Garb and Janoff's statements were descriptive of actual conditions, one would expect a large mass of acetylated sulfonamide compound to crystallize from urine acid in reaction. Instead, a diligent search is commonly required to find even a few crystals in freshly voided specimens, and the greater part of excreted sulfonamide compound remains in solution in many specimens. However, crystals will form on standing at 37.5 C.; hence a portion of the sulfonamide compound is maintained in supersaturated solution. Therefore, even a slight gain in solubility may delay crystallization to a significant extent and so represent a benefit inadequately described by calculations based on solubility equilibriums. Obviously, the degree of supersaturation is much less when two or more sulfonamide compounds are present.

Therapeutic trial of a sulfadiazine-sulfamerazine combination in experiments soon to be published indicated small but significant superiority of the combination over sulfadiazine alone used in treatment of pneumonia. At present we believe that sulfonamide combinations offer several established advantages and that the objections offered as yet have not had sufficient merit to preclude this type of sulfonamide medication.

PROTEIN HYDROLYSATE THERAPY

To the Editor:—In the August 7 issue of The Journal, page 1289, there appeared an article entitled "Evaluation of Protein Hydrolysate Therapy for Peptic Ulcer," by Dr. Edward E. Woldman and his associates.

The excellent and detailed studies done by the authors warrant their concluding paragraph, in which they state, "Protein hydrolysate is of value only as a food but has little value as a therapeutic agent for peptic ulcer."

Several years ago, when we first used protein hydrolysate therapy for peptic ulcer, we noticed a decrease in the free hydrochloric acid of the gastric content which we attributed partially to acid-binding property of the hydrolysate. It was also our impression that the bad taste of the protein hydrolysate decreased or possibly completely inhibited the cephalic phase of gastric secretion. In subsequent studies of patients with peptic ulcer a lowering of gastric acidity was observed only when distasteful foods were used in the dietetic management. An adequate diet to which was added some distasteful food invariably produced a decrease in gastric acidity. These studies were temporarily discontinued during the war period. It is important to note that Dr. Woldman and his associates administered the protein hydrolysate by tube feedings. A comparative study utilizing the oral route of administration of protein hydrolysates to evaluate further the effect of their bad taste on the cephalic phase of gastric secretion might reveal a greater decrease in free acidity than demonstrated by these authors.

These authors also demonstrated that protein hydrolysate feedings delayed the gastric emptying time considerably. They quoted Thomas and Cridor as having concluded "That there is an inhibition of gastric motility when the end products of protein digestion are placed in the upper part of the small intestine." This diminution of gastric motility and activity perhaps more than the probably heretofore overestimated degree of acid reduction by protein hydrolysate may account for the reported favorable results of protein hydrolysate therapy in peptic ulcer.

The effect of protein hydrolysates in decreasing gastric motility and their incomplete diminution of gastric acidity might be regarded as a form of "medical vagotomy." Further search for more effective medical measures in the therapy of peptic ulcer still remains essential.

IRRADIATION OF SPLEEN AND PITUITARY FOR CONTROL OF PUBERAL BLEEDING

To the Editor:—In the April 10, 1943 issue of The Journal you published my paper on "Irradiation of the Spleen and Pituitary for Control of Puberal Bleeding," which I read before the joint meeting of the Section on Obstetrics and Gynecology and the Section on Radiology at the American Medical Society's meeting in June 1942.

I stated then, "Treatment of the spleen and pituitary offers a readily available and effective method for treating puberal bleeding without direct irradiation of the ovaries, thus removing any fear of possibly adverse effect on the result of future pregnancy."

In this article I presented the case of a young girl who was treated for puberal bleeding, who married and gave birth to a normal baby girl. I am now able to report subsequent follow-up in this case. She now has 3 normal children, the first a girl, born in February 1942, the second a boy born in April 1945 and the third a girl born in October 1946.

This substantiates my statement, that when irradiation is properly administered no harm ensues to the mother or offspring subsequently born to her.

Ira I. Kaplan, M.D., New York.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Chiropractic Practice Acts: Right of Examining Board to Adopt Rules Adding to Statutory Requirements.—This was a consolidation of five separate actions against the State Board of Chiropractic Examiners to determine whether or not the board had power to enact rules imposing more stringent requirements and restrictions on applicants for license than those enumerated in the law itself. From judgments in favor of all the plaintiffs the defendant appealed to the district court of appeal, first district, division 2, California.

The initiative act which created the chiropractic board authorized the board, among other things, "To adopt from time to time such rules and regulations as the board may deem proper and necessary for the performance of its work, copies of such rules and regulations to be filed with the Secretary of State for public inspection. . . . To do any and all things necessary or incidental to the exercise of the powers and duties herein granted or imposed." In conformity with these provisions the board adopted, in 1944, rule 17(*a*) which provides in part: "(*a*) The required number of academic hours of attendance in any Chiropractic School or College in the State of California will be four thousand (4,000) for all students matriculating after March 1, 1944." At the same time rule 17(*c*) was adopted, reading as follows: "(*c*) All students shall have at least fifty (50) per cent vision and hearing, and no major physical defects."

The statute, said the court, prescribes a schedule of "minimum" educational requirements prerequisite to examination for license to practice covering a course of "not less" than 2,400 academic hours. This was enacted in 1922. The defendant board in 1944, by rule, increased the required number of academic hours to 4,000. It cannot be argued, said the court, that the defendant board acted arbitrarily or unreasonably in demanding this additional education. To the contrary, it would be more reasonable to say that it would have been deficient in its duties as an agency concerned with the public health and welfare if it had neglected to so act. It is a fair and reasonable interpretation of the statute that it was intended to permit the board to take cognizance of existing conditions so as to provide more efficient treatment of the sick and that it was with such purpose in view that the statute fixed the "minimum" requirements and gave to the board the power to enact rules "proper and necessary for the performance of its work." If this is not a proper interpretation of the statute, then we can see no reason for the use of the word "minimum" in the statute. The plaintiffs argue that the statute was enacted to relieve the chiropractors from the unreasonable control of the medical board, but that does not explain the use of the word "minimum." If the purpose was to fix a schedule of educational requirements which no board or agency could exceed, then the proper word would have been "maximum." But in fixing a "minimum" schedule the meaning expressed in the clear language of the statute is that "at least" such hours of instruction were required, and thus it was left open to the board to require additional instruction either in the same subjects of study specified in the statute or in such new or additional subjects as the board might determine. For these reasons the judgments in the four causes based on the additional educational requirements cannot be sustained.

In the other case which was consolidated herewith, the question was as to the validity of rule 17(*c*), requiring all students to have at least 50 per cent vision and hearing and no major physical defects. The trial court declared such rule to be unenforceable, and the plaintiffs contend that such ruling is correct on the ground that the board was without power to adopt the rule and that the question of reasonableness of the rule is not open to discussion. With this, said the court, we do not agree. The question of power is answered in what has been said heretofore. Since the rule is applicable to all those seeking license to practice, it is clearly within the powers of the board. No provision of the statute fixes physical qualifications. The rule is therefore not in conflict with the statute, and the only question debatable is whether it is unreasonable, arbitrary or capricious. The effect of the plaintiff's argument is that the board is without power to deny a license to one who is totally blind, deaf or without arms or hands or to one who is confined in a state penitentiary or mental institution. The unreasonableness of this possibility negates the contention that the statute does not authorize the defendant board to forestall the absurdities by appropriate rules and regulations.

Accordingly the judgment of the trial court in all of the cases consolidated was reversed, with the holding that the board of chiropractic examiners was authorized to enact rules imposing requirements and restrictions on applicants for license above or in excess to those enumerated in the initiative act creating the chiropractic board.—*Hunt v. State Board of Chiropractic Examiners, 196 P. (2d) 77 (Calif., 1948).*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I & II.* Various Centers, Feb., June and Sept. 1949. *Part II.* April, 1949. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2, Pa.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology, Inc.: *Written.* July 15. Various locations. Final date for filing application is April 15. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Avenue, New York 27.

American Board of Internal Medicine: *Oral.* San Francisco, Feb. 8-10, 1949. New York City, March 23-25. Final date for filing application is Jan. 2. Philadelphia, June 1-3. Final date for filing application is Jan. 2. *Written.* Oct. 17, 1949. Final date for filing application is May 1. Asst. Sec.-Treas., Dr. W. A. Werrell, 1 W. Main St., Madison 3, Wis.

American Board of Neurological Surgery: *Oral.* Chicago, June 1949 Final date for filing application is Jan. 1949 Sec., Dr W. J. German, 310 Cedar Street, New Haven, Conn

American Board of Ophthalmology: *Written.* Jan. 14. *Oral.* San Francisco, March 21-24; New York, June 11-15; St. Louis, Oct. 15-19; Boston, Dec. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

American Board of Obstetrics and Gynecology, Inc.: *Oral.* Chicago, May 8-14. Final date for filing application is April 1. Sec., Dr. Paul Titus, 1015 Highland Building, Pittsurgh 6.

American Board of Orthopedic Surgery. *Part I.* Various Centers, April and May. Final date for filing application is Dec. 31. Sec., Dr. Francis M. McKeever, 1136 W 6th St., Los Angeles 14.

American Board of Otolaryngology: New York, May 11-14; Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

American Board of Pathology: Boston, April. Final date for filing application is March 1. Sec., Dr. Robert A. Moore, 507 S. Euclid Ave., St. Louis 10, Mo.

American Board of Pediatrics: St. Louis, Feb. 18-20. Baltimore, April 22-24. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Rd., Rosemont, Pa.

American Board of Physical Medicine: Atlantic City, June 4-5. Final date for filing application is March 15. Sec., Dr. R. L. Bennett, Georgia Warm Springs Foundation, Warm Springs, Ga.

American Board of Plastic Surgery. Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo

American Board of Psychiatry and Neurology: *Oral.* May. Final date for filing application is Feb. 15. Sec., Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Surgery: *Written.* Various Centers, March 1949. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

American Board of Urology. Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 28-30, 1949. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

Alaska:* Juneau, March 1. Sec.-Treas., Dr. W. M. Whitehead, Box 140, Juneau.

Arkansas:* Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana.

Colorado:* Denver, Jan. 4-7. Final date for filing application is Dec. 18. Sec.-Treas., Dr. W. W. King, 831 Republic Bldg., Denver 2.

Connecticut:* Hartford, March 8-9. Secretary to the Board, Dr. Creighton Barker, 258 Church Street, New Haven.

Delaware: *Examination.* Dover, Jan. 11-13. *Endorsement.* Jan. 20. Sec., Dr. J. S. McDaniel, 229 S. State St., Dover.

District of Columbia:* *Reciprocity.* Washington, Dec. 13. Sec., Dr. George C. Runland, 4130 Municipal Bldg. East, Washington.

Georgia: *Examination.* June, Atlanta and Augusta. *Reciprocity.* Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

Guam: *Endorsement.* Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam, % F.P.O. San Francisco, Calif.

Hawaii: *Examination.* Honolulu, Jan. 10-13. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu 53.

Idaho: Boise, Jan. 10-12. Dir., Bureau of Occupational Licenses, Miss Estella S. Mullner, State House, Boise

Illinois: Chicago, Jan. 11-13. Superintendent of Registration, Mr. Fred W. Ruegg, State House, Springfield.

Indiana: *Examination.* Indianapolis, June. Sec., Board of Medical Registration and Examination, Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

Iowa:* *Examination.* Des Moines, Dec. 6-8. *Endorsement.* Des Moines, Dec. 6. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

Kansas: Topeka, Dec. 15-16. Sec., Board of Medical Registration & Examination, Dr. J. F. Hassig, 905 N. 7th St., Kansas City.

Kentucky: *Examination.* Louisville, Dec. 13-15. Sec., Dr. Bruce Underwood, 620 S 3rd St., Louisville 2.

Louisiana: *Examination.* New Orleans, Dec. Sec.-Treas., Dr. R B. Harrison, 1507 Hibernia Bank Bldg., New Orleans 12. *Homeopathic Examination.* Baton Rouge, subject to call. Sec., Dr. F. H. Hardenstein, 715 Pere Marquette Bldg., New Orleans.

Maine: Portland, March 8-9. Sec., Dr. Adam P. Leighton, 192 State Street, Portland.

Maryland: *Examination.* Baltimore, Dec. 14-17. *Endorsement* At the discretion of the Board. Sec., Dr Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homeopathic Examination* Baltimore, Dec. 7-8 Sec., Dr. J. A Evans, 612 W 40th St., Baltimore.

Massachusetts: *Examination.* Boston, March 8-11. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

Minnesota:* Minneapolis, Jan. 18-20. Sec., Dr. J. F. DuBois, 230 Lowry Medical Arts Building, St. Paul.

Mississippi: *Reciprocity.* Jackson, Dec. 6 Exec. Officer, State Board of Health, Dr. Felix J. Underwood, Jackson.

Montana: Helena, April 4-6. Sec., Dr. O. G. Klein, First National Bank Building, Helena.

Nebraska:* *Examination.* Omaha, June. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

Nevada: Carson City, May 2. Sec., Dr. G. H. Ross, 112 N. Curry Street, Carson City.

New Hampshire: Concord, March 10. Sec., Board of Registration in Medicine, Dr John S Wheeler, 107 State House, Concord.

New Jersey: *Examination.* Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

New Mexico: Santa Fe, April 11-12. Sec., Dr. V. E. Berchtold, 141 Palace Ave., Santa Fe.

New York: *Examination.* Various Centers, Feb 1-4. Sec., Dr. J. L. Lochner, Jr., 23 S. Pearl St., Education Bldg., Albany.

North Carolina: *Endorsement.* Raleigh, Jan. 17. Sec., Dr. Ivan M. Procter, 226 Hillsboro St., Raleigh.

North Dakota: *Examination.* Grand Forks, Jan. 4-7. Act. Sec., Dr. C. J. Glaspel, Grafton.

Ohio: *Examination* Columbus, Dec. 13-15. Sec., Dr. H. M. Platter, 21 W Broad St., Columbus

Oregon:* *Examination.* Jan. 5-7. Final date for filing application is Dec. 22, 1948. *Endorsement.* Jan. 21-22. Final date for filing application is Jan. 3. Exec. Sec., Mr. Howard I. Bobbitt, 608 Failing Bldg., Portland.

Pennsylvania: *Examination.* Philadelphia, Jan. 1949. Act Sec., Mrs M G Steiner, 351 Education Bldg., Harrisburg

Puerto Rico: *Examination.* Santurce, March 1. Sec., Mr. Luis Cueto Coll, Box 3717, Santurce.

Rhode Island:* *Examination.* Providence, Jan. 6-7. Chief, Mr. Thomas B. Casey, 366 State Office Building, Providence.

South Carolina: *Endorsement.* Columbia, Dec. 6. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

South Dakota:* Pierre, Jan. 18-19. Sec., Dr. G. J Van Heuvelen, Capitol Bldg., Pierre.

Tennessee:* *Examination.* Memphis, Dec. 22-23. Sec., Dr. H. W. Qualls, 1635 Exchange Building, Memphis 3.

Utah: *Examination.* Salt Lake City, July. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

Vermont: *Examination.* Burlington, Feb. Sec., Dr. F. J Lawliss, Richford

Virgin Islands: *Examination.* Charlotte Amalie, Dec. 8-9. Comm., Dr. Christian R. Moorhead, Charlotte Amalie.

Washington:* Seattle, Jan Sec., Dept. of Licenses, Miss Virginia Wotherspoon, Olympia.

West Virginia: Charleston, Jan. 3-5. Sec., Public Health Council, Dr. N. H. Dyer, Capitol Bldg., Charleston 5.

Wisconsin:* Madison, Jan. 11-13, 1949. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls, Wis.

Wyoming: *Examination.* Cheyenne, Feb. 7. Sec., Dr. Franklin D. Yoder, Cheyenne.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Alaska: Juneau, Feb. 21-26. Sec.-Treas., Dr. C. Earl Albrecht, Box 1931, Juneau.

Arizona. *Examination.* Tucson, Dec. 21. Sec., Mr. Francis A. Roy, University of Arizona, Tucson.

Connecticut: New Haven, Feb. 12. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

District of Columbia: *Examination.* Washington, April 18-19. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., East, Washington.

Florida: *Examination.* Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

Iowa: *Examination.* Des Moines, Jan. 11. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination.* Ann Arbor & Detroit, Jan. 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

Minnesota: *Examination.* Jan. 4-5, April, June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

Oklahoma: Spring of 1949. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon: *Examination.* Portland, Dec. Sec., Basic Science Examining Committee, Dr. C. D. Byrne, Univ. of Oregon, Eugene.

Rhode Island: *Examination.* Providence, Feb. 9. Chief, Mr. Thomas B. Casey, 366 State Office Building, Providence.

Tennessee: *Examination.* Memphis, Dec. 30-31. Sec., Dr. O. W. Hyman, 874 Union Avenue, Memphis 3.

Washington: Stattle, Jan. Sec., Dept. of Licenses, Miss Virginia Wotherspoon, Olympia.

Medical Motion Pictures

FILM REVIEWS

The following 16 mm., color, silent, motion picture was prepared in 1947 and is procurable on loan from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

The Surgical Treatment for Splenic Flexure Carcinoma with Solitary Liver Metastasis. 900 feet, (3 reels), showing time thirty-nine minutes.

The film shows the surgical management of an obstructing carcinoma of the splenic flexure with a solitary liver metastasis. A preliminary cecostomy is made to decompress the colon followed, in several weeks, by a resection of the primary lesion and the solitary liver metastasis. A primary end to end anastomosis of the colon is performed. The cecostomy is closed three weeks after resection of the obstructing neoplasm.

Reel 1 shows the case history, physical findings, radiologic studies and technic for performing the cecostomy. The cecum is exteriorized through a modified McBurney's incision. The anatomy involved in the making of the incision is well captioned and illustrated. Gauze is placed between the cecum and abdominal wall to stimulate adhesions. Two Babcock clamps are placed on the exteriorized portion of the cecum and taped to skin to help prevent it from slipping back into the abdomen. The cecostomy is opened in twenty-four hours, and a mushroom catheter is inserted into the large bowel.

Reel 2 illustrates the resection of the primary lesion and liver metastasis. The incision used is not shown, but according to the author is the same as that used and described in his film for vagotomy. If the making of the incision were included, the teaching value of the film would be improved. The primary lesion is widely resected and the continuity of the bowel reestablished by an end closed anastomosis. The arterial supply to the colon in this region is well demonstrated.

The metastasis and a small portion of surrounding normal tissue are removed from the left lobe of the liver. Previously placed interrupted mattress sutures controlled the bleeding very well. The raw surface of the liver is covered by sheets of oxycel gauze, which are held in place by sutures. No attempt is made to close the defect in the liver.

The final stage, closure of the cecostomy, is shown in the third reel. The bowel is carefully dissected from the abdominal wall and the edges of the cecostomy trimmed and then closed. The cecum is replaced in the abdominal cavity.

The surgical technic is good and the tissues are handled gently. The operative field is not obscured by the operator's hands.

This film can be recommended for showing to groups of general surgeons, residents, interns and senior medical students. Generally speaking, photography is good except for a few sequences which are out of focus. The titles are clear. There is evidence that the camera was hand held. Blue drapes were substituted for white drapes about half-way through the film.

Perforated Ulcer. 16 mm., color, silent, 300 feet, showing time twelve minutes. Prepared in 1948 by Howard G. Reiser, M.D.; David S. Fox M.D., and Hilger P. Jenkins, M.D., The Division of Surgery, The Woodlawn Hospital, Chicago. Procurable on loan from Hilger P. Jenkins, M.D., The Woodlawn Hospital, Chicago.

This film is designed chiefly to supplement a conference or lecture on perforated ulcer. No attempt is made to tell the complete story as to such aspects as etiology, diagnosis, treatments, prognosis and complications. It shows the nature of the condition as seen at the operating table and at autopsy. The surgical technic used in repairing the perforations and the pathology are well demonstrated.

The film can be recommended as an adjunct to a lecture or conference on perforated ulcer to general surgeons, residents, interns and medical students. The purpose of the film is excellent, and the idea could be well adapted to many other subjects.

Photography is good except for a few scenes in which a better camera angle would have afforded a clearer view of the subject, in which the surgeon's hands obstructed the surgical field.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Clinical Pathology, Baltimore

18:523-592 (July) 1948

Diffuse Platelet Thromboses with Thrombocytopenia and Hemolytic Anemia (Thrombotic Thrombocytopenic Purpura). E. E. Muirhead, G. Crass and J. M. Hill.—p. 523.

Intragroup Incompatibility Due to hr″ Factor. A. S. Wiener and H. R. Peters.—p. 533.

Antithrombin Activity of Stored Plasma. M. Stefanini.—p. 537.

Azoospermia and Aspermia. O. J. Pollak.—p. 542.

*Comparison of Sensitivity of Methods Used for Detection of Carbon Monoxide in Blood. Helen I. Wikoff and Gwendolyn B. Carson.—p. 548.

Rapid Method for Estimation of Blood Sugar. J. Kleeberg.—p. 551.

Methods for Detection of Carbon Monoxide in Blood.—Wikoff and Carson found that human blood must contain carbon monoxide in a saturation of at least 4 per cent before the presence of carbon monoxide can be established by qualitative laboratory tests. Pyrotannic acid and 1 per cent tannic acid (which is used in Wetzel's test) are the reagents most sensitive to the presence of carbon monoxide in human blood. The Hartridge Reversion Spectroscope will detect a concentration of 8 per cent saturation, but blood must be at least 30 per cent saturated before carbon monoxide can be detected with an ordinary biologic spectroscope.

American Journal of Pathology, Ann Arbor, Mich.

Experimental Argyrosis: IV. Morphologic Changes in Experimental Animal. C. T. Olcott.—p. 813.

Observations in Guinea-Pigs Following Injection of Specific Hematopoietic Substances Derived from Beef Liver. L. M. Meyer and A. Sawitsky.—p. 835.

Pathology of Gargoylism: Report of Case and Review of Literature. Lotte Strauss.—p. 855.

*Studies on Periarteritis Nodosa: III. Differentiation Between Vascular Lesions of Periarteritis Nodosa and of Hypersensitivity. Pearl M. Zeek, C. C. Smith and J. C. Weeter.—p. 889.

Congenital Alveolar Dysplasia of Lungs. E. MacMahon.—p. 919.

Adenomatoid Tumors of Fallopian Tube. A. B. Ragins and R. D. Crane.—p. 933.

Fulminating Meningococcic Infections.—Ferguson and Chapman say that whenever the incidence of Neisseria meningitidis infections approaches epidemic proportions there is an increase in fulminating fatal infections. The progress of the disease in these cases is so rapid that death commonly occurs within twelve to twenty-four hours. The presenting clinical picture is frequently one of pharyngitis and fever and sometimes gastrointestinal symptoms, followed by the rapid development of widespread petechiae, cyanosis, peripheral vascular collapse and death. This condition has come to be known as the Waterhouse-Friderichsen syndrome, with collapse and sudden death supposedly produced as the result of massive bilateral hemorrhage into the adrenal glands. In the past few years the authors have had the opportunity of studying 16 cases of acute fulminating meningococcic infection in which autopsies were done. N. meningitidis was recovered from cultures of either blood or cerebrospinal fluid, or both, in each case. The pathologic changes found at autopsy in these cases support the view that the presenting clinical syndrome is the result of an overwhelming bacteriemia and toxemia. From this series it would appear that massive bilateral adrenal hemorrhage is only an associated lesion and is not responsible for the clinical picture presented. Cases having the same clinical syndrome show no great destruction of adrenal cortical substance. The authors believe that the term Waterhouse-Friderichsen should be discontinued.

Periarteritis Nodosa and Hypersensitivity.—Zeek and her associates point out that recent literature contains frequent reference to lesions which resemble periarteritis nodosa and which occur in certain cases of hypersensitivity to various substances, especially to the sulfonamide compounds. Their own studies on necrotizing panarteritis have revealed cases of two types. One type is associated with hypersensitivity. In this report the lesions of this condition are called hypersensitivity angiitis, both arteries and veins usually being involved. The term periarteritis nodosa is retained for the other type. The authors studied in rats the various stages in the development of experimentally produced lesions of periarteritis nodosa, from the time of their initiation until fifty-two weeks later. Similar lesions were found in each of 15 cases in man. Seven other cases in man which were associated clinically with hypersensitivity presented vascular lesions of a different type and distribution. Periarteritis nodosa can be differentiated from hypersensitivity angiitis by (1) the morphologic characteristics of early preexudative lesions, (2) the distribution of the lesions in relation to the bifurcation of vessels, (3) the size and type of vessels primarily affected and (4) the presence or absence of lesions in splenic follicular arterioles and in the arteries of the pulmonary circulation.

Cherney's Incision.—Burch and his co-workers demonstrate that Cherney's modification of Bardenheuer's incision offers advantages for the execution of difficult interventions deep in the pelvis. The incision is made in a curvilinear fashion beginning from 1 to 2 fingerbreadths below and medial to the anterosuperior iliac spine, crossing the midline, running almost straight and just within the hairline, and terminating below the iliac spine of the opposite side. The peritoneal cavity is entered laterally and the incision is carried across 1 to 2 fingerbreadths above the reflection of the vesical peritoneum. The peritoneal incision usually extends from one inferior epigastric artery to the other. There is no contraindication to dividing one or both arteries. Curarization is an aid in overcoming any difficulty in the closure. Two-thirds of the 60 cases in which the authors used the incision involved gynecologic operations. While ordinary gynecologic operations do not require the wide exposure provided by this incision, in the more difficult cases the incision is a distinct advantage. Three of the patients had carcinoma of the cervix and were submitted to radical hysterectomies. These, as well as the 1 case of calculus in the lower part of the ureter, illustrated the desirability of the incision for exposing the ureter in its terminal portion. In low cervical and extraperitoneal cesarean section, the exposure of the lower uterine segment is accomplished more easily with this than with the customary vertical incision. There were 2 cases of carcinoma in the rectosigmoid and 1 case of diverticulitis in the same region, in which resection and anastomosis were done at or below the peritoneal reflection. The anastomoses were easily done. There were no deaths and remarkably few complications. There were no wound infections. All wounds were securely healed and in satisfactory condition on the patient's discharge from the hospital. This usually occurred on the ninth postoperative day. In no instance has wound weakness or herniation been noted.

Normal Granulopoiesis of Megakaryocyte.—Schwarz demonstrates that granulopoiesis begins in the megakaryoblast in a well defined, distinct area, for which the term "functional area" is proposed. The "functional area" is located near the indentation of the nucleus, at the site of the archoplasm. By concentric and continuous expansion it gradually involves the entire cytoplasm with the exception of a narrow border zone, which remains free of granulation. The granulopoiesis is monocentric. Granulopoietic foci independent of the primary area apparently never develop. The position and the growth of the "functional area" kept the nucleus in an eccentric position. Nuclear structures do not visibly participate in the formation of the granules.

Granulopoiesis in Megakaryocyte in Thrombopenic Purpura.—Schwarz presents the case of a woman, aged 25, who had had symptoms of hemorrhagic diathesis since her sixteenth year. The diagnosis of Werlhof's disease had been made repeatedly. Summarizing the detailed studies on this case of chronic essential thrombopenic purpura, in which the megakaryocytes showed exceptional changes, the author says that hyalinization and absence of the azurophilic granulation were the pathologic features. The changes were followed from their beginning in the megakaryoblast throughout the development of the megakaryocyte. The changes were not due to a degenerative process but corresponded to a functional disturbance of granulopoiesis. The progressive stages of the disorder are in full agreement with those of normal granulopoiesis as it was analyzed in the foregoing paper. The observed disturbance cannot be ascribed to a splenic factor or to damage caused by a toxin. A deficiency of substances necessary for granulopoiesis may be responsible. Consequently, "essential" thrombopenic purpura divides into three types: (1) the common type with preserved granulopoiesis and partial influence of a splenic factor; (2) a type of functional failure of granulopoiesis, probably in the nature of a deficiency; (3) a type with degenerative or destructive changes of cytotoxic origin.

Pathologic Anatomy of Beryllium Poisoning.—According to Scott two types of human illness have appeared where workers have been exposed to beryllium compounds: "acute pneumonitis" and "chronic pulmonary granulomatosis" (delayed chemical pneumonitis). The experimental work reported has to do mostly with the changes occurring in tissues after inhalation of hydrated beryllium sulfate ($BeSo_4.4H_2O$) and after intravenous and intraperitoneal administration of the substance. The lesions occurring in various organs after administration of beryllium sulfate were focal necrosis of the liver, tubular epithelial necrosis of the kidney and degenerative changes of the hemopoietic system. The local effects of beryllium sulfate were studied only on the eyes and the respiratory tract in rats, mice, guinea pigs, hamsters, rabbits and dogs which had inhaled a beryllium sulfate dust six hours daily for eleven days. The median particle size was approximately 4 microns, and the concentration of the dust was approximately 88 mg. per cubic meter of inhaled air. Guinea pigs and dogs showed the most extensive and frequent ocular changes. The lungs of all the animals showed histologic changes; in guinea pigs the lesions were few and not diffuse; in rabbits they were more widespread and frequently involved most of one or more lobes. An inflammatory exudate has been found in the lumens of the terminal bronchi in all species. Superficial ulceration of bronchial epithelium was frequently present and was accompanied by bronchial epithelial proliferation. In some species there was pulmonary edema.

Present Status of Fever Therapy.—Bierman shows that the development of antibiotics has greatly reduced the necessity for the use of physically induced fever in the treatment of gonorrhea. Fever still has a place in the treatment of drug-resistant infections. Combined with chemotherapy, it is valuable in the treatment of syphilis of the central nervous system, and by itself it is of value in syphilitic infections of the eye. It is useful in the treatment of arthritis, brucellosis and Sydenham's chorea. It is claimed to be of value in the therapy of anterior poliomyelitis and malignant growths when combined with roentgen radiation. Meperidine hydrochloride is said to be the best form of sedation during the administration of fever. Plasma vitamin A and carotene levels become depressed during the administration of physically induced fever. Elevation of body temperature has a delayed inhibitory influence on spermatogenesis. In rabbits, fever causes a reduction of antibody titers and occasionally of the complement contained in the serum. It increases phagocytosis. Myelinated nerve fibers of the rabbit can be damaged by high temperatures.

Pulmonary Resection for Pulmonary Tuberculosis.—Conklin reviews observations on 42 patients who underwent resection for pulmonary tuberculosis. In 13 pneumonectomies there were 4 operative deaths and 2 late deaths from progression of the disease. Of 7 patients still living 2 have had empyema (1 with fistula), and 1 has had a slight progression of disease, which has been clearing under treatment with streptomycin. All 7 have negative sputum and are considered improved. In 29 lobectomies there were 3 operative deaths and 3 late deaths from progression of the disease. Of 23 patients still living 2 have had empyema (1 with fistula), 1 had a postoperative spread of the disease and 8 have had evidence of late reactivation of preexisting lesions. Three of the 42 patients had postoperative spread of the disease and 2 of those are dead. Thirteen have had late reactivation, exacerbation or progression of preexisting lesions. Of these, 4 are dead. Nine of the 13 are living and are considered improved, the sputum being negative in 7. Of 33 living patients 27 had negative sputum at the time of the most recent examination. In 4 of the living patients, however, the ultimate prognosis is poor. The author gained the impression that the morbidity and mortality associated with resection for pulmonary tuberculosis are still too high. Resection cannot be considered as a therapeutic procedure to supplant the various forms of collapse therapy which have been shown to be relatively safe and effective. There are cases, however, which collapse therapy cannot control, and for some of these resection may provide the only means to cure.

Streptomycin Therapy of Tuberculosis.—Farber and Eagle state that streptomycin is indicated in the following conditions: laryngeal and endobronchial tuberculosis, miliary tuberculosis, tuberculous meningitis, osseous tuberculosis, tuberculous lymphadenitis, sinuses and fistulas, and exudative tuberculous pulmonary lesions not responsive to conservative therapy. Streptomycin may have a place as a palliative medication in genitourinary tuberculosis and tuberculous enteritis. It is desirable to limit the use of streptomycin to these types of tuberculosis for the following reasons: 1. Streptomycin is a toxic drug. When the disease process is severe, the prognosis grave and use of streptomycin indicated the toxicity hazard is not too great, but when the disease process can be controlled by other measures or when streptomycin has shown little promise in similar cases, the toxicity hazard cannot be taken lightly. 2. After prolonged treatment with streptomycin, tubercle bacilli frequently become resistant to it. This resistance is prolonged, and a return of sensitivity has not been reported. Therefore the drug may become totally ineffective at a later date when the indication for its use is more urgent. Streptomycin is merely an adjunct to the treatment of tuberculosis. In the concentrations obtained in the blood, the drug is only bacteriostatic. The killing of tubercle bacilli and healing of lesions must be accomplished by the immune mechanisms of the body, and the patient should be given all the supportive measures of modern tuberculosis therapy.

Diagnosis of Activity and Inactivity in the Rheumatic State.—According to Rosenblum the course of rheumatic fever varies widely. One cycle may appear to end in a few weeks, leaving no obvious sequel; another may overwhelm the patient and quickly cause death; still another may be one of a number of recrudescences characterized by arthritis, fever and advancing cardiac damage. The clinical picture most often witnessed includes recurrences of symptoms and signs alternating with periods of apparent quiescence, especially in the earlier age group. Thus, the diagnosis "rheumatic fever" is clinically inadequate unless it takes into account the concept of activity and inactivity. The material which forms the basis for this paper is drawn from experiences with patients in the Naval Service (1942 to 1946), in the diagnostic clinics sponsored by the California State Board of Public Health and the Heart Division of the California Tuberculosis and Health Association, in hospital teaching wards and in private practice. Acute carditis is the most important, the most frequent and the most destructive manifestation of rheumatic activity. It is recognized by tachycardia, variability in heart sounds, rapid increase in cardiac size, cardiac insufficiency and acute pericarditis. Nodules and erythema marginatum are both closely identified with active rheumatic fever. Chorea is practically synonymous with rheumatic fever. Pneumonitis, acute bronchitis and acute pleurisy occurring in a rheumatic patient are highly suggestive of rheumatic activity if combined with other signs of activity, but not in the absence of other signs. When migratory polyarthritis occurs in a known rheumatic person it can be taken as presumptive evidence of activity. Fever in rheumatic patients is ordinarily present during the beginning of a rheumatic cycle. The sedimentation rate is characteristically elevated in acute phases of rheumatic fever. If roentgenoscopy reveals sudden enlargement of all or part of the heart, acute carditis is present. In the electrocardiogram auriculoventricular block is indicative of rheumatic carditis. Activity will be found more frequently in the younger age groups, particularly children, for then the disease is most active and severe, and recurrences are more common than they are after puberty. Of 700 children who were referred to a special clinic for the diagnosis of rheumatic fever, only 545 had received adequate study for a final diagnosis. Of these 399 had rheumatic fever or rheumatic heart disease, and, of the rheumatic group, 110 were considered to have active disease and 289 inactive.

Thyroid and Low Temperature.—Adult female rats were made hypothyroid by thiouracil feeding, and their length of survival was determined under cold room conditions with and without thyroxin administration. Rats made hypothyroid by thiouracil feeding failed to survive on exposure to a low environmental temperature. Length of survival under these conditions averaged 5.7 days (range 3 to 7 days). One hundred per cent survival over a 28 day period was obtained in animals similarly treated but administered thyroxin.

Preoperative Treatment for Gallbladder Surgery.—Freeman stresses that the condition of the liver bears a direct relationship to the morbidity and mortality in surgery of the gallbladder. Damage to the liver is most apt to be present in the group in which the gallbladder disease has been of long standing. Since there is no reliable test that will indicate slight damage to the liver, the author suggests that the surgeon assume that damage to the liver is present in cases of prolonged gallbladder disease. The author advises that crude liver extract be administered and that the patients be hospitalized for dietetic control for two weeks prior to the surgical treatment.

Toxicity of Flours Treated with Improving Agents.—Radomski and his co-workers describe experiments with "agene"-treated flour and bread made from it. The improving agent, known as "agene," is defined as 1 per cent nitrogen chloride in air saturated with water vapor. The purpose of treatment with "agene" is to alter the baking characteristics of freshly milled flour, thereby rendering it immediately usable in modern baking equipment and eliminating the necessity of prolonged storage. Bread made from "agene"-treated flour produces fright fits in dogs. Flours treated with benzoyl peroxide, chlorine, chlorine dioxide and bromate are harmless to dogs when fed for six weeks. The ED_{50} (the amount of a substance which produced an effect in 50 per cent of the animals) of gluten "saturation treated" with nitrogen chloride is approximately 3.5 Gm. per kilogram. Rabbits are of the same order of sensitivity to "agene"-treated gluten as dogs and can be used as assay animals. Cats are also sensitive but less so, while rats and Rhesus monkeys are apparently resistant so far as the production of gross symptoms is concerned.

Nodular Goiter and Thyroid Cancer.—*Anglem and Bradford* report that of 363 patients with single nontoxic adenoma of the thyroid 33 (9 per cent) had thyroid cancer. This high incidence of cancer makes obligatory the removal of all single thyroid nodules. The incidence of cancer (9) in nontoxic multinodular goiters (187) is sufficiently low (4.8 per cent) so that the authors concede that the propriety of operating on all such patients might be questioned if there were not other compelling reasons why the growth should be removed. Multinodular goiter is not a simple benign process, but a progressive disease that goes on, first, to develop toxicity in a significant percentage of cases as indicated by the increasing incidence of toxicity as one ascends the age scale. Secondly, it produces serious mechanical disturbance, chiefly by compression and deviation of the trachea by retrotracheal, substernal and intrathoracic extension. The mortality from operations that can be classed as prophylactic is virtually zero. The incidence of complications in operations on this class of patient is insignificant, compared with the hazards of leaving the goiter.

Penicillin in Diphtheria.—Crawford treated with penicillin 97 patients who were admitted to a U. S. Army Station Hospital in Berlin for diphtheria or the diphtheria carrier state during the period of July to December 1946. For comparison the results of the treatment with penicillin are reported along with those obtained in treating 50 patients during the same epidemic but in the six previous months when penicillin was not used as part of the routine treatment. Forty-five patients with acute pharyngeal diphtheria were immediately given a single average dose of 60,000 units of diphtheria antitoxin and in addition were started on three hourly doses of 20,000 units of penicillin (40,000 units in cases of more severe disease). Penicillin was continued for seven days (fifty doses) or longer if the pharyngeal mucosa was not entirely healed. In comparison with the 50 patients who were not given penicillin, the average length of hospitalization was cut from fifty-seven to forty-five days. In 2 patients serious cardioneurologic symptoms developed, and 1 patient had minor symptoms of this type as compared with 3 and 9 respectively in the control series. There were no deaths, while there were 3 deaths in the controls. The average period of hospitalization dropped from sixty-one to forty-three days. Only three patients were held beyond the six weeks' minimum because they continued to harbor virulent organisms in the nasopharynx, while 29 were held beyond this minimum in the control group, a reduction from 57 to approximately 8 per cent. Fifty-two carriers were treated with penicillin, 44 of whom received an initial course of penicillin, consisting of 20,000 units every three hours for fifty doses. The carrier state was terminated in 37 cases, or 87 per cent. Six of the "penicillin failures" and 7 previously untreated patients were subjected to tonsillectomy, only 1 patient remaining a carrier after this procedure. Penicillin is a valuable adjunct in the treatment of diphtheria and the diphtheria carrier state, but it does not supplant the use of antitoxin in the acute stage or obviate the necessity for surgical treatment in a selected group of carriers.

Blood Bilirubin in Differentiation of Gallbladder Disease and Peptic Ulcer.—Navarro and Campos point out that it is often necessary to resort to numerous, long and tedious laboratory examinations before it can be said that a case is either one of chronic gallbladder disease or peptic ulcer. They present 4 cases which illustrate the difficulty encountered in the differentiation. In all of them the clinical history and physical findings at the time of admission gave little suggestion of a possible chronic hepatobiliary condition. A careful perusal of the histories inevitably led to peptic ulcer as the first consideration. The persistent presence of bilirubin in blood and urine, however, was a factor which suggested some hepatobiliary disorder. Subsequent developments confirmed the presence of chronic gallbladder disease. The authors have encountered a number of similar cases, but the 4 reported are especially representative. They admit that their studies on the value of bilirubin determination in the differential diagnosis of peptic ulcer are still too limited to make sweeping conclusions.

Emetine in Intestinal and Hepatic Amebiasis.—Parmer found that injection of emetine into rabbits was followed by a relatively high drug concentration in the liver for more than a month, whereas the level in the intestine was always much lower and became undetectable after four days. The high concentration and prolonged presence of emetine in the liver and a low concentration and transient presence of the drug in the intestine are suggested as the explanation for the efficacy of emetine in amebic disease of the liver and the drug's failure in amebic intestinal disease in man.

Fibrocystic Disease of Pancreas.—According to Goin, fibrocystic pancreatic disease is a congenital, familial, highly fatal disease of infants, regularly accompanied by pulmonary changes which are demonstrable in the roentgenogram. It is generally considered to be of rather infrequent occurrence, but it is likely that it is the diagnosis, rather than the disease, which is uncommon. Necropsies on babies indicate that it accounts for perhaps 4 per cent of all infant deaths. The disease has become recognized as a clinical entity only in the past ten years. The disease manifests itself almost entirely as a combination of disease of the respiratory tract and a feeding problem. It may be suspected on the basis of roentgenograms of the chest. These are not, in themselves, diagnostic of pancreatic fibrocystic disease, and it is only in association with a history of repeated pulmonary infection that the condition may be suspected. If the radiologist is aware of the nature of fibrocystic disease, and will elicit a short history, he will frequently be able to furnish the clue which will enable the clinician to establish the diagnosis. Early diagnosis is essential if the child is to have any chance of survival. The pulmonary disease is combated, as is any other pulmonary infection, with sulfonamide drugs and with penicillin, particularly aerosol penicillin. The concomitant vitamin A deficiency requires the administration of large amounts of vitamin A, frequently as much as 150,000 units per week supplemented with vitamins B, C and D. Pancreatic extract is a logical form of substitution therapy. Enteric-coated granules of pancreatic extract are now available, and these may be offered in the baby's food. Milk can be replaced by the casein hydrolyzates, which require no pancreatic ferments for their digestion. "Nutramigen," a casein hydrolyzate in amino acid form with dextrin, maltose and olive oil, is a convenient substitute. The author presents 2 illustrative cases.

Roentgenologic and Physiologic Changes in Pulmonary Edema.—Goodrich points out that pulmonary edema produces shadows on roentgenograms of the chest that simulate other conditions. Certain features help to differentiate edema in most instances. These are (1) the diffuseness of the shadows, (2) relative clearness of the extreme apical and basal lung fields, (3) a tendency for the shadows to vary in size and to show a shift in location on serial roentgenograms, (4) enlargement of the vascular shadows and (5) enlargement of the heart. The underlying physiologic factors in the production of pulmonary edema are (1) increased intracapillary hydrostatic pressure, (2) decreased osmotic pressure of the blood and (3) increased capillary permeability. Pulmonary edema seen in association with heart failure, nephritis and excessive parenteral fluid intake is discussed and illustrative cases are presented. Clinical correlation is essential in determining the responsible disease and abnormal physiology. The shadows seen in the lung fields with edema depend on the interplay of the three physiologic factors. The reasons why edema may occur unilaterally or segmentally are not clear. This may be related to the neurogenic control of capillary size and permeability.

Pelvic Cellulitis.—According to Blake and Diddle it is desirable to differentiate between primary pelvic cellulitis and primary intraperitoneal pelvic infection. The former usually follows trauma to the cervix, uterus or vaginal vault, occurring in criminal abortion, operative delivery or uterine instrumentation. Pelvic cellulitis is frequently due to nonhemolytic streptococci. These micro-organisms are rather resistant and may remain potentially dangerous within an inflammatory mass for long periods of time. On the contrary, the gonococcus, the usual cause of intraperitoneal infection, becomes attenuated in a few weeks or months. The authors discuss observations on 88 obstetric and gynecologic patients with pelvic cellulitis, of whom 81 survived and 7 died. Many of these infections were due to the nonhemolytic streptococcus and, as would be expected, did not respond to treatment with penicillin, streptomycin, sulfadiazine or sulfathiazole alone, or in combination. Since the streptococci may remain potentially active in an old inflammatory mass for long periods, elective pelvic operations should be delayed for six months or, better still, for a year or two.

Cancer of Stomach. J. K. Quattlebaum.—p. 462.

Intra-Abdominal Hernia as Cause of Intestinal Obstruction.—According to Ellis and his associates there are seven possible places where herniation and strangulation of the bowel can occur within the abdomen. These are in the fossae about the duodenum, including the foramen of Winslow, around the cecum, around the sigmoid, in the supravesical region, through the diaphragm, in exaggerations of normal mucosal folds such as the broad ligaments and congenital defects, and through the omentum. Then there are intestinal protrusions secondary to previous intra-abdominal surgical treatment. Obstruction with no apparent predisposing cause is the type under discussion. The authors present the case of a man, aged 70, in whom preoperative diagnosis of obstruction in the sigmoid, probably on the basis of tumor, was made. At operation the colon was found greatly distended, but no lesion could be found in it. The small bowel was distended in its upper portion, but the ileum near the cecum was flat. The collapsed bowel was followed and was found to pass under a peritoneal fold. The hernia was easily reduced by simple traction. The authors stress that the treatment of these lesions is the same as that of any intestinal obstruction. Especial attention is called to the anatomic arrangement about the orifice of the fossa, for it would be a tragedy blindly to enlarge the neck of the sac and in so doing to sever the inferior mesenteric vein in all cases and, in many, the left colic artery. The reported case was easy in that simple traction reduced the hernia, but, when this is not true, the authors recommend opening the sac over the dilated bowel and deflating the bowel by means of Wangensteen's aseptic technic. This will make it possible to reduce the hernia.

Amebiasis. J. E. Stone.—p. 222.

Limitations of Electrocardiography.—According to Stewart, the normal limits of the electrocardiograph are subject to frequent exceptions. This is particularly true as regards the conduction times of the P-R interval and QRS complex. Abnormalities of the electrocardiogram must always be evaluated with this in mind. The electrocardiograph is of assistance in only a small percentage of cases of congenital heart disease; in patent interventricular septal defect and patent ductus arteriosus the electrocardiogram is most often normal. In rheumatic fever in which myocardial involvement is presumed to be invariably present, the electrocardiogram may show significant changes in only 30 per cent of cases. Determination of the electrical axis of the QRS complex and conclusions as to ventricular hypertrophy may at times be helpful but are subject to many possible errors, and even in the most experienced hands they are of limited value. Coronary sclerosis without associated myocardial degeneration cannot be detected by the electrocardiograph. The electrocardiogram may return to normal after myocardial infarction and tracings made before death may show no abnormality; unless previous tracings have been made and are available the presence of the normal tracing may be misleading. The electrocardiogram is influenced to a considerable extent by the position of the heart. Almost any component of the tracing may be influenced by this factor. The electrocardiogram may be influenced also by various drugs, metabolic disorders and toxic conditions. These conditions or agents may produce changes in the tracing similar in all or many respects to those produced by heart disease.

Streptomycin in Granuloma Inguinale.—Sauer and his co-workers treated 5 Negro patients, 4 men and 1 woman between the ages of 27 and 52, with granuloma inguinale with streptomycin. Tissue spreads from the lesions were examined and Donovan bodies were demonstrated in all the patients. Four grams of streptomycin per day, divided into six doses administered every four hours, were given for five days, or a total of 20 Gm. Lesions on the prepuce, on the glans penis, on the scrotum, on the fourchette and labia were completely healed within six to fifteen days after treatment was completed, with no signs of renewed activity when examined five to seven weeks later. The incidence of treatment failures must still await the test of time, but streptomycin offers new hope to the patient whose disease has become resistant to the antimony drugs.

Postpartum Necrosis of Anterior Pituitary.—Sheehan presents 22 cases of postpartum necrosis of the anterior pituitary and says that the significant facts about these cases are in agreement with 19 reported previously. No necroses were found in the pituitaries of patients who died earlier than twelve hours after delivery. It appears that the death of the anterior pituitary tissue usually occurs at about the time of the delivery. Several hours are required before the histologic changes of coagulation necrosis are sufficiently advanced to be identified in sections. The necrosis is always associated with thrombosis of parts of the vascular supply of the gland, and this appears to be the local factor responsible for the ischemia. That the necrosis has its onset at about the time of the delivery suggests that there is some specific obstetric complication. Analysis shows the patient has invariably suffered from a severe circulatory collapse as a result of hemorrhage and/or shock at the delivery. The obstetric causes of pituitary necrosis in women who died from twelve hours to thirty-five days after delivery are listed as retained placenta and postpartum hemorrhage, placenta praevia, accidental hemorrhage, rupture or inversion of uterus, prolonged labor, toxemia or eclamptic shock and abortion. The pituitary necroses are found in women who have survived the first twelve hours after delivery. There are, however, a large number of women who die as a result of shock and/or hemorrhage during the first twelve hours. The most important clinical question is how many women in whom severe pituitary necrosis develop do not die in the puerperium but survive to have clinical cases of long-standing hypopituitarism.

Postpartum Necrosis of Pituitary.—Jeffcoate supports nearly everything that has been said by Sheehan about postpartum necrosis of the anterior pituitary, but considers it unfortunate that authors now describe two syndromes, (1) Simmond's and (2) Sheehan's, differentiating between them according to the causation and whether cachexia is present or not. There seems little basis for this. He thinks that there is only one disease, anterior pituitary failure, the usual cause of which is postpartum or intrapartum necrosis. The ideal treatment would be to secure a regrowth of the anterior pituitary lobe, or at least the hypertrophy or hyperplasia of the remaining fragments. In cases of mild disease, in which ovarian function has not ceased completely and conception is possible, the occurrence of pregnancy may result in sufficient hypertrophy of the remaining healthy pituitary tissue. The alternative is substitution therapy with various pituitary factors, but this is generally unsatisfactory, and so replacement therapy can be given at a lower level by means of thyroid, desoxycorticosterone, adrenal cortical extracts, estrogens, progesterone and testosterone as an alternative to the androgens of the adrenal cortex. The author gives a brief account of an experiment carried out on a woman of 41 who showed all the typical features of Simmond's disease which she had for four years and which followed postpartum hemorrhage in her third confinement. The possibility of tissue transplants in such patients had been discussed and transplanting of tissue which had undergone neoplastic change and which presumably no longer required its natural stimulus had been considered. The author and associates looked particularly for an adrenal cortical tumor; ultimately one presented in a girl 4½ years old who showed typical features of the adrenogenital syndrome. The blood groups of both patients were the same. The adrenal tumor, which ultimately proved to be a cortical adenoma, was removed. Half of the tumor was used for two transplants (approximately 13 Gm. each), one into each of the rectus abdominis muscles. The effect of the transplant was only temporary; eight months after the transplant the 17-ketosteroid excretion had fallen to nil. It was proved, however, that the patient suffers most as a result of the loss of adrenal cortical function. Until it is possible to provide full anterior adrenal pituitary substitution therapy, there is a good reason to believe that most patients would derive most benefit from an attempt to replace some or all of the adrenal cortical factors.

Pilonidal Sinus in a Barber's Hand.—Patey and Scarff believe that pilonidal sinus is essentially an acquired infective and foreign body granulomatous reaction to buried hair. Among the reasons which had led to this view was the development of a pilonidal sinus in a barber's hand as a reaction to hair embedded there. The man, aged 34, had often picked out hairs which had stuck in the skin of his hands. Then years ago an abscess had developed from this cause in the web between the middle and ring fingers of the left hand. The abscess had been incised and had healed. About the middle of 1947 a sinus developed in the web between the middle and ring fingers of the right hand, into which hairs tended to enter and whence they often had to be picked out. In September 1947, the condition flared up into acute cellulitis of the web with associated lymphangitis and lymphadenitis. Under treatment with penicillin the acute inflammatory reaction subsided. In November 1947, he was readmitted to hospital, and the sinus and nodule were excised. The nodule into which the sinus led was a small cyst containing about half a dozen hairs. The cyst had ruptured to form a small abscess. The authors present a second, similar case which was communicated to them by other observers. They say that these are the third and fourth recorded cases of a typical pilonidal sinus in a barber's hand.

*Postbronchoscopic Reactions. C. M. Smidt.—p. 178.

Postbronchoscopic Reactions.—Smidt presents observations made in the course of five hundred bronchoscopic interventions. None of these interventions were made for the removal of a foreign body. A total of one hundred and nine bronchoscopies were made on 45 tuberculous patients. As a rule, bronchoscopy is a harmless procedure, but in 18 instances fever followed the intervention in tuberculous patients. In another case a secondary rise in temperature occurred a week later and lasted ten days. Two of the patients with the initial rise in temperature died after twelve days and three weeks, respectively. These cases involved women with extensive tuberculous lesions of the lungs. A male patient exhibited propagation of bronchial tuberculosis to the larynx without elevation of temperature or any pulmonary dissemination of the process. In the course of the three hundred and ninety-one interventions on 270 nontuberculous patients, temperature rise occurred in about 12 per cent of the cases. Thus the initial rise in temperature after bronchoscopy is not characteristic of tuberculosis. Although tuberculosis is not always a contraindication to bronchoscopy, it is contraindicated in patients whose general condition is extremely poor, for in these it may produce dissemination of the process.

Leukopenic Index and Food Allergies.—Memmesheimer used the leukopenic index of Vaughan for the detection of food allergies in 250 patients of whom 166 had eczema or an eczematoid, 56 urticaria, 16 asthma and 12 various cutaneous lesions. The index is the ratio between the fasting value of the leukocytes and that value which is obtained during the digestion of the food presumably responsible for allergic manifestations. The index is positive when intake of the food is followed by a decrease in leukocytes and is negative when an increase follows. The author found that Vaughan's index is valuable in the detection of food allergies. Since no special apparatus is required, it can be carried out even in small clinical laboratories. Exclusion from the diet of the foods that have been detected as allergens by means of the leukopenic index produced impressive therapeutic results. Removal of foci of infection is likewise helpful and is frequently followed by considerable improvement.

*War Nephritis: Etiopathogenesis. C. Coruzzi and G. Lodi.—p. 19.

War Nephritis.—Coruzzi and Lodi observed 70 soldiers with war nephritis who entered military hospital in the course of the first semester of 1941. Ten patients in the group had edema which was controlled by bed rest and administration of a diet rich in vitamins C and B. The authors believe that war nephritis is due to diminished resistance of the body because of certain avitaminosis. Intense humidity is a causal factor of importance secondary to avitaminosis. The treatment consists of bed rest and administration of a diet rich in vitamins C and B.

*General Pathology of Diskopathies. A. Ricard and P. F. Girard.—p. 419.

Volkmann's Contracture.—Fontaine and his co-workers produced in dogs a contracture or flexure of the paw of the forefoot by injecting several cubic centimeters of "tenebryl" (sodium diiodomethane sulfonate, an analogue of methiodal sodium) into the humeral artery. These contractures occurred regularly three to eleven seconds after the injection and were associated with sharp pain and disappearance of the peripheral pulse. The contractures were recorded by electromyography; they reached their maximum immediately and subsided gradually within fifteen to thirty minutes. Direct compression of the humeral artery by tourniquet did not produce contractures, but they became manifest as soon as the tourniquet was removed and the injected iodine substance was allowed to reach the periphery. The trunks of the nerves of the paw were sectioned, but spasms of the paw were still produced by intra-arterial injection of "tenebryl." The contracture was of short duration and a second injection of "tenebryl" proved ineffective. Ischemia by direct compression of the humeral artery does not produce muscular spasm. The contractures obtained by intra-arterial injection of "tenebryl" appear only after the irritative substance has reached the peripheral vessels. A central nervous mechanism may be considered because of the fact that section of the peripheral nerves greatly reduced the intensity of the spasm and prevented its recurrence. These results may offer an explanation for the origin of Volkmann's ischemic contractures in men. They support the observation of Lombard, who reports that in a child with Volkmann's disease, associated with paralysis of the three nerves, contracture of the fingers subsided after infiltration of flexors and pronators with procaine hydrochloride while paralysis persisted. Another experiment showed that stretching of the leg of the dog during the decreasing phase of the contracture caused reappearance of the contracture. This may explain the occasional failure of treatment of Volkmann's ischemia by early straightening of flexed fingers.

Diskopathies.—According to Ricard and Girard, "discal disease" is characterized essentially by degeneration of the intervertebral cartilage. It may be caused by trauma, by inflammatory lesions or by a local abiotrophic process. A hernia of the nucleus pulposus may result occasionally, but discal chondromalacia occurs in the majority of the cases. It may be followed immediately by the crushing of the disk, sometimes associated with protrusion of the cartilage, which may vary according to circumstances. Dislocation of the vertebral column may be another sequela which may be caused by retropulsion in the cervical region or by rotation of a vertebra around its axis in the lumbar region. The term "hernia of the nucleus pulposus" does not seem to give an exact description of the lesion, in which protrusion of the disk frequently cannot be demonstrated on surgical intervention. One must consider another pathogenesis in which the vertebral dislocation has a relative part. This concept is suggestive of surgical fixation of the movable vertebra in order to obtain excellent permanent results.

*Thoracoplasty in Pulmonary Tuberculosis in Adolescents: Technic, Indications and Late Results. A. Sangiovanni and L. L. Boffi.—p. 245.

Thoracoplasty in Pulmonary Tuberculosis in Adolescents.—Sangiovanni and Boffi report good immediate and late results of thoracoplasty in 5 adolescents with bilateral pulmonary tuberculosis. The technic and indications are the same as in adults; namely, operation in two or three stages with adequate intervals between the stages. The indications are: presence of fibrocaseous tuberculosis, open, stabilized or chronic, in which pneumothorax cannot be carried out or in which pneumothorax was ineffective. In bilateral tuberculosis it is advisable to delay the operation, which can be performed when the contralateral lesion is in a period of minimal activity.

Book Notices

Survey of Food and Nutrition Research in the United States, 1947: A Compilation of Research Pertaining to Foods and Nutrition in Academic, Governmental, and Industrial Laboratories. By the Committee on Survey of Food and Nutrition Research of the Food and Nutrition Board with the Support of the Committee on Food Research of the Quartermaster Food and Container Institute for the Armed Forces, R&D Branch, O.Q.M.G. Paper. Price, $1. Pp. 306. Food and Nutrition Board, National Research Council, 2101 Constitution Ave., N.W., Washington 25, D.C., 1948.

This book makes available the names of institutions and research workers who are interested in problems of foods and nutrition. It supplies also a list of titles of research projects now being carried on or contemplated. Of necessity, such a work as this has a certain number of drawbacks such as the lack of critical selectivity in listing laboratories with reference to the adequacy of physical facilities and trained personnel. Nevertheless, the work constitutes a valuable attempt to collect and correlate material into reference form so that one can see the type of research being carried on in the field of food and nutrition. The method of indexing is rather complex but is clearly explained, so that little difficulty should be encountered in finding the material being sought.

The book is organized into general sections under physiology, chemistry, technology, economics, bacteriology, psychology, participating organizations and personnel involved in this type of research. The listing indicates 4,086 projects, 5,000 investigators and 606 contributing organizations. The subject index is 96 pages long.

This valuable book fills the need for a comprehensive listing of research projects being conducted in the field of foods and nutrition in the United States. It is recommended to research workers and to executives who are seeking skilled personnel and laboratories where food and nutrition studies can be conducted.

Rural Health and Medical Care. By Frederick D. Mott, M.D., and Milton I. Roemer, M.D., M.P.H. Cloth. Price, $6.50. Pp. 608, with 38 illustrations. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 18, 1948.

The disappearance of physicians from many villages, coincident with the passing of the horse and buggy era, served to direct attention to the rapidly changing relation between a dynamic medical science and the society which it sought to serve.

The thinking of those who formulated solutions to apparent maladjustments in earning capacity and social opportunity available to our people reached divergent conclusions usually by following dissimilar paths of reasoning. The research technic is usually considered a search for truth, which is established by the searching analysis of research material. The same technic can be utilized to bolster an opinion previously held.

Following the first World War, the sudden collapse in realty values brought hardship and financial ruin to many. The continuing inequity between the price received and the price he had to pay made the farmer acutely aware of his need for economic parity with labor and capital. It was quite to be expected that the idea of parity should become the yardstick of other civilian values.

The authors have done a commendable job in compiling data from all available sources about rural living and the incidence of morbidity and mortality. Comparisons with like statistics involving urban populations are made to show that the rural health level might be improved if urban advantages could be applied.

This compilation of facts and figures covering health levels, health needs, health personnel and facilities, services and expenditures, together with a recital of governmental efforts to improve rural health, will be a welcome source of material otherwise difficult to find.

In the discussion of voluntary health plans the authors concede that the plans have produced striking improvement in certain directions while they deplore the limited quantity of aid provided when compared with the comprehensive service envisaged by proponents of compulsory tax-supported medical care. The frank acknowledgement by the authors of the need for compulsion in tax-supported plans should earn for them much credit for sincerity; and honesty of expression. Their optimism in the ultimate triumph of their plan is revealed by the last sentence of this chapter: "One can hardly miss the analogy of the experience of some thirty-five other nations in which the growth of voluntary plans was invariably the preliminary step to the organization of national systems of 'compulsory' or universal health insurance."

The last chapter of the book, entitled "The Goal in Sight," recites in moving detail the evidence in every state in the Union of increasing interest in health matters as evidenced by formation of health councils, state conferences and like activities. The authors assert their firm conviction that the only successful method is through compulsory tax-supported medical service established by federal legislation.

Those who live in or near the country know that there is no ground swell demand emanating from large segments of the population. Such agitation as witnessed to date has been created by those leaders who understand and value the benefits which medicine can bestow and altruistically want those benefits available to every one.

It is evident that some plan of health education must precede any great triumph in the field of rural health. Given this advantage, the initiative and resourcefulness of our rural people can be depended on to find the solution in the best American tradition of community and individual accomplishment.

Diabetes Mellitus and Exercise: A Physiopathologic Study of Muscular Work in Patients with Diabetes Mellitus. By E. O. Errebo-Knudsen. Reprinted from "Reports of the Steno Memorial Hospital and the Nordisk Insulinlaboratorium," Volume III, 1948. Denne Afhandling er af det lægevidenskabelige Fakultet antaget til offentlig at forsvares for den medicinske Doktorgrad, København. Pp. 152, with 39 illustrations. G. E. C. Gads Forlag, Vimmelskaftet 32, Copenhagen K, 1948.

This small volume translated from Danish deals with the pathologic physiology of an important subject—the effect of muscular exercise on the person with diabetes. That the work was done under the eyes of Dr. H. C. Hagedorn—discoverer of protamine zinc insulin—at the Steno Memorial Hospital in Copenhagen, Denmark, is reassuring as to its scientific worth.

First there is a historical view of the subject. After that is a description of the experimental procedures, then the results of the experiments and last a discussion of the findings in the light of their clinical aspects. Attention is called to the fact that previous observations by various workers were based on blood sugars taken at the end of exercise periods—which would not have given the same readings as those taken during the exercise. It is also pointed out that records were not made of the total work done in comparison with levels of blood sugar.

These studies revealed that in nondiabetic persons the physical condition of the subject determined the type of blood sugar curve more than the intensity of muscular effort. The magnitude of the carbohydrate depots and the ease with which carbohydrate was mobilized were equally important in the pattern of the blood sugar curves. After ingestion of carbohydrate, if exercise is taken, the blood sugar curve runs at a lower level than when no exercise is taken. When exercise is begun an hour after a carbohydrate meal, blood sugar falls, even to hypoglycemic levels. These same methods applied to diabetic patients tended to give curves similar to those of nondiabetic persons, but the patterns of the curves were comparatively inconstant. Severe exertion of sufficient duration induced hypoglycemia, but this hypoglycemia was less severe where the subject had been subsisting on a high carbohydrate diet. Diabetic persons who had been well regulated were less easily thrown into hypoglycemia than those which were not stabilized.

So far as ketone production is concerned, exercise is followed first by a reduction in ketones. This reduction is then followed by an increased output, and another period of increased output occurs during the period of restitution. Reviewing previous observations on the occurrence of ketones after exercise, Knudsen notes that the generally accepted opinions have been that light exercise does not cause increased ketonuria, but that severe exertion does. This corroborates the early observation of Barach made in 1909 on a series of 55 young men taking part in the Marathon Race (24.85 miles). Barach found that the ketone output (betahydroxybutyric acid—diacetic and acetone) varied directly with the strenuousness of the effort; with the distance covered in the shortest time.

So far as respiratory quotient is concerned, these studies revealed that in normal persons after exercise the respiratory quotient is increased. In diabetic persons the tendency is similar but not constantly so.

Reviewing the entire series of experiments, one readily sees that there are still too many unknown factors and that these will not be revealed by the blood and urine sugar curves, by the ketone output or the respiratory quotient.

Hepatic function, glycogen storage, mobilization of sugar, hormone influences—all these are involved to such an extent that the simpler diagnostic criteria fail to reveal the underlying pathologic physiology. As the author himself suggests, these experiments are the first steps toward more research in pursuit of a complete understanding.

Introduction to Physiology. By W. H. Newton, D.Sc., M.D., Holt Professor of Physiology, The University, Liverpool. Cloth. Price, $2.50. Pp. 284, with 113 illustrations. Williams and Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

This small volume, in the admirable tradition of English science, attempts to present human physiology with sufficient rigor and detail, yet with sufficient vigor and sweep, so that it will appeal both to the professional student and to the general reader. On the whole it succeeds well.

The first third treats activity of the whole organism, beginning with heat production, body temperature and problems of comfort and climate, and moving on to control by the nervous system and the nature of movement. Then comes a brief survey of the structure and function of the great organ systems of the body, followed by chapters dealing with circulation, respiration, exercise, food, digestion, metabolism, excretion, endocrines, reproduction and sense organs in greater detail.

The text is well written, lucid and provocative, with a minimum of technical terms or of factual recitation. Chemical matters are mostly elided. The figures, over one hundred, are informal and occasionally unattractive, but mostly clear and informative. There is no bibliography. The volume could profitably be put in the hands of the interested layman or beginning student.

The Mechanism of Abdominal Pain. By V. J. Kinsella, M.B., Ch.M., F.R.C.S. Cloth. Price, 32s. 6d. Pp. 230, with 17 illustrations. Angus & Robertson, Ltd., 89 Castlereagh St., Sydney, N.S.W., Australia, 1948.

This book, divided into twenty-two chapters, deals with the subject of abdominal pain. Interspersed in the first chapter, pertaining to historical data, are some interesting anatomic plates starting with the time of Vesalius. Basing his opinion on clinical evidence—namely, patients with transverse lesions of the spinal cord—Kinsella is of the opinion that some pain fibers from the abdominal viscera probably ascend in the sympathetic trunk, but not in the vagus. The author emphasizes the limitations of animal experimentation and prefers to make his observations in man during operations with the patient under local anesthesia.

He stresses the belief that if a viscus is cut or clamped no pain results because few nerve fibers are present; however, if the vascular part of the mesentery is cut or clamped pain results because of the great number of fibers which are present and stimulated. The subject of muscular rigidity is discussed; however, this is not differentiated from muscular defense. He divides parietal adhesions into two types, the painless and the painful, the latter being attached to the parietal peritoneum. Chronic appendicitis is mentioned as a definite entity to which many would take exception. He does not identify what his concept of chronic appendicitis is, and since many deny the existence of such a condition one is left wondering what part this "lesion" played when associated with other pathologic changes.

Chapter 22 contains an excellent general summary which amplifies the material previously presented. Although the book deals with material which is moot and open to discussion, it has been approached scientifically and presented well. The book is well written and can be recommended to those interested in the subject of abdominal pain.

Medical Symphony: A Study of the Contributions of the Negro to Medical Progress in New York. By Gerald A. Spencer, M.D. Cloth. Price, $3.50. Pp. 120, with illustrations. The Author, 129 W. 129th St., New York 27, 1947.

The title of this small book is taken from a far fetched metaphor which likens the various groups of physicians to the groups of instruments in a symphony orchestra, each of which has its individual score and contributes to the harmony of the whole. The implication is that Negro physicians have a definite role in the medical profession and require equal opportunity for expression, for development and to contribute. While the subtitle indicates it to be a study of the contributions of Negro physicians to medical progress in New York, there is in fact no reference to any achievement that has actually advanced medicine. A good deal of space is given to an account of the struggle which Negroes have made for positions on hospital staffs, particularly on Harlem Hospital staff. Memberships in medical societies, generally considered as necessities, are regarded as accomplishments. Reference is made to dentists who have lucrative practices, druggists who are successful, and nurses who hold good positions. The conviction is obtained that, with one or two exceptions, the excellent opportunities for study and research which New York affords have been disregarded by Negro physicians. In addition to being mistitled the book is poorly written and edited.

Recent Advances in Pathology. By Geoffrey Hadfield, M.D., F.R.C.P., Professor of Pathology in the University of London, London, and Lawrence P. Garrod, M.A., M.D., B.Ch., Professor of Bacteriology in the University of London. Fifth edition. Fabrikoid. Price, $6. Pp. 363, with 60 illustrations. The Blakiston Co., 1012 Walnut St., Philadelphia 5, 1947.

The fifth edition, as previously, endeavors to set forth some, although not all, of the progress in pathology. The chapter on liver has been thoroughly revised and includes the recent concepts of hepatic disease in relation to diet, cirrhosis and the underlying changes in infectious hepatitis.

The chapter on inflammation includes some of Mencken's concepts of leukotaxine, necrosin and the role of hyaluronic acid and hyaluronidase in bacterial diseases.

In a brief chapter, the hypersensitive state in infections is discussed. An excellent chapter, with illustrations, describes reticulosis. Of particular interest are the chapters on experimental cancer research. In the cardiovascular system, rheumatic fever, hypertension and atheromatosis are reviewed from the experimental point of view.

Renal diseases are described according to a modification by Ellis of the original Volhard and Fahr classification. Crush syndrome and extrarenal uremia are included. A short chapter on the ductless glands has been added.

The contents are both interesting and clear in their descriptions and give the newer concepts of many important pathologic subjects.

American Pharmacy. Vol. II: Advanced Pharmacy: Medical, Surgical and Dental Supplies; Animal Health Pharmacy. Editor-in-Chief: Rufus A. Lyman, M.D., Director, School of Pharmacy, University of Arizona, Tucson. Technical Editor: George Urdang, Ph.G., D.Sc.Nat., Director, American Institute of History of Pharmacy, Madison, Wis. Advisory Editors: James M. Dille, Ph.D., Professor of Pharmacology, University of Washington, Seattle, and others. Cloth. Price, $7. Pp. 379, with 111 illustrations. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1947.

This book, volume II of the American Pharmacy series—will have a special appeal for the busy physician who would like to have a working knowledge of the vast number of medical, surgical, dietary and health supplies carried by a well equipped pharmacy.

No pains were spared by the editor, one of the nation's foremost pharmacy educators holding an M.D. degree, to make this book highly informative and useful. It is conveniently divided into two well organized parts. The first deals with such subjects as flavoring and coloring agents, odors and deodorants, solvents, stabilizing agents, injections, colloids, suspensions, emulsions and tablet manufacturing. Of special interest is a basic study on the extraction of animal tissues.

Because of the completeness of the topics covered, the book should make a valuable addition to the physician's library. That goes the same for the pharmacist who prides himself on a knowledge of the pharmaceutic needs of the medical profession.

Food and Nutrition: The Physiological Bases of Human Nutrition. By E. W. H. Cruickshank, M.D., D.Sc., Ph.D., Regius Professor of Physiology in the University of Aberdeen, Aberdeen, Scotland. Cloth. Price, $4.50. Pp. 326, with 41 illustrations. *William Wood & Co.*, Mt. Royal & Guilford Aves., Baltimore 2, Maryland, 1946.

This book presents a survey of the present knowledge of the physiology of food and nutrition. Dr. Cruickshank, a well known authority in the field of nutrition, gives a résumé of the history of human dietaries and goes on to discuss the nutrition of various people, dwelling at some length on the nutritional status in England and the effects of wartime rationing on the health of the populace. The physiologic bases of nutrition and dietary planning are clearly presented, along with the social and economic aspects of foods. Although the scope of the book may appear to be broad, it will be found that the author discusses only those subjects which he regards as being of current interest. While the book is intended primarily for the medical student and the practitioner, the directness and clear style of the author make it valuable to any one interested in the contribution of food to the health of the individual and the nation.

Clinical Ophthalmology for General Practitioners and Students. By H. M. Traquair, M.D., F.R.C.S., Consulting Ophthalmic Surgeon, Royal Infirmary, Edinburgh. Cloth. Price, $9. Pp. 264, with 72 illustrations. C. V. Mosby Co., 3207 Washington Blvd., St. Louis 3, 1918.

As the preface states—"This book might be called 'Ophthalmology Without an Ophthalmoscope.'" It is written in simple language and does not go into a great deal of detail. Also, many subjects are omitted entirely. It is essentially a reference book for the general practitioner, who often is at a loss to understand the letters from ophthalmologists and discussions he may have with ophthalmologists about patients whom he also is treating.

A rather interesting, though short chapter is devoted to "Misconceptions and Prejudices," and there is a short appendix in which advice is given to the general practitioner who may be called into court to give an opinion on some ocular condition. This chapter also contains a number of prescriptions which might be helpful to him when he cannot send his patient immediately to a specialist.

Malaria with *Special Reference to the African Forms.* By W. K. Blackie, M.D., Ph.D., F.R.C.P. Boards. Price 10s. 6d. Pp. 104, with 1 plate. Published for the Post-Graduate Press by The African Bookman, P.O. Box 3115, *Cape Town, 1947.*

The first three chapters comprise a concise and well presented historical review, the parasitology of the species of the plasmodia pathogenic for man and the structural and humoral pathology of the disease. The remainder of the monograph is devoted to an excellent description of the varied clinical features of the disease, diagnosis and treatment. The differing phenomena in the nonimmune European and the African who has acquired premunition from repeated infection are emphasized. However, the author places a somewhat undue importance on certain serologic procedures for the diagnosis of infection. The chapter on treatment is a useful exposition of therapeutic methods for the management of the particular clinical types and a discussion of the respective usefulness of quinine, quinacrine, pamaquine naphthoate and chlorguanide hydrochloride. This monograph can be recommended unqualifiedly to the practitioner of medicine in the tropics.

Experiment Design and Judgment of Evidence. By Errett C. Albritton, M.D., Professor of Physiology, *George* Washington University School of Medicine, Washington, D. C. Paper. Price, $2.85. Pp. 114, with 26 illustrations. The Author, 1335 H St., N.W., Washington, D. C., 1948.

The stress in this book is implied by the title; it is a book on experiment design and not a statistics book. The first 59 pages are devoted to the description of the problems which arise in the planning of medical experiments and in the type of observations to be made. Approximately 20 pages are devoted to the technic of calculation, the central point being the development of a "result-statistic," which is a constant to be referred to a table presenting probabilities for explaining observed results on the basis of chance. The remainder of the book is devoted to an analysis of the problems which have arisen in medical research, the majority having been taken from The Journal of the American Medical Association. A minimum of mathematics is required of the reader. Only the simplest statistical tools are explained, the more complicated subjects, such as correlation, are left to other textbooks. Illustrative problems cover percentages, means, chi-square and simplest forms of variance analysis. Dr. Albritton has succeeded to an amazing extent in presenting these somewhat abstract statistical concepts in a form which is usable by physicians in medical research. The favorable reception given the earlier brief edition will undoubtedly be far exceeded by the reception given the new edition.

Hernia: Anatomy, Etiology, Symptoms, Diagnosis, Differential Diagnosis, Prognosis, and Treatment. By Leigh F. Watson, M.D., F.I.C.S. Third edition. Cloth. Price, $13.50. Pp. 732, with 323 illustrations by Helen Lorraine, Willard C. Shepard and Ralph Sweet. C. V. Mosby Co., 3207 *Washington Blvd.*, St. *Louis* 3, *1948.*

Watson's book has been standard on the subject of hernia for over twenty-five years. This new edition, the third, still maintains the general excellence of presentation that prevailed in the earlier ones.

There is much new material in the text, including accounts of the Harrington technic for repair of hiatus hernia; Babcock's procedure using fine wire sutures; current trends regarding early ambulation, thrombosis and embolism and suture materials. The sections devoted to the surgical and to the sclerosing therapy technic are particularly directed to the reader's attention as being especially praiseworthy. Much information appertaining to the medicolegal aspects of hernia is also present.

The well known medical artists Lorraine, Sweet and Shepard deserve credit for their accurate, crisp drawings.

Every practicing surgeon should avail himself of a copy of this comprehensive treatise on the subject of hernia.

Traitement chirurgical de la tuberculose pulmonaire. Par Henry Joly. Paper. Price, 820 francs. Pp. 282, with 211 illustrations. Vigot Frères, 23 *rue de l'École-de-Médecine (VI^e^ Arr^t^), Paris, 1947.*

This work by a French surgeon is of extreme interest as showing the continued progress made in thoracic surgery in France as well as in other countries during the recent war. There is a good introduction with historical review of thoracic surgery. The principles of collapse therapy and the anatomic considerations are thoroughly discussed. There is a chapter devoted to the functional study of the lungs before operation which is excellent. Thoracoplasty, extra-pleural pneumothorax, cavitary drainage and phrenic nerve paralysis are all discussed. The indications are especially well studied. There is a separate section on combinations of collapse therapy measures and another on the treatment of empyemas complicating pneumothorax.

The book is well illustrated with sketches and diagrams, the reproduction of roentgenograms is excellent and there are numerous illustrations of the use of tomography. This book is highly recommended for use by thoracic surgeons and phthisiologists.

Progress in Clinical Medicine. By Various Authors. Edited by Raymond Daley, M.A., M.D., M.R.C.P., and Henry G. Miller, M.D., M.R.C.P., D.P.M. Cloth. Price, $6. Pp. 356, with 39 illustrations. Grune & Stratton, 381 Fourth Ave., New York 16, 1948.

The book presents an excellent review of important recent advances in the field of clinical medicine. This is not a textbook, but should serve well as a brief refresher course. The bibliography and laboratory data are excellent. One might be unfamiliar with some of the British terminology. The rapidity of scientific advance makes a small part of the material presented obsolete as soon as it is written, but this should not detract from the value of the book as a whole.

Eating for Health. By Pearl Lewis, B.S. Cloth. Price, $2.25. Pp. 121, with 3 illustrations. The Macmillan Company, 60 Fifth Ave., New York 11, 1948.

Pearl Lewis presents an elementary discussion of reasons why the body requires food; which foods contain nutrients essential for health, and representative diets for normal persons of different age groups. The book is written for the layman. The untrained housewife will find it particularly helpful in planning and preparing well balanced meals. Miss Lewis was formerly in charge of the dietary department of the Kahler Hospital and Hotel.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

INFLUENZA VACCINE

To the Editor:—What is the status of immunization with influenza virus vaccine? Is there any point in giving mixed influenza virus vaccine, and, if so, what products are now available and when should they be given?

Shepard G. Aronson, M.D., New York.

Answer.—Influenza virus vaccine has been shown to have definite effect in the protection against influenza, type A and type B. However, in 1947 the strain which appeared was somewhat different antigenically, and the vaccine employed at that time had little influence. Since then a representative strain of that group (A′) has been incorporated in the vaccine and one can anticipate that it should also be beneficial. In view of previous results the vaccine might well be of some aid in the prevention of influenza. Influenza virus vaccines are prepared by a number of commercial firms and are all licensed by the National Institute of Health by the same standards. Probably it would be more effective to administer the vaccine in October or thereabouts, in order to obtain any effect before an epidemic should appear.

ROCK WOOL

To the Editor:—For the past six months a patient has had chronic bronchitis. He states that it started after lathing a building in which "rock wool" was used as insulation material. Several times this material fell in his face and he had a "coughing spell." Roentgenograms of his chest show numerous spots, which might be foreign material in his lungs. Sputum is negative for acid-fast bacilli. Could such insulation material produce acute laryngitis followed by bronchitis? What treatment is indicated? As this case may become a legal matter I need help in making the correct decision.

J. Guild Wood, M.D., Weatherford, Okla.

Answer.—Insulating rock wool is a manufactured complex glassy silicate. Its content of free silica is insignificant, and other constituents are incapable of producing any harmful pneumonoconiosis akin to silicosis. After prolonged and extensive exposure to rock wool dust, the most that might arise would be "benign pneumonoconiosis." The extent of exposure implied in the query is casual and negligible. Gross exposure to any particulate substance on an accidental basis might induce minor and temporary inflammation along the respiratory tract on a mechanical basis. Fairhall and his associates (*J. Indust. Hyg.* **17**:263 [Nov.] 1935), from their investigation of properties of rock wool conclude:

> The chemical data thus obtained entirely deny the existence of any hygienic hazard in connection with contact with commercial rock wool of the type investigated. The histological examination of the lungs, liver and kidneys revealed no constant or significant pathological changes. In the dusted cats there was evidence of inhalation of considerable quantities of silicate and the accompanying changes in the lungs were those which one might expect such foreign matter to produce.

So far as rock wool is involved in the present instance, no treatment is indicated and the prognosis is unequivocally good.

RETINITIS PIGMENTOSA

To the Editor:—Is retinitis pigmentosa hereditary, and should one with this disease be advised not to have children? What advances have been made in treatment of this disease?

M.D., New Jersey.

Answer.—Retinitis pigmentosa is chronic slowly progressive degeneration of the retinal neuroepithelium, rods and cones, with migration of pigment granules into the empty retinal spaces and connective tissue hyperplasia. Symptomatically it is characterized by night blindness, progressive disturbances of the visual field, usually in the form of a ring scotoma and optic atrophy, and typical widespread visible pigment deposits in the substance of the retina. The disease slowly progresses to blindness, with frequent remissions and recovery of function. The cause of the condition is not known. Levy-Wolff (Pathogenesis of Retinitis Pigmentosa, *Am. J. Ophth.* **23**:275-285 [March] 1940; 418-322 [April] 1940) considers the condition primarliy a vascular disease due to a hypothalmic disturbance. Brown and Whitney (Peripheral Vascular Picture in Retinitis Pigmentosa, *Arch. Ophth.* **24**:984, 1940) found a generalized disturbance of the capillary system, to which they attributed the disease. It may be inherited as a dominant characteristic, affecting either sex, as a sex-linked recessive transmitted by females and affecting only males or as a recessive trait. No reliable eugenic advice as to the possibility of transmission to the next generations can be given until the nature of the pedigree has been worked out. An impressive number of pedigrees have been determined (Duke-Elder, W. S.: Text-Book of Ophthalmology, St. Louis, C. V. Mosby Company, 1941, vol. 3, pp. 2,765-2,792), and the condition is considered as being universally inherited even when other cases in the immediate family cannot be identified.

There is no specific treatment. Methods involving vasodilation by drugs or section of the ocular sympathetic nerves have been favored because of the obvious vasoconstriction of the retinal arterioles, but there is no evidence of permanent improvement. Gordon (Treatment of Retinitis Pigmentosa, with Special Reference to Filatov Method, *Am. J. Ophth.* **30**:565 [May] 1947; The Experimental Treatment of Retinitis Pigmentosa, *Tr. Amer. Acad. Ophth. & Otolaryng.*, p. 191 [Jan.-Feb.] 1948) treated a number of patients with the widely publicized Filatov method, without beneficial results. The remissions which occur normally in the course of the disease have led to many enthusiastic reports, but as yet nothing is known that will cause permanent improvement.

HIRSUTISM

To the Editor:—What is the best advice that I can give a mother who is worried about hirsutism of the arms and legs of her two young daughters, aged 8 and 6 years? The children are apparently healthy and normal, though the older is already beginning to have pubic hair.

R. L. Bohannon, M.D., Salina, Kan.

Answer.—It is difficult to answer this inquiry with certainty, as the tendency to hypertrichosis depends on the peculiar constitution of each person. Certain endocrine disturbances, such as hypothyroidism or hyperthyroidism, tumor of the adrenals, the ovaries or the pituitary, are associated with excessive hair growth. In others, pathologic disturbance associated with hypertrichosis is absent. This group has been thoroughly studied by many investigators, but their conclusions remain suppositions. Hypertrichosis runs in families. Therefore, one should delve into family history before coming to conclusions. If both of these children are normal and healthy and familial tendency toward hirsutism is absent the chances are that the children will have normal distribution of hair, although this cannot be absolutely determined at present.

FRÖLICH'S SYNDROME

To the Editor:—I have 2 boys, aged 14, identical twins, with Frölich's syndrome. Both have feminine contours, gynecomastia, extreme obesity and genu valgum. The testicles are descended but small. The penis in both boys is small. There is no axillary or pubic hair. They are listless, sluggish and unaggressive. The basal metabolism is minus 30 per cent; roentgenograms of the pituitary fossa reveal no abnormalities. I have them on a reducing diet (1,100 calories) and ½ grain thyroid daily. Please advise on the use of gonadotropins—the kind, the amount and frequency of administration.

M.D., Illinois.

Answer.—One of the most urgent needs with these patients is careful use of diet and thyroid. The diet should be generously adequate in its supply of high quality protein and of all recognized vitamins, since caloric restriction must be employed and may be required indefinitely.

Since only basal metabolism test data are submitted as evidence of the possible need of thyroid, serum cholesterol determination while thyroid has not been employed for at least three weeks is suggested. Also, bone age records should be obtained from the hands or the feet and from the epiphyses at the upper end of the femur. Progress in reducing an unduly high cholesterol content and in accelerating the maturing of the bones will be useful as criteria for the proper dosage of thyroid in the future. Unless the bone maturity is delayed and the cholesterol level is elevated above normal limits, it is possible that little will be achieved by the use of thyroid in spite of the low basal metabolic rate. Nevertheless, thyroid should be employed as facilitating the treatment of these patients.

It may be wise to omit treatment with gonadotropins in 14 year old twins of this type until one sees how much can be achieved by dietary control plus or minus thyroid for a period of six to twelve months. Adolescent development need not be expected just at this time. In case there is a decision either now or later to use gonadotropins, the one of most demonstrated benefit will be the chorionic gonadotropin derived from extracts of urine of pregnant women. Such material would be administered hypodermically in doses varying from 100 to 500 units three to seven times per week. The duration of treatment and size of the dose would be determined by the rate of growth of the testicles, the penis and possibly the prostate. The prostate may be expected to enlarge with effective therapy of this type. It may be wise to give such treatment in cycles of four weeks with treatment, allowing two to four weeks without treatment, rather than continuously. On this matter there is still some difference of opinion.

INCREASED SEDIMENTATION RATE

To the Editor:—I am 64 and have a systolic pressure of 152 and diastolic 106. Examination shows enlargement of the left side of the heart, but no chronic infection. Roentgenograms reveal no dental infection; my tonsils have been removed; the prostate gland is normal, and roentgenograms of the gastrointestinal tract reveal no abnormalities except for some colon atony. What is the explanation of a sedimentation rate of 38?

M.D., California.

Answer.—In general, the sedimentation rate is normal in uncomplicated hypertension with enlargement of the heart; it may increase with congestive failure, but there are apparently no signs of this. Comparable to the body temperature and the leukocyte response, the sedimentation rate test is a nonspecific test for the presence, usually, of tissue injury. An elevated sedimentation rate is usually correlated with an increase in the concentration of plasma fibrinogen. Occasionally, the increased sedimentation rate is correlated with an increase in the concentration of the serum globulins. It is suggested, therefore, that a determination be done of the total serum albumin and total serum globulin using the Howe method for separation of albumin and globulin, employing 22.5 per cent sodium sulfate. Another simple procedure is formol-gel test: add 1 drop of 40 per cent formaldehyde to 1 cc. of serum and allow the well mixed reagents to stand at room temperature twenty-four hours, after which it is read for jellification. If jellification occurs, the serum globulins are abnormal. The serum globulins may be elevated in such conditions as chronic hepatic disease, certain chronic infections and in multiple myeloma. Not infrequently, the sedimentation rate is observed to be elevated for no apparent cause and may be a sequel to a mild infection with slow decrease of the sedimentation rate following the infection. Therefore, it is well to repeat the sedimentation rate test at weekly intervals for a month to see whether or not it decreased spontaneously.

TARNIER AXIS TRACTION

To the Editor:—Are the Tarnier axis traction forceps considered obsolete and, if not, are any of the better obstetricians using them in preference to a cesarean in delay at the pelvic inlet?

Eugene C. Lowe, M.D., Miami, Fla.

Answer.—The Tarnier axis traction forceps is still used by some obstetricians. Stander (Williams Obstetrics, ed. 7, New York, D. Appleton Century Company, Inc., 1945, p. 1,030) says, "We usually employ the Tarnier forceps using the traction rods or not according to circumstances, as we believe it better to become thoroughly familiar with one instrument than to have several for use under difficult conditions." On the other hand, the following statement appears in the De Lee-Greenhill "Textbook of Obstetrics," W. B. Saunders Company, ed. 9, Philadelphia, 1947, p. 900):

> Axis-traction is not universally recommended by obstetric authorities. We cannot share the enthusiasm of some obstetricians for axis-traction forceps. By means of Pajot's maneuver the head can be given a direction which a knowledge of the mechanism of labor will indicate; by careful observance of the tendencies of movement which the forces of nature impart to the head one can determine in which way to apply traction and one can aid one or the other as required. With the axis-traction device there are so many joints between the hand and the head that it is impossible to impress on the latter any specific motion. All the knowledge one has accumulated regarding normal and abnormal labor mechanisms goes for naught and all one can do is to pull blindly on the cross bar. In actual practice, when we have used both instruments on the same case, we have been better satisfied with the simple Simpson forceps and we seldom use any other. The Tarnier instrument has a murderous cephalic curve; cognizance of this should be taken when the handles are being screwed together, otherwise a large number of dead and injured children will result. In all axis-traction instruments there is the possibility of the curved arms or the joints bending or breaking under the force applied. De Lee witnessed three such accidents.

Practically no obstetrician willingly applies forceps for delay at the pelvic inlet because this is a high forceps operation which carries with it danger to both mother and baby. Cesarean section is definitely indicated in such cases.

LABOR IN DIABETIC PATIENTS

To the Editor:—Is premature induction of labor in a diabetic patient considered advisable? If so, when is it to be performed?

R. W. Merrill, M.D., Morris, Minn.

Answer.—One cannot be dogmatic when it comes to the treatment of pregnancy combined with diabetes. Some believe that diabetes can be adequately controlled in pregnancy, whereas others advocate the use of estrogens and progesterone plus the treatment of the diabetes. All agree that the incidence of toxemia is greater with diabetes, with concomitant serious hazards to the fetus. Babies of diabetic mothers are likely to be larger, with increased hazard due to disproportion between the baby and the mother's pelvis. For these reasons, some recommend premature induction of labor or cesarean section in these cases. Several factors in these cases are of importance: (1) A diabetic mother, if the disease is not under control, is a serious operative risk; (2) if the mother is toxic she is a much poorer risk for surgery; (3) a premature infant is a serious problem at best, and, when born of a diabetic mother, it is a still greater problem, and (4) a premature infant does not stand labor well, particularly through a poorly prepared cervix and perineum. A diabetic mother should be watched metriculously and constantly during pregnancy, from the point of view of her diabetic control and the development of toxemia. Section or induction of labor by rupture of membranes in a diabetic mother should be done only if it is the only way to ensure a live mother and baby. Medical induction may be tried if thought necessary *and if the cervix seems soft.*

DIET AFTER NEPHRECTOMY

To the Editor:—What specific diet should a patient observe after nephrectomy? A white woman, aged 36, underwent this operation in July 1948, because of chronic pyelonephritis on the right side which had begun as pyelitis of pregnancy eight years previously. Severe attacks of renal pain during the last six months necessitated the operation. The left kidney is normal. The patient is without other disease. She has had no postoperative complications, and she has had no pyuria since the operation.

M.D., Nebraska.

Answer.—In the absence of other indications for modification of diet, such as obesity, malnutrition, hypertension or renal functional impairment, the diet of a patient after nephrectomy should be normal.

"WILD CARROT" TEA

To the Editor:—A diabetic patient claims that "wild carrot" tea has helped her diabetes. She has increased her diet while taking this tea and her glycosuria has disappeared. Is this not due to a raised renal threshold to glucose produced by the "wild carrot" tea?

M.D., Ohio.

Answer.—Plant extracts have been advocated in the treatment of diabetes, but so far as is known no formal test has demonstrated that any of these extracts are of value. Obviously, before one accepts the statement of a patient that a preparation is of use in diabetes, one should conduct an experiment preferably with a diabetic animal. It should be placed on a definite diet and insulin dosage for a period sufficiently long so that the metabolism is constant, then one can add the material to be tested for a week or more and note the results and thereafter follow this period with another period of observation as a control. To accept the opinion of a patient without such criteria will lead to many false conclusions.

OBSTETRIC ANALGESIA

To the Editor:—The literature cautions against use of obstetric analgesics during the last half of labor. An accurate estimation of this time factor, in my experience, is impossible. What harmful effect on the baby is apt to occur if say 4½ grains (0.29 Gm.) of "nembutal" (pentobarbital sodium) and 1/150 grain of scopolamine hydrobromide are given within one or two hours preceding delivery?

Glenn T. Howard, M.D., Pearsall, Texas.

Answer.—One must face the fact that any narcotic or analgesic given to the mother within one-half to two hours of delivery may, but does not necessarily, suppress the respiratory center of the fetus as it does in the mother. Some of these infants are difficult to revive. No one can predict delivery by the clock: one can only try not to give sedatives except perhaps gas unless the delivery is expected to be at least two hours away. When not sure, either give nothing or give repeated small doses of sedative. In the case cited, if the time of delivery could not be estimated, 1½ grains (0.0975 Gm.) of "nembutal" repeated would be safer than 4½ grains at one time. Patients are difficult to control when under the influence of scopolamine bromide.

Everything else being normal, that is, pelvis, size of baby and strength of pains, one can reasonably expect a half-hour

ANESTHESIOLOGY WITHIN THE VETERANS ADMINISTRATION

Chairman's Address

RALPH M. TOVELL, M.D.
Hartford, Conn.

Rather than discuss in general terms the present status or future of the specialty, I have elected to report on progress in anesthesiology within the Veterans Administration. It seemed that this occasion was an auspicious one to outline developments in a governmental organization where revolutionary changes in practice have occurred within the last two years. Prior to the appointment of General Omar N. Bradley as Administrator and Major General Paul R. Hawley as Chief Medical Director, medical organization within the agency had improved little since World War I. Throughout the years between World War I and II neither physicians nor technicians specializing in anesthesiology were employed on a full time basis.

With the enactment of Public Law 293 by the Seventy-Ninth Congress on Jan. 3, 1946, establishing a department of medicine and surgery in the Veterans Administration, the foundation was laid for a far reaching reorganization of facilities for medical care. The objective was to provide medical care second to none for veterans and at the same time provide facilities for teaching and training of medical personnel returning to civilian life after World War II. By this law, physicians, dentists and nurses were no longer subject to the rules and regulations of the Civil Service, although they were to receive the benefits of the Civil Service Retirement Act of May 22, 1920, as amended. Basic requirements for physicians eligible for employment were outlined as follows: (1) citizenship in the United States, (2) graduation from a school of medicine approved by the Administrator, (3) license to practice as a physician in a state or territory of the United States or in the District of Columbia, (4) adherence to the physical requirements of the department and (5) professional qualifications to meet accepted national standards. A new scale of salaries commensurate with training and experience was established. Specialists certified by the American specialty boards and the Veterans Administration were to be paid an additional 25 per cent of base pay up to a limit of $11,000 per year. It is well to emphasize that anesthesiologists were accorded opportunity equal to that of other specialists in reference to income which they might receive. This situation was one of unique advantage to our specialty. The trend toward all too frequent exploitation was avoided. Coupled with this advantage, there was the opportunity and responsibility to provide service to patients and training for residents. The degree to which these responsibilities have been assumed is a measure of success and, at the same time, it is a measure of the need for continuing effort toward an ideal.

The organization of the office of the Chief Medical Director included Professional Services, made up of a representative from each of the specialties of medicine and surgery. Each member is known as a director of his particular division or section. The majority of these persons are part time employees, but in the central office there is a full time cadre who carry on routine business, put into effect the policies promulgated by the division and maintain close contact with all members of the division in order to provide coordination of effort. A parallel organization now exists in each of the thirteen branch offices, and for each branch a branch section chief of anesthesiology has been appointed. These men have unstintingly diverted their efforts from their practices and have given excellent service. In both central and branch offices, the professional service division is operational as well as advisory. Its members visit hospitals to insure adherence to approved practices. Branch section chiefs, when visiting hospitals, check on programs for teaching and contribute to those programs by conduction of clinics and seminars. Their duties, in addition, include evaluation of professional personnel, giving advice on appointments and transfers and procurement of equipment and supplies. Policies regarding construction and remodeling of hospitals are usually accomplished by joint action of the members of the division. Opportunity has been afforded for meetings of branch section chiefs of anesthesiology, at which problems are discussed and policies established.

It has been a policy for each general medical and surgical hospital to organize a section on anesthesiology with a chief or acting chief in charge. His duties are to provide coverage in anesthesia, inhalation and intravenous therapy, blood transfusions and diagnostic and therapeutic procedures anesthetic in nature. These duties include preoperative evaluation of patients and administration of preliminary medication and anesthetics, followed by postoperative care of patients whose condition is referable to anesthesia.

Public law 293 authorized establishment of a system of residencies. Through the activities of the chief of the division of research and education, liaison has been effected with medical schools to provide part time consultants and attending physicians in each specialty to nearby Veterans Administration hospitals. This arrangement has worked well and has been particularly advantageous in helping to bridge the gap between

demand and supply of anesthesiologists in terms of coverage of the constantly increasing work load and in terms of teaching and training of residents. It is interesting to note that as of Jan. 31, 1948, twenty-five hospitals had received temporary approval for residency in anesthesiology. Sixty-three residents were enrolled; one full time employee was receiving training and twenty-nine vacancies existed.

As of March 5, 1948, five certified anesthesiologists were connected with hospitals as full time employees and forty-one other certified anesthesiologists were serving in the capacity of consultants or attending anesthesiologists on a part time basis. In addition, sixty-eight anesthesiologists were employed on a full time basis and twenty-four were cooperating as consultants or attending anesthesiologists on a part time basis. These men are progressing toward certification within the near or foreseeable future. The figures indicate a major change in coverage, but one cannot gloat over the improvement because many hospitals are still lacking the services of men well trained in the specialty. The situation is a challenging one, demanding our best efforts and utmost cooperation in providing adequate coverage. The need is acute, because officers in the Army and Navy assigned to the Veterans Administration are now completing their tours of duty. An appreciable number of these men have shown zeal and aptitude, and their services have been of real value. Their replacement will be difficult, but nevertheless it is imperative. Your cooperation in providing a solution to the problem is invited.

V A FORM 10-2822

Fig. 3.—Form for monthly report

In order for any program of training to be successful, it was realized that standard forms for recording each anesthetic administered were necessary. With the active cooperation of the branch section chiefs, such a form (figs. 1 and 2) was developed and made available to each hospital. Anesthetists attached to certain hospitals have requested permission to use other forms, embodying facilities for coding and punching. These requests have been granted. In all hospitals monthly reports (fig. 3) have been prepared on a standard basis and submitted to the central office for statistical evaluation. These reports have proved of value in determining distribution of work and in estimating needs for equipment and skilled coverage. Agents and methods employed during the last six months of 1947 are indicated in tables 1 through 5. These tables reflect the magnitude of the work and the distribution of agents and methods.

Comparison of specific supplementary methods employed in January 1947 with those in January 1948 reveals that endotracheal intubations increased from 815 to 1,120. Instances of employment of curare increased from 288 to 663. In January 1947, 5,672 transfusions and 2,217 units of plasma were administered, whereas in January 1948, 7,757 transfusions and 1,047 units of plasma were given. In the same months the total number of anesthetics increased from 12,830 to 16,425, whereas the total number of patients receiving oxygen therapy increased from 1,957 to 2,606. It is fair to state that, without increased skill in coverage, the change in work load to a much higher incidence of major operative procedures would not have been possible.

Last year at the Annual Session, this Section initiated an Anesthesia Study Commission, with the Chairman of the Committee empowered to report progress at this meeting. So far as the Veterans Administration is concerned, attempt has been made to cooperate by establishment of a parallel organization including each of the branch section chiefs as members responsible for the collection of data in their own areas. Mechanisms have been set up whereby each chief will be notified of untoward events occurring in hospitals, with responsibility resting with him to investigate each incident. It is the prerogative of each chief to establish an anesthesia study commission in his branch as the situation demands.

5. Rectal alone	0.1	45
6. Specified combinations	11.0	10,064

Throughout the year 1947 and continuing into 1948, monthly reports have included lists of complications occurring in each hospital. These lists are studied carefully by each branch section chief, and he is at liberty to investigate and recommend remedial measures aimed at prevention and correction. It has been a task of some magnitude to establish this system of reporting, and, at this time, it would be premature to attempt a detailed report correlating such factors as operation and anesthetic agents and methods employed, with complications including incidence of recovery and fatality. An unwarranted high incidence of untoward reactions to anesthetics topically applied preliminary to endoscopic examination of the larynx, bronchi, esophagus or stomach was noted. A technical bulletin on this subject was prepared and distributed. By this means, attempt was made to acquaint personnel with the relative hazards of agents and methods, and safeguards were promulgated. Likewise, a bulletin was issued dealing with the intravenous administration of fluids, the hazards of air emboli and their prevention. At the present time a bulletin is being prepared for issue on the subject of mechanical resuscitators and their operation, particularly for patients suffering from poliomyelitis. These efforts are a part of the educational program, and it is the intention to continue along these lines, enlisting the assistance of eminent educators interested in each topic prepared.

9. Other regional blocks	4.9	3,321

SUMMARY AND CONCLUSIONS

The Veterans Administration recognizes the need for adequate anesthetic coverage. Attempt has been made to provide it. A teaching program has been instituted, and progress of it has been fostered, by efforts in many directions. Libraries in hospitals have been augmented by procurement of carefully selected books. Anesthetists have been encouraged to attend meetings and participate by presentation of papers. A number of papers have been published, and others are in the process of publication. Exhibits have been prepared, one of which was shown at the Annual Meeting of the American Medical Association in 1947. It was our intention to have another exhibit for this meeting, but allocation

of space could not be effected. Accomplishments have been real, but ideals have not yet been achieved. Problems needing solution exist. The paramount one is procurement of personnel. The cooperation of the profession at large will be needed if success is to be attained. It is hoped that cooperation will be extended on a continuing but accentuated basis.

My gratitude and thanks are extended to the many working within the Veterans Administration and those participating on a part time basis for their valuable suggestions and advice and for their generous cooperation and untiring faithful effort.

ANTICOAGULANT THERAPY OF CORONARY THROMBOSIS WITH MYOCARDIAL INFARCTION

IRVING S. WRIGHT, M.D.
CHARLES D. MARPLE, M.D.
and
DOROTHY FAHS BECK, Ph.D.
New York

The possibility of preventing the extension of coronary thromboses and the development of mural thrombi in the presence of myocardial infarction by the use of anticoagulants was suggested by Solandt, Nassim and Best[1] in 1938. These investigators were able to prevent the development of both coronary thrombi and of intracardiac mural thrombi under conditions in which such thrombi are usually produced experimentally in animals, by the use of the anticoagulant, heparin. Their observations were not applied to human beings on any significant scale because of the difficulties and the risk felt to be inherent in the use of heparin clinically. In the years 1945 and 1946, Wright,[2] Nichol and Page[3] and Peters, Guyther and Brambel[4] reported encouraging results following the use of the anticoagulant "dicumarol" in the treatment of coronary thrombosis with myocardial infarction in human beings. These reports were preliminary in nature, since only small numbers of cases were reported. However, the uniformly favorable results appeared to justify a more extensive study of the use of anticoagulants in the treatment of coronary thrombosis.

Accordingly, in the spring of 1946, the Board of Directors of the American Heart Association authorized the formation of the Committee for the Evaluation of Anticoagulants in the Treatment of Coronary Thrombosis with Myocardial Infarction. This committee is composed of internists with special interest in cardiovascular diseases associated with the sixteen hospitals which have contributed cases to this study. Workers in several additional institutions have participated in an advisory or consulting capacity. The participating hospitals and the responsible investigators, the consultants and the staff from the central laboratory are listed in table 1.

Each investigator has been assisted by a team of residents, fellows and associates from his staff. Full credit must be accorded each of these workers, whose wholehearted cooperation has been indispensable to the success of this study. One thousand cases of coronary occlusion and myocardial infarction have been studied under the conditions of this investigation.

PLAN OF THE STUDY

Slightly fewer than one half of the 1,000 patients have been treated by conventional methods alone. The others have had anticoagulant therapy in addition to conventional treatment. A record of each case has been prepared in detail on master forms by the responsible investigator and his associates and forwarded to the central office of the committee at the New York Hospital. The master forms are being subjected to intensive statistical analysis, and a definitive report on the 1,000 cases will be prepared as promptly as the analysis will permit. The present report includes data obtained from analysis of the first 800 cases reported to the central laboratory. Although it is possible that the addition of the last 200 cases, and other later revisions, may change the figures somewhat, it is unlikely that the conclusions will be altered significantly, since the relationship of the control and treated groups as to deaths and thromboembolic complications has remained relatively stable as the sample has increased in size.

Three hundred and sixty-eight patients admitted to the participating services on even days received conventional therapy and constitute "the control group." Four hundred and thirty-two patients admitted on odd days received anticoagulants in addition to conventional therapy and constitute "the treated group."

The principles used as guides in the administration of "dicumarol" and heparin were as follows:

(*a*) Heparin may be given for the first forty-eight hours or more if desired.

(*b*) Prothrombin determinations are to be done each day, and no "dicumarol" should ever be ordered unless the morning prothrombin report is available.

(*c*) "Dicumarol" in the amount of 200 to 300 mg. daily should be given until the prothrombin time is 30 seconds.

(*d*) "Dicumarol" in the amount of 50 to 100 mg. daily should be given if the prothrombin time is between 30 and 35 seconds.

(*e*) "Dicumarol" is withheld if the prothrombin time is 35 seconds or more. Then, no drug is given until the prothrombin time is again down to 30 seconds or less, after which the drug is again given cautiously in 100 mg. doses.

(*f*) The Link-Shapiro technic, with undiluted whole plasma, or the Quick method is to be used for determining the prothrombin clotting time, and it is suggested that the Link-Shapiro method with 12.5 per cent diluted plasma be employed as an additional check or safeguard. All prothrombin times are given in terms of the Link-Shapiro (undiluted) method.

(*g*) Unless contraindications arise, the "dicumarol" therapy is to be continued in the chosen cases over a minimum period of thirty days, preferably thirty days after the last thromboembolic episode.

(*h*) In instances of hemorrhagic manifestations, the use of synthetic vitamin K preparations, in doses of 60 to 75 mg., and transfusions of fresh whole blood (may be citrated) are recommended.[5]

A comparison of the patients in the "control" group with those in the "treated" group shows a striking similarity in regards to age, history of previous infarction and estimated severity of the present attack, as shown in table 2. The average age in the control group was 60 years and that in the treated group 59 years. The average age in the control group of male patients was 58.9 years and that in the treated group 57.2 years. For the female patients the average age in the control

group was 64.1 years and in the treated group 64.6 years. In this series of 800 cases, the average for female patients was approximately 6.4 years more than that for the male patients.

In analyzing the two groups for a history of one or more previous infarctions, it was observed that 24 per cent of the control group and 22 per cent of the treated group had had one or more previous infarctions.

An estimate of the severity of the attack was made for each patient at the time of diagnosis and recorded as mild, moderate or severe. Twenty-three per cent of the control group and 30 per cent of the treated group were classified as having severe attacks. Although this classification is admittedly arbitrary, the results suggest that the treated group contains a somewhat greater proportion of severely ill patients. The control and treated groups were also closely similar when the medical histories of cardiovascular diseases and the locations of their original infarcts were compared.

Table 2.—*Composition of Sample* *

Item Compared	Control Group (Even Days)	Treated Group (Odd Days)
Number of cases	368	432
Average age	60 yr.	59 yr.
Proportion male	77%	76%
One or more previous infarctions	24%	22%
Illness "severe" at onset	23%	30%
Anticoagulant therapy received (exceptions as noted)	88% no anticoagulants; 12% some anticoagulants (primarily after complications)	81% "dicumarol" without heparin; 14% "dicumarol" plus some heparin; 3% no anticoagulants because of renal or hepatic disease or hemorrhage; 2% no anticoagulants because of miscellaneous errors

* Total group: 800 patients with coronary occlusion with myocardial infarction surviving the first day of hospitalization.

Eighty-eight per cent of patients in the control group received no anticoagulant, but 12 per cent did receive some anticoagulant therapy, often for short periods only. Anticoagulants were administered to patients in the control group following the development of a thromboembolic complication in 3 cases out of 5 and in the remaining cases because of pressure on the part of the family or a private physician[6] or miscellaneous reasons. Of the treated group, 81 per cent received "dicumarol" only, while 14 per cent received "dicumarol" and some heparin. In 3 per cent of the "treated" patients no anticoagulants were given because of concurrent renal or hepatic disease or because of hemorrhagic conditions, and 2 per cent received no anticoagulant because of miscellaneous errors.

In the computation of the rates on which all of the charts are based, small and conservative corrections were made in order to simplify the presentation. In the control group the rates are corrected for exceptions to the "no anticoagulant" rule. Rates as shown are those which it is estimated would have occurred if no subject in the control group had received any anticoagulant. They differ only slightly from the data as actually reported and are believed to present a truer picture of rates without anticoagulants. In the treated group the rates are corrected for erroneous omissions of anticoagulants. There is evidence that with more intensive and inclusive anticoagulant therapy, the rates for death and complications in the treated group would have been lower than those shown. No correction was made for those patients from whom anticoagulants were withheld because of specific contraindications. These omissions are considered to be disadvantages inherent in this type of treatment.[7] In both groups all rates for thromboembolic complications and hemorrhagic manifestations, as stated in this interim report, refer to conditions diagnosed clinically. Statistics based on postmortem observations were not yet available at the time of writing, but were being analyzed.

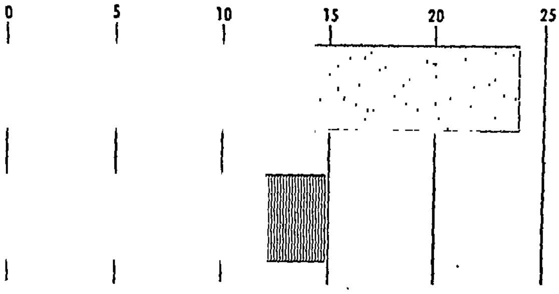

Fig. 1.—Percentage of deaths in the control and treated groups studied, indicated by the horizontal row of figures at the top. The upper bar shows results in the control group (24 per cent), and the lower bar in the treated group (14.9 per cent), one-third fewer deaths than in the control group. The hatched areas indicate deaths after one or more thromboembolic complications, and the darkened areas indicate deaths not preceded by a thromboembolic complication.

Figure 1 illustrates the contrast between the death rates in the control group and in the group that received anticoagulant therapy. Twenty-four per cent of the control patients died, whereas 15 per cent of the treated patients died. Thus, somewhat more than one third of the subjects who would have died without anticoagulant therapy survived the specific attack under consideration when anticoagulants were given. This difference is statistically significant.[8] Further examination indicates that the greatest improvement was achieved in patients who had suffered one or more thromboembolic complications prior to death. Such deaths occurred in roughly 10 per cent of the control group, but in only 3 per cent of the treated group. Death not preceded by a clinically recognized thromboembolic complication occurred in approximately 14 per cent in the controls as against 12 per cent in the treated group. As previously anticipated, anticoagulants reduced the death rate largely by reducing the incidence of those thromboembolic complications which, directly or indirectly, result in death.

---

[6] This factor became intensified as the study progressed.

[7] These corrections were made by assuming that if anticoagulants had been completely withheld from all control patients receiving anticoagulants they would have experienced at least as many further complications and would have died at least at the same rate as did control patients of comparable age who received no anticoagulants at any time in approximately comparable circumstances. If actual rates for subgroups among these patients for whom exceptions were made did not already exceed these estimates, the estimates were substituted for the actual data for these particular subgroups. An appropriate modification of this correction procedure was applied in the case of the treated group and for hemorrhagic manifestations in both groups. The resulting corrected figures are portrayed graphically and referred to in the text without reference to the corrections or to the exceptions in treatment. The corrections for exceptions proved to be small and sometimes were completely without effect on the rates. They do not alter at any point the basic differences between the groups from which conclusions are drawn.

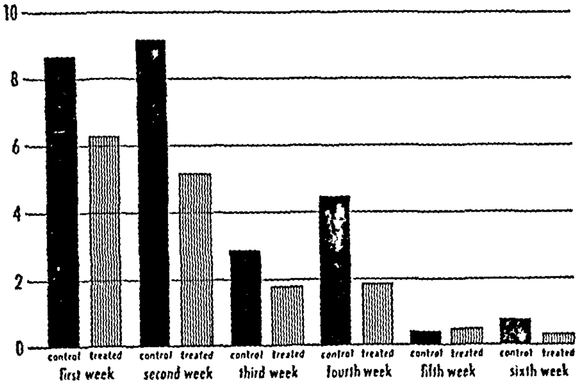

Fig. 2.—Death rates by week of illness. The number of deaths per hundred survivors from the previous week is shown in the vertical column of figures on the left.

The death rates by weeks of illness, as shown in figure 2, were highest during the first two weeks, but were still considerable during the third and fourth week. For each period the death rate for the control patients was observed to be significantly greater than that for the treated group. These figures indicate that anticoagulant therapy, if not used before, should be begun even as late as the second or third week after a myocardial infarction has occurred—or later if complications have developed—and, secondly, that, to give maximal protection, anticoagulant treatment should be continued for at least four weeks after the last thromboembolic episode.

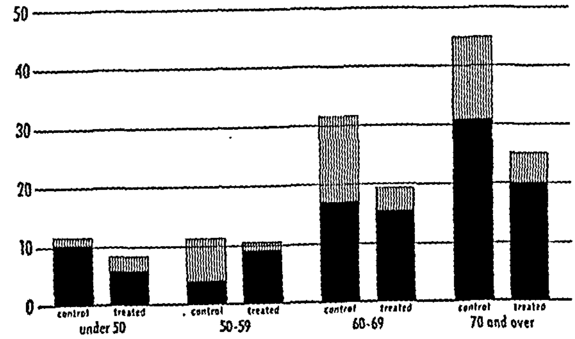

Fig. 3.—Death rates by age groups. The percentage of patients who died is shown in the vertical column of figures. The darkened areas indicate deaths not preceded by a thromboembolic complication, and the hatched areas indicate deaths after one or more thromboembolic complications.

Figure 3 presents the death rates by major age groups. The greatest benefits in the reduction of the mortality rate are in patients 60 years or older. These statistics show that the therapeutic effect of anticoagulants is sufficiently important that they should be used in the older age groups. Hemorrhagic complications have been so few and so mild throughout the entire study and the benefits of treatment of the older age group are so pronounced that we do not hesitate to prescribe anticoagulants for older patients. It should be recognized, however, that older patients have a higher incidence of unrelated complications and that careful consideration of such factors is mandatory. While the crude death rates for patients under 59 in both the treated and the control group did not show a significant difference, it will be seen in figure 6 that the incidence of thromboembolic complications is high in these age groups and that the treated patients show a much lower incidence of thromboembolic complications. Such thromboembolic complications may not only be serious incidents in themselves, but they may result in such serious permanent disabilities as hemiplegia (following cerebral emboli), chronic venous insufficiency (following thrombophlebitis) or residual myocardial damage (following repeated myocardial infarction).

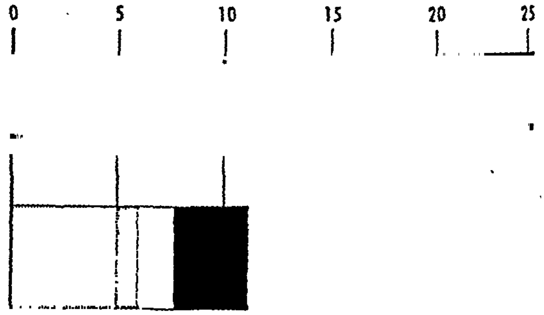

Fig. 4.—Percentage of cases in which one or more thromboembolic complications developed and the time when the complications occurred. Cases were classified by the status of anticoagulant therapy at the time of the first complication. The upper bar is of the control group and the lower bar of the treated group. The horizontal row of figures at the top indicates the percentage. The checked areas indicate complications occurring after the third day of anticoagulant therapy; the dotted areas indicate complications occurring during the first three days of anticoagulant therapy, and the darkened areas indicate complications occurring while the patient was not receiving anticoagulants.

Figure 4 shows the [illegible] of cases in which one or more [illegible] developed. In 25 per cent of the control patients, in contrast to only 11 per cent of the treated patients, at least one such complication developed. This difference is statistically significant. However, of these treated patients, 3.5 per cent presented their first complication before they had received anticoagulants[9] and 1.5 per cent presented their first thromboembolic complication during the first three days of anticoagulant therapy, before "dicumarol" is ordinarily fully effective. Thus 5 per cent presented thromboembolic complications when anticoagulant therapy could not have been fully effective and only 6 per cent presented thromboembolic complications while they were actually under the full effect of anticoagulant therapy.

The number of thromboembolic complications per hundred cases is presented in figure 5. Among each hundred cases in the control group, thirty-six thromboembolic complications were diagnosed clinically.

---

[8] The term "statistically significant" is used throughout the text to mean that the chances that two random samples from the same population would yield on the basis of chance alone differences as great as those observed and in the same direction are less than 1 in 100. In most instances the chances of obtaining these differences in two samples from the same universe are in fact much less than 1 in 100—in the case of thromboembolic complications, less than 1 in a 1,000.

[9] Included in this group are those who never received anticoagulants because of contraindications.

whereas among each hundred cases in the treated group, only fourteen thromboembolic complications were so diagnosed. In other words, the patients in the "treated group" experienced slightly more than one third as many thromboembolic complications as did the control group, a contrast that is again highly significant statistically. This contrast is further emphasized by the following facts. It is noted that five thromboembolic complications per hundred cases developed while the patients were not receiving anticoagulant therapy and two and five-tenths thromboembolic complications per hundred cases developed during the first three days of anticoagulant therapy when "dicumarol" is not considered efficacious. Actually, then, only six and five-tenths thromboembolic complications per hundred treated patients occurred in patients who were receiving the full therapeutic effect of anticoagulant therapy. This figure includes complications in some patients whom we would not now consider to have been having adequate treatment at the time the complication occurred. Autopsies were conducted on 48 per cent of the patients who died among the 800. The autopsy records for these cases are being studied intensively and will yield further light on the effects of anticoagulant therapy on thromboembolic complications.

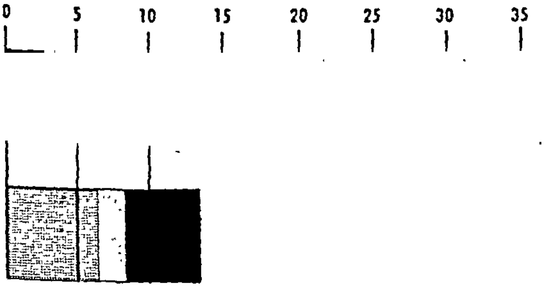

Fig. 5.—Number of thromboembolic complications. The upper bar is of the control group and the lower bar of the treated group. The horizontal row of figures at the top indicates the number of complications per hundred cases. The dotted area indicates the complications occurring during the first three days of anticoagulant therapy; the checked areas indicate complications occurring after the third day of anticoagulant therapy, and the darkened areas indicate complications occurring while the patient was not receiving anticoagulants.

The highest incidence of thromboembolic complications among the control cases occurred in the age group between 50 and 59 (fig. 6) in distinct contrast to the death rate by age groups (fig. 3). The explanation for this contrast may be that, while the younger patients suffer numerous thromboembolic complications and while some of these complications result in serious damage, the younger patients are able to survive them. Thus a person under 60 may have three or four thromboembolic complications without a fatal episode, whereas an older patient may succumb to the initial attack and hence not have an opportunity of experiencing repeated thromboembolic attacks. This chart clearly indicates the value of anticoagulant therapy in preventing thromboembolic complications in all age groups. Within the treated group, a distinction is made between patients actually receiving anticoagulants and those who were not receiving anticoagulants at the time of their thromboembolic complications. This further emphasizes the effects of anticoagulant therapy.

In figure 7 the rate of thromboembolic complications by week of illness is considered. The advantage in using anticoagulants is clearly demonstrated for each of the first four weeks of the illness. As is the case with deaths, the incidence of thromboembolic complications is highest in the second week, but is significant throughout the first four weeks. This, again, clearly indicates the importance of beginning anticoagulant therapy even as late as the second or third week following a myocardial infarction. Since it is impossible to predict from the condition of the patient during the first week whether thromboembolic complications will develop during subsequent weeks and whether the patient will die from them, it is important to give anticoagulants to all patients with coronary occlusion and myocardial infarction unless specific contraindications exist.

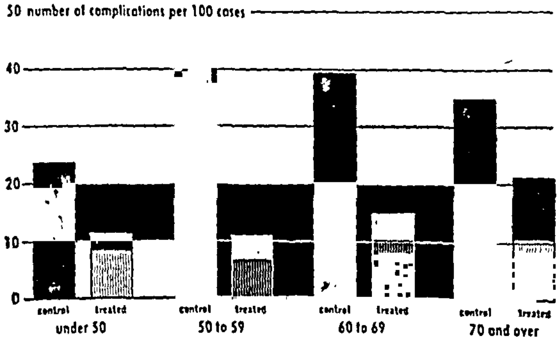

Fig. 6.—Number of thromboembolic complications by age groups. The hatched areas indicate the complications occurring during anticoagulant therapy, and the darkened areas indicate the complications occurring while the patient was not receiving anticoagulants.

Figure 8 indicates the types and locations of thromboembolic complications as they were encountered and the effects of anticoagulant therapy in each group. Under the classification of secondary myocardial infarctions, there was evidence of extension of the original thrombosis in 9 cases per hundred in the controls, as against 2 cases per hundred in treated patients. There was infarction of new areas in the myocardium in 6.5 cases per hundred in the controls, as against 2.5 among treated patients. Pulmonary emboli occurred in 9.4 cases per hundred among the controls, as against 5.2 cases among the treated subjects. Moreover, half of the so-called treated patients were not actually receiving anticoagulants at the time they suffered their pulmonary embolus. Cerebral emboli occurred in 3.4 per hundred of the control patients, as against 1.4 per hundred among the treated patients. Peripheral emboli developed in 3 per hundred of the control group, as

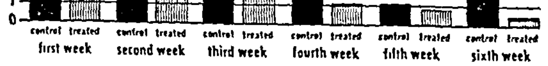

Fig. 7.—Number of thromboembolic complications by week of illness. The vertical column of figures shows the number of complications per hundred survivors from the previous week. The hatched areas indicate the complications occurring during anticoagulant therapy, and the darkened areas indicate the complications occurring while the patient was not receiving anticoagulants.

against 1 per hundred of the treated group, and venous thromboses occurred in 5 per hundred of the control patients as against less than 2 per hundred of the patients. Hence it will be seen that at every site and with every type of complication, those receiving anticoagulant treatment in addition to conventional treatment had a distinctly better chance of escaping thromboembolic complications than those who received the conventional forms of treatment only.

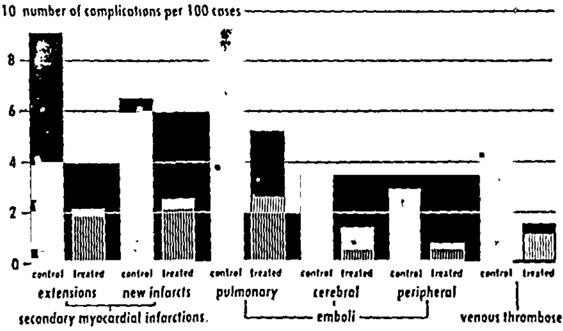

Fig. 8.—Types and locations of thromboembolic complications. The hatched areas indicate the complications occurring during anticoagulant therapy, and the darkened areas indicate the complications occurring while the patient was not receiving anticoagulants.

The hazard of hemorrhagic manifestations resulting from anticoagulant therapy has been carefull reviewed (fig. 9). It should be noted that hemorrhagic manifestations unrelated to anticoagulants numbered 6 per hundred in the control group. This is in comparison to a rate of slightly more than 12 per hundred cases among those patients who were classified as "odd day," or "treated," patients. It should be noted, however, that of these complications in the latter group, two in twelve developed in patients who were not receiving anticoagulants when their hemorrhages occurred. In an additional three in twelve complications the hemorrhages were known to be due to causes other than anticoagulant therapy and not aggravated by that treatment. The total hemorrhagic manifestations in the treated group which are known to have been due to causes other than anticoagulants approaches that observed in the control group. An additional seven complications per hundred cases, however, were believed to be due to, or aggravated by, anticoagulants. The incidence of

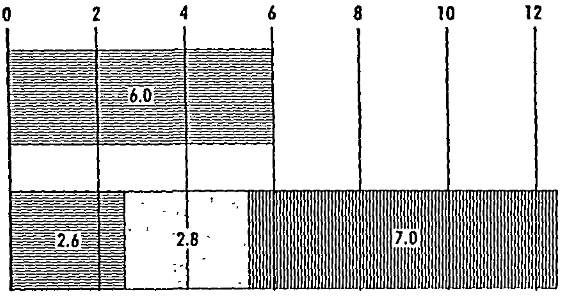

Fig. 9.—Relation of hemorrhagic manifestations to anticoagulants. The upper bar is of the control group and the lower bar of the treated group. The hemorrhagic manifestations were mild in 50 per cent of the cases. The horizontal line of figures at the top shows the number of hemorrhagic manifestations per hundred cases. The areas with vertical hatching indicate that the hemorrhagic manifestations were due to or aggravated by anticoagulant therapy; the dotted areas indicate occurrence while the patient was receiving anticoagulants but due to other causes, and the areas with horizontal hatching show occurrence when no anticoagulants were being given.

severe hemorrhages resulting from anticoagulant therapy was extremely low. Of the thirty hemorrhages clinically observed, fifteen, or 50 per cent, were mild in severity, fourteen, or 47 per cent, were moderately severe and only one (3 per cent) was severe. The postmortem observations on hemorrhagic phenomena are not yet ready for presentation, but those examined to the date of reporting presented no alarming picture of the hemorrhagic risks in anticoagulant therapy under proper controls. Blumgart and his co-workers,[10] working with dogs whose coronary arteries had been ligated, observed that animals treated with "dicumarol" (in some instances to the point where prothrombin times of 132 seconds resulted) showed no increase of hemorrhages in the myocardium, endocardium or pericardium as compared with animals that did not receive "dicumarol."

The sources of bleeding in relation to anticoagulants are demonstrated in figure 10. There is a definite incidence of hemorrhages among the control group in each of the categories except that for epistaxis. Hemorrhages due to causes other than anticoagulant therapy also occurred in three of the categories in the treated group. There will be noted that hemorrhages occurred more frequently in the treated group in all categories except that of hemoptysis. The explanation for the greater incidence of hemoptysis in control patients is that pulmonary infarction is much commoner among these patients than among the treated patients.

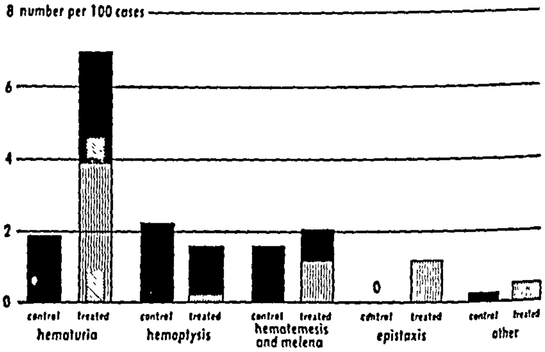

Fig. 10.—Sources of bleeding in hemorrhagic manifestations. Fifty per cent of the manifestations were mild. The areas of diagonal hatching indicate gross hemorrhage; the areas of vertical hatching indicate hemorrhagic manifestations due to or aggravated by anticoagulant therapy, and the darkened areas indicate hemorrhagic manifestations due to other causes.

The records of patients who received anticoagulant therapy and yet presented thromboembolic complications or died are being subjected to analysis in the central laboratory. It appears, on the basis of present experience, that a considerable proportion of the failures occurred because the prothrombin time was not adequately prolonged. While there is at present a question as to what constitutes the minimal effective therapeutic prothrombin time, it is our experience that a safe and effective therapeutic range is between 30 and 50 seconds, by Link-Shapiro modification of Quick's one stage method. This range, as interpreted in our laboratory, would approximate a prothrombin activity of between 20 and 10 per cent. For heparin, the clotting time should be approximately three times normal. Although statistical evidence as to the relative incidence of thromboembolic complications at various prothrombin times (i. e., at various levels of reduced prothrombin activity) is not yet available, a review of those cases in which thromboembolic complications occurred during the administration of "dicumarol" reveals that, of the

---

[10] Blumgart, H. L.; [illegible] M.; Lewis, H. D., and Wessler, S.: The [illegible] Heart in Experimental Acute Coronary Occlus [illegible] 60: 228, 1947.

38 complications[11] occurring under these conditions, only 4 occurred in patients whose prothrombin time is known to have been maintained at 30 seconds or more for at least the three days before the complication appeared. Further analyses regarding this factor will be recorded in forthcoming publications. It is not sufficient to state that a patient has received coagulants. Key questions which must be answered are: how much, how long, what levels of effectiveness were obtained and how consistently were these maintained? With this information, it should usually be possible to determine whether a failure was caused by drug or was the responsibility of those administering it.

SUMMARY

This report summarizes the results obtained by a preliminary statistical analysis of the first 800 cases studied by the Committee for the Evaluation of Coagulants in the Treatment of Coronary Thrombosis with Myocardial Infarction. In the analysis, the incidence of deaths and of both thromboembolic and hemorrhagic complications has been compared in a "control" series of patients treated by conventional methods alone and in a series of "treated" patients who received anticoagulants ("dicumarol," heparin, or both) in addition to conventional treatment. The composition of the two groups was observed to be essentially the same.

The rates of deaths and the number of thromboembolic complications per hundred cases have been calculated for the control and treated groups as a whole, by week of illness, by age of patient and by type and location of the specific thromboembolic complication. The percentage of cases in which one or more complications developed has also been analyzed. The results in every category studied indicate that the use of anticoagulants improves strikingly the outlook of the patient suffering a coronary occlusion with myocardial infarction. The incidence of hemorrhagic manifestations was also analyzed. It was observed that about six minor or moderate hemorrhagic manifestations per hundred cases occur in patients not receiving anticoagulants, but that this incidence is about six per hundred higher in patients receiving anticoagulants. However, only one serious hemorrhage was observed clinically in the entire 800 cases.

Although the minimum prolongation of the prothrombin time necessary to obtain a therapeutic effect from "dicumarol" in each patient has not been established, it is our experience that a range of from 30 to 50 seconds, as measured by the Link-Shapiro modification of the Quick one stage technic, produces a safe and an effective therapeutic level. This range of prothrombin times approximates a decrease in prothrombin activity to between 20 and 10 per cent, as determined in our laboratory. In using heparin we attempt to prolong the clotting time of whole blood to approximately three times the normal value by the Lee-White technic. In only 4 cases out of the entire series did thromboembolic complications occur when the prothrombin time had been maintained at a level of 30 seconds or more for at least three days prior to the occurrence of the complication.

CONCLUSIONS

1. On the basis of data compiled from 800 cases of coronary occlusion with myocardial infarction, it is concluded that patients treated with anticoagulants in addition to the conventional forms of treatment present a death rate and incidence of thromboembolic complications during the first six weeks period following an attack significantly lower than those experienced by patients treated solely by conventional methods.

2. Anticoagulant therapy should be used in all cases of coronary thrombosis with myocardial infarction unless a definite contraindication exists.

3. In the absence of hemorrhagic conditions the hazards from hemorrhage are not sufficient to contraindicate the use of anticoagulants in coronary occlusion, provided that there are facilities for adequate laboratory and clinical control.

ABSTRACT OF DISCUSSION

Dr. Bernard Drexler, Rochester, N. Y.: What is considered an adequate laboratory or other method of controlling the use of heparin in these cases? We know that the prothrombin time is a fairly decent method of control or knowing when the patient is getting enough "dicumarol," but how about the heparin?

Dr. Walter Vest, Huntington, W. Va.: Would Dr. Marple give a sample method of the use of the anticoagulants?

Dr. Charles D. Marple, New York: Regarding the laboratory control of heparin administration, satisfactory results are attained clinically if the clotting time is prolonged to between two and three times the normal. Determining clotting times by the Lee-White method, by which any time up to 10 minutes is normal, the clotting time should be maintained between 30 to 45 minutes with heparin. About the plan for administering "dicumarol," we emphasize that the stated values are obtained by the Link-Shapiro modification of the one stage method, with the use of a commercial thromboplastin obtained from rabbit lung. Normal values for whole plasma are from 15 to 17 seconds. When talking of prothrombin tests, the results must be so qualified, since, if one uses a different method, a variation in technic or a different thromboplastin, the prothrombin times obtained will differ, perhaps considerably. When a diagnosis of coronary occlusion with myocardial infarction is made, the anticogulant should be administered immediately. If the diagnosis is disproved later, treatment with the drug is discontinued. If the initial prothrombin time is normal, or below, the patient should be given 300 mg. of "dicumarol." On the second day and thereafter the dose of "dicumarol" is estimated according to the prothrombin time on the particular day. "Dicumarol" should never be administered until a test of prothrombin time has been done and results reported on that day. If the prothrombin time is less than 30 seconds, 200 mg. of "dicumarol" should be given each day until the time has reached 30 seconds. From 30 to 35 seconds, 50 to 100 mg. should be administered, and when the prothrombin time is above 35 seconds, "dicumarol" should not be given. If the prothrombin time does not exceed 50 or 60 seconds, nothing should be done; "dicumarol" should not be given until the prothrombin time falls again. When the prothrombin time approaches or reaches 30 seconds on the down grade, "dicumarol," 100 to 200 mg., should again be given if the time is below 30 seconds and 50 or 100 mg. if the time is between 30 and 35 seconds.

The patient's prothrombin time should be maintained between 30 and 50 seconds and "dicumarol" therapy continued for thirty days from the last thromboembolic complication. No 2 patients react alike, and a patient may react differently from day to day, particularly in the presence of congestive failure or hepatic or renal disease. If the prothrombin time exceeds 60 seconds, one should beware of hemorrhage. Vitamin K therapy is effective in the majority of cases in reducing the prothrombin time, and it is fairly effective in controlling hemorrhage, but it must be administered repeatedly in doses of 60 to 75 mg. intravenously every four hours.

In terms of percentage in our cases prothrombin times of 30 to 40 seconds represent a reduction of prothrombin activity to approximately 10 to 20 per cent of normal. We agree with Nelson Barker that one must reduce prothrombin activity to about 20 per cent of normal. If a different method is used, or a different thromboplastin, values in seconds will represent a somewhat different percentage than do values with our technic.

---

[11] Complications for which the date is not accurately known and those occurring on days for which no prothrombin time is available are excluded from this total, but complications occurring in control cases during anticoagulant therapy are included.

CANCER OF THE LARYNX

Five Year End Results in a Series of Patients Treated Between 1930 and 1942

CHEVALIER L. JACKSON, M.D.
JOHN V. BLADY, M.D.
CHARLES M. NORRIS, M.D.
and
WALTER H. MALONEY, M.D.
Philadelphia

Six hundred and twelve patients with cancer of the larynx were treated at the Temple University Hospital from 1930 to 1947 inclusive (table 1). Surgical treatment was used in 453 [illegible] or thyrotomy, a form of partial [illegible] and total laryngectomy in 244), and irradiation was used in 159 cases.

Five year end results can now be computed only on three hundred and seventy-one treatments given through December 1942. Of the 118 patients treated by laryngofissure, 102 were determinate. By determinate we mean that they did not die of other cause within five years of treatment and were traced. Prior to 1940 the laryngectomies done at the Temple University Hospital were done by others, and we include in the five year analysis only the 39 cases in which the operation was performed by us in the years 1940 to 1942 inclusive; of these, 35 were determinate. There was no operative mortality in this series. Of the 91 patients treated by irradiation, 83 were determinate.

Table 1.—*612 Cases of Carcinoma of the Larynx (1930-1947 Inc.)*

	Laryngofissure	Laryngectomy	Irradiation
1930	7	15	0
1931	5	10	1
1932	8	9	1
1933	14	5	4
1934	8	12	4
1935	8	12	8
1936	7	11	9
1937	14	12	9
1938	5	5	13
1939	12	22	7
1940	11	18	6
1941	12	11	10
1942	7	20	10
1943	14	17	11
1944	17	12	7
1945	15	17	13
1946	23	12	18
1947	22	24	10
Totals	209	244	159

In table 2 are shown the five year end results in the 206 determinate cases of cancer of the larynx without palpable nodes treated by us from 1930 to 1942 inclusive. Laryngofissure was done in 102 determinate cases, with a five year survival rate of 81 per cent. In the 35 determinate cases in which laryngectomy was done, a 66 per cent cure rate was obtained. The 69 patients without palpable nodes when first seen who were treated by irradiation showed a five year survival rate of 51 per cent. (Fourteen patients with palpable nodes were all treated by irradiation, but none survived five years; these cases are considered in computing the final five year survival rate.) The series in which treatment was by roentgen irradiation included both intrinsic and extrinsic cases. The five year survival rate of initial treatment among the 206 patients without palpable nodes treated surgically and by irradiation is 68 per cent.

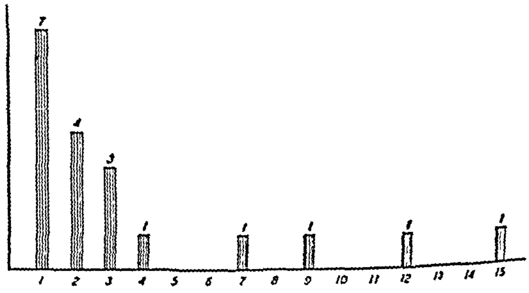
RECURRENCES

Table 2.—*Five Year End Results in the 206 Determinate (Intrinsic and Extrinsic) Cases with No Metastasis When First Seen, 1930-1942*

	Determinate Cases	Recurrence and/or Metastasis in 5 Years	N. E. D. 5 Years	Percentage 5 Year Cures
Laryngofissure	102	19	83	81
Laryngectomy (1940-1942 inclusive)	35	12	23	66
Irradiation	69	23	35	51
Total	206	54	141	68

The interval of recurrence in the 19 cases in which it developed following laryngofissure is shown in the chart. It is interesting to note that 14 of the 19 recurrences (74 per cent) developed in the first three years and that 4 of the remaining 5 developed after five years (1 each in the seventh, ninth, twelfth and fifteenth year respectively). This tends to show that three year cure rates are not entirely valueless, and furthermore that five year cure rates are certainly not final. Of course, late recurrences always raise the question of whether we are dealing with a recurrence of the old tumor or with a new primary growth. We do not believe it possible to set any time as the period after which a tumor arising in the same region as a previous one is to be considered a new tumor and not a recurrence. A study of the location and histologic character of the original tumor compared with the location and histologic character of the supposed recurrence might shed some light on this problem.

The methods and results of treatment of the recurrences after laryngofissure are shown in table 3. Three patients had second laryngofissures, but 1 of these later had a laryngectomy for a second recurrence, and has now been free of disease for five years. Of the 2 that had only second laryngofissures, both are free of disease, 1 for more than five years. Of 6 patients who had laryngectomies, 1 has been lost to follow-up, 1 is dead of disease and the remaining 4 are free of disease, 2 of them for more than five years. One patient had a laryngectomy, then roentgen irradiation, and, in addition, neck dissections with interstitial irradiation for bilateral cervical metastasis, but is now free of disease more than five years after the last treatment. Of the 7 determinate patients with recurrence after laryngofissure treated by irradiation, 4 are dead of disease and 3 are well, 2 for more than five years. Summarizing,



Recurrences (19 cases) in a series of 102 laryngofissures.

From the Departments of Laryngology and Roentgen and Radium Therapy, Temple University Hospital, Philadelphia.

Read before the Section on Laryngology, Otology and Rhinology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 25, 1948.

of the 19 patients with recurrence after laryngofissure, 17 were determinate, and of these 17, 6 are dead of disease and 11 are well, 7 of them for more than five years after the last treatment. Subtracting the 4 patients still free of disease after treatment of recurrence but treated less than five years ago, we can consider 13 determinate, and the five year recurrence salvage rate 54 per cent (7 out of 13). Of course, some of the 4 patients treated less than five years ago will undoubtedly reach five years without further recurrence.

Recurrence or metastasis developed in 12 of the 35 determinate cases in which laryngectomy was done by us. Recurrence alone developed in 3 cases, metastasis without local recurrence in 8, and both recurrence and metastasis in 1. Only 1 patient in this group has survived more than five years. He was the patient already mentioned, who had been first treated by laryngofissure, then had local recurrence for which a total laryngectomy was done, and subsequently had bilateral cervical metastasis. He is now free of disease six years after treatment of the metastasis.

Table 3.—*Treatment of Recurrences Following Laryngofissure*

	Total Cases	Determinate Cases	D O D	N.E.D. 1-5 Years	N.E.D. Over 5 Years
2d LF *	2	2	0	1	1
2d LF and LG †	1	1	0	0	1
LG	6	5	1	2	2
LG, roentgen ray, ND ‡ and radon	1	1	0	0	1
Roentgen ray or radium	8	7	4	1	2
Untreated	1	1	1	0	0
Totals	19	17	6	4	7

Five year survival rate (7/13) = 54%

* LF = laryngofissure. † LG = laryngectomy. ‡ ND = neck dissection.

Table 4.—*Treatment of Recurrences After Irradiation*

	Determinate Cases	N.E.D. Over 5 Years
Second course of roentgen rays	17	5
Laryngectomy	3	2
Total cases treated	20	7

Five year survival rate (7/20) = 35%

In 23 of the 69 patients treated by irradiation recurrence developed, and of 17 of these who received a second course of irradiation, 5 are free of disease for more than five years (table 4). Laryngectomy was done in 3 patients, and 2 of these have been without disease for five years following operation. Three were not treated. Thus the salvage rate for treated recurrences after irradiation was 35 per cent (7 out of 20).

METASTASES

In this series no patient with cancer of the larynx having cervical metastases when first seen was treated by laryngofissure or laryngectomy. Of the 83 determinate patients treated by roentgen irradiation, however, 14 had metastases. Thirteen patients received roentgen radiation to the primary lesion and the metastases. There were no five year survivals in this group. One patient was treated by a radical neck dissection with implantation of radon, and remained well for four and one-half years, after which time a lesion in the lung developed which was thought to be a second primary. He died of generalized metastases fifty-nine months after treatment of the primary lesion and cervical metastases.

As shown in table 5, a total of 33 patients had metastases after receiving treatment to the primary lesion. Of this group, 29 patients received treatment for the metastases. Seven of these patients survived five years, giving a five year survival rate of 21 per cent. Only 1 patient of 13 treated by roentgen irradiation alone and 1 patient of 3 treated by roentgen and radon irradiation survived five years. Five of 9 patients treated by partial or radical neck dissection in combination with radon and/or roentgen irradiation survived five years. In this series, there were no patients treated by surgery alone.

Table 5.—*Treatment of Metastases Developing After Treatment of Primary Tumor*

	Total Cases	D O D*	D O C†	N.E.D. 5 Years
Roentgen ray	13	12	0	1
Roentgen ray and radon	3	2	0	1
Radon alone	4	4	0	0
Surgery, roentgen ray, radon	9	3	1	5
No treatment	4	4	0	0
Totals	33	25	1	7

Five year survival rate (7/33) = 21%

* D O D = dead of disease.
† D O C = dead of other causes without evidence of recurrence or metastasis.

Since 1940, the treatment of cervical metastases from cancer of the larynx at the Temple University Hospital has been as follows: For patients presenting metastases on admission, roentgen treatment is generally employed for treatment of the primary lesion in the larynx; if possible, the metastases are incorporated in the same portal. After the irradiation, either before severe radiation epithelitis develops or after it has completely healed, the metastases are surgically exposed and radon is implanted in a tissue dosage of 5,000 to 10,000 gamma roentgens, or a neck dissection with or without implantation of radon is performed. More recently, we have treated a number of patients by radical neck dissection followed by external radiation to the primary lesion. In a few cases laryngectomy combined with neck dissection has been done. The results in these cases, however, are not suitable for evaluation, because the treatment was given less than five years ago. For metastases occurring after the primary disease has been controlled, a radical neck dissection is performed, and radon is implanted when there is perinodal infiltration.

Table 6.—*Five Year End Results Including Recurrence Salvage in Cases Without Palpable Metastases When First Seen*

	Determinate Cases	N.E.D.* 5 Years Following Primary Treatment	Recurrence and/or Metastasis	N.E.D. 5 Year Following Further Treatment	Total N.E.D. 5 Year Survival Including Treatment of Recurrences and Metastases
Laryngofissure	102	83 (81%)	19	7	90 (88%)
Laryngectomy	31†	20 (65%)	11	0	20 (65%)
Roentgen ray	69	35 (51%)	23	9	44 (64%)
Total	202	138 (68%)	53	16	154 (76%)

* N.E.D. = 5 year survival rate (154/202) = 76%.
† Total cases treated by laryngectomy (1940-1942) minus 3 treated initially by laryngofissure and one treated initially by roentgen ray.

In table 6 are shown the final end results, including the ultimate five year salvage of recurrence in addition to the cure rate obtained by each respective method. It will be noted that the salvage of 7 of the patients in whom recurrence developed after laryngofissure raises the final survival rate of the group to 88 per cent. None of the 11 patients with recurrence after laryngectomy as a primary method of treatment survived five years, but the salvage of 9 of the recurrences and metastases after initial treatment by roentgen irradiation raises the final survival rate of that group to 64 per cent. The five year survival rate for cancer of the larynx without metastasis when first seen, in the 202 patients included in this series, therefore, is 76 per cent. Including the 14 patients who had metastasis when first seen who all were treated by roentgen irradiation and none of whom survived five years, the over-all five year survival rate among the 216 determinate patients with cancer of the larynx (intrinsic and extrinsic) treated by us from 1930 to 1942, inclusive, is 72 per cent.

SUMMARY AND CONCLUSIONS

Six hundred and twelve patients were treated at the Temple University Hospital in the years 1930 to 1947 inclusive. Four hundred and fifty-three partial or total laryngectomies were done, and 159 patients were treated initially by irradiation (table 1).

Three hundred and seventy-one operations or initial courses of treatment were given through December 1942 (one hundred and eighteen laryngofissures, one hundred and sixty-two laryngectomies and ninety-one initial courses of treatment by irradiation) and therefore are suitable for evaluation of five year end results. However, sixteen of the laryngofissures were indeterminate because of death from other cause within five years or failure of follow-up, leaving 102 (determinate) patients surviving more than five years. Of the one hundred and sixty-two laryngectomies, the one hundred and twenty-three done prior to 1940 were not done by us, and 4 of the patients on whom we performed laryngectomy died of other cause or were lost to follow-up, leaving thirty-five operations in determinate cases; only thirty-one of these should be counted, however, because 3 patients had been treated previously by laryngofissure and 1 by irradiation. Of the 91 patients treated initially by irradiation, 8 were indeterminate and 83 determinate. Adding these groups, 102 patients operated on by laryngofissure, 31 by laryngectomy and 83 treated by irradiation, we have 216 determinate patients treated by us from 1930 to 1942 inclusive, with a final survival rate of 72 per cent.

Analysis of the nineteen recurrences in one hundred and two laryngofissures showed that 74 per cent occurred in the first three years and that four (22 per cent) occurred after five years. It is suggested, therefore, that three year statistics have some value and that five year statistics are by no means final.

With regard to laryngofissure, the initial cure rate of 81 per cent and the salvage of 51 per cent of the recurrences following this procedure lead us to insist on its value and to protest against the current tendency to disparage it. However, we strongly urge that its use be severely restricted to suitable cases.

Recurrence after laryngectomy has, in this series, not been successfully treated, but recurrences after irradiation have been salvaged by second courses of irradiation and laryngectomy.

Continued post-treatment observation for at least five years, and preferably for life, is advised for all cases, and the prompt institution of intensive treatment, surgical or radiative, or a combination of the two, is necessary in case of recurrence or metastasis if salvage of failures of initial treatment is to be secured.

Criteria for the selection of treatment should be constantly studied and reevaluated in the light of end result analyses such as that presented in this paper, and technic of treatment should likewise be reevaluated and modified according to experience.

ABSTRACT OF DISCUSSION

Dr. Gordon B. New, Rochester, Minn.: Patients with cancer of the larynx as a rule have only one good chance to get well. While secondary operations and irradiation will sometimes salvage an additional group, the surgeon who determines what the original method of treatment is to be has an important decision to make and should have all the available information that will aid him in doing this. To give the patient the best possible chance, I feel that microscopic examination of a fresh frozen section is essential. This frequently aids in selecting a small group of patients which may be successfully taken care of under suspension laryngoscopy, the lesion being destroyed with surgical diathermy or by means of radium seeds. This fresh frozen section may also determine whether a conservative operation or a laryngectomy should be done. Four methods are used in the treatment of carcinoma of the larynx: 1. The removal or treatment of the local lesion under suspension laryngoscopy; 11 per cent of our patients are treated in this manner. 2. Thyrotomy may be used as an exploration to determine the treatment of choice, either a conservative operation or a laryngectomy. The surgical removal of the growth with cartilage and diathermy are used in 41.2 per cent of our cases. 3. Laryngectomy alone or associated with dissections of nodes is used in 47.8 per cent of our cases. 4. Irradiation for the inoperative cases is used in 21.5 per cent of our cases. The size, the location and the extent of the growth, the grade of the malignancy, the presence or absence of extralaryngeal extensions of the disease or metastasis to the cervical nodes, the age of the patient and his general condition all must be considered. We use suspension laryngoscopy, and after a careful examination with "pentothal sodium," oxygen and curare, a biopsy is made, and with this method we are able to take care of a percentage of our cases. We feel that the fresh frozen section diagnosis must be employed in order to give the patient the best possible treatment. The operative mortality in the treatment of carcinoma of the larynx has been reduced considerably in the last few years with improvement of technic and the use of penicillin. From 1939 to 1945, 217 laryngectomies, 173 thyrotomies and 38 laryngeal suspensions and removal of the carcinoma were done at the clinic, making a total of 428 patients with only 2 deaths—both of coronary thrombosis—an operative mortality of 0.47 per cent.

Dr. Paul Holinger, Chicago: The overwhelming rich mass of statistics which Dr. Jackson has presented leads us to feel that we must digest them before beginning a discussion. I should like to ask two questions in regard to some of the points raised. Would it be possible to include in this study the grade of the tumors in relation to the various modalities of therapy used, and finally in relation to the end results? Dr. New mentioned this in his discussion, but I repeat it because of the second question that comes to mind. The second question is the relation of the age of the patient to the incidence of recurrence. This is possibly in part at least dependent on the grade of malignancy encountered in each case of recurrence. Thus the problems of the grade of the tumor, the age of the patient and the incidence of recurrence might show a definite relationship. I should like to take this opportunity to compliment Drs. Jackson, Blady, Norris and Maloney, not only for presenting this gold mine of statistics, but also in the excellence of the results which they have achieved in the treatment of cancer of the larynx. We all look forward to the opportunity of studying the tables after they are printed.

Dr. Gabriel Tucker, Philadelphia: The authors have presented a large series of cases, and I wish to compliment them on their excellent results on which their accurate and beautifully presented statistics are based. In my own consecutive series of 680 cases of cancer of the larynx I have recently reviewed a group of cases observed between 1933 and 1943, with a follow-up for five year end results to 1948. This series included

331 cases. In the ten year period there were 117 laryngofissures and 75 laryngectomies. The results in the laryngofissure group have been tabulated and are as follows: Five patients died of primary cancer of the lung without recurrence in the larynx. Three patients died of cardiovascular disease, 1 of acute nephritis, 1 of an old bronchiectasis (a postoperative pulmonary complication). In all, 10 patients died in the five year period from other causes without recurrence of cancer in the larynx. In 6 cases, follow-up was unobtainable. This reduced the number to 101 that may be used to estimate the percentage of five year freedom from cancer. Fourteen of this group had recurrence and metastasis and died of cancer with involvement of the larynx. Deaths from cancer in the five year period were 14 out of 117; deaths from other causes 16; five year cure by thyrotomy, 86 per cent. It is the responsibility of the surgeon who operates on laryngeal cancer to do everything possible to see that adequate follow-up observation is carried out. It is not only a matter of follow-up for recurrent carcinoma, but other conditions may arise in the larynx. Dr. McReynolds of Galveston, Texas, told me of a patient on whom I did a laryngofissure for squamous cell carcinoma of the larynx fifteen years ago. The patient consulted Dr. McReynolds because of increasing hoarseness and on examination a mass was found on the larynx, which on removal was histologically found to be a fibroma.

Dr. Murdock Equen, Atlanta, Ga.: Dr. Jackson's presentation has afforded us much food for thought and, as usual, he is to be congratulated on his excellent results. When a patient presents himself with cancer of the larynx, the operator must determine, according to his experience, what operation will afford that particular patient the best chance for recovery, varying from the partial removal of a vocal cord to total laryngectomy with radical dissection of the nodes of the neck. However, we feel that in the presence of an extensive intralaryngeal growth, a total laryngectomy plus intensive roentgen therapy has given us the best results. It might be well to consider rehabilitation of these patients as far as the voice is concerned. We recently presented before the University of Alabama postgraduate seminar a woman who, five years ago, had had a total laryngectomy, and she spoke distinctly with an esophageal voice over a microphone and was heard clearly throughout the large assembly hall. The difficulty in obtaining artificial larynges during the war made both the doctor and the patient realize what an excellent esophageal voice may be obtained by patients after many hours of tedious practice.

Dr. Chevalier L. Jackson, Philadelphia: I am sorry that Dr. Martin got lost out in Iowa and missed connections. He sent a courteous telegram of apology. I am most grateful to Dr. New for his discussion and also to Dr. Holinger, Dr. Tucker and Dr. Equen. There are a few comments that I should like to make, but I will be extremely brief, because I have asked the chairman to allow our collaborator, Dr. John Blady, to make the final statement of the discussion. Dr. New and Dr. Holinger have both mentioned grading. I should like to say that we take grading into consideration in the borderline cases in making the decision between the various methods of treatment. The grading, we think, is one of the less important factors, in our experience, but certainly not to be ignored. Dr. Blady can give you some figures about the evaluation of grading. I was interested in Dr. Tucker's 5 cases of carcinoma of the bronchus. We have had several in which it was difficult to tell whether the bronchial lesion was a primary tumor or a metastasis, because we have had some in which we were sure of metastasis.

Dr. John V. Blady, Philadelphia: When we deal with cancer, I believe that we should not confine ourselves to one particular modality of treatment when several modalities are available. Cancer requires radical treatment regardless of whether it is by irradiation or by any method of surgery. In our clinic we feel that the methods are secondary to the primary consideration of the treatment that will give the patient the best prognosis. In our consideration of treatment, for example, laryngectomy has definite criteria, and so does laryngofissure. Dr. Jackson has indicated the type of cases suitable for laryngofissure; however, the decision on the selection between laryngofissure and irradiation, and laryngectomy and irradiation, is not always quite so easy. Dr. Holinger asked about grading. In our opinion grading is an important criterion which helps in the selection of one or the other modality of treatment. Some time ago we analyzed the relationship of grades of tumor and results. We found that in grade 1 and grade 2 cancer, for example, the five year survival statistics of all three methods (that is, laryngofissure, laryngectomy and roentgen irradiation) were equally good, but grade 3 type of tumor, we found, behaved entirely differently. For laryngectomy, for example, the end results for grade 3 cancer were 44 per cent five year survivals in a group of 27 cases. On the other hand, in the cases that we thought suitable for irradiation and which were so treated, the five year results were only 27 per cent. Grade 4 tumors are definitely radiosensitive and radiocurable. One more thing deserves to be stressed. Treatment by irradiation has been relegated as treatment for inoperable cancer and only considered when the surgeon was of the opinion that he could not remove all of the tumor. I feel operability of the tumor is not the criterion for irradiation. Treatment by irradiation when properly used in the selected cases may not only save the patient's voice and spare him untold anguish but may also save his life. In our efforts to continue to improve our methods of treatment and thereby save more lives, we should continue to study criteria which may eventually give us the best procedure for each case of cancer.

CARCINOMA OF THE BREAST

SIR STANFORD CADE, K.B.E., C.B.
London, England

As a cause of death, cancer of the breast is registered in increasing numbers. The rise in incidence is a real one and not due to better methods of diagnosis or to more accurate certification. This increase, nevertheless, is due chiefly to the changes in the age structure of the population, that is to an increase in the number of persons living at ages of 50 to 75 years. As a more speculative reason, it can be said that cancer of the breast is on the increase when the birth rate is falling and when lactation does not take place. Smaller families, failure of lactation and longevity contribute their share in the increase of the disease. In England and Wales, it heads the list of incidence as the site of cancer in women and accounts for over 20 per cent of the total deaths due to cancer in women. This increase in mortality and in incidence suggests the need for an unbiased review of the present day methods of treatment and a critical analysis of the causes of failure to reduce the mortality rate. Such an analysis must be based on the natural history of the disease and should correlate this with the various methods of treatment.

In comparison with all other sites of cancer, with the exception of cancer of the skin, the breast is the most favorable site, that is, the least rapidly lethal site. The expectation of life in untreated patients has been computed from time to time in many countries. The mean duration is 39.3 months; it is therefore essential that one should not rely on three year survival rates as a yardstick to measure the efficacy of any given form of treatment. To appreciate the achievement of accomplishment of treatment, Prof. Major Greenwood investigated the expectation of life of a woman 55 years of age, under various conditions. On actuarial estimation, the normal expectation of life is 18.77 years (age at death, 74 years); with untreated cancer of the breast it is reduced to 3.8 years (age at death, 59 years). What happens if treatment is

---

Read before the Section on Radiology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

given? If the treatment is given under average conditions, the expectation of life is 5.78 years (age at death, 61 years); if treatment is given under best conditions, 12.93 years of life can be expected (age at death, 68 years). Even under the best conditions, there is a loss of 5 years of life on the average. How does the best condition differ from the average? It differs firstly in the condition of the patient when first applying for treatment and secondly in the actual methods of treatment.

CONDITION OF THE PATIENT

The state of the patient can be assessed from many angles: (1) age, (2) clinical type of tumor, (3) histologic variety of tumor, (4) duration of symptoms, (5) physiologic state of the breast and (6) extent of the disease.

Age.—Except for carcinoma of the breast in the very young (under 25 years of age), there is no definite evidence that the disease is more lethal in the third or fourth decade than in more advanced years of life. There is some evidence that in the very old (over 75 years of age) the disease does not materially shorten life.

Clinical Types.—The clinical types are well known and fall into one of the following types: (1) scirrhous, (2) encephaloid, (3) duct carcinoma, (4) atrophic scirrhous and (5) Paget's disease of the nipple. Of these the most malignant is the common scirrhous type and the least malignant, the atrophic scirrhous type. The encephaloid or soft variety, although it grows more rapidly and breaks down, is less lethal, as the incidence of skeletal metastasis is less frequent and longer delayed. The duct carcinoma and Paget's disease of the nipple are of moderate degree of malignancy.

Histologic Varieties.—Microscopic varieties are many. The following six cover the commonest types: (1) papillary carcinoma, (2) intraduct carcinoma, (3) adenocarcinoma, (4) scirrhous carcinoma, (5) medullary carcinoma and (6) mucoid carcinoma. The prognostic significance of these various types is as follows: the most malignant are the scrirrhous and the medullary and the least malignant the papillary and the intraduct types. The in between group is that of adenocarcinoma and of mucoid carcinoma. The most malignant give rise to metastasis earlier in the stage of the disease, and also more frequently.

Duration of Symptoms.—When a sufficiently large number of patients are available for study, it becomes clear that the actual length of history or duration of the disease does not by itself imply a poor prognosis. Thus very short histories of three weeks, or less, are not infrequently associated with obvious spread to the axillary lymph nodes, and, conversely, eight to twelve months' history may show the tumor, although bulky, to be still localized in the breast. Duration by itself is of less importance than rate of growth; a slow rate is as a rule associated with long histories and indicates a low grade of malignancy; the converse is also true.

Physiologic State of the Breast.—It is generally recognized that pregnancy and lactation are factors which seriously affect prognosis. Rate of growth of mammary cancer during pregnancy and lactation is rapid, and termination of pregnancy leads to temporary regression. The most virulent type of all, the acute cancer, is seen during lactation. The virulence of the disease is evidenced by the early and widespread lymph node invasion.

STAGE OF THE DISEASE

To assess the immediate and ultimate prognosis, to estimate the probable expectation of life and above all to find out the value of any given method of treatment, clinical staging is of paramount importance. Many classifications have been suggested. The best known and the most valuable is that of U. V. Portmann. It is a clinical classification and has the merit that it can be applied by the clinician on examination of the patient, without accessory aids. I have selected Portmann's classification as the most likely to throw light on the efficacy of various methods of treatment. In a simplified form and with minor modifications, it is as follows:

Stage I.	Tumor of the breast only
Stage II.	Tumor of the breast and cutaneous changes and/or axillary glands
Stage III.	Tumor of the breast and supraclavicular glands or contralateral axillary glands or fixation to pectoral fascia
Stage IV.	Skeletal or visceral metastasis

Of all factors affecting prognosis, stage of the disease is the most important; size, site, length of history, rate of growth, histologic variety or clinical type have some prognostic value, but the key to the assessment is clinical staging.

Attention must be drawn to the following points:

1. Stages I and II are anatomically within the area covered by radical mastectomy; stage III is beyond surgical excision and stage IV only suitable for palliative measures.

2. Cutaneous involvement can be one of three types: (*a*) direct spread of the tumor to the skin, with or without fungation; it is the least malignant; (*b*) the diffuse invasion with edema, the pigskin, or *peau d'orange,* type; it is of grave prognosis (*c*) the invasion of the skin by multiple discrete nodules is the most grave as regards chances of recovery.

3. Prognosis in stage I and II cases, depends on the presence or absence of palpable axillary nodes. It is, of course, agreed that sometimes clinically nonpalpable nodes show histologic invasion and, conversely, palpable nodes may occasionally show inflammatory changes only; but in most cases the presence or absence of palpable and clinically malignant axillary nodes is the best guide to the future of the patient.

CHOICE OF METHOD OF TREATMENT

The methods used are radical mastectomy, radiation (radium or roentgen rays) and a combination of both. The stage of the disease guides the selection of the method.

In stage I the method of choice is radical mastectomy. It is not contended that radiation alone cannot achieve total regression of the tumor for five to eight years; but at present it does not do so as certainly, as regularly and as frequently as radical mastectomy. Nearly 90 per cent of five year survivals and 65 per cent of ten year survivals have been obtained by radical surgical treatment in stage I cases. It remains the method of choice. A considerable number of patients treated solely by radium has shown equally good results, but in some cases the condition recurred locally after eight years and in others it remained quiescent but they were not free from disease.

In patients with stage II lesions the results from surgical treatment show a great drop; no longer 90 per cent but only 30 per cent of five year survivals are achieved. Here radiation as the sole method of treatment is nearly as good (or as poor) as surgical treatment, but the combined method results in a definite improvement.

In stage III cases, radiation alone has given better results than surgical treatment and is the method of choice.

Surgical Treatment.—Radical mastectomy is considered the method of choice. The operative mortality rate is low, 1.65 per cent in 11,014 mastectomies done in twenty-two hospitals in London and the main university cities in England and Wales. Morbidity is slight, and most women have a full range of movement at the shoulder joint. Radical mastectomy remains the greatest achievement of surgery in the treatment of cancer of the breast.

Simple mastectomy is suitable in aged persons for the removal of a fungating mass, in bad surgical risks and in cases in which radiation is not considered suitable. The value of simple mastectomy is limited; it does not touch the axillary contents, and if disease is present there, there it remains.

Radical mastectomy is unsuitable in patients with edema of the skin, discrete cutaneous nodules and large fixed or extensive lymph nodes. In such cases, incalculable harm has followed radical mastectomy. The condition in such cases should be recognized as inoperable and the patient not submitted to operation. Patients live longer and in far greater comfort without surgical treatment, which is really not surgical intervention, but interference. It is considered important to stress the point that surgical treatment in unsuitable cases is a grave error of judgment.

Radiotherapy.—Radiotherapy is applicable as the sole method of treatment or in association with surgical treatment; in the latter it can be given as preoperative treatment, as postoperative treatment or both before and after operation. The indication for each will be considered.

Radiotherapy as the Sole Method of Treatment.—Radiotherapy is the method of choice without question in the treatment in cases of stage III lesions. Surgical treatment in this group has proved a failure, that is, the percentage of five year survivals after surgical treatment is negligible. On the other hand, the achievement of radiation is not only better, but considerable. The cases can be subdivided into two groups: (1) those cases in which complete regression of the disease is achieved, in which on clinical examination there is no evidence of active cancer. These patients are in a minority; they are the most radiosensitive group, and the question arises: when such total regression is achieved, should radical mastectomy be performed? There is as yet no definite answer to this question, but my impression at present is that it is justifiable to be content with radiation only and to await developments. If there is recurrence of local disease, surgical treatment should be considered, especially if further radiotherapy is handicapped by cutaneous changes due to previous radiation. Such cases are seen five to eight years after adequate radium therapy. (2) Cases in which regression but not total disappearance of the lesion is achieved by radiotherapy. In this group, many patients remain well for periods of five years and more. They still have a tumor of the breast, perhaps harder and smaller than before treatment, with palpable axillary or cervical nodes, but the disease is quiescent, does not cause much inconvenience and does not affect the general health of the patient. This palliation is a great achievement, if not the greatest of radiotherapy; careful follow-up of patients in this group shows without doubt the value of this method.

PREOPERATIVE AND POSTOPERATIVE RADIOTHERAPY

It is important to define precisely what is meant, what is aimed at and what is achieved by these two different uses of radiation.

Preoperative Radiotherapy.—Preoperative radiotherapy aims at sterilization of an active neoplasm in the breast, of the skin over it and of the immediate regional lymph nodes, in the axilla and below the clavicle. Careful histologic studies of breasts amputated at various periods after irradiation have been made and show obvious effects familiar in other sites, such as the uterus, the skin and the tongue. These changes vary from complete fibrosis to various degrees of degeneration of cancer cells—formation of fusion giant cells, abnormal mitosis, hyaline degeneration or calcification. Statistical evaluation of this method—preoperative radiation followed by radical mastectomy—is forthcoming from several centers in England and in Scandinavian countries. At Westminster Hospital, in 448 cases analyzed between 1930 and 1942, the five year survival rate with preoperative radiation was greater than with postoperative treatment, namely, 73 per cent in the former and 53 per cent in the latter (Dr. Stoll, Westminster Hospital, 1947).

Postoperative Radiotherapy.—Postoperative radiotherapy deals, and can only deal, with extension of the disease, actual or potential, beyond the anatomic area covered by the radical mastectomy, namely, the supraclavicular and anterior mediastinal or retrosternal lymph nodes and the skin flaps lifted at the operation. Unless the lesion is inoperable—and it is my contention that, if so, it must not be operated on—postoperative radiation deals with potential disease and is of speculative value. An analysis of my own series of cases and those at Westminster Hospital shows that in stage I cases no improvement of five or more years' survival has been achieved by postoperative radiation as compared with radical amputation as the sole method of treatment. It is reiterated that this applies only to stage I cases, stage I clinically and subsequently proved to be so by an absence of metastasis on histologic examination of all axillary lymph nodes. Postoperative treatment is of value in stage II cases, in which axillary lymph nodes although operable are shown to contain metastasis. In such cases, postoperative radiation improves the prognosis. In stage II cases, the ten year survival rate is thereby raised from 25 per cent by surgical treatment alone to 32 per cent by surgical treatment and postoperative radiation.

The value of postoperative radiation in stage III cases is less than that of radiotherapy as the sole method. Here ten year survival is obtained in 7 per cent only by surgical treatment and nearly double that —13 per cent—by radiation, whereas a combination gives only 9 per cent, showing that surgical treatment in stage III, alone or with radiation, is a worse method of treatment than radiation alone.

STATISTICAL EVALUATION OF RESULTS

The total number of patients with cancer of the breast treated in the period 1925-1948 is 915. The cases are subdivided in the following groups:

Primary cases with surgical treatment alone	381
Primary cases, treatment with radium alone	144
Primary cases, surgical treatment and radium	233
Recurrent cases, treatment with radium	157
Total	915

Of the 915 patients, 594 were treated more than five to fifteen years prior to the time of writing and lend themselves to statistical analysis. There were in fact, 632 such patients, but 38 could not be traced and were omitted. Of these, 348 patients could be followed up to fifteen years or more, and these are shown in table 1.

Table 2 shows the survival rates by stage of the disease, according to the method of treatment.

Table 1.—*Cancer of the Breast, 348 Cases*

Stage	Total Number	Percentage of Surviving Patients, Free from Disease		
		5 Years	10 Years	15 Years
I	97	87	65	36
II	138	29	25	12
III	95	20	15	7
IV	18	0	0	0

Table 2.—*Cancer of the Breast, 1932-1938; 263 Cases: Five and Ten Year Survival*

Stage	Percentage of Patients Surviving After Surgical Treatment		Percentage of Patients Surviving After Treatment with Radium		Percentage of Patients Surviving After Surgical and Radium Therapy	
	5 Years	10 Years	5 Years	10 Years	5 Years	10 Years
I	67	65	70	60	78	63
II	29	25	25	21	35	32
III	9	7	15	13	10	9

SUMMARY

The choice of method of treatment depends chiefly on the clinical stage of the disease. Radiotherapy is of value: (1) as the sole method of treatment in cases of stage III disease, and here the end results following radiotherapy are better than those following surgical treatment; (2) as a preoperative measure in cases of stage I disease, when improved results can confidently be expected, and (3) as a postoperative measure in cases of stage II disease and for recurrences. Radical mastectomy remains the best method of treatment in cases of stage I disease.

ABSTRACT OF DISCUSSION

Dr. U. V. Portmann, Cleveland: That cancer of the breast is increasing in England and Wales is interesting, and the explanations seem logical. I know of no published evidence that the incidence is increasing in this country. I have noted a proportionately higher percentage of benign tumors of the breast and early stage I and II cancers during the past fifteen years than previously. It may be that women and possibly physicians have been educated to discover breast tumors earlier and seek treatment more promptly. I agree that young women have just as good a chance of survival as the elderly, provided that the extent of involvement is similar in both age groups. Also I agree that scirrhous carcinoma is the most malignant type. Scirrhous carcinomas grow relatively slowly and insidiously, invade extensively when still rather small and are most radioresistant. Also, I agree that pregnancy and lactation seriously affect prognosis. This may be explained by the supposition that there are physiologic factors necessary for development and growth of the fetus which also stimulate growth of cancer. The presence or absence of involvement of axillary nodes is of considerable prognostic significance. About 85 per cent of women without axillary involvement (stage I) survive five years after radical mastectomy alone. But there are 15 per cent who die of cancer before that. In the latter group, neoplastic cells may have passed through the axilla to supraclavicular nodes or extension may have taken place elsewhere as, for example, to the internal mammaries or parasternal nodes where they are undetectable. In such circumstances radiotherapy could be of little benefit. Axillary involvement seldom was detected in patients, in whom the disease was ultimately classified as stage II involving few nodes. Of such patients 40 per cent undergoing operation alone and 60 per cent of those having postoperative radiotherapy survived five years. Fifty per cent of our series with primary cancer of the breast, up to 1939, had clinical and pathologic "criteria of incurability," with or without evidences of remote metastases when first examined (stages III and IV). Of those without remote metastases (stage III), 15 per cent given radiotherapy alone, and only 4 per cent of those operated on, survived five years.

Dr. Robert J. Reeves, Durham, N. C.: I believe that we in this country agree with Sir Stanford's ideas. It is not known why one carcinoma of the breast may be purely osteomyelitic, whereas, another may be purely proliferative, similar to the type of cancer in the prostate. There is little difference in stage I cures throughout the world. I am happy to see a universal agreement in regard to the stage of the disease and the criteria of curability. Dr. Portmann's criteria of curability is something which we in the South are trying to get all of our radiologists and surgeons to agree on, because there are still some surgeons who believe that some patients are incurable; however, they may be operable. But the point of this classification is that we do not believe that irradiation can make an incurable condition curable. I am occasionally requested to use radiation for incurable patients, to make them operable. This usually does more harm than good. Sir Stanford's classification of the pathologic and clinical appearance of cancer cannot be stressed too much among radiologists, as one must know the basic pathologic condition and the clinical classification and appearance of the lesion before one employs irradiation and gives a prognosis. The location of the tumor in the breast is also important, because of the lymphatic drainage. One must know the lymphatic drainage of the breast in order to give adequate irradiation. It is also agreed that in the stage I disease operation alone is the method of choice. In the clinic with which I am associated, at the surgeon's request, we give postoperative radiation, more as a matter of insurance. We cannot always be certain about the extent of the lesion. However, we believe that the percentage of cures has increased, whereas in stage II, radiation alone is certainly never advocated; it is either given preoperatively or postoperatively, combined with surgical treatment. I hope that radiologists can agree on therapy some day, as the surgeons have agreed on the type of operation. Unfortunately, there is still some difference of opinion as to the type of irradiation, whether it be preoperative or postoperative, and also the points irradiated.

Dr. Henry J. Ullmann, Santa Barbara, Calif.: May not one interpret the 15 per cent (that Dr. Portmann spoke about) of failures in stage I to be those cases in which generalized metastasis has already occurred? If one removes the primary lesion before it has spread, one cures the patient. If one does not, the patient may have extensive recurrences or may have metastasis years later. I would like to ask Sir Stanford whether it is not possible to bring on artificial menopause by irradiation in persons below the menopause age, and cannot radiologists convince many surgeons that it is useless to give postoperative radiation for insurance in stage I cases? Should not postoperative radiation be used only in stage II cases for the recurrences, that is, when preoperative radiation has not been done? When at operation the surgeon finds nodes in the axilla that are not palpable, that is, the pathologic stage II—not clinical—should he or should he not immediately refer the patient for postoperative irradiation? Should one save postoperative irradiation for the possibility of recurrences? I should like Sir Stanford's opinion on that.

Dr. Robert R. Newell, San Francisco: Doctors who take the trouble to codify their diagnosis and treatment and to collect their statistics and present them to us perform a priceless service, particularly in cancer. In deciding what treatment to use for one's patients, one may classify them by any scheme that fits one's therapeutic convictions. But classification has also to serve in comparing the results of different methods of treatment in the hands of different doctors. For this purpose, classifications should be uniform. For some doctors Sir Stanford's stage II would spread over into stage III, because they would attempt a surgical cure only if skin were not involved in the cancer. Also, I am uncertain whether his stage I is the same for his patients treated surgically as for those treated with radium, because in the former one has microscopic check on the axillary nodes but for the latter only palpation, with its well known errors in missed glandular metastases and in enlarged benign nodes miscalled cancerous (about 30 per cent).

Dr. Constance A. P. Wood, London, England: Sir Stanford Cade said that he had noticed that it was in those patients who gave a long history of symptoms before coming for treatment that he often obtained the best end clinical result. I think this is true not only in cancer of the breast but also in cancer of the cervix. In a survey made in London of approximately 1,000 cases of cancer of the cervix, it was shown that the highest five year survival rate occurred in that group of patients giving the longest clinical history of symptoms. I believe that this is explained by the fact that in the more slowly growing types of tumor and, hence, those giving the longest clinical histories, though their initial response to radiation is slower, the final end result obtained is better than in the more rapidly growing anaplastic types. The anaplastic so-called radiosensitive type of growth with a short clinical history may show a good initial response to radiation but a low final cure rate. Thus, there is no correlation between radiosensitivity and radiocurability. The more rapidly growing types of tumor are the ones which give the worst results both to radiation and to surgical treatment.

Sir Stanford Cade, London, England: Dr. Portmann asked what evidence we had that preoperative treatment does affect the prognosis. We have not been doing this preoperative treatment systematically for as long as postoperative radiation, and there has been little opportunity so far to compare the two series of five year results statistically. In stages II and III results were improved by about 20 per cent in the five year survival rate. We were encouraged and guided in adopting preoperative radiation by the results obtained at the Radiumhemmet in Stockholm. If Professor Berven is in the room, perhaps he will confirm this, as I believe that there they have improved the survival rate from 7 or 9 per cent to 30 per cent by giving preoperative as well as postoperative radiation. I entirely agree with Dr. Portmann about the question of submitting doubtful cases to surgical treatment. I should like to stress the point that, accepting his criteria of incurability, one should not submit inoperable cases to surgical treatment. In the clear way that he put it, "These are the criteria of noncurability." In that important group I wish to stress the value of roentgen rays as a palliative treatment. Many women with incurable cancer—perhaps as many as 25 per cent—are given an added five year survival by roentgen therapy. They live with their tumor, which has been rendered more or less innocuous by radiation. We have found no value in postoperative radiation in stage I cases, and the survival rate in early cases is not improved by postoperative treatment. Dr. Newell's criticism is valid. As regards my definition of stage I, I know that my classification is not the best, but I have been inclined to accept it for the sake of simplicity. In stage II, I have included in one group those with axillary nodes and those with metastasis. I have done it because these cases are still within the anatomic area of a radical mastectomy. I realize that the various types of skin and glandular spread are of different prognostic significance; nevertheless I group them together on anatomic grounds. Then I break them down into subgroups, some suitable for surgical treatment, others for radiotherapy. I thank Dr. Constance Wood for drawing attention to the fact that the length of history has nothing to do with the stage of the disease. A patient with a history of two years, or eighteen months, can still be in stage I, and this indicates that we are dealing with a different type of cancer of lesser virulence or rate of growth.

d-TUBOCURARINE IN WAX AND OIL

For Control of Muscle Spasm in Tetanus

MILTON R. WEED, M.D.
DONALD F. PURVIS, M.D.
and
ROBERT D. WARNKE, M.D.
Detroit

In the treatment of tetanus, the primary aims are neutralization of the toxin and control of tetanic muscle spasms. Whereas a therapeutically sound regimen for administration of antitoxin has been formulated,[1] control of the convulsions and muscle spasm has remained unsatisfactory. The purpose of this paper is to report the effect of a new preparation, d-tubocurarine in wax and oil,[2] on the convulsions and muscle spasm in this disease. Each cubic centimeter of this preparation contains 175 mg. of d-tubocurarine in 4.8 per cent wax in peanut oil. Our results with this material in 3 consecutive patients with tetanus who lived have been sufficiently good to warrant more extended observation.

REPORT OF CASES

Case 1.—R. Z. (fig. 1), an 11 year old white school boy, was admitted to the Detroit Receiving Hospital June 11, 1947, complaining of frontal headache and cramping pains in the left leg and back, of twenty-four hours' duration, and of difficulty in opening his mouth, of six hours' duration. Twelve days before admission, while wading, he had punctured the plantar surface of his left foot with a nail. About five days later swelling and redness were noted about the wound site, and in the next few days purulent material exuded from the lesion. The patient had not received tetanus toxoid previously and did not receive antitoxin at the time of the injury.

Physical Examination.—Physical examination revealed an acutely ill boy who screamed in pain as repeated violent convulsive spasms racked his body into opisthotonus. His flushed face was wet with sweat. The temperature was 102 F., pulse rate 104, respirations 22 and blood pressure 120 systolic and 70 diastolic. His neck and back were stiff. Spasm of his jaw muscles prevented separation of his teeth for examination of the mouth and throat. The abdominal muscles were moderately tense. There was pronounced spasm of the left leg with plantar flexion of the foot. A small well healed scar was present over the midplantar surface of the left foot. Slightest stimulation of the left leg resulted in generalized tetanic convulsions. The results of the remainder of the physical examination were not remarkable.

Course.—The patient was immediately placed in a quiet darkened room and was given 60,000 international units of tetanus antitoxin intravenously and 40,000 units intramuscularly. During the next three days he was given an additional 100,000 units of antitoxin intramuscularly. Curare ("intocostrin") was administered in 100 unit doses intramuscularly at approximately four hour intervals during his first two hospital days. Relaxation of the spastic muscle groups occurred within twenty minutes and lasted about one hour. The patient complained of

[2] The drug was supplied through the courtesy of E. R. Squibb & Sons, New York.

diplopia, salivation and dysphagia following administration of the curare. On June 13 a supply of d-tubocurarine in wax and oil was obtained, and the patient was given 0.5 cc. of this preparation intramuscularly without effect. On the following day the dose was increased to 0.75 cc. Moderate relaxation of jaw and back muscles was noted in about an hour. At two hours relaxation was greater, with considerable decrease in the number and severity of tetanic spasms. The effect seemed to wear off in about twenty hours. From June 14 to June 22 with the exception of June 20, when it was omitted with return of spasm and tetanic contractions, the patient was given 0.75 cc. daily. On June 22 there was an exacerbation of tetanic contractions with severe spasm of back and leg muscle groups. The dosage of d-tubocurarine in wax and oil was increased to 1.25 cc., with relief of symptoms in about two hours. This dose was given daily until June 26, when our supply of the drug was exhausted. None of the toxic symptoms noted with aqueous curare were observed. In addition, the patient was given penicillin 30,000 units every three hours as a prophylactic against pneumonia. Paraldehyde, 8 cc. in oil, was given by rectum every eight hours for sedation. Later chloral hydrate, 4 cc. every four hours, by mouth, was substituted, because he could not retain the paraldehyde. When the d-tubocurarine in wax and oil was exhausted, tribromoethanol solution ("avertin," with amylene hydrate [solution]), 3 cc. in 150 cc. of water, was administered rectally at night for seven days.

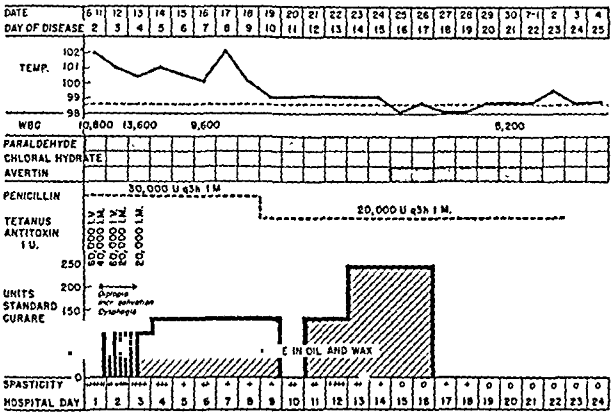

Fig. 1.—Chart of data in case 1.

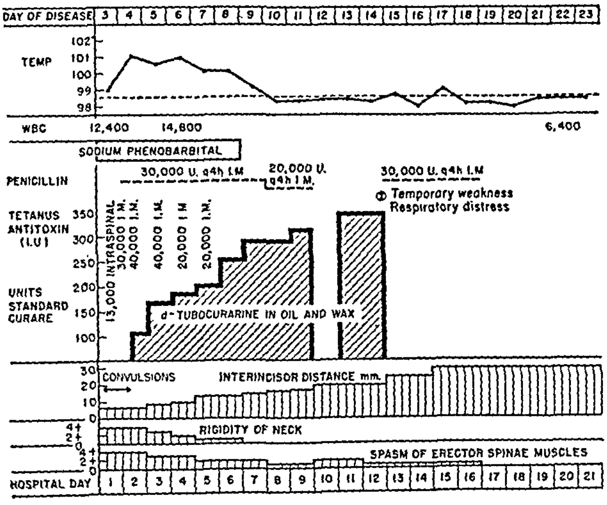

Fig. 2.—Chart of data in case 2.

On June 18, seven days after the initial dose of antitoxin, a macular erythematous rash developed, which responded promptly to 50 mg. of diphenhydramine hydrochloride ("benadryl hydrochloride"), administered three times daily by mouth. On July 12, because of residual plantar flexion of the left foot, a short leg walking cast was applied. This was removed July 18, and the patient was discharged two days later, on his fortieth hospital day. One month later he was well and had resumed all his previous activities.

Comment.—This represents a case of severe local and generalized tetanus. Treatment with d-tubocurarine in wax and oil was employed over a fourteen day period without manifestation of toxicity. There was no evidence of cumulative effect. Relief of spasm was gratifying, but the dosage employed initially was too small to achieve the maximum benefit possible without toxicity. We believe that the infected focus of infection should have been debrided in spite of its innocuous appearance and that intrathecal antitoxin should have been administered under ether anesthesia at the time of débridement in the operating room.

Case 2.—R. W. (fig. 2), a 45 year old Negro carpenter, was admitted to the Detroit Receiving Hospital Sept. 28, 1947, because of stiffness of the jaws of two days' duration and attacks of cramping pain in the middle part of the abdomen, back and extremities of one day's duration. Three weeks before admission he smashed the distal phalanx of his left ring finger with a hammer.

Physical Examination.—Physical examination revealed an acutely ill man with risus sardonicus and opisthotonus, crying out with pain. The temperature was 98.8 F., pulse rate 80, respirations 20 and blood pressure 160 systolic and 90 diastolic. Maximum measurement of interincisor distance was 7 mm. His neck was stiff and his back was arched so that a fist could be passed under it with ease. There was pronounced spasm of the abdominal muscles and of the extremities, and touching them produced painful spasms. The terminal phalanx of the left ring finger revealed a loose finger nail with crusted granulations at its edges. The results of examination otherwise were not remarkable.

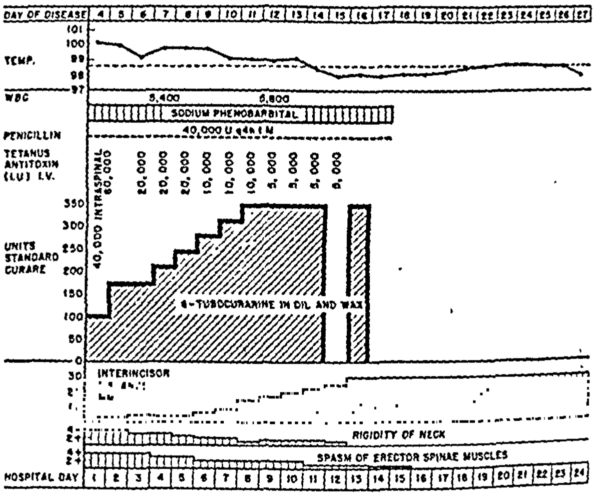

Fig. 3.—Chart of data in case 3.

Course.—The patient was given 3,000 units of antitoxin intrathecally and 30,000 units intramuscularly at once, and the wound was debrided. An additional 120,000 units of antitoxin was given during the next four days. Sedation with phenobarbital sodium, 0.16 Gm. intramuscularly every six hours, was ineffectual in controlling convulsions or spasm. Twenty hours after admission, treatment with d-tubocurarine in wax and oil was begun with a dose of 0.6 cc. (105 mg. d-tubocurarine). Slight relaxation was noted in about two hours, but tetanic spasms continued. The daily dosage was increased by increments of 40 to 60 mg. of d-tubocurarine) until 2 cc. of the preparation (350 mg. d-tubocurarine) was given daily. With a dosage of 1.2 cc. the patient was free of spasms and was able to eat and move about. Spasticity tended to increase somewhat after eighteen to twenty-four hours, but convulsions did not recur. Further increase in dosage was continued to secure maximal relaxation and to determine when toxic symptoms might appear. On the eleventh day of therapy, thirteen hours after intramuscular injection of 2 cc. of the preparation, the patient slipped off a bedpan. In trying to get back into a comfortable position he experienced difficulty in breathing, cyanosis, increased salivation with tracheal obstruction, dysphagia, generalized weakness and tachycardia, but no diplopia. Considerable mucus was aspirated with an intratracheal catheter; he was given oxygen intranasally and in forty-five minutes was apparently no worse for the experience. Treatment with d-tubocurarine in wax and oil was discontinued, with return of moderate, but not troublesome, stiffness of the legs and back the next day. Ten days later, on his twenty-first hospital day, the patient was discharged.

Comment.—This represents a case of generalized tetanus in which treatment for eleven days with d-tubocurarine in wax and oil resulted in gratifying relief of tetanic spasms when the dosage was 1.2 cc. daily. The dosage was increased to secure more adequate muscle relaxation and to determine at what level toxicity might appear. On the second day of a 2 cc. dosage, the patient slipped off a bedpan and experienced severe respiratory difficulty. It was postulated that this reaction was due to inadvertent massage of the injection site with release of a toxic amount of d-tubocurarine rather than to a cumulative effect, because the symptoms subsided rapidly and previously we had observed a decrease in curare effect in this patient eighteen to twenty-four hours after injection. For sedation, we believe that paraldehyde, chloral or ether in oil by rectum are preferable to the phenobarbital sodium given in this case.

Case 3.—R. W. (fig. 3), a 62 year old white unemployed man, was admitted to the Detroit Receiving Hospital Nov. 7, 1947, because of stiffness of the extremities and back of three days' duration and "locking" of his jaws of six hours' duration. One week before admission he had scraped the base of his left thumb on a cement block. For eight years he had had a varicose ulcer over the external malleolus of the left ankle, for which a saphenous ligation had been done at another hospital two months before the present admission.

Physical Examination.—Physical examination revealed an acutely ill elderly man with stiff neck, rigid back and extremities and moderate spasm of the abdominal muscles. His mouth could not be pried open to remove his false teeth. Maximum interincisor distance was 3 mm. There were no convulsions. The temperature was 100 F., pulse rate 80, respirations 20 and blood pressure 156 systolic and 90 diastolic. There was moderate retinal and peripheral arteriosclerosis. At the base of the left thumb was a healing abrasion, which did not appear infected. Over the external malleolus of the left ankle was a varicose ulcer covered with a thin dirty gray exudate, from which gram-positive spore-bearing bacilli and gram-positive cocci were obtained on smear. Results of physical examination otherwise were not remarkable.

Course.—The patient was given 40,000 international units of antitoxin intrathecally and 60,000 units intravenously, and his wounds were debrided. An additional 110,000 units of antitoxin was administered during the next eleven days. The patient was given 0.6 cc. of d-tubocurarine in wax and oil intramuscularly, with some subjective relief of symptoms in about two hours. The dosage was increased by increments of 0.2 cc. until the amount administered was 2 cc. daily. There was progressive decrease in muscle spasm and increase in the interincisor distance. When the medication was discontinued for one day, however, there was no notable increase in measurable muscle spasm. Two additional doses were given in an attempt to produce electrocardiographic changes. None occurred. The patient was discharged on his thirty-third hospital day.

Comment.—This represents a case of tetanus of moderate severity. The patient was given 3,570 mg. of d-tubocurarine over a period of fourteen days, with relief of painful muscle spasm. For six days he received 2 cc. of the wax-oil mixture (350 mg. d-tubocurarine) daily without toxicity and with no evidence of cumulative effect.

COMMENT

For control of the convulsions and muscle spasm in tetanus many drugs have been employed with only limited success. The disadvantage of sedatives and anesthetics is that, if given in amounts adequate to control convulsions, they interfere with the nutrition and vegetative functions of the patient. Furthermore, some which depress respiration, notably the barbiturates and tribromoethanol solution, have been shown to shorten the life of experimental animals with tetanus.[3]

Treatment with curare, which acts primarily at the motor end plate, avoids these disadvantages. Its desirable relaxant effect permits the patient with tetanus to eat, move, void and defecate, but in our previous experience the aqueous preparation (intocostrin ®)[3a] proved of limited value because of its short action (fifteen minutes to an hour) and its frequent unpleasant side reactions: diplopia, dysphagia, hypersecretion, laryngeal paralysis, respiratory paralysis and occasional drops in blood pressure to shock levels. Administration of aqueous curare by constant intravenous drip as described by West[4] presents almost insurmountable technical difficulties in tetanus patients.

d-Tubocurarine in wax and oil, however, seems to produce a prolonged relaxant effect without many of the unpleasant side reactions of curare. Schlesinger[5] has given 1,500 injections of this preparation in amounts ranging from 0.4 to 2.5 cc. to 200 patients with various spastic conditions. Duration of action in his series varied from twenty-four to one hundred and sixty-eight hours, with longer action in the cases of less severe disease. Duration of action and dosage, in the absence of a method for measuring curare blood levels, must be judged by clinical observation. In our 3 patients with tetanus, the duration of action following doses of 0.6 to 2.0 cc. ranged between eighteen and twenty-four hours or more, but no cumulative effect was noted. The relaxant effect was apparent within one to three hours after injection. The daily maintenance dosage varied between 1.25 cc. for a 38 Kg. boy and 2.0 cc. for an 80 Kg. man. When maintenance doses were reached, the patients were able to eat, move about and defecate and were not stimulated into spasm by examination. On the basis of our experience, we believe it safe to give an initial intramuscular dose calculated on the basis of 3.5 to 4.0 mg. of d-tubocurarine per kilogram of body weight, but not to exceed 2.5 cc. of the preparation. Subsequent dosage must be gaged by clinical response. The objective is to control convulsions and relax spasm without producing muscle paralysis.

Toxic effects were observed in only 1 of our patients (case 2). He experienced difficulty in breathing, increased salivation and cyanosis when he slipped off the bedpan. He was completely relieved by tracheal aspiration and oxygen within an hour. It was thought that he had inadvertently massaged the site of injection, with release of a toxic amount of curare. Because Pearlstein and Weinglass[6] reported that curare has a cardiotoxic effect which precludes its use "for long periods as would be necessary in treatment of tetanus," we made frequent studies of the circulation in our patients. Electrocardiograms taken before, during and after treatment showed no significant changes. The systolic blood pressures fell between 10 and 20 mm.

of mercury, but there was no notable change in the pulse rate and no arrhythmias developed. These patients received total doses of d-tubocurarine ranging from 2,485 mg. in eleven days to 3,570 mg. in fourteen days.

Although we encountered no serious toxic reactions, we believe that the same precautions should be observed in treatment with d-tubocurarine in wax and oil as with aqueous curare. This preparation should not be given to myasthenic patients or to patients with renal disease. In addition, the suspension must be shaken vigorously before it is withdrawn from the vial to insure uniform distribution of the d-tubocurarine, the syringe and needle must be kept perfectly dry, and massage of the site of injection must be avoided. Until further experience with this preparation is attained, the patient with tetanus must be watched constantly. Cumulative action may occur, and a laryngoscope, endotracheal tube, aspiration apparatus, neostigmine and oxygen for nasal administration must be available for immediate use.

SUMMARY

Three cases of tetanus in which d-tubocurarine in wax and oil was used for control of convulsions and muscle spasms are reported. In optimum dosage, this preparation produced relief of tetanic muscle spasms without serious side reactions. The duration of action was eighteen to twenty-four hours or more, but in dosages employed no cumulative effect was noted. All of the patients lived. From this experience it is concluded that d-tubocurarine in wax and oil is an effective agent for controlling tetanic muscle spasms and is not unduly dangerous. Precautions in using this preparation are noted.

Clinical Notes, Suggestions and New Instruments

TREATMENT OF RECTAL AND RECTOSIGMOID POLYPS

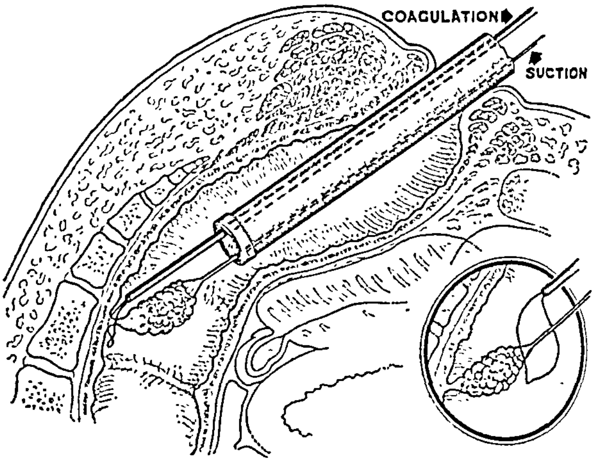
Funnel Tip Suction as an Aid in Their Removal

PAUL C. MORTON, M.D.
New York

The removal of polyps of the upper part of the rectum and rectosigmoid presents technical difficulties of some magnitude if performed through a proctoscope. The proper and complete removal of such a lesion through the anal outlet may give accurate data for proper diagnosis and prognosis and information as to the need for further operation. Piecemeal removal of such lesions should be avoided, because the gross appearance of the polyp, together with sections through the base or pedicle, is most important in determining the proper treatment of the patient.

These lesions can be removed by several technics. David[1] advocated section of the sphincter in the posterior commissure with prolapse of the mucous membrane with the polyp and local excision. Others have approached the lesion through the ischiorectal space with local excision and without sphincter section. Removal through a proctoscope with an electric snare provides a simpler form of treatment for the majority of lesions. The current should be of the coagulating type and of low intensity, so that a slow thorough coagulation of the base will be accomplished. The development of radio tube machines with settings for known depth of coagulation makes such a current available.

The major technical difficulty is in engaging the polyp through the loop snare to secure the pedicle well away from the base of the polyp and in normal tissue. As an aid in controlling the prolapse of the polyp through the loop, a modification of the usual suction tube has been devised. A small funnel tip replaces the standard distal end and side openings. The instrument also has finger tip control of suction through an opening in the tube at the proximal end. This allows control of suction by the operator. This instrument is introduced into the proctoscope after the coagulating snare is placed near the polyp. The funnel suction tip is introduced through the wire snare and engages the polyp (insert at lower right hand corner of the figure). This gives strong but gentle and bloodless traction. The pedicle can then be put on the stretch and the wire loop pulled down on the pedicle at a safe distance from the base (figure). The coagulating current is now applied, and the wire snare is slowly tightened, with removal of the polyp. It must be emphasized that this instrument is useful only to prolapse the polyp through the snare and insure removal through normal tissue. Strong traction of a lesion above the peritoneal reflection is dangerous and may lead to a perforation of the sigmoid.



Drawing illustrating the technic described. Insert: The funnel suction tip is introduced through the wire snare and engages the polyp.

The funnel suction has been helpful in establishing the fixation and mobility of questionable lesions. When the tumor is engaged in the funnel one can determine whether there is a broad firm fixed base or a freely mobile polyp with a pedicle. Patients in whom polyps above the peritoneal reflection have been removed are hospitalized for from three to five days. No anesthesia is necessary.

The following suggestions will lead to fewer technical difficulties in this procedure:

1. The inverted position on a standard rectal table or the prone position with hips elevated and shoulders and legs depressed should be used wherever possible.

2. A large diameter proctoscope should be used; a 1-inch (2.5 cm.) proctoscope is preferable to a ⅞ inch (2.2 cm.) instrument.

3. The suction funnel must have a lumen of sufficient diameter to permit good suction and to allow passage of small pieces of tissue which may break away from the polyp, thus plugging the tube and preventing suction.

4. It is essential to have adequate assistance to hold the proctoscope in position and to hand to, and take from, the operator the various instruments which are being used.

5. Adequate and reliable suction equipment must be used with the suction funnel.

The funnel tip suction can be made in any hospital engine room. The following specifications have given the most practical instrument: (1) copper tubing with 3 mm. inside and 5 mm. outside diameter, (2) length 44 cm. and (3) funnel tip 1 cm. in diameter.

SUMMARY

A suction funnel for grasping and manipulating rectal and rectosigmoid polyps is described. Its use will facilitate the complete and safe removal of high rectal and rectosigmoid polyps through the proctoscope.

From the Surgical Service, St. Luke's Hospital, New York.

THE PHYSIOLOGIC EFFECTS OF HEAT

KHALIL G. WAKIM, M.D.
Rochester, Minn.

Before the physiologic effects of heat are discussed it would be instructive to consider the factors constituting the physiologic background for the regulation and maintenance of body temperature. This will afford a scientific basis for the dynamic stability of body temperature and indicate the modus operandi of the various factors taking part in regulation of temperature and in production of the physiologic effects.

NORMAL RANGE OF BODY TEMPERATURE

The temperature of the human body, in health, remains remarkably constant under conditions of extremely varying heat production and heat loss. The normal range of body temperature as determined by a thermometer placed in the mouth is between 96.7 and 99 F. The average is about 98.6 F. (37 C.). The rectal temperature is about 1 F. higher (97.2 to 99.5 F.) and the axillary about 1 F. lower than the oral temperature. Rectal temperature is the highest and most reliable. The temperature taken in the axilla or the groin is inaccurate, especially in thin subjects. Oral temperature is liable to variations from local conditions; for example, it is lowered by evaporation of sweat or contact with cold air. Hot drinks may raise the oral temperature. Activity of the muscles of mastication with the consequent increase of blood flow through them raises the oral temperature. This liability to variation makes oral temperature less reliable than rectal. The temperature of internal organs is about 2 or 3 F. higher than the temperature of the skin.

Diurnal Variations.—Variations in the body temperature occur in the same person throughout the day. The temperature of the average person is lowest about 4 a. m. and highest between 4 and 7 p. m. This normal variation is due to the degree of muscular activity which occurs during the day. A reversal of the ordinary daily routine, as in night workers, reverses the temperature curve. During sleep the temperature falls because of bodily inactivity and diminished control of the temperature-regulating mechanism, which shows itself in vasodilatation of cutaneous vessels. This is the reason why one chills easily during sleep. During severe exercise the temperature may rise to 39 or 40 C. (102.2 or 104 F.). This rise is proportional to the exertion and is due to the heat liberated by the active muscles. It is not accompanied by any ill effects or feeling of discomfort. It helps to increase the breathing and the pulse rate and facilitates the dissociation of oxyhemoglobin in the tissues. The body temperature may fall to 36 or 36.5 C. (96.8 or 97.7 F.) in the early stages of prolonged exposure to extremely cold weather. People shiver reflexly during such exposures and produce sufficient energy to maintain a body temperature within normal range.

The body temperature has been known to fall to 24 C. (75.2 F.) and to rise to more than 45 C. (113 F.) without fatal effects; these are probably the limits compatible with subsequent recovery.

Age Variations.—The temperature in infants is irregular at first, but periodicity gradually sets in with the development of regular periods of activity and rest. Heat regulation in very early life is imperfect. A fit of screaming causes a rise; a cold bath may lower the temperature by 7 F.

In persons of advanced age the temperature is usually subnormal. The body is less active, the circulation is feeble and there is less power of accommodation for changes in external temperature. Persons of this group tend to suffer in extremes of temperature.

THE REGULATION OF BODY TEMPERATURE

The temperature of warm-blooded animals remains practically unchanged, though the surrounding temperature varies between 0 F. or below and 100 F. or above. Mammals and birds possess efficient mechanisms for maintaining a constant body temperature against extreme changes in environmental temperatures. They are called homothermic animals. On the other hand, the body temperature of cold-blooded animals, such as the frog and turtle, is practically that of the environment. These are called poikilothermic animals.

The body temperature of man represents the balance struck by the heat produced by the tissues plus heat obtained from warmed food and the heat dissipated into the environment. Temperature regulation is effected by balancing heat production against heat loss. Heat production is the result of chemical reactions; heat loss is dependent on physical factors; they are therefore designated respectively as chemical and physical regulations of the body temperature.

Avenues of Heat Loss.—Heat is lost from the body by several ways:

1. Radiation, Convection and Conduction: The loss of heat by these means varies (*a*) with the environmental temperature; (*b*) in man, with the nature and amount of clothing, and (*c*) with the metabolic activity and the quantity of heat produced within the body.

The cooling of warm objects varies with the temperature of the air and neighboring objects. Warm objects lose heat rapidly through radiation, conduction and convection into the surrounding cooler environment. The rate of heat loss gradually decreases as the temperature of the object approaches that of the surroundings. Certain factors operate to encourage or minimize heat loss in the living body, depending on whether the environmental temperature is high or low: (*a*) Redistribution of blood is an important factor. The superficial blood vessels in the subcutaneous tissues and skin dilate or constrict and through the diversion of blood from the visceral regions to the surface of the body or from the surface to the internal organs, heat loss is correspondingly facilitated or hindered. (*b*) Alterations of blood volume[1] also play a role. A rise of body temperature leads to augmentation of blood volume. Two factors are concerned in the increase of the blood volume which follows a rise of environmental temperature: (1) contraction of the spleen, whereby whole blood is discharged into the general circulation;

Professor of Physiology, Mayo Foundation, and Consultant in Section on Physiology, Mayo Clinic.

[1] Barcroft, J.; Meakins, J. C.; Davies, H. W.; Scott, J. M. D., and Fetter, W. J.: Phil. Tr. Roy. Soc., London, s.B **211**: 455, 1922.

(2) dilution of the blood, by water drawn from the tissues to augment the circulating fluid. The fluid drawn into the circulation is mainly from the skin, muscles and liver. At low temperature, for example, during exposure to cold, the blood volume is reduced and the blood becomes more concentrated, as shown by an increase in the percentage of blood solids. It is not altogether clear by what means this movement of water is brought about. However, there is evidence[2] of a nervous element (vasomotor nerves) in the mechanism. It has been demonstrated that after section of the spinal cord in the lower cervical region concentration of the blood does not occur when the animal is placed in a cold bath; the body temperature falls. However, if a normal animal is exposed to cold, the blood becomes concentrated and the body temperature does not change. Cold applied locally after section of the splanchnic nerves causes anhydremia as a result of the transudation of water into the skin of the cooled region. The migration of water is attributed to constriction of the cutaneous arterioles and consequent slowing of the capillary blood flow, which, in turn, apparently through oxygen lack, increases the permeability of the capillary wall. It is probable, therefore, that exposure to cold induces blood concentration through both central and direct peripheral effects. These changes of blood volume are of paramount importance in the regulation of body temperature. (*c*) Increased cardiac output is a third factor. Environmental temperatures above 30 C. (86 F.) produce moderate increase in minute cardiac output (5 to 30 per cent increase).

The rate of conduction of heat through the subcutaneous tissues to the skin varies considerably in different persons owing to the presence of varying quantities of fat. Fat serves to insulate the body from heat loss. Obese persons, therefore, become more easily overheated when, as in muscular exercise, heat production is increased; for the same reason they are better able to resist low temperatures.

Radiation, convection and conduction are influenced by the humidity of the atmosphere as well as by its temperature. Water vapor is less dense than dry air, and warm air than cool air. A layer of warm air saturated with moisture covers the surface of the clothed body. Convection currents are, therefore, set up between it and the surrounding atmosphere when this is cool and has a low water vapor content. When the surrounding air is nearly saturated with moisture (high relative humidity), as on close summer days or in a room crowded with people, loss by convection is reduced to a minimum. Wind also serves to remove the warm layer of air next to the skin and replace it with cooler air, thus increasing heat loss. Humid air is more opaque to radiant energy than dry air. A high water content of the atmosphere, therefore, also reduces heat loss by radiation. Dry air at a temperature much above body temperature may not cause a rise in the latter because the heat lost through evaporation may equal that gained by radiation and conduction, as well as that produced by metabolism. High environmental temperature will increase total metabolism by causing an actual rise of the temperature of the tissues and a greater velocity of their chemical reactions.

2. The Role of Evaporation in Temperature Regulation: The amount of heat lost from the body by radiation, conduction and convection is lowest whenever the temperature of the environment is close to that of the body. In fact, heat loss by these avenues ceases when the environmental temperature approaches 99 F. If the environmental temperature rises above body temperature, in the absence of other means of cooling, the body is bound to gain heat. When, under such circumstances, radiation, conduction and convection are no longer adequate to prevent increase of body temperature, vaporization becomes the important means for heat loss through the skin. Vaporization is the avenue for the entire heat loss of a naked man lying quietly in an environment at 34.5 C (94.1 F.) and covered with sweat.

To change water from the liquid to the gaseous state (vaporization) involves the loss of heat from the surrounding material, including the water itself. This heat is called the heat of vaporization. Evaporation is a cooling process. The heat absorbed in the vaporization of 1 cc. of sweat amounts to 0.58 calory.

There is a certain small amount of water in man which is lost in amounts of about 30 to 50 cc. per hour from the respiratory membranes and skin because they are moist; this is known as insensible water loss, to distinguish it from sensible perspiration (sweat). Persons born without sweat glands vaporize the same amount of water as normal persons[3] under basal conditions. In the absence of activity of the sweat glands the surface of the avascular epidermis is moistened by extravascular fluid originating from the capillary loops of the dermal papillae. Even at ordinary room temperature when no perspiration is obvious, heat loss through evaporation from the skin and lungs amounts to about 25 per cent of the total heat loss. When the environmental temperature rises, or heat production in the body increases, the respiratory rate increases, and the heat lost through warming the inhaled air is thereby augmented.

The relative humidity of the air, that is, the degree to which the atmosphere is already saturated with moisture, has an inverse influence on the rate of evaporation of water. Sweat which simply drips from the skin without evaporating does not increase heat loss. This is the basis for the crippling of heat elimination by sweat when the relative humidity is high. It is common experience that one feels hotter and suffers more discomfort in a hot and humid atmosphere than in one that is hot and dry.

The following are additional minor avenues for heat loss:

3. The Warming of Inspired Air to Body Temperature: The amount of heat lost in this manner depends on the temperature of inhaled air. At the usual room temperature it amounts to only about 3 per cent of the total heat loss.

4. Liberation of Carbon Dioxide from Solution in the Blood into the Gaseous State in the Lungs: This process involves the absorption of heat, but it contributes only about 4 per cent of the total heat loss.

5. The Heat Lost in the Excreta (Urine and Feces): This amounts to only about 1 to 2 per cent of the total.

Temperature Regulation by Altering Heat Production.—The production of heat goes on continuously in all tissues in order to supply the resting energy requirements. Heat production occurs mainly in skeletal muscles where exothermic chemical reactions, oxidative and nonoxidative, are continuously going on. The heart contributes some heat. All mechanical energy liberated by cardiac muscle is converted within the body into heat. The liver and kidneys, wherein numerous chemical reactions are performed, also are good sources of body heat. Tonic contractions of muscles even at rest add to the basal heat in the body. When more heat is required, the muscles become tense owing to an increase in tone. In answer to the question whether an increase in the tone of the skeletal musculature, below the stage of shivering, plays a part in chemical regulation of body temperature, Burton and Bronk[4] obtained objective evidence of the occurrence of a true "thermal muscular tone" by studying the action currents of muscle. This increase of tone began with the first sign of rise in metabolic rate. Shivering appeared later on when coordinated intermittent firing of motor units occurred. One of the most potent conditions that bring about an increase of heat production is a low environmental temperature. On exposure to a cold environment the metabolism rises. This is effected through the increase of tone of the skeletal musculature and the involuntary contractions in the form of shivering and chattering of the teeth. Paralysis of the skeletal muscles by curare leads to inability to maintain a normal body temperature in a cold environment. However, because the physical mechanisms of control remain intact, high environmental temperature can be resisted. Transverse section of the spinal cord at the level of the sixth cervical segment abolishes both the chemical and the physical regulation, at least until lower centers take over and a few of the mechanisms, especially physical, recover partially. Pilomotor muscles contract, causing "goose flesh," which is a vestige in man of the mechanism causing the ruffling of the hair or feathers in other mammals and birds to entrap a thicker layer of air.

The specific dynamic action of foodstuffs, especially proteins, sets free a certain amount of heat in the body. Protein food is an important factor in the chemical regulation of body temperature. In cold climates the per capita consumption of protein food is much greater than in the tropics. In winter one is more inclined to eat foods with high specific dynamic action than in the summer. At high environmental temperatures the physical mechanisms which hasten heat loss are counteracted by the specific dynamic action of food. This is why a low protein diet is more suitable for hot weather.

The Relative Importance of Chemical and Physical Means of Temperature Regulation.—When the environmental temperature is close to that of the body, both physical and chemical regulation of body temperature are least active. As the environmental temperature falls, physical regulation alone will suffice to maintain body temperature at first, but with greater reduction of environmental temperature chemical regulation will also become active. Du Bois[5] reported that the basal metabolism of a naked man in a calorimeter is surprisingly level in an environmental temperature between 22.7 and 34.5 C. (72.9 and 94.1 F.). This suggests that by adjusting heat loss alone man has an effective means of maintaining a constant temperature over an environmental range of 23 to 35 C. (73.4 to 95 F.).

Nerve Centers Regulating Temperature.—The reactions that take part in the maintenance of thermal equilibrium are under control of the central nervous system. Both the somatic motor and the visceral motor neurons take part in this control. The somatic motor fibers produce panting by activating the respiratory muscles, and shivering by activating the muscles of the trunk and extremities. The visceral motor neurons of the autonomic nervous system activate the erector pili muscles of the hair follicles and the sweat glands, and control the caliber of the cutaneous blood vessels. Sympathectomy eliminates passage of sympathetic impulses to cutaneous vessels, erector pili muscles and sweat glands and renders the animal extremely susceptible to cold.

The Role of the Hypothalamus.—The hypothalamus integrates the reactions responsible for thermal equilibrium. Through its influence on the somatic and visceral motor neurons, the hypothalamus functions as a physiologic thermostat and changes the rate of heat production and heat loss according to the thermal status and requirements of the body. Experimental evidence[6] indicates that the anterior portion of the hypothalamus is responsible for the prevention of hyperthermia when the body is exposed to warm environment. This is performed through panting, sweating and cutaneous vasodilatation, which increase heat loss and prevent overheating of the body. The application of cold to the hypothalamus causes a rise, and heating it a fall in the temperature of the body. Barbour[2] showed that application of cold to the hypothalamus caused vasoconstriction in the rabbit's ear. Stimulation of the hypothalamus caused sweating. In the normal state the heat-regulating centers are influenced (*a*) by the temperature of the blood flowing through them and (*b*) reflexly from the skin. The production of bilateral lesions in the anterior portion of the lateral hypothalamic area leads to fatal hyperthermia because of failure of the heat-dissipating mechanisms. Lesions of the posterior portion of the hypothalamus will, furthermore, lead to inability to maintain a body temperature within normal range on exposure to a cold environment. Such observations led to the conclusion that in the normal state the anterior portion of the hypothalamus is responsible for protection against a hot environment and the posterior portion is responsible for protection against a cold environment.

It is possible that the endocrine glands, specifically the thyroid and adrenal glands, play some role in the thermoregulatory mechanisms. The body temperature tends to be subnormal after experimental adrenalectomy or thyroidectomy. Also, in Addison's disease and in cretinism body temperature is subnormal. Serum taken from animals exposed to severe cold causes a rise of metabolic rate when administered to other animals. Exposure to cold increases the rate of the denervated heart. Prolonged exposure to cold produces hyperplasia of the thyroid gland and increased activity of the adrenals. The hormones liberated by the thyroid and adrenals participate in the catabolic processes which produce extra heat during exposure to cold. Hartman and Hartman [7] and Cannon and his associates [8] reported evidence of the influence of the adrenals on metabolism in response to cold through the increase in output of epinephrine. The adrenotropic and thyrotropic hormones of the anterior pituitary stimulate the thyroid and adrenals during prolonged sojourn in a cold environment and take part in the thermal adjustments, causing effective resistance against cold.

TYPES OF HYPERTHERMIA

According to the French physiologist Richet,[9] the various types of hyperthermia may be classified into two important groups: (1) passive fever, which is undergone by the organism, and (2) active fever, which is aroused by the organism. Hot baths, long wave diathermy, short wave diathermy, the Kettering hypertherm (hot humid air) and luminous and nonluminous heat cabinets are included among the means of inducing passive fever. Under such conditions the body does not make any effort to raise its own temperature. Effort is exerted to become cooler; in other words, the heat-eliminating mechanisms usually are put into action.

Active fever is aroused by the organism and may be induced by injection of foreign proteins, malarial parasites, typhoid vaccine or some colloidal substances. In this type of fever, the organism makes an effort to raise its own temperature and the cells are active in producing it. The cells have been stimulated either directly, or indirectly through the nervous system. This is an endogenous febrile reaction. Accompanying the active fever induced by foreign proteins or by typhoid vaccine administered intravenously, the manifestations of shock usually appear, whereas with the passive fever induced by physical means there are no manifestations of shock.

Chronologically the phases of the febrile reaction produced by intravenous administration of typhoid vaccine can be arranged as follows: (1) prodromal phase, (2) chill phase, (3) flush phase and (4) defervescence phase.

Some of the more important signs and symptoms of these phases are the following: 1. During the prodromal phase yawning, stretching, general malaise, abdominal unrest, nausea, chilliness, pallor and weakness with some headache usually appear. Altschule and Freedberg [10] stated that during the prodromal phase of an endogenous febrile reaction no significant physiologic or chemical alterations can be observed but the chill phase is characterized by a sympathetic discharge leading to marked generalized vasoconstriction which causes circulatory stasis of variable degrees. 2. During the chill phase there is a general increase of muscle tone and a definite feeling of cold with shivering, chattering of teeth, severe pallor, cyanosis, low cutaneous temperature and rising body temperature. Johnson and associates [11] reported that the spasm of cutaneous blood vessels during the chill was due to activity of the sympathetic system and that in sympathectomized limbs there was no spasm of the cutaneous vessels during a chill caused by injection of typhoid vaccine. 3. During the flush phase there is a general feeling of warmth and relaxation with congestion, redness, sweating and high cutaneous and internal temperatures. 4. During the defervescence phase there occurs a gradual diminution of congestion, redness and body temperature.

The following are some of the salient characteristics of hyperthermia produced by physical means: The prodromal phase and its manifestations are absent; the chill phase and its manifestations are absent; the flush phase develops gradually from the onset with consistent increase of blood flow, and defervescence usually sets in as soon as the physical agent used as a source of heat is discontinued.

The beneficial effects obtained from the induction of hyperthermia are not necessarily due to the fever per se, for certain treatments have helped without elevation of body temperature. This has led to the use of the expression "pyrotherapy without fever." Furthermore, a patient may have a very high temperature and yet get no benefit from it. If it should ever be proved that the benefit derived from pyrotherapy is due to the fever per se, then the hyperthermia produced by physical means would be the method of choice, because, as mentioned previously, this type of fever is associated neither with prodromas nor with chills and the manifestation of shock.

Why does fever occur in the organism? In general, it can be definitely stated that fever occurs as a result of imbalance of the heat-producing and heat-eliminating mechanisms. If heat loss is reduced or if heat production is increased without an accompanying increase of heat elimination, a rise of body temperature is bound to occur. Hardy [12] stated that a normally functioning heat-eliminating mechanism can rid the body of excess heat up to twelve times the basal heat production. If this heat were conserved, it would suffice to raise the temperature of the body to 50 C. (122 F.) in thirty-five minutes. A relatively small increase of heat production, if associated with a large reduction of heat loss, such as occurs in malarial chills, can produce very high temperature. This shows that in the development of fever the mechanism of heat loss is as important as that of heat production. Fever can be easily induced by hot baths, by hypertherm cabinets (hot humid air) or by luminous and nonluminous heat cabinets because, under such conditions, the body is unable to use the skin to eliminate its heat as it normally does. As mentioned previously, the fever produced by such physical agents is neither ushered in by a prodromal phase nor preceded or followed by chills. Furthermore, the flush phase of this type of fever is associated with extreme vasodilatation. In fact, the pink color of the skin all over the body is a prominent feature of fever induced by physical means.

SYSTEMIC EFFECTS OF HEAT

Changes in body temperature, whether as a result of severe environmental variations or of infectious, metabolic or toxic agents, produce more or less profound effects on the various biologic processes within the body. As has been stated in the preceding discussion, the heat to which the body reacts may have its origin in extrinsic factors or internally from metabolic processes. For clarity the physiologic effects of heat will be considered in relation to the body systems with which they are connected.

Effects on Blood Cells.—McCutcheon [13] noted that the rate of locomotion of leukocytes was affected by temperature in a manner similar to that of a chemical reaction; the maximal rate was reached at 40 C. (104 F.). Madsen and Wulff [14] observed that the normal blood temperature was the optimal temperature for phagocytosis. Krusen [15] studied the blood picture before and after artificial fever at temperatures of 104 to 106.8 F. (40 to 41.6 C.) and obtained an average increase of leukocytes from 7,125 per cubic millimeter of blood before fever to 11,269 after fever. After the fever there was a relative increase of neutrophils and a relative decrease of lymphocytes. Hargraves and Doan [16] observed a characteristic postfebrile leukocytosis which was so constant that they felt justified in designating it as the "febrile hemogram." They found that the peak of leukocytosis, reaching about 40,000 leukocytes or more per cubic millimeter of blood, occurred usually several hours after the cessation of fever. It is believed that artificial hyperthermia induced by physical means exerts an effective mobilization of body defenses against disease.

Effects on the Cardiovascular System.—The ability to withstand high environmental temperature is a good index of a properly functioning cardiovascular system. It is common experience that, during a hot spell, fainting, collapse and even death are often the lot of those with poor cardiovascular reserve. The effects of heat on the cardiovascular system can be classified as cardiac and vascular. The cardiac effects during hyperpyrexia include a disappearance of the common sinus arrhythmia and its replacement by regular cardiac rhythm. The electrocardiographic changes induced by fever are variable and inconsistent. The P-R interval, that is, the conduction time between the atria and ventricles, is shortened during fever.

Heart Rate: Within physiologic limits, the rate of generation and the speed of propagation of impulses are increased under the influence of agents that raise the temperature of the body. This means that a greater number of impulses are traveling to the various organs of the heated body. When a general rise in temperature of the body is produced from heating, the result is an increase in the rate of the heart beat. When a general rise in temperature of the body takes place, the metabolic activity of the pacemaker of the heart (sinoauricular node) is augmented and the initiation and rate of passage of the cardiac impulses along the conductive system are increased. Consequently the heart speeds up under the influence of heat.

It has been observed [17] that in artificially produced fever the pulse rate rises more or less proportionately to the rise in body temperature, in the ratio of about 10 beats for 1 F., much as it does in naturally occurring fever. In our studies on the effects of artificial fever, my colleagues and I obtained an average increase of 10.5 heart beats per minute for every rise of 1 F. in arthritic patients. Hill and Flack [18] obtained a mean increase in pulse rate of 44 beats per minute for a rise of 2.4 C. (4.3 F.) in rectal temperature. Bazett [17a] found with similar baths a mean increase of 37 beats per minute for a rise of 2 C. (3.6 F.).

Cardiac Output: From his study of the pulse curve by the use of the tachogram method, Bornstein [19] concluded that the output of the heart per minute was increased by hot and cold baths; the hot baths increased the heart rate but decreased the stroke volume, while the cold produced the reverse combination. Baths of less than 40 C. (104 F.) cause little change in cardiac output because the decrease in stroke volume is balanced by the increase in pulse rate.[20] Heymans [21] observed with administration of warmth an increased cardiac output too great to be accounted for only by an increase in heart rate; an increase in stroke volume was indicated.

Blood Pressure: The effects of external heat and hyperthermia on the blood pressure are varied.[22] In general it can be stated that external heat in most forms tends to lower the blood pressure and cold tends to raise it. Bazett [17a] noted, however, that a bath of more than 40 C. (104 F.) may give a blood pressure above normal while a cold bath may occasionally induce a temporary fall followed by a rise. In our studies [23] on artificial fever by the use of tub baths the effects on blood pressure were variable. Of the 15 subjects, the systolic pressure showed some rise in 4 subjects, a slight fall in 6 and no change in 5. In 11 subjects there was some fall of the diastolic pressure, in 2 there was no change and in the remaining 2 there was a slight rise. Similarly, the changes in blood pressure as a result of fever induced by the Kettering hypertherm were as follows: Of the 15 subjects studied, 5 showed some rise in systolic blood pressure, 3 showed no change and the remaining 7 showed a slight fall. In all subjects there was a fall of diastolic blood pressure with the exception of 1, in whom no change in diastolic pressure occurred.

The changes in blood pressure occur as a result of interaction of alterations in cardiac output and vasomotor reactions. The rise of blood pressure during exposure to cold is due to increase of cardiac output and to vasoconstriction in the superficial areas of the body. The varying response of blood pressure to warmth is dependent on the degree of vasodilatation, on the degree of alteration in heart rate, on the cardiac output per stroke and per minute and on the pulse pressure. The position of the subject influences venous return and consequently the blood pressure and the differential distribution of the blood to the various parts of the body.

Vascular Tree: In general, it can be stated that heat, no matter from what source, influences the vascular tree in several ways.

1. Axon reflex. The thermal stimulation of sensory receptors in the skin may bring about vasodilatation through the axon reflex.[24] Since the passage of these

impulses is away from the central nervous system, rather than toward it, as is usually expected to take place along sensory nerve fibers, Bayliss [25] called them "antidromic impulses." Axon reflexes play an important role in the cutaneous vasodilatation observed in subjects exposed to heat. Furthermore, the sympathetic nerves are believed to contain vasodilator fibers. While perfusing the hind limbs of dogs, Burn [26] frequently obtained vasodilatation on stimulation of the lumbar sympathetic chain. He suggested the presence of a general system of vasodilator fibers. Lewis and Pickering [27] presented evidence supporting the existence of sympathetic vasodilator fibers in man. This, however, was denied by Uprus and associates.[28]

2. Metabolites. The metabolites liberated in the tissues act as direct vasodilators. Heat increases the speed of chemical reactions occurring in the living organism. The metabolites, liberated at a great rate under the influence of heat, exert their well known direct chemical vasodilator effect on the small vessel bed throughout the body. This brings about two definite effects; namely, (*a*) an increase in the caliber of the blood vessels and (*b*) an increase in the number of patent vessels; that is, under the influence of heat, new vascular channels are widely opened up in addition to the dilatation of those already patent.

3. Vasodilatation from central effects. With a general rise in temperature of the body, the warmed blood circulating through the heat-regulating centers in the hypothalamus will bring about a discharge of impulses to increase the dissipation of heat. Consequently, a generalized vasodilatation is produced and heat loss is increased by radiation, conduction and convection through the skin. The pinkish skin after exposure to microwaves, diathermy, hot baths or any other source of heat is a manifestation of this generalized cutaneous vasodilatation brought about by local and central mechanisms.

Respiration.—The respiratory rate in man is increased with hyperthermia. Sutton [29] reported an increase of 5 to 6 respirations per minute per degree increase in rectal temperature. If the rise of temperature is rapid, definite hyperpnea with deep respiration is observed and a real sensation of air hunger is experienced. The hyperpnea causes a marked fall in alveolar carbon dioxide tension.[30]

The fall in alveolar carbon dioxide tension is accompanied by alkalosis.[31] Landis and associates [30c] reported rises in p_H of the blood plasma varying between 0.12 and 0.33 during experiments with hot baths. The large volumes of carbon dioxide given off as a result of the hyperpnea would increase the respiratory quotient often much above unity. Koehler [31] has shown a maintained alkalosis in febrile patients. The rise of temperature increases the metabolism and lowers the threshold of the respiratory center.

Sweat Secretion.—An important effect of the application of heat to the body is the profuse sweating that takes place during and for some time after the application of heat. Since the skin in man is the most important accessory channel, next to the kidneys, for the elimination of water, salt and certain other [32] constituents (urea, uric acid, creatinine, phosphates and sulfates), the idea of elimination through the skin by application of heat has been widespread. This constitutes the rationale for the long-standing use of the sweating procedure for the nephritides with edema and retention of blood urea and other nitrogenous products. The value of this therapeutic measure in the elimination of salt and water is accepted, but the compensatory excretion of nitrogenous products by way of the sweat glands is doubted.[33] Pemberton [34] stated that, in nephritic conditions accompanied by pronounced evidences from laboratory tests of retention of nitrogen, or by clinical evidences which suggest the toxemia consequent on such retention, the sweating process is to be considered. He and his associates [35] reported that in conditions accompanied by retention of blood nitrogen the sweat may contain nitrogen in amounts larger than normal. In his study of the control of sweating in normal men, Robinson [36] noted that the rectal temperature and rate of sweating increased with increments in work intensity up to values averaging 38.5 C. (101.3 F.) and 850 Gm. per hour in the hardest work. Since the cutaneous temperature was constant in these experiments, he concluded that the increased sweating must have depended on a direct effect of internal temperature on the heat-regulating center and possibly also on stimulation of the center by the increased neuromuscular activity. When the work was kept constant but the effective temperature was varied in another group of experiments, the average cutaneous temperature and rate of sweating increased directly with increasing effective temperature in this range, varying from 28 to 36 C. (82.4 to 96.8 F.) and from 50 to 1,500 Gm. per hour respectively. In this latter group of experiments the stimulus for increased sweating was considered to be dependent entirely on reflexes from the skin.

EFFECTS OF EXCESSIVE HEAT

When exposure to extremely high environmental temperature is sufficiently prolonged, the effects of heat may be so severe that certain crippling clinical states may develop. Among these, three merit differentiation [37]; namely, (1) heat cramps, (2) heat prostration or heat exhaustion and (3) heat hyperpyrexia or heat stroke.

Ill health, in the form of a full-blown chronic organic disease, inadequate sleep, excessive fatigue, senescence, inadequate supply of sodium chloride, dehydration and alcoholism, is an important factor predisposing to the untoward effects of heat.

Heat Cramps.—Heat cramps constitute a syndrome associated with painful tonic and clonic spasms after prolonged exertion in a hot environment. This syn-

drome is also recognized as miner's cramps, fireman's cramps and stoker's cramps, commonly appearing in those who labor in the heat of fire rooms, especially if one or more of the predisposing factors is coexistent. Maximal susceptibility is in the first few days before acclimatization is established.

The symptoms of heat cramps develop after a period of muscular twitching. The patient is seized with violent, painful spasms associated with abdominal colic, nausea, vomiting and diarrhea. He becomes stuporous, pallid and covered with sweat. Respiration is embarrassed by intercostal and diaphragmatic spasms giving a picture of mild tetany. The pulse is rapid but strong, and the temperature is slightly above normal. The leukocyte count is elevated; there is hemoconcentration from dehydration with a consequent rise in the erythrocyte count and the plasma proteins. Serum sodium and chloride are low. Sometimes acidosis appears, owing to depletion of fixed base from the body rather than to accumulation of fixed acids. The amount of urine is scanty and the excretion of sodium and chloride in the urine is much reduced, owing to excess elimination in the sweat. The cause of the cramps is probably a disturbance of the electrolyte balance, especially of the sodium and calcium ions within and outside active muscle tissue. Heat cramps can be prevented by the intake of 0.2 per cent sodium chloride solution or dilute Ringer's solution during the period of severe exertion in a hot environment.

Heat Prostration or Heat Exhaustion.—This syndrome is characterized by collapse without elevation of body temperature during exposure to an excessively hot environment. During the collapse, manifestations of peripheral vascular failure, with pallor, poor venous return and hypotension, are present. The body temperature is not far from normal and the heart rate is usually less than 100 per minute. The findings in the blood and urine show minor deviations from normal. Adequate water and salt to maintain optimal concentration within the body during exposure to high temperature and the avoidance of the predisposing factors are highly preventive.

Heat Hyperpyrexia or Heat Stroke.—This is often spoken of as "thermic fever" or "sunstroke." It is a syndrome consisting of high elevation of body temperature resulting from exposure to excessive heat. Usually those afflicted with chronic degenerative conditions, especially in the late decades of life, are highly susceptible. The onset of acute symptoms is usually preceded by partial or complete cessation of sweating, which is indicative of a breakdown of the heat-regulating mechanism. Headache, vertigo, fainting and abdominal distress are premonitory symptoms. Delirium and coma may develop in those severely affected and the chances for recovery are slim. Temperatures as high as 110 F. have been reported. Whenever the rectal temperature is above 106 F. the prognosis is bad and profound shock, convulsions and circulatory collapse are usually terminal. The mortality rate may be as high as 50 per cent. Leukocytosis is present; acidosis may develop, and casts may be present in the urine. In the presence of pulmonary congestion, bronchopneumonia may become a dangerous complication. Necropsy findings show generalized congestion of the brain, lungs and abdominal viscera, and minute hemorrhages may be present.

REPORTS OF THE COUNCIL

The Council on Physical Medicine has authorized publication of the following reports. HOWARD A. CARTER, *Secretary.*

GENERAL ELECTRIC CRYSTAL CONTROLLED MODEL D INDUCTOTHERM ACCEPTABLE

Manufacturer: General Electric X-Ray Corporation, 4855 W. McGeoch Avenue, Milwaukee 14.

The Model D Inductotherm is a high frequency generator of electric energy designed for production of heat within human tissues by means of electromagnetic induction. The application to the human body can be made with either the cable or the disk electrodes, both of which are available.

The height of the unit is 109 cm. (43 inches). The other dimensions are 50 by 66 cm. (19½ by 26 inches). The shipping weight is 200 Kg. (441 pounds). For operation it requires alternating current at 100 to 130 volts and 15 amperes. The power input is stated to be 1,800 watts and the output over 200 watts at 13.56 megacycles per second. Accessories include a flexible arm, a disk electrode, a cable electrode, a wall rack and a space set.

The Federal Communications Commission has granted type approval for the Inductotherm Model D, and the Department of Reconstruction and Supply of the Canadian government has approved it. The apparatus is listed by the Underwriters' Laboratories, Inc.

Model D Inductotherm has been tested in a laboratory and clinic acceptable to the Council. It was found to be well made, convenient to operate and a satisfactory source of heat for the administration of diathermy.

The Council on Physical Medicine voted to include the General Electric Crystal Controlled Model D Inductotherm in its list of accepted devices.

PURITAN PM-250 MASK AND BAG ACCEPTABLE

Manufacturer: Puritan Compressed Gas Corporation, 1240 W. Jackson Boulevard, Chicago 7.

This assembly is designed for the administration of oxygen or of gaseous mixtures containing oxygen to human subjects. It consists of the following parts, which may be purchased separately: (1) a nosepiece, made of light plastic, capable of being fitted to various sizes and shapes of nose, and equipped with an adjustable vent; (2) a supply bag, made of latex and provided with an automatic relief valve; (3) an adjustable head strap made of pure gum rubber; (4) an aluminum bag-to-hose connection, and (5) 152 cm. (5 feet) of latex supply tubing. The shipping weight of the whole is 900 Gm. (2 pounds).

The apparatus, on investigation, was found to be satisfactory for use in the various conditions in which oxygen therapy has been demonstrated to be of value. While the advertising also mentions the treatment of migraine, the Council does not consider the oxygen treatment of migraine to have proved to be effective.

The Council on Physical Medicine voted to include the Puritan PM-250 Mask and Bag in its list of accepted devices.

PURITAN SF-2 OXIFIER ACCEPTABLE

Manufacturer: Puritan Compressed Gas Corporation, 1240 W. Jackson Boulevard, Chicago 7.

The Puritan SF-2 Oxifier is an assembly intended to be attached to a tank of oxygen or other gas containing oxygen to be administered to patients. The parts include a single stage regulator, commercial ⅞ inch (22 mm.) cylinder connection, tube type flowmeter, audible warning signal, standard quart (946 cc.) humidifier jar, single and double catheter connections, two catheters, tubing and wrench. The shipping weight of the assembly is 5.4 Kg. (12 pounds).

The Council on Physical Medicine voted to include the Puritan SF-2 Oxifier in its list of accepted devices.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

535 North Dearborn Street - - Chicago 10, Ill.

Cable Address - - - - "Medic, Chicago"

Subscription price - - - - - Twelve dollars per annum in advance

Please send in promptly notice of change of address, giving both old and new; always state whether the change is temporary or permanent. Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, DECEMBER 11, 1948

ASSESSMENT TO PROVIDE EDUCATIONAL PROGRAM

At the recent St. Louis interim session of the American Medical Association, the House of Delegates unanimously voted to assess each member of the Association $25. The fund thus provided will be used for a nationwide plan of education on the progress of American medicine, the importance of the conservation of health and the advantages of the American system in securing a wide distribution of a high quality of medical care. The assessment will come to the members through the state and county societies.

A CALL TO ACTION AGAINST NATIONALIZATION OF MEDICINE

One of the most fundamental actions taken by the House of Delegates at the Interim Session was the decision to assess every member of the Association $25 in order to provide a fund adequate for meeting the proposal of the present administration and particularly of the present Federal Security Administrator to nationalize the services of the medical profession through the enactment of a compulsory sickness insurance act covering every person in the United States.

Almost since the day of Mr. Truman's election Mr. Ewing has been engaging in a one man campaign in behalf of this legislation, speaking on the radio, granting interviews to the press, issuing announcements from his office and attempting to break down public confidence in the medical profession by every possible technic. In this activity he has leaned heavily on his brochure "The Nation's Health," which purports to be related in some manner to the National Health Assembly but which represents a perversion of the data there offered and which bears not the slightest resemblance to the official record of the conclusions of the various sections of the National Health Assembly.

Mr. Ewing has leaned largely on two statements which also bear but little or no resemblance to scientifically established fact. He has asserted that some 300,000 lives could be saved if only his proposals were made the law of the land, and he has said again and again that some 70,000,000 persons, or approximately one half the population of the United States, are without proper medical care. The 300,000 persons who he alleges die "needlessly" each year include 40,000 deaths from accidents. The National Safety Council would, no doubt, be interested to know exactly how Mr. Ewing would prevent those deaths. In 1945, 170,000 persons died from communicable diseases, and Mr. Ewing assures us that 120,000 of these persons need not have died. Actually the death rates from communicable diseases in the United States are the lowest in our history, and in 1947, when the total number of deaths was higher than in 1945, only 137,000 deaths were deaths from communicable diseases. Since there is no evidence that any considerable number of these persons died without medical attention, one wonders as to just how Mr. Ewing would propose to save these lives through the enactment of compulsory sickness insurance.

The statement that 70,000,000 persons are without proper medical care simply because 70,000,000 persons happen to have incomes found by statisticians to be less than $3,000 per family per year is another statement without the slightest support in factual evidence. If 70,000,000 Americans were without proper medical care, there would be the kind of public revolt that occurs when one half of a nation's population becomes hungry or happens to be without food or shelter, which are among the necessities of life. Actually the farm population, which is a large portion of those included among these 70,000,000 persons, has relatively low cash income but has also for the most part access to good medical care.

The argument of Mr. Ewing is based wholly on income figures, and Mr. Ewing chooses to disregard entirely a technical term used by economists, namely priorities. Since one out of every four persons in the United States has a motor car, one out of two a radio, and since our people find funds available for such substances as liquors and tobacco in amounts almost as great as the total bill for medical care, one cannot but refer to the priorities and to the lack of suitable education which makes people choose to spend their money for such items rather than for the securing of medical care. Already throughout most of this nation organizations and facilities are available for insurance at exceedingly low rates against the costs of hospitalization and the costs of surgery, obstetrics or other medical care. The people have begun to learn and are insuring themselves increasingly against these costs, but Mr. Ewing suggests that they be forced to pay for their medical care by deductions from their wages or other income rather than voluntarily choosing to protect themselves against the costs of illness as free Americans have chosen since the democracy was established.

The House of Delegates at its meeting just held in St. Louis adopted for the American Medical Association a policy in relation to compulsory sickness insurance which states in unequivocal terms the point of view of the medical profession toward Mr. Ewing's proposals:

"The American Medical Association reaffirms its belief in the application of the principle of medical care insurance on a voluntary basis. The American Medical Association has encouraged and assisted the development of voluntary prepayment plans. Coverage is now provided throughout the country, and protection is being extended rapidly to an ever increasing proportion of our population.

"The American people now enjoy the highest level of health, the finest standards of scientific medical care and the best quality of medical institutions thus far achieved by any major country of the world.

"The great accomplishments of American medicine are the result of development by a free profession working under a free system, unhampered by Government control.

"The experience of all countries where Government has seized control of medical care has been progressive deterioration of the standards of that care to the serious detriment of the sick and needy.

"The American medical profession is unalterably opposed to the institution of any system of medical care which would result in damage to the American public. Our carefully considered opinion is that any scheme of political medicine would be a catastrophe for the American people.

"Compulsory sickness insurance, notwithstanding misleading bureaucratic propaganda, is a variety of socialized medicine or state medicine and possesses the evils inherent in any politically controlled system. It is contrary to American tradition and is the first and most dangerous step in the direction of complete state socialism. The American Medical Association rejects any such scheme as a method of the distribution of medical care; we are equally certain that when the people understand the facts, they also will reject it with the same finality.

"On the basis of experience, we are convinced that voluntary medical care insurance, with the continued support of the American medical profession, can and will solve the economic problem of the distribution of medical care within the existing framework of private enterprise.

"It has been demonstrated that the voluntary method provides a better and less costly service and avoids the imposition of enormous taxation.

"The continuing purpose and determination of the American Medical Association is to maintain and improve the standards of medical care and to make that care available to all our people."

Mr. Ewing in his radio talks and in his interviews has chosen to insult, berate, deride and ridicule the great medical profession of this country. The physicians of the United States may well stand before the people of our country on their record of service to the people. Again and again Mr. Ewing has referred to the fact that the lives of 140,000,000 persons are more important than the wishes of 180,000 physicians. Let the people know that medical care comes from the medical profession and that no compulsory sickness insurance plan or other form of nationalization of medical service can succeed without placing on that medical profession the total burden of service. Mr. Ewing would do well to confer with leaders of the medical profession as to the path that medicine should take in this country rather than relying on the kind of arguments that win cases before juries for great corporations or for criminals.

THE ST. LOUIS SESSION

The St. Louis Session has been almost unanimously praised as one of the most interesting and successful meetings of the American Medical Association. The total registration was 4,526, which included 2,200 Fellows of the Association. So great was the interest that the Board of Trustees is considering the possibility of opening these sessions to all members of the Association instead of limiting them exclusively to the Fellows.

The primary purpose of the Interim Session is the holding of a meeting of the House of Delegates and the provision of graduate medical education for general practitioners of the area concerned. A new technic was used in presenting graduate medical education, and of its abounding success there can be no question. Both the large lectures and the smaller clinics and demonstrations were packed to capacity. The television show provided by E. R. Squibb & Sons, which brought clinics directly from the various hospitals and medical schools of St. Louis to the auditorium, also was crowded beyond its seating capacity throughout the session. The Scientific Exhibit, as usual, was a chief center of interest for many who attended. Exhibitors at the technical exhibit also voiced their satisfaction at the number of persons they were able to see. Several exhibitors commented that a high percentage of the audience were men who had never previously attended sessions of the American Medical Association.

Other features of the session included the entertainment, which was attended by 4,000 visitors, enthusiastic in their reception of the visiting artists, all of national importance. The Grass Roots Conference also enlisted a capacity audience. The final general session was devoted to the presentation of a medal to an outstanding general practitioner, a medal to Father Alphonse Schwitalla for distinguished service in maintaining the ideals of medicine, and a lecture by Professor A. C. Ivy on the relationship of socialized medicine in Germany to the actions of the Nazi medical criminals.

Prior to the Interim Session a Public Relations Conference was held and brought forth a large audience of executives of state and county medical societies especially interested in this aspect of modern medical educational work. A conference was held for state medical society officials and for the editors of state medical journals. This program was also enthusiastically received and served to place before the representatives of state medical societies the problems currently of greatest concern to the medical profession.

The city of St. Louis did its utmost for the success of the occasion. Great thanks are due to the local committee on arrangements, including particularly Drs. Alphonse McMahon and Robert Schlueter, who helped to develop the clinical material for the educational sessions and in making arrangements for the special sessions. Moreover, St. Louis provided perfect weather.

SHALL ARMY MEDICINE BE CONTROLLED BY THE DIRECTOR OF LOGISTICS?

The place of the Medical Department in the staff organizations of the three armed services has become increasingly the concern of medicine and its allied professions during the past ten years. During this period about one half of the practicing physicians of this country have served in the armed services. Probably no other profession or occupational group has contributed so high a percentage of its members to the service of their country.

Among the various factors that have troubled physicians during their tours of duty in the armed services and, particularly, those who have served in the Army, is the placing of medicine among the services of supply. From the philosophic (and unfortunately practical) point of view, those who guide the destiny of the Department of the Army have considered the provision of medical and allied services a supply problem, of a nature similar to that of providing food or clothes, transportation or ordnance equipment. This type of thinking relegated the Office of the Surgeon General to the Army Service Forces during World War II. It placed medical sections in the Service of Supplies echelon in certain overseas theaters of operations. This type of thinking now has placed the Medical Department under the Director of Logistics, as directed in Circular No. 342, dated Nov. 1, 1948, and entitled "Organization of the Department of the Army."

In peace or in war the maintenance of the man power of the armed services in an effective and healthy condition is a prime objective. The Medical Department plays a paramount role in this endeavor. No other advice should be more often sought by the commanding officer, either battalion commander or chief of staff, than that of the surgeon. Now Circular No. 342, paragraph 12 b, states, "under the direction of the Chief of Staff and the Assistant Secretary of the Army on *procurement and related industrial matters* [italics ours] as prescribed in paragraph 4. 1, the Director of Logistics *directs and controls* [again italics ours] the operations and administrative activities of the heads of the Technical Services." The Surgeon General of the Army is listed among the heads of "Technical Services."

Consistently since World War II, the American Medical Association has worked diligently to obtain the proper recognition and status for the medical and allied professions in the armed services. Following strong representations by the Committee on Emergency Medical Service of the American Medical Association, Secretary of the Army Kenneth C. Royall on December 1 announced that the historic position of the Surgeon General as direct adviser to the Secretary and Chief of Staff remains unchanged despite the recent top level reorganization of the Army. The directive outlining the reorganization, Mr. Royall said, will be amended to clarify the Surgeon General's status. The amendment, the Secretary declared, will state:

"In matters of standards of health and medical care of the troops, and the utilization of professional medical personnel, the Surgeon General shall have direct access to the Secretary of the Army and the Chief of Staff."

In April 1945, Secretary of War Stimson said: "I consider that the care of the sick and wounded and the character of the hospitalization in the Army are matters for the direct responsibility of the Secretary of War; also that the Surgeon General should be his principal adviser in regard to these vital matters. To this end I wish it clearly understood that I am to have direct access to him and he to me on such matters whenever either of us deems it to be essential." This statement, Mr. Royall said, was a declaration of long-standing Army policy, reaffirmed in December 1945 by Mr. Stimson's successor, Robert P. Patterson.

Current Comment

RENAL FUNCTION IN INFANTS

With the birth of the child, the task of removing fixed wastes from the circulatory system is transferred suddenly from the placenta to the kidney. At this time the child's kidney is not yet fully developed and it has not reached the state of efficiency characteristic of the adult organ.[1] Infant urine has a low specific gravity which is not increased in severe dehydration to the extent observed in the adult. Both urea and mineral clearances are low when compared with the mature subject on the basis of surface area. The rate of glomerular filtration and the rate of tubular secretion of substances such as creatinine are also low. Infants excrete a smaller fraction of ingested water than do adults, and only little diuresis results from the administration of hypertonic salt solution. If the baby is normal, the kidney will do all the work required of it, but if it is abnormal or must undergo some surgical operation, the pediatrician must assist the kidney to restore the normality of the internal environment. To do this, he requires all the information on renal function which the investigator is able to supply.

ORGANIZATION SECTION

Official Notes

SCIENTIFIC EXHIBIT—ATLANTIC CITY SESSION

The following representatives have been appointed to the Scientific Exhibit from each of the eighteen Sections of the Scientific Assembly to assist in the procurement of exhibits:

Section on Internal Medicine

Thomas C. Garrett, M.D., The Midnight Pass Road, Siesta Key, Sarasota, Fla.

Section on Surgery, General and Abdominal

Walter G. Maddock, M.D., 250 East Superior Street, Chicago.

Section on Obstetrics and Gynecology

Frederick H. Falls, M.D., University of Illinois College of Medicine, 1853 West Polk Street, Chicago.

Section on Ophthalmology

Georgiana Dvorak Theobald, M.D., Chairman, 715 Lake Street, Oak Park, Ill.
Phillips Thygeson, M.D., St. Claire Building, San Jose, Calif.
Edwin B. Dunphy, M.D., Massachusetts General Hospital, Boston.

Section on Laryngology, Otology and Rhinology

James B. Costen, M.D., 722 Beaumont Medical Building, St. Louis.

Section on Pediatrics

Albert V. Stoesser, M.D., 412 Delaware Street, S.E., Minneapolis.

Section on Experimental Medicine and Therapeutics

Robert W. Wilkins, M.D., Evans Memorial Hospital, 65 East Newton Street, Boston.

Section on Pathology and Physiology

Alvin G. Foord, M.D., Huntington Memorial Hospital, Pasadena, Calif.

Section on Nervous and Mental Diseases

A. B. Baker, M.D., University of Minnesota Medical School, Minneapolis.

Section on Dermatology and Syphilology

Francis W. Lynch, M.D., 350 St. Peter Street, St. Paul.

Section on Preventive and Industrial Medicine and Public Health

Paul A. Davis, M.D., 1436 Delia Avenue, Akron, Ohio.

Section on Urology

John H. Morrissey, M.D., Chairman, 40 East 61st Street, New York.
Robert Barnes, M.D., 1216 Wilshire Blvd., Los Angeles.
Earl Ewert, M.D., 7 Longfellow Road, Cambridge, Mass.
John Dees, M.D., Duke Hospital, Durham, N. C.

Section on Orthopedic Surgery

Tom Outland, M.D., Crippled Children's Hospital, Elizabethtown, Penn.

Section on Gastro-Enterology and Proctology

Donovan C. Browne, M.D., 1534 Aline Street, New Orleans.
J. P. Nesselrod, M.D., 636 Church Street, Evanston, Ill.

Section on Radiology

S. W. Donaldson, M.D., 326 N. Ingalls Street, Ann Arbor, Mich.

Section on Anesthesiology

Harold F. Bishop, M.D., Grasslands Hospital, Valhalla, N. Y.

Section on General Practice

M. B. Casebolt, M.D., 4000 Baltimore, Kansas City, Mo.

Section on Chest Diseases

Edwin R. Levine, M.D., Michael Reese Hospital, 29th and South Ellis Avenue, Chicago.

Application blanks for space in the Scientific Exhibit at the Atlantic City Session, June 6-10, 1949, may be obtained from the Section Representatives or from the Director, Scientific Exhibit, American Medical Association, 535 North Dearborn Street, Chicago 10, Ill.

Washington Letter

(From a Special Correspondent)

Dec. 6, 1948.

Government Wins Kordel and Urbuteit Cases in Supreme Court

By the narrowest margin, the U. S. Supreme Court on November 22 decided the Kordel and Urbuteit cases in favor of the federal government, thereby providing a strong deterrent to interstate marketing of misbranded "health foods" and therapeutic devices. Involving the same issue — whether labeling literature must be affixed to or physically accompany the product to bring the shipment within the purview of the Federal Food and Drug Act—the two cases were heard together. The *split decisions (5 to 4) had the same dissenters in each case. They* were Justices Black, Frankfurter, Murphy and Jackson.

"It would, indeed, create an obviously wide loophole to hold that these drugs would be misbranded if the literature had been shipped in the same container but not misbranded if the literature left in the next or in the preceding mail," said the majority opinion, delivered by Justice Douglas, in the Kordel case. ". . . one article or thing is accompanied by another when it supplements or explains it, in the manner that a committee report of the Congress accompanies a bill. No physical attachment one to the other is necessary. It is the textual relationship that is significant."

The Court ruled similarly in reversing an appellate court decision in favor of Fred Urbuteit, whose "sinuothermic" machine had been seized by federal agents. "The problem is a practical one of consumer protection, not dialectics," said the *Supreme Court, Justice Douglas also delivering this opinion.* "The fact that the false literature leaves in a separate mail does not save the article from being misbranded."

The dissenting opinion, drafted by Justice Black, applied to both cases. It held that the Food and Drug Act does not cover misbranding of products occurring as long as eighteen months following their shipment.

Disposition of 55 cases in lower courts throughout the country has been held up pending outcome of the Lelord Kordel appeal and the government's appeal in the Urbuteit case. Food and Drug Administration officials feel the Supreme Court decisions will strengthen enforcement immeasurably.

Manual on Premature Infants Published

A 400 page paper-bound book, "Premature Infants: A Manual for Physicians," has just been published by the Children's Bureau. Intended mainly for use by general practitioners, the volume presents the general problem and deals with such survival measures as resuscitation, incubator care, nutritional requirements and prevention and treatment of infections. The book's author is Dr. Ethel C. Dunham, consultant to the *Children's Bureau. Price is $1.25 and copies are purchasable* from the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Another new publication of Children's Bureau is a 63 page monograph by Dr. George Wolff on child mortality attributable to rheumatic fever and cardiac diseases. It may be procured (25¢) from the Superintendent of Documents also.

To help finance the International Congress on Rheumatic Diseases, which will be held in New York May 30 to June 3, 1949, U. S. Public Health Service has approved a grant of $15,000 on recommendation of the National Advisory Health Council.

Carnegie Institution Annual Report

Detailed accounts of 1947-1948 progress in its various departments and divisions, including embryology, genetics and the biologic sciences, are presented in the annual report of Carnegie Institution of Washington. The report was published December 10.

GOVERNMENT SERVICES

ARMY

COMMISSIONS FOR PSYCHIATRIC SOCIAL WORKERS

The U. S. Army has reserve commissions available for psychiatric social work officers in the new program of the Neuropsychiatric Consultants Division. Commissions in the Organized Reserve Corps are available to all who qualify educationally and physically with no reference to prior military service. The rank of individual commissions will be commensurate with professional experience and training. Minimum requirement for commission is a master's degree from an approved school of social work, with a major in case work. Applicants with one year's experience can qualify for a first lieutenant's commission and with four additional years for that of captain. Twelve years of experience and training will meet the requirement for the rank of major. At the time of commission, the reserve officer may make application for duty of short periods of ninety days or for extended periods of at least three years. There are opportunities for qualified reserve officers who wish to serve on extended active duty for a three year period in the neuropsychiatric services of the new training centers being opened in the Army. Openings also exist in the Army general hospitals here and overseas. Information about reserve commissions may be obtained from the Personnel Division, Office of the Surgeon General, The Pentagon, Washington, D. C.

MEDICAL MEETING IN TOKYO

U. S. Army medical officers held a meeting with civilian consultants from the homeland recently at the Eighth Army's 361st Medical Station Hospital and 406th General Medical Laboratory in Tokyo. The civilian physicians participating are members of the faculties of medical colleges of the United States and represented one of several similar groups of civilian consultants which the Army Medical Department has been sending abroad to bring to medical officers the latest advances and technical information. At the Tokyo conference, Dr. Joseph M. Hayman Jr., professor of medicine, Western Reserve University Medical School, Cleveland, spoke on "The Collagen Diseases," and Dr. R. W. Waggoner, professor of psychiatry, University of Michigan Medical School, Ann Arbor, on "Diagnosis of Pathologic Personalities."

In the panel on encephalitis, Capt. F. J. Mayer discussed American cases; Major T. O. Berge, chief, Section of Virus and Rickettsial Diseases of the General Laboratory, discussed laboratory diagnosis; Lieut. Col. R. S. Aronson, chief, Section on Pathology of the Laboratory, discussed pathologic changes, and Major A. A. Hellams and Capt. F. M. Phillips discussed psychiatric residual effects.

Lieut. Col. G. W. Hunter, chief, Zoology Section of the General Laboratory, discussed parasitic diseases of Japan. There was a symposium on leprosy with a demonstration of cases led by Dr. M. C. Morton, assistant chief, Medical Service Division, Public Health and Welfare.

The program was introduced by Lieut. Col. W. T. Tigertt, Commandant of the General Medical Laboratory.

TRAINING IN CIVILIAN INSTITUTIONS

The following additional Army Medical Department officers have been accepted for training by the civilian hospitals and schools indicated: Lieut. Col. Harold S. McBurney and Major Humbert N. Riva for courses in orthopedic surgery and gynecology, respectively, at the New York Postgraduate Medical School, New York; Capt. Robert G. Stanley for a course in obstetrics and gynecology at the Long Island College Hospital, Brooklyn; Capt. Donald W. S. Stiff for a course in radiology at the Mary Fletcher Hospital, Burlington, Vt.; First Lieut. Robert W. Puckett for a course in internal medicine at the Huntington Memorial Hospital, Pasadena, Calif., and, as first lieutenants for intern training, Samuel P. Oast at the Bellevue Hospital, New York; Robert L. Sherman at the City Hospital, Welfare Island, New York; Joseph L. Girardeau at the Grady Memorial Hospital, Atlanta, Ga.; Robert S. Taylor at the Methodist Hospital, Indianapolis; Joseph M. Damron at the Medical College of Virginia, Richmond; Kenesaw Mannings at the Provident Hospital and Training School, Chicago; Harold G. Carstensen at the University of Chicago Clinics, Chicago; Hugh H. Curnutt at the Scott and White Hospital, Temple, Texas, and Winston C. Jesseman at the Cincinnati General Hospital, Cincinnati.

SCIENTIFIC MISSION TO JAPAN

The Department of the Army announced November 17 that a mission composed of five American scientists selected by the National Academy of Sciences was expected to arrive in Japan late in November to review progress made by Japanese scientists on development of democratic national organizations for scientific activity. The mission arrived at the time that 40,000 Japanese scientists representing all fields of research were participating in the election of 210 members of Japan's first National Science Council. This election is said to be the first attempt of scientists of any country to elect at large members of its supreme scientific organ. The United States scientists comprising this mission are: Dr. Detlev W. Bronk, chairman, National Research Council, and president-elect of Johns Hopkins University, chairman of the mission; Dr. E. C. Stakman, chief, Division of Plant Pathology and Botany, University of Minnesota, and president-elect of the American Association for the Advancement of Science; Dr. Zay Jeffries, vice president of General Electric Company and general manager of its chemical department; Dr. I. I. Rabi, professor of physics, Columbia University, consultant, Research and Development Board, who was awarded the 1944 Nobel Prize in Physics, and Dr. R. Adams, head, department of chemistry, University of Illinois, and chairman of the scientific advisory group that visited Japan in 1947.

The mission is expected to remain in Japan until about December 18, spending most of its time in Tokyo in discussion with occupational personnel and Japanese scientists and making short visits to Hiroshima, Kyoto, Sapporo and Sendai.

REFRESHER COURSE FOR FLIGHT NURSES

The Surgeon General announces that a ten day refresher course for former flight nurses will be conducted at the Air Evacuation School at Randolph Field, Texas, Jan. 16-28, 1949. Applications are invited from graduate nurses under 35 who have had the flight nurse course in the Air Evacuation School and who are members of the Army Nurse Corps Reserve. Applications should be made to the commanding general of the Army area in which the nurse resides, prior to Dec. 15, 1948. The qualified flight nurse will be ordered to active duty for the ten day period with full pay and allowance for the grade she holds in the Reserve Corps. The purpose of the course is to acquaint nurses with new developments in the duties of the flight nurse in air evacuation. The Air Force estimates that more than sixteen hundred nurses have been trained in Air Evacuation School since the course was established in August 1943.

APPOINT 232 INTERNS

Major General Raymond W. Bliss, the Surgeon General, announced November 16 the appointment of medical school graduates to fill 232 internships in five Army teaching hospitals. The interns, who were selected from among 800 applicants, will on July 1, 1949, after being commissioned first lieutenants in the Reserve, go on duty with full pay and allowances and will be indoctrinated in the military application of their one year's rotating internship training. Later they will have the opportunity to apply for commissions in the Regular Army Medical Corps.

NAVY

EXAMINATIONS FOR APPOINTMENT IN REGULAR NAVY

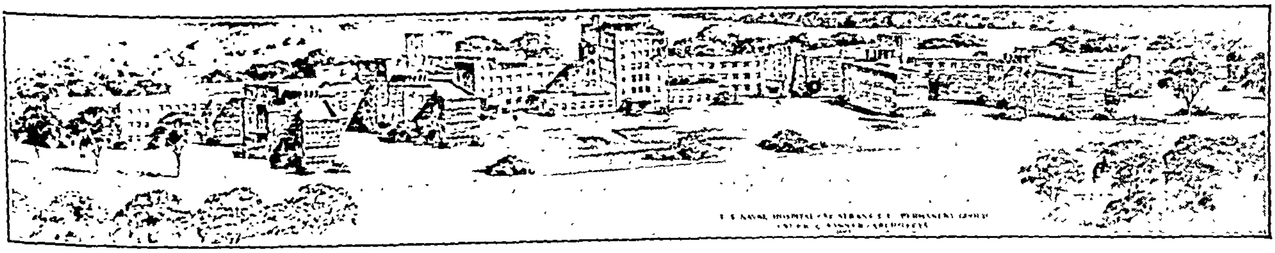
Examinations for the selection of candidates for appointment to the grade of lieutenant (jg) in the medical corps of the Navy will be held at Naval hospitals in continental United States Jan. 24-28, 1949. Graduates of approved medical schools in the United States or Canada who have completed intern training in accredited hospitals or who will complete intern training within four months of the date of the examination, and who are physically and otherwise qualified, are eligible to take the examination. Candidates, who must be less than 32 years of age at the time of appointment, are required to appear before boards of medical examiners and supervisory Naval examining boards at the Naval hospital nearest their place of residence to demonstrate their physical and professional qualifications for appointment.

Following approval by the President of the United States, selected candidates will receive their appointment and orders assigning them to duty in a Naval medical facility for active Naval service. The law provides additional compensation at the rate of $100 a month for each month of active service performed by medical corps officers of the Navy. This is in addition to any pay, allowances or emoluments that medical corps officers are otherwise entitled to receive. Information concerning the procedure of application may be obtained from Naval Officer Procurement offices or from the Bureau of Medicine and Surgery, Navy Department, Washington 25, D. C.

in the Navy. They are: George A. Anderson, Washington, D. C.; Wendell W. Buckhaults, Perryton, Texas; John B. Cavenaugh, Chicago; John E. Driscoll, Chicago; Charles B. Foelsch Jr., Maywood, Ill.; Edwin W. Gilley, Gate City, Va.; Roland E. McClain, Lodi, Ohio; Guy D. Niswander, Coopers, W. Va.; Jack W. Rhodes, Estill, S. C.; Joseph O. Romness, Belgrade, Minn.; Paul L. Rowan, Seattle; Carlton L. Sexton, Pensacola, Fla.; Joseph T. Sheridan, Morton Grove, Ill.; James M. Sinnett, Spencer, W. Va.; Eugene Y. Smith Jr., Charleston, S. C.; Winston F. Whipple, Long Beach, Calif., and George C. Wilson, Tecumseh, Mich.

THE LARGEST NAVY HOSPITAL CONTRACT EVER AWARDED

The Navy announced November 3 that construction had started on the new buildings for the Naval hospital at St. Albans, Queens, New York city. This is said to be the largest hospital contract ever awarded by the Navy's Bureau of Yards and Docks. The $14,823,000 project, including nine buildings, is expected to be completed in two and a half years. This hospital was planned before the war, and foundations for the construction were laid at that time. Four ward buildings in the original plans have been eliminated from the present contract. The new permanent buildings will be located directly in front of the old facilities on the site which was formerly part of the St. Albans Country Club. The largest unit ever built for cancer therapy,



Navy Hospital at St. Albans, N. Y.

NEW REGULAR OFFICERS

Lieut. Comdr. Frances L. Willoughby of Pitman, N. J., and Lieut. Trowbridge R. Mafit of Chicago have transferred from an active reserve status to the Medical Corps of the Regular Navy. Lieut. Comdr. Willoughby is the first woman medical officer to transfer to the Regular Navy.

Lieut. Doris Cranmore of Eloise, Mich., of the Medical Allied Science Section, who recently was appointed in the Regular Navy, is the first woman to be accepted in the Medical Service Corps. She is on duty at the Medical Center, Bethesda, Md.

Lieutenant Commander Leo S. Madlem Jr. has recently transferred from active reserve status to the medical corps of the Regular Navy.

POSTGRADUATE TRAINING

The following medical officers have been nominated for duty under instruction in the fields of postgraduate training indicated: Comdr. Nicholas Musso, M.C., of Washington, D. C., to a residency in obstetrics and gynecology at the Naval Hospital, St. Albans, Long Island, N. Y.; Lieutenants (jg) Frederick W. George III, M.C.R., of Burgettstown, Pa., to a residency in radiology at the Naval Hospital, San Diego, Calif.; Charles L. Lear, of Montebello, Calif., to a residency in general practice at the Naval Hospital, Long Beach, Calif., and William C. Turville, M.C., of Revere, Mass., to a residency in surgery at the Naval Hospital, St. Albans, Long Island, N. Y.

NEW NAVY INTERNS

Seventeen new members of the Navy's Medical Intern Training Program have accepted commissions as lieutenant (jg) in the Medical Corps Reserve and have reported for their first active duty in internships at civilian medical institutions. On completion of their internships, they will serve on active duty according to the Navy, a 20,000,000 volt betatron, will be constructed underground and connected through a tunnel with a ward building housing the St. Albans Cancer Clinic. The equipment will include also a 1,000,000 volt x-ray unit. The complete installation will include the betatron therapy building, six three-story ward buildings, a six-story administration and treatment building and a two-story building for hospital personnel. The architects are York and Sawyer, New York.

PERSONALS

Captain Glenn S. Campbell, M.C. (Retired), of Alhambra, Calif., has voluntarily requested recall to active duty and will be assigned to the Naval Hospital, Long Beach, Calif.

Lieut. (jg) Morton J. Aronson, now at the Naval Hospital, St. Albans, N. Y., has been nominated for a residency in psychiatry at the Naval Hospital, Bethesda, Md.

Lieutenant (jg) George M. Stevens, M.C.R., of Angleton, Texas, has reported to the Naval Hospital, Portsmouth, Va., for his first active duty.

Captain Bernard S. Pupek, M.C., U.S.N., Retired, has requested recall to active duty.

The following medical reserve officers have requested recall to active duty: Comdr. Roscoe M. Waterhouse of Bronx, N. Y., who will be assigned to the Naval Recruiting Station at Springfield, Mass.; Lieut. Robert G. Dunn Jr., of Richmond, Va., to the Naval Hospital, Philadelphia, and Lieut. Benjamin F. Gundelfinger of Richmond, Calif., to the Naval Station, Treasure Island, San Francisco.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

Doctors' Breakfast Club.—The Doctors' Breakfast Club of the San Fernando Valley Branch of the Los Angeles County Medical Association, formed eighteen months ago, meets every Wednesday morning at 8 o'clock in the Sky Room of the Lockheed Air Terminal in Burbank. The plan is being imitated locally and elsewhere in the county. One topic is presented for discussion at each meeting; emphasis is placed on practical factors involved, and research and historical references are avoided.

Honored for Tuberculosis Control Work.—Dr. Irving M. Schor, Visalia, was a recipient of the Tulare County Tuberculosis and Health Association's annual medical award for tuberculosis control in the county. It was presented at the meeting of the Tulare County Medical Society November 18. The purpose of the award, which the association plans to make an annual custom, is to give recognition to physicians in the county who are extending help and cooperation in solving the tuberculosis problem.

Not One Bona Fide Case Reported.—The Alameda County Medical Association has advertised a guarantee of medical care for all who need it regardless of their ability to pay. From the 750,000 persons in the county there has been not one bona fide case reported to the headquarters office of any one's being refused medical care because of lack of money with which to pay the doctor. The association has also repeatedly advertised a request for complaints on excessive fees and other unethical acts, and reports that although there have been answers to the request they have been few and even these usually proved to be primarily a misunderstanding.

CONNECTICUT

Narcotic Violation.—Dr. Louis Klein, Hartford, pleaded guilty to violation of the Federal Narcotic Code in the district court at Hartford, and on September 8 sentence was suspended and he was placed on probation for five years.

Major Activities of Department of Health.—The Connecticut State Department of Health has published an attractive blue and white 12 page pamphlet, the purpose of which is set forth in its title, "Major Activities." The organization of the department's nineteen bureaus and divisions and their function in public health are clearly stated.

Vesalius Collection on Display.—The works of Andreas Vesalius, father of modern anatomy, are now on display in the Yale Medical Library, New Haven. The exhibit comprises writings ar [illegible] from the Vesalius Collection in the Yale School of [illegible] Library brought together by the late Dr. H [illegible] display will remain in the Yale Medical Library through December. Angered by the criticism of his work, Vesalius gave up his research and teaching and went into a self-imposed retirement. Not until many years after his death were his theories and discoveries accepted. The Yale Medical Library exhibit also includes Vesalius' thesis, many reproductions of drawings from his works and selections from his lesser known medical writings.

ILLINOIS

Special Society Meetings.—The Illinois Psychiatric Society, meeting in Chicago December 2, heard a "Symposium on Mind and Brain in Psychiatry." The participants speaking by invitation were Dr. Ralph W. Gerard, Dr. Warren S. McCulloch and Dr. Ward Halstead.——Dr. Alex J. Arieff, Chicago, addressed the Illinois State Physical Therapy Association December 1 on "Electrodiagnostic Testing in Peripheral Nerve Injuries."

Chicago

Hospital News.—Ravenswood Hospital opened its new $1,500,000 addition November 13. It provides room for one hundred additional beds and allows for expansion of the x-ray, laundry, pharmacy and dietary departments.

The Thirteenth Fenger Lecture.—The thirteenth Christian Fenger Lecture of the Institute of Medicine and the Chicago Pathological Society will be delivered at the Palmer House Jan. 10, 1949 at 8 p.m. by Dr. Dallas B. Phemister on "Circulatory Disturbances of the Skeletal System."

Lectures on Fertility.—Two visiting lecturers will address the Chicago Medical Society December 15 at 8 p.m. in the John B. Murphy Memorial Auditorium. Dr. Robert S. Hotchkiss of Cornell University Medical College, New York, will speak on "Procedures in the Investigation of Male Fertility," and Dr. Charles L. Buxton of Columbia University College of Physicians and Surgeons, New York, on "Gynecological Aspects of Sterility."

Grants for Research.—Grants totaling $22,462 have been awarded to the University of Illinois' Chicago Professional Colleges as follows: A grant of $10,800 from the U. S. Navy for continued research in the prophylaxis and treatment of experimental hypertension to the department of physiology under the direction of Dr. George E. Wakerlin; a grant of $4,882 from the American Society of Heating and Ventilating Engineers for studies in physiologic adjustments of human beings to rapid changes in environment to the department of medicine under the direction of Dr. Robert W. Keeton; $3,780 from the U. S. Public Health Service for research on cephalometric roentgen study of the growth of the human head from the eighth to the fifteenth year to the College of Dentistry under the direction of Allan G. Brodie, Ph.D.; $2,000 from the Illinois Federation of Women's Clubs to Dr. Danely P. Slaughter for a fellowship in cancer, and $1,000 from the American Medical Association for studies on pancreatic function to the department of surgery under the direction of Dr. Warren H. Cole.

Personals.—Dr. Klaus R. Unna, associate professor of pharmacology, University of Illinois College of Medicine, was recently a guest lecturer at the International Dermatological Congress in Hamburg, Germany. He spoke on "Recent Advances in Antihistamine Therapy."——Dr. Robert A. Esser has been appointed assistant director of the Behavior Clinic of the Criminal Court of Cook County. Dr. Esser is a graduate of Northwestern University School of Medicine, 1945. He was head of neuropsychiatry at the U. S. Naval Hospital at Pensacola, Fla., prior to his recent discharge from the navy.——Mr. Frank R. Shank, assistant superintendent of clinics, University of Chicago, has been appointed to direct the administration of Chicago Lying-in Hospital and dispensary of the university. Mr. Shank, who became assistant superintendent of the clinics in 1947, will retain other administrative duties in the University Clinics.——Dr. Jacob P. Greenhill recently returned from South America, where he lectured in Spanish. He was made honorary professor at the University of San Marcos, Lima, Peru, and received honorary memberships in nine societies devoted to obstetrics, gynecology and sterility. He was also a guest of the Second Brazilian Congress on Obstetrics and Gynecology.

KANSAS

Annual Cancer Conference.—The first annual Midwest Cancer Conference will be held at the Broadview Hotel, Wichita, Jan. 20-21, 1940, under the sponsorship of the Kansas Medical Society and the Kansas Division of the American Cancer Society. There will be no registration fee. Eight guest speakers will present two papers each during the scientific program, and Dr. Charles S. Cameron, medical director of the American Cancer Society, will be the banquet speaker January 20. Round table luncheons will be held each day. Physicians from Kansas and neighboring states are invited.

Dinner Honoring Dr. Nesselrode.—At a dinner given by the board of directors of the Kansas Division of the American Cancer Society in Wichita October 27, Dr. Clifford C. Nesselrode, Kansas City, was honored on the occasion of his retirement as president. Dr. Nesselrode has served on the board of directors of the American Cancer Society since its founding and has been president of the Kansas Division since its organization. He also served as chairman of the Kansas Medical Society's first Committee on Control of Cancer. Dr. Robert H. Riedel, Topeka, gave the principal address.

MICHIGAN

Society News.—The Detroit Dermatological Society has elected the following officers for 1948-1949: Dr. Clarence E. Reyner, Detroit, president; Dr. Frank Stiles Jr., Lansing, president-elect, and Dr. Herbert H. Holman, secretary-treasurer.

Health Center Opened in Detroit.—The Northwest Health Center, the first building planned and built in Detroit for public health purposes, was opened early in October. Biologic supplies, food handlers' physical examination forms and birth certificates are available at the new center. It will serve an area comprised of 16 per cent of Detroit's population.

MINNESOTA

The Sixteenth Judd Lecture.—The sixteenth E. Starr Judd Lecture will be given by Dr. E. W. Alton Ochsner, William Henderson professor of surgery at Tulane University, New Orleans, Jan. 18, 1949, at 8:15 p.m. at the Museum of Natural History, University of Minnesota, Minneapolis, on "The Treatment of Postphlebitic Sequelae by Vasodilatation and Other Measures." The late Dr. E. Starr Judd, an alumnus of the Medical School of the University of Minnesota, established this annual lectureship in surgery a few years before his death in 1935.

Sixteen Counties Accredited in Tuberculosis Control.—Cottonwood County was awarded accreditation certificates for its accomplishments in tuberculosis control at a ceremony in Windom in September. A county is accredited when its tuberculosis rate drops to an average of 10 or less per 100,000 population for a five year period and when not more than 15 per cent of its high school seniors react positively to the tuberculin test. It is the sixteenth county in the state to be accredited. Certificates were awarded by the Minnesota State Medical Association and the Minnesota Department of Health.

Dr. Freeman Goes to Montana.—Dr. George H. Freeman, superintendent of the St. Peter State Hospital, St. Peter, for twenty-three years, resigned October 1 to become superintendent of the state hospital at Warm Springs, Montana. Dr. Burton P. Grimes, former assistant superintendent, succeeds him. Dr. Freeman ends forty-two years of service in Minnesota state institutions beginning at St. Peter State Hospital, moving to the Willmar State Hospital and in 1925 back to the St. Peter institution. Dr. Grimes was a member of the medical staff from 1937 to 1940 and has been assistant superintendent since 1946.

MISSOURI

Dr. Schauffler Honored.—Dr. Robert M. Schauffler, *Kansas City*, was awarded a citation by the R. J. Delano School November 8 for "having rendered outstanding service in the education of crippled children; having continued this counsel over a long period of years and having given professional services to many needy children."

Personal.—Dr. Carl F. Cori and his wife, Dr. Gerty T. Cori, Nobel prize winning professors of biochemistry at Washington University School of Medicine, St. Louis, were awarded honorary doctor of science degrees by Boston University October 22. The ceremony was a part of the one-hundredth anniversary of the founding of Boston University School of Medicine.

NEW YORK

Roentgen Survey in Niagara Falls.—A mass chest roentgenologic survey to cover 60,000 persons is being carried on by the city health department in Niagara Falls with the cooperation of the State Department of Health, the Tuberculosis and Health Association of Niagara County and the Niagara County Sanatorium.

New York City

Third Harvey Lecture.—Dr. Fritz A. Lipmann, associate in biochemistry, Harvard Medical School, Boston, will deliver the third Harvey Lecture of the current series at the New York Academy of Medicine December 16 on "Biosynthetic Mechanisms."

Annual Meeting of James Ewing Society.—The second annual scientific session of the James Ewing Society will be held at Memorial Hospital Jan. 14-15, 1949. The program is as follows: A round table panel, "Relationship of Gastric Ulcer to Gastric Cancer," under the chairmanship of Dr. George T. Pack; a symposium, "Scientific Basis for Chemotherapy in Cancer," by members of the staff of the Sloan-Kettering Institute for Cancer Research, Dr. Cornelius P. Rhoads chairman; a symposium, "Radical Surgery in Advanced Cancer"; Dr. Gray H. Twombly, chairman.

Cancer Committee on Chemicals.—The formation of a cancer prevention committee to collect information about chemicals that cause cancer and to devise methods of preventing persons from coming into contact with such chemicals has been announced in New York. Its chairman is Dr. William E. Smith, a member of the staff of Sloan-Kettering Institute for Cancer Research, a section of Memorial Hospital Center. The committee's work will include testing of materials to find whether they have cancer-producing abilities and then carrying over these findings into everyday life, formulating practical methods for preventing people from coming in contact with these materials.

Hospital Given Large X-Ray Machine.—The Lila Motley League for Cancer Research has raised enough money for the Hospital for Joint Diseases to purchase a 2,000,000 volt x-ray machine for cancer research and treatment and provide a building to house the machine. Delivery is expected some time next summer. It will be operated under the direction of Dr. Milton Friedman. The project is part of the hospital's cancer treatment and research program, which includes the addition of twenty beds for patients and new physics and radiobiologic laboratories. The league is made up of twenty women who are raising funds for cancer research in memory of a friend who died of cancer.

Medical Schools Merge.—Formal agreement has been signed for the union of the New York Post-Graduate Medical School and Hospital with the New York University-Bellevue Medical Center. Simultaneously New York University announced the formation of the new postgraduate school. Through this move the medical center will have two medical schools, the other being the New York University College of Medicine, which will be devoted exclusively to the training of medical students. Dr. Robert Boggs was appointed last June acting dean of the Post-Graduate Medical School of the New York University-Bellevue Medical Center. Associate deans of the new school are Dr. Clarence E. de la Chapelle, formerly associate dean of the College of Medicine, and Dr. C. Travers Stepita of the faculty of Post-Graduate Medical School. Edwin A. Salmon, director of the New York University-Bellevue Medical Center, states that the new move gives added impetus to building plans of the university section of the medical center, for which an 11 acre site has been acquired just north of the Bellevue Hospital. Negotiations between the two schools began December 1946.

NORTH CAROLINA

Dr. Norton Receives Medal.—Dr. John W. R. Norton of Raleigh, head of the North Carolina State Board of Health, received the first Reynolds Medal and scroll at the October meeting of the North Carolina Public Health Association in Durham. The medal, given in honor of Dr. Carl V. Reynolds, Raleigh, former state health officer, is awarded to the association member who presents the most outstanding address or paper at the convention. Dr. Norton received it for his address which outlined the work of the health department and stressed the importance of developing cooperative relationships in public health in the state.

OREGON

Society News.—At a meeting of the Oregon State Society of Anesthesiologists at the University of Oregon Medical School library, Portland; December 8, Dr. John J. Bonica of the Tacoma General Hospital presented a paper on "Regional Anesthesia." There was also a series of short motion pictures beginning at 7 p. m.

Portland to Have Red Cross Blood Bank.—The American Red Cross has chosen Portland as one of its thirty "pilot" cities in a nationwide blood service program for installation of a blood bank service which will open Jan. 1, 1949. The program is sponsored by the Multnomah County Medical Society. Dr. Nicholas P. Sullivan, formerly affiliated with Eli Lilly and Company, Indianapolis, is technical director of the city's regional blood donor service, which will include five Washington and nine Oregon counties. The center will be equipped to process blood fully. Dr. Warren C. Hunter, Portland, is chairman of the medical advisory committee for the blood service program.

PENNSYLVANIA

Personal.—Dr. Lewis J. Kowalski of Philadelphia has been named assistant director of mental health in the State Welfare Department. Dr. Kowalski is a graduate of Temple University School of Medicine, Philadelphia, 1926.

County Society Centennial Celebration.—The one hundredth anniversary dinner and dance of the Bucks County Medical Society was recently held in the Doylestown Armory. Guest of honor was Dr. John B. Carrell of Hatboro, 97, the oldest known physician in Pennsylvania, a graduate of the Jefferson Medical College, Philadelphia, 1876. Among the visitors present were Lieutenant Governor Daniel B. Strickler, representing the governor, Dr. Gilson C. Engel, president of the Medical Society of the State of Pennsylvania, and Dr. Milton F. Percival, both of Philadelphia, representing the Philadelphia County Medical Society.

Philadelphia

Dedicate Blockley Medical Library.—The Blockley Resident and Ex-Resident Association of the Philadelphia General Hospital held its annual banquet meeting and dedicated the new Blockley Medical Library December 7. Dr. Harry E. Ungerleider, New York, director of medical research, Equitable Life Assurance Company, was chairman of the meeting. The library is in the Old Museum Room of the Laboratory Building and will contain nearly 4,000 volumes, including the historically valuable Boerhave's Anatomy, printed in the seventeenth century and recognized as the first book printed about anatomy. Dr. Nathan H. Einhorn, Philadelphia, is chairman of the Library Committee.

Remaining Courses in Cancer.—The School of Medicine of the University of Pennsylvania will present the two remaining special courses in the diagnosis and treatment of cancer for graduate physicians in 1949 under a grant from the Division of Cancer Control of the Department of Health, Commonwealth of Pennsylvania. The second of the three courses will be presented January 17-29 and the third from April 25 to May 6. Application blanks will be sent on request to Dr. Robert C. Horn, Secretary of the Cancer Commission, Hospital of the University of Pennsylvania, Philadelphia 4. The courses are limited to a small group, and applications must be received not later than four weeks before opening date of the course. Tuition and fees and some compensation for the time spent away from regular practice will be paid by the Division of Cancer Control of the State of Pennsylvania, Department of Health.

SOUTH CAROLINA

Five Year Florence County Health Program. — The South Carolina State Board of Health has selected Florence County as the "pilot" county in the state for a coordinated health program. The services of the departments of education, agriculture, extension and public health will be coordinated in the interest of a more extensive and a more adequate health program. Demonstration of the five year program will utilize all available services and facilities of the state and county.

TEXAS

Dr. Callan Honored.—The people of Rotan set aside October 8 as "Dr. Callan Day" in honor of Dr. Chester U. Callan, general practitioner, whose story appeared in the *Saturday Evening Post* October 9. Stores closed during the one hour program which paid tribute to the physician, with Dr. Tate Miller, Dallas, president of the State Medical Association of Texas, as chief speaker. A dinner in his honor and dedication of the high school football game to him that evening were highpoints of the day. Abilene Christian College, of which Dr. Callan is a graduate and trustee, had a program and luncheon in his honor October 19.

County Society Gives Library to State Association.—The Travis County Medical Society Library has been donated to the library of the State Medical Association of Texas, making it available to many physicians in the state. The journal and book collections of the society have been built up gradually since 1930 through appropriations and gifts from individual physicians and their families. Since the war the library has been housed in the basement of the Austin Public Library. However, after the removal of the central offices of the library of the state medical association to Austin this year, the county society voted to have its library assimilated in the larger collection.

WISCONSIN

Dr. Gavin to Head Board of Health.—Dr. Stephen E. Gavin, Fond du Lac, has been appointed president of the Wisconsin State Board of Health, succeeding Dr. Ira F. Thompson, Beloit, who has resigned because of ill health but will remain on the board. Dr. Gavin has been vice president. Dr. Thompson was appointed president of the board at its July-August meeting.

Public Health Conference at Madison.—On December 20-21 a Public Health Conference will be held at the Wisconsin Memorial Union Theater, Madison, under the sponsorship of the Wisconsin Public Health Council, the Wisconsin Association for Public Health, the University of Wisconsin and the Wisconsin State Board of Health. Visiting speakers include:

Haven Emerson, New York, Health Units for the Nation.
John W. Ferree, New York, Organization and Functions of a County Public Health Council.
Roscoe P. Kandle, New York, Community Health Surveys.
Vlado A. Getting, Boston, Functions of a Local Health Department.
Basil C. MacLean, Rochester, N. Y., Coordination of Hospitals and Health Departments.
George D. Cummings, Lansing, Mich., Functions of a Public Health Laboratory.
Ellis S. Tisdale, C. E., Sr., Marietta, Ga., Functions of a Sanitarian in a Local Health Department.
Frederick S. McKay, D.D.S., Colorado Springs, Colo., Fluorine in the Prevention of Dental Decay.
Paul H. Stevenson, Washington, Local Public Health Mental Hygiene Activities.
Margaret Taylor, R.N., Minneapolis, The Public Health Nurse Rations Her Time.

A panel on local health units will be held Monday afternoon and another on Local Public Health Programs on Tuesday; the visiting speakers will take part.

HAWAII

Hawaii Cancer Society.—The newly inaugurated Hawaii Cancer Society has concluded its initial membership and fund-raising campaign with proceeds totaling about $75,000. It is financing a program of cancer education to be conducted by the Department of Public Instruction. In cooperation with the Pan-Pacific Surgical Congress the society also has sponsored a public lecture on cancer.

LATIN AMERICA

New Society.—An Argentinean Society of Logopedia and Phonetics was recently established in Buenos Aires. It is concerned with the various aspects of voice, speech and hearing. The officers are as follows: Dr. Eduardo Casteran, president, and Dr. Renato Segre, secretary.

South American Neurosurgical Congress.—The third South American Neurosurgical Congress will be held in Buenos Aires March 20-27, 1949, organized by the Chair of Neurosurgery of the Faculty of Medical Sciences of Buenos Aires under the auspices of the Argentine government. Subjects of the meeting are surgical treatment of epilepsy, hemostasis in neurosurgery and lobotomies. This congress has been held every two years since 1945. The general secretary is Prof. Dr. Ramón Carilo, Neurosurgery, Paraguay 2201, Buenos Aires.

GENERAL

Gastroenterological Association Contest.—The National Gastroenterological Association is offering $100 and a certificate of merit for the best unpublished contribution on gastroenterology. Contestants residing in the United States must be members of the American Medical Association. Entries for the 1949 prize should be limited to 5,000 words, submitted in five copies accompanied by an entry letter, and must be received not later than April 1, 1949 at the National Gastroenterological Association, 1819 Broadway, New York 23.

Mississippi Valley Society Contest.—The Mississippi Valley Medical Society is offering a cash award of $100, a gold medal and a certificate of award for the best unpublished essay on any subject of medical interest and practical value to the general practitioner. Contestants, who must be members of the American Medical Association, should submit their typewritten manuscripts in five copies, not to exceed 5,000 words, not later than May 1, 1949. For further information address Dr. Harold Swanberg, secretary, Mississippi Valley Medical Society, 209-224 W. C. U. Building, Quincy, Ill.

Meeting of Pathologists.—The north central regional meeting of the College of American Pathologists will be held December 18 at the University of Illinois School of Medicine, Chicago. Subjects to be discussed include "The Medical Legal Practice of Pathology," "Relationship of the Army Institute of Pathology to the Pathologist" and three seminars, "Differential Diagnosis in Certain Lesions of Bones and Joints," "Brain Tumors" and "Diagnosis of Liver Drainage by Functional and Morphologic Methods." Brigadier General Raymond O. Dart, director of the Army Institute of Pathology, Washington, D. C., will be the visiting lecturer.

Rheumatism Foundation Drive.—The Arthritis and Rheumatism Foundation of 535 Fifth Avenue, New York 17, opened in November a four week campaign to raise at least $2,000,000 to develop a nationwide research program to discover the cause and to improve methods for the treatment, cure and prevention of arthritis and other rheumatic diseases; to establish fellowships for research teams and specialists; to develop centers for research, teaching and treatment, and to promote better medical and public understanding of these diseases. The Arthritis and Rheumatism Foundation was formulated last summer (The Journal, July 24, p. 1142).

Act to Abate Pollution of Boundary Waters.—As the result of investigations by the International Joint Commission of the pollution of boundary waters, industries in the Detroit area have made or contemplate making improvements aimed at abating industrial waste pollution and estimated to cost over $6,000,000. The International Joint Commission is a United States–Canadian body established under the terms of a 1909 "boundary waters treaty" between the United States and Great Britain. The first survey of boundary waters was made in 1911, when sewage pollution of lake waters was found responsible for the high typhoid death rates in lake cities. A board of technical advisers made up of two each from the U. S. Public Health Service, the Canadian Department of National Health and Welfare, the State of Michigan and the Province of Ontario was established by the commission to plan and interpret more recent studies. Laboratory work and field studies in the United States were performed by the Public Health Service Environmental Health Center at Cincinnati, the U. S. Geological Survey, the Corps of Engineers, the Coast Guard and the U. S. Air Force. A statement of objectives was prepared by the board and adopted by the commission in April 1948.

Conference of Group Therapy Association.—The annual conference of the American Group Therapy Association will be held in Einhorn Auditorium of the Lenox Hill Hospital, New York, January 21-22. The conference will be preceded by a special meeting on January 21, limited to personnel of state, county and veteran hospitals, which will be given over to an analysis of aims and objectives of group psychotherapy. Ronald Lippitt, Ann Arbor, Mich., and Dr. S. H. Foulkes of the British Institute of Psychoanalysis, will be the main speakers at the Friday evening session, which will deal with "The Role of the Leader in Group Development and Therapy." Topics to be discussed at the other sessions include "Current Research in Group Psychotherapy" and "Clinical Applications of Group Psychotherapy."

Celebrate Anniversary of Kahn Test.—The Conference of State and Provincial Health Laboratory Directors at a dinner meeting November 7 in Boston observed the twenty-fifth anniversary of the first demonstration of the Kahn reaction before the American Public Health Association in 1923. Reuben L. Kahn, Sc.D., Ann Arbor, Mich., was honored at a banquet. The *Journal of the Michigan State Medical Society* devoted much of its October issue to this anniversary. Dr. Kahn developed the Kahn test for syphilis in 1923 while employed as an immunologist of the Michigan Department of Health Laboratories. He is now chief of the Serology Laboratory at University Hospital and associate professor of serology in the department of dermatology and syphilology at the University of Michigan Medical School.

Society Elections.—Officers of the Mississippi Valley Medical Society recently selected Dr. Nathaniel G. Alcock, Iowa City, president elect, and Dr. Harold Swanberg, Quincy, Ill., secretary-treasurer.——At the recent meeting of the American Academy of Pediatrics in Atlantic City, Dr. Edward B. Shaw, Berkeley, Calif., was named president elect and Dr. Warren R. Sission, Boston, succeeded Dr. John A. Toomey, Cleveland, as president. Reelected were Dr. Clifford G. Grulee, Evanston, Ill., secretary-treasurer, and Dr. Edgar E. Martmer, Detroit, assistant secretary.——At the Conference of State and Territorial Health Officers in Washington, D. C., November 14-17, Dr. Robert H. Hutcheson, commissioner of the Tennessee Department of Public Health, Nashville, was elected president succeeding Dr. Vlado A. Getting, Boston. Dr. Leroy E. Burney, state health commissioner of Indiana, continues as secretary-treasurer.

Survey of the Practice of Pharmacy.—The first section of the findings and recommendations of the survey of the practice of pharmacy has been published. The survey was inaugurated by various segments of the profession of pharmacy and the drug industry, but supervised by the American Council on Education. Funds and the work of implementing the recommendations were made available by the American Foundation for Pharmaceutical Education. A large portion of these supporting data will be published later in separate volumes. Among the recommendations in the report prepared under the direction of Edward C. Elliott, president emeritus of Purdue University, are the following: raising the standards of the admission to the nation's seventy colleges of pharmacy; more careful testing and screening of students during the early college training and encouragement of high school men and women of ability to take up the study of pharmacy; general overhauling of the present four year college pharmacy course; organization of a National Convention for Pharmaceutic sciences and increased instruction on the economic aspects of the practice of pharmacy; establishing six year college programs leading to the degree of doctor of pharmacy; creation of a Commission on Pharmaceutical Manpower to insure adequate records for the balancing of supply against demand for trained pharmacists; organization of a National Convention for Pharmaceutical Legislation to formulate uniform controls in the interest of public health, and a system of classifying colleges into A, B and C institutions.

The survey also continues a detailed analysis of more than 13,000 prescriptions assembled from 220 pharmacies, located in 186 cities, towns and villages of 39 states. The results furnish a comprehensive review of modern prescription practice and provide important data for the profession of medicine as well as pharmacy.

FOREIGN

United Nations Fights Pellagra. — The United Nations International Emergency Children's Fund has announced that it recently began to provide supplementary food to aid the cure of more than 35,000 children and women in Rumania suffering from pellagra because of dietary deficiencies. This is in addition to 400,000 who are getting one extra meal daily through the fund. Supplies are distributed through canteens set up by the Rumanian Government.

Institute Against Venereal Diseases.—Dr. Leo Dub, of the Public Health Branch, Office of the Military Government of the United States, Civil Affairs Division, Frankfurt-a.M., Germany, has organized an Institute against Venereal Disease there on request of Deutsche Gesellschaft zur Bekampfung der Geschlechtskrankheiten with the help of the military government and members of the University of Frankfurt Medical School. Besides a department of prophylaxis there will be a library, legal and editorial departments and a section to wage a medical campaign against venereal diseases. The institute has begun operation on a limited scale.

Antituberculosis Vaccination Program.—More than a half million children in Czechoslovakia, Poland and Yugoslavia were tested and half of that number vaccinated during the summer months, at the beginning of the United Nations International Children's Emergency Fund's mass vaccination program. It is being conducted as a joint enterprise with the Danish Red Cross and its Scandinavian associates, in cooperation with the World Health Organization. Work will also be under way this winter in Finland, Greece and Hungary, and negotiations are now going forward in Bulgaria, Italy and Albania. Most of the children were in the rural areas, but with bad weather ahead emphasis is shifting to the cities, where the children are more easily reached. Reports from Czechoslovakia tell that in the villages 90 per cent of the children came or were brought to the centers where the vaccination teams were working, a tribute to the local effort made to impress on the people the importance of this undertaking.

CORRECTION

International Tuberculosis Prevention.—In the Current Comment "International Tuberculosis Prevention," in The Journal, Nov. 27, 1948, page 973, line 24, the words "positive reactors" should read "negative reactors."

Marriages

Charles Earl Miller, Hackettstown, N. J., to Miss Jacqueline L. Munley of Coral Gables, Fla., in Radnor, Pa., September 11.

James George Sullivan, South Amboy, N. J., to Miss Estelle Marie Hess of Capitol Heights, Md., November 6.

Henry M. Larson, Morristown, N. J., to Mrs. Etta Carrington Brown Pitney in Mount Vernon, October 30.

John Francis Dillon, Washington, D. C., to Miss Frances Joanne Niehaus, in Arlington, Va., September 22.

Mary H. Rowley to Mr. William A. Busino, both of Schenectady, N. Y., in Milton, Vt., recently.

Leonard S. Sutton, Providence, R. I., to Miss Harri G. Marcus of New York, November 7.

Frank J. Sanzaro to Miss Patricia Ann Woodworth, both of Washington, D. C., November 6.

John T. O'Neil, Patchogue, N. Y., to Miss Elizabeth Mary McGraw of Albany, October 27.

Jason O. Cook Jr., Amherst, Mass., to Miss Jane Santway of Watertown, N. Y., October 2.

Robert Chandler Lake, Detroit, to Miss Eleanor L. Amidon of Greenville, Mich., October 3.

Merlon A. Webber to Mrs. Grace L. Craig, both of Pittsfield, Maine, September 19.

Richard P. Doody to Miss Catherine Elizabeth Purtle, both of Troy, N. Y., October 9.

James Craig Joyner to Miss Lucie Burke Alcott, both of New York, November 10.

George Theodore Schneider to Miss Ann LeJeune, both of New Orleans, October 9.

Joseph Tomarkin, to Mrs. Lenore White Gordon, both of Cleveland, August 8.

Deaths

Ross McClure Chapman ⊕ Towson, Md.; born in Belleville, N. Y., July 13, 1881; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1905; professor of psychiatry at the University of Maryland School of Medicine and College of Physicians and Surgeons in Baltimore; specialist certified by the American Board of Psychiatry and Neurology; member and past president of the American Psychiatric Association, the American Psychopathological Association and the Baltimore County Medical Society; member of the American Psychoanalytic Association, Southern Psychiatric Association, Association for Research in Nervous and Mental Disease and the American Orthopsychiatric Association; an Associate Fellow of the American Medical Association; fellow of the American College of Physicians; served during World War I; during World War II a member of the special committee on selective service in Washington; for many years superintendent of the Sheppard and Enoch Pratt Hospital; died in the Union Memorial Hospital, Baltimore, September 24, aged 67, of carcinoma.

Richard Dingwell Freeman, Orange, N. J.; born in Dublin, Ireland, in 1866; University of Dublin School of Physic, Trinity College, Dublin, Ireland, 1890; member of the American Medical Association; fellow of the American College of Surgeons; past president of the Society of Surgeons of New Jersey; for many years affiliated with the Orange Memorial Hospital, where he founded the William Pierson Medical Library; founder of the Central Registry for Nurses; on the staff of the New Jersey Orthopedic Hospital; for many years active in the Boys Scouts of America and in 1932 received the Silver Beaver award; died October 2, aged 82, of coronary thrombosis.

Theophil Klingmann ⊕ Ann Arbor, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1892; specialist certified by the American Board of Psychiatry and Neurology, Inc.; fellow of the American College of Physicians; member of the Association for Research in Nervous and Mental Disease and the American Psychiatric Association; served on the faculty of his alma mater; medical director of the Mercywood Neuropsychiatric Hospital; affiliated with St. Joseph's Mercy Hospital, where he died September 19, aged 80, of cerebral thrombosis.

Louise Hopkins Meeker, Scarsdale, N. Y.; Boston University School of Medicine, 1906; Cleveland Homeopathic Medical College, 1909; specialist certified by the American Board of Pathology, Inc.; formerly on the faculty of the New York Post-Graduate Medical School and Hospital in New York; member of the American Association of Pathologists and Bacteriologists; served on the staff of New York Post-Graduate Hospital in New York; died in Grasslands Hospital in Valhalla, N. Y., September 21, aged 69, of cerebral hemorrhage.

Bernard Hyman Appel, Boston; Tufts College Medical School, Boston, 1922; member of the American Medical Association; formerly on the faculty of his alma mater; on the staff of Beth Israel Hospital; died in the Massachusetts Memorial Hospital September 3, aged 50.

Edward J. Bedell, Elsmere, N. Y.; Albany Medical College, 1893; for many years health officer of the town of Bethlehem; died September 23, aged 83, of cerebral hemorrhage.

Bernard Lincoln Branley, Tulsa, Okla.; University of Minnesota Medical School, Minneapolis, 1927; member of the American Medical Association; served in the medical corps of the U. S. Naval Reserve during World War II; at one time superintendent of health; affiliated with St. John's Hospital; died August 29, aged 48, of leukemia.

Charles Perry Burke, Eastgulf, W. Va.; Jefferson Medical College of Philadelphia, 1911; member of the American Medical Association; died September 24, aged 72.

John Carling, Los Angeles; New York University Medical College, New York, 1898; fellow of the American College of Surgeons; formerly affiliated with the Veterans Administration; died in St. Vincent's Hospital September 14, aged 81, of coronary occlusion, hypertension and carcinoma of the prostate.

Bender Zelotes Cashman ⊕ Pittsburgh; Johns Hopkins University School of Medicine, Baltimore, 1909; professor of gynecology at the University of Pittsburgh School of Medicine; member of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons; fellow of the American College of Surgeons; past president of the Pittsburgh Academy of Medicine; served during World War I; affiliated with the Elizabeth Steel Magee Hospital, St. Francis Hospital and Woman's Hospital; died October 7, aged 62.

James Newton Cliatt, Memphis, Tenn.; Louisville (Ky.) Medical College, 1891; served during World War I; died September 4, aged 80, of carcinoma of the pancreas.

Charles Frederick Cogswell, Scituate, Mass.; Harvard Medical School, Boston, 1893; died September 16, aged 83.

Peter Cortelyou Cornell, Buffalo; University of Buffalo School of Medicine, 1888; died September 24, aged 83, of congestive heart failure.

Wendell Phillips Crane ⊕ Holstein, Iowa; State University of Iowa College of Medicine, Iowa City, 1929; city health physician; affiliated with the Sioux Valley Hospital in Cherokee; died in St. Joseph's Hospital, Sioux City, October 17, aged 43, of coronary thrombosis, hypertensive heart disease, diabetes mellitus and anterior poliomyelitis.

Isaac Elmer Davis, Chapman, Kan.; College of Physicians and Surgeons, Medical Department Kansas City (Kan.) University, 1897; died in Abilene August 28, aged 84, of myocarditis and cirrhosis of the liver.

Clinton Lloyd Decker, East Orange, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1901; formerly mayor of Boonton; served during World War I; died August 30, aged 74, of chronic myocarditis.

Paul Albinus Dineen ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1914: associate professor of clinical surgery at the Cornell University Medical College; served overseas during World War I; medical director of the International Telephone and Telegraph Company; on the staff of the New York Hospital; died in New Milford, Conn., September 20, aged 60, of cerebral embolism.

William Henry Drissen ⊕ Port Washington, Wis.; Northwestern University Medical School, Chicago, 1911; for many years city and county health officer; on the staff of St. Alphonsus Hospital, where he died September 10, aged 71, of cerebral hemorrhage.

Thomas Frank Dunn, Silex, Mo.; University of Tennessee Medical Department, Nashville, 1901; died in the Missouri Baptist Hospital, St. Louis, September 25, aged 76, of carcinoma of the liver.

John William Edwards ⊕ Brooklyn; Long Island College Hospital, Brooklyn, 1907; for many years on the staff of the Swedish Hospital; died September 19, aged 79, of heart disease.

Leo Louis Elliott ⊕ Paso Robles, Calif.; George Washington University School of Medicine, Washington, D. C., 1910; member of the Medical Association of Montana; formerly associated with the Indian Service; served during World War I; died August 27, aged 59, of coronary occlusion.

Francis Bartow Enneis, Jacksonville, Fla.; Loyola University School of Medicine, Chicago, 1918; member of the American Medical Association; died September 30, aged 54, of coronary occlusion.

Morris Farkas, West Orange, N. J.; Cornell University Medical College, New York, 1909; member of the American Medical Association; formerly health officer; died in the Orange (N. J.) Memorial Hospital October 6, aged 61, of arteriosclerotic heart disease.

Calvin Barstow Faunce Jr., Boston; Baltimore Medical College, 1904; member of the American Laryngological, Rhinological and Otological Society, American Medical Association, American Otological Society and the New England Otological and Laryngological Association; fellow of the American College of Surgeons; served during World Wars I and II; affiliated with the Infants Hospital, Massachusetts Eye and Ear Infirmary, Massachusetts General Hospital and the Faulkner Hospital, where he died September 22, aged 67.

Frederick Andrew Fischer, Cincinnati; Eclectic Medical College, Cincinnati, 1917; died in the Good Samaritan Hospital September 24, aged 54, of diabetes mellitus.

James Henry Fitzbutler, Chicago; Louisville (Ky.) National Medical College, Medical Department State University, 1896; Illinois Medical College, Chicago, 1904; died August 27, aged 75.

Claude Edward Fortin, Santa Monica, Calif.; McGill University Faculty of Medicine, Montreal, Canada, 1903; L. R. C. P., London, and M. R. C. S., England, 1909; died August 9, aged 69, of coronary thrombosis.

Irvin R. Fox ⊕ Eugene, Ore.; University of Oregon Medical School, Portland, 1921; past president of the state board of medical examiners; member of the American College of Chest Physicians and the North Pacific Society of Internal Medicine; fellow of the American College of Physicians; on the staff of Sacred Heart Hospital; died September 21, aged 57, of coronary thrombosis.

William Mostyn Freeman, Walworth, Wis.; Rush Medical College, Chicago, 1901; died August 7, aged 70.

John Vincent Gallagher, Milford, Mass.; Tufts College Medical School, Boston, 1902; member of the American Medical Association; medical examiner for the Sixth Worcester District; on the staff of the Milford Hospital; died September 17, aged 71.

Charles R. Galloway ⊕ Libertyville, Ill; Rush Medical College, Chicago, 1892; for many years member of the library board; on the staff of the Condell Memorial Hospital; died September 26, aged 77, of carcinoma of the transverse colon and the liver.

Robert Aloysius Gaughan ⊕ Hazleton, Pa., University of Pennsylvania School of Medicine, Philadelphia, 1913; fellow of the American College of Surgeons and the International College of Surgeons; member of the founders group of the American Board of Surgery; affiliated with Hazleton State Hospital; died September 16, aged 58, of coronary occlusion.

James Charles Gower, Gainesville, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1908; member of the American Medical Association; died September 2, aged 72.

Elmer Henry Gramling, Wauwatosa, Wis.; Marquette University School of Medicine, Milwaukee, 1919; member of the American Medical Association; past treasurer of the Milwaukee County Medical Society; served on the faculty of his alma mater; formerly on the staffs of the Misericordia, Milwaukee County and St. Luke's hospitals in Milwaukee; died October 8, aged 52, of coronary sclerosis.

Otto C. Griep, Dayton, Ohio; University of Louisville (Ky.) Medical Department, 1893; died in Grandview Hospital September 18, aged 80, of cerebral hemorrhage.

William Duncan Grigsby ⊕ Blaney, S. C.; Medical College of the State of South Carolina, Charleston, 1906; died in Baptist Hospital, Columbia, September 28, aged 70, of gastric ulcer.

Joseph Hanson, Detroit; Dearborn Medical College, Chicago, 1905; member of the American Medical Association; died in Saginaw, Mich., September 16, aged 72, of congestive cardiac failure and uremia.

Martin O. Hanson, Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1901; died August 19, aged 73, of coronary thrombosis.

Abraham Irving Haskell ⊕ Louisville, Ky.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1916; assistant clinical professor of medicine at the University of Louisville School of Medicine; served during World War I; affiliated with the Jewish Hospital, where he died September 16, aged 56, of cerebral hemorrhage and hypertension.

Thomas Joseph Houlihan ⊕ Ida Grove, Iowa; Rush Medical College, Chicago, 1902; past president of the Ida County Medical Society; died in St. Joseph's Hospital, Sioux City, September 2, aged 71, of right sided cardiac embolus and fracture of right hip.

George Webb Johnson, Hartsville, S. C.; University of West Tennessee College of Medicine and Surgery, Memphis, 1914; Meharry Medical College, Nashville, Tenn., 1916; died August 30, aged 59.

Frank Emerson Jones, Knoxville, Tenn.; University of Tennessee College of Medicine, Memphis, 1930; member of the American Psychiatric Association; affiliated with Knoxville General Hospital and Fort Sanders Hospital, where he died September 2, aged 43, of pulmonary tuberculosis.

Charles Joseph Kennedy, Dearborn, Mich.; Miami Medical College, Cincinnati, 1904; died September 6, aged 66, of bronchopneumonia.

Samuel Harold Korman, Brooklyn; Eclectic Medical College, Cincinnati, 1936; served on the staffs of the Kings County and Brooklyn State hospitals; died in the Beth David Hospital, New York, September 16, aged 38, of carcinomatosis.

Basil Gerald W. Larke, Rogers City, Mich.; Detroit College of Medicine, 1906; for many years township health officer; died in the University Hospital, Ann Arbor, September 5, aged 67, of carcinoma of the head of the pancreas.

Leslie Leverich ⊕ Dallas, Texas; University Medical College of Kansas City, Mo., 1897; member of the Kansas Medical Society and of the Central Association of Obstetricians and Gynecologists; an Affiliate Fellow of the American Medical Association; fellow of the American College of Surgeons; past president of the Wyandotte County (Kan.) and Dickinson County (Kan.) medical societies; formerly on the staff of the Bethany Hospital in Kansas City, Kan.; died September 14, aged 82.

William Henry Long, Somerville, N. J.; Columbia University College of Physicians and Surgeons, New York, 1898; past president of the Somerset County Medical Society; for many years medical director of the public schools and county physician; for many years surgeon for the Central Railroad of New Jersey, the Lehigh Valley Railroad, the Reading Railroad and the Public Service Company; died September 7, aged 71.

Earl J. Lossing, Grand Rapids, Mich.; Grand Rapids Medical College, 1905; died August 18, aged 67, of hypostatic pneumonia and cerebral arteriosclerosis.

Otto Lowits, Newark, N. J.; Long Island College Hospital, Brooklyn, 1908; member of the American Medical Association; affiliated with the city health department; on the staff of the Newark Beth Israel Hospital; member of the Selective Service System during World War II; reappointed to examine registrants in the new draft; died September 1, aged 62, of coronary occlusion.

Gregory F. Lukianoff, Long Island City, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1923; at one time on the faculty of the University of Virginia in University, Va.; died recently, aged 52, of cirrhosis of the liver and cerebral arteriosclerosis.

Jeremiah Fletcher Lutz ⊕ Glen Rock, Pa.; College of Physicians and Surgeons, Baltimore, 1894; specialist certified by the American Board of Radiology; fellow of the American College of Physicians; member of the Radiological Society of North America, Inc., and the American College of Radiology; served during World War I; affiliated with York (Pa.) Hospital; died in the Veterans Administration Hospital, Fort Howard, Md., September 11, aged 75, of arteriosclerosis.

Michael Francis Maloney, Ogden, Utah; Creighton University School of Medicine, Omaha, 1945; interned at the Queen of Angels Hospital in Los Angeles and the Thomas D. Dee Memorial Hospital in Ogden; died in Price City Hospital, Price, September 9, aged 29, of acute rheumatic fever.

Thomas Hambden Massey, Smithfield, Va.; University of Virginia Department of Medicine, Charlottesville, 1907; member of the American Medical Association; served overseas during World War I; affiliated with Buxton Hospital in Newport News and Lakeview Hospital in Suffolk; died September 18, aged 64, of paralysis.

John William Miller ⊕ Paducah, Ky.; University of Louisville School of Medicine, 1927; member of the American Association of Pathologists and Bacteriologists; formerly surgeon in the U. S. Public Health Service Reserve; served during World War I; affiliated with the Riverside Hospital; died September 27, aged 48, of cerebral hemorrhage.

Ray Thomas Munger, Plainfield, N. J.; Baltimore Medical College, 1909; member of the American Urological Association; fellow of the American College of Surgeons; affiliated with Somerset Hospital in Somerville, Rahway (N. J.) Hospital, Bonnie Burn Sanatorium in Scotch Plains; on the staff of the Muhlenberg Hospital; died September 19, aged 63.

Henry Milo Newkirk, Swink, Colo.; Marion-Sims College of Medicine, St. Louis, 1897; died in Mennonite Hospital and Sanitarium, La Junta, September 7, aged 78, of cerebral hemorrhage and arteriosclerosis.

Walter Kearnes Nihart, Edgerton, Ohio; Michigan College of Medicine and Surgery, Detroit, 1906; died August 20, aged 69, of coronary thrombosis.

Lewis Augustav Oster, Hollywood, Fla.; University of Wooster Medical Department, Cleveland, 1912; died in Fort Lauderdale, Fla., September 14, aged 60, of heart failure.

Donald Robert Owen ⊕ Omaha; University of Nebraska College of Medicine, Omaha, 1918; served overseas during World War II; died September 23, aged 54, of coronary thrombosis.

Percy Leigh Parsons, Traer, Iowa; State University of Iowa College of Homeopathic Medicine, Iowa City, 1901; Chicago Homeopathic Medical College, 1902; member of the American Medical Association; died August 21, aged 72.

Adolph August Passer ⊕ Olivia, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1912; died August 18, aged 68, of cerebral hemorrhage.

Edward Allen Pierce, Portland, Ore.; University of the City of New York Medical Department, New York, 1885; member of the American Medical Association and the American Trudeau Society; past president of the Oregon State Medical Society and of the state board of health; at one time attending physician at the Portland Open Air Sanatorium in Milwaukie; died September 25, aged 93.

Charles Banning Porter, St. Johns, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1899; died in the Clinton Memorial Hospital September 19, aged 76, of coronary disease.

Cyrus Marion Rambo ⊕ Zanesville, Ohio; Starling Medical College, Columbus, 1891; on the staff of the Good Samaritan Hospital in Bethesda; died September 20, aged 85, of infection from a tooth and splenic thrombosis.

John Wyeth Ray ⊕ Houston, Texas; Louisiana State University Center, New Orleans, 1938; served in the medical corps, Army of the United States, during World War II; died August 20, aged 40.

Jay Verne Rice, Wellsville, Ohio; University of Louisville (Ky.) School of Medicine, 1910; formerly health commissioner of the city of Wellsville; died in Birmingham, Ala., September 1, aged 66.

Eduard Rischar ⊕ Cameron, Texas; Keokuk (Ia.) Medical College, College of Physicians and Surgeons, 1900; fellow of the American College of Surgeons; formerly owner of the Cameron Hospital; died August 1, aged 76.

James E. Robbins, Stillwater, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1893; formerly affiliated with the Danville (Pa.) State Hospital and the Wernersville (Pa.) State Hospital; died in the Bloomsburg (Pa.) Hospital August 27, aged 86, of hypostatic pneumonia.

Luke C. Roberts, Jonesville, Ky.; Louisville Medical College, 1901; member of the American Medical Association; died August 22, aged 73, of cerebral hemorrhage.

Thomas Erle Rucker, Lynchburg, Va.; Medical College of Virginia, Richmond, 1902; member of the American Medical Association; served during World War I; died September 4, aged 67, of carcinoma of the throat.

Frank Theodore Schowengerdt ⊕ Cortland, Neb.; Marion-Sims-Beaumont Medical College, St. Louis, 1902; past president of the Gage County Medical Society; formerly member and president of the school board; at one time mayor of Cortland; served on the staffs of the Mennonite Deaconess Home and Hospital in Beatrice, Bryan Memorial Hospital and St. Elizabeth Hospital in Lincoln, where he died September 12, aged 72.

Abraham W. Schram ⊕ Chicago; Rush Medical College, Chicago, 1896; associate clinical professor of medicine at the Loyola University School of Medicine; specialist certified by the American Board of Internal Medicine; for many years active in the Chicago Health Department; on the staff of the Mercy Hospital; died September 4, aged 73, of cerebral hemorrhage.

Harry Will Shryock, Seattle; Denver College of Medicine, 1900; member of the American Medical Association; served during World War I; for many years on the staff of the Firland Sanatorium; died September 30, aged 76.

Straut Watson Shurtz, Champaign, Ill.; Rush Medical College, Chicago, 1893; member of the American Medical Association and of the Fifty Year Club of the Illinois State Medical Society; formerly affiliated with Champaign County Hospital in Urbana; died in Burnham City Hospital September 24, aged 81, of diabetes mellitus, arteriosclerosis and myocarditis.

Crandall P. Sisco ⊕ Springdale, Ark.; University of Arkansas School of Medicine, Little Rock, 1911; director of the First State Bank; on the staff of the City Hospital in Fayetteville; died August 24, aged 61, of arteriosclerotic heart disease.

William Wilson Sisserson, Yardley, Pa.; Medico-Chirurgical College of Philadelphia, 1916; served during World War I; surgeon in the U. S. Public Health Service reserve during World War II; formerly on the staff of Muhlenberg Hospital in Plainfield, N. J.; in charge of the Veterans Administration outpatient department in Trenton, N. J., where he died September 2, aged 56, of myocardial infarction.

Homer William Smith ⊕ Rochester, N. Y.; University of Buffalo School of Medicine, 1913; served with the city health department; examining physician for the Selective Service during World War II; affiliated with Monroe County Hospital and the Park Avenue Hospital, where he died September 5, aged 63, of coronary sclerosis.

James Arthur Smith, Chattanooga, Tenn.; University of Louisville (Ky.) Medical Department, 1912; member of the American Medical Association; served during World War I; died in Erlanger Hospital August 26, aged 64, of bronchopneumonia.

John Augustus Sperry, San Francisco; Medical Department of Tulane University of Louisiana, New Orleans, 1905; member of the American Medical Association; affiliated with the Children's and Stanford University hospitals; died September 29, aged 66.

Seymour Leopold Spier, New Haven, Conn.; Yale University School of Medicine, New Haven, 1904; for many years police surgeon; died in the Undercliff Sanatorium, Meriden, September 22, aged 76, of carcinoma of the rectum and pulmonary tuberculosis.

Walter David Spoor ⊕ Schenectady, N. Y.; Denver Homeopathic College, 1896; died in the Ellis Hospital August 11, aged 73, of uremia.

Thomas Alexander Steele, McKeesport, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1901; an officer during World War I; served a term in the state legislature; died in the Veterans Administration Hospital, Aspinwall, August 7, aged 68, of hypertensive cardiovascular disease.

Albert Henry Steffens, Anaheim, Calif.; Barnes Medical College, St. Louis, 1900; also a dentist; died October 2, aged 74, of injuries received when he was struck by an automobile while crossing the street.

Lewis H. Sterner, Hanover, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1889; member of the American Medical Association; on the staff of the Hanover General Hospital; died August 27, aged 84, of leukemia and heart disease.

Axel Waldemar Swenson, Van Nuys, Calif.; Minneapolis College of Physicians and Surgeons, medical department of Hamline University, 1901; served during World War I; died August 22, aged 72.

Phillips Jackson Tunnell, Norwalk, Calif.; College of Medical Evangelists, Loma Linda and Los Angeles, 1923; died in Barlow Sanatorium, Los Angeles, August 6, aged 49, of tuberculosis.

George Oscar Wallace, Clayton, Ala.; Medical College of Alabama, Mobile, 1891; member of the American Medical Association; at one time probate judge of Barbour County, member of the county board of education and county health officer; died September 7, aged 80, of embolism and pyelonephritis.

Richard William Walt ⊕ North Hollywood, Calif.; University of Southern California School of Medicine in Los Angeles in 1942; interned at the San Bernardino (Calif.) County Charity Hospital; an officer in the medical corps, Army of the United States, during World War II; affiliated with St. Joseph's Hospital in Burbank, Glendale Sanitarium and Hospital and Behrens Memorial Hospital in Glendale; on the attending staff of Los Angeles County Hospital; died August 16, aged 32, of injuries received in an automobile accident.

Robert Hanford Waterfield, New York; Columbia University College of Physicians and Surgeons, New York, 1933; member of the American Medical Association and the American Psychiatric Association; affiliated with the Lenox Hill Hospital, where he died August 18, aged 52, of acute coronary occlusion.

Mortimer Harold Weiss ⊕ Newark, N. J.; Columbia University College of Physicians and Surgeons, New York, 1925; served during World Wars I and II; on the staff of the Beth Israel Hospital; died August 6, aged 48, of cerebral hemorrhage.

Ewald Alfred Sigmund Werner ⊕ Los Angeles; College of Physicians and Surgeons, medical department of the University of Southern California, Los Angeles, 1910; affiliated with the Good Samaritan and California Lutheran hospitals; served during World War I; died in Veterans Administration Hospital, Van Nuys, August 30, aged 61, of acute myocardial infarction.

Benedict Nolasco Whipple ⊕ Bristol, Conn.; Yale University School of Medicine, New Haven, 1907; fellow of the American College of Surgeons; on the staff of Bristol Hospital; died August 4, aged 63, of myocardial infarction.

Raymond R. Whitten ⊕ Ionia, Mich.; Detroit College of Medicine, 1912; affiliated with Ionia County Memorial Hospital; died in Blodgett Memorial Hospital, Grand Rapids, September 11, aged 63, of rheumatic heart disease with mitral stenosis.

Oliver Benjamin Winkler, Lebanon, Ill.; St. Louis University School of Medicine, 1927; member of the American Medical Association; affiliated with the Christian Welfare Hospital in East St. Louis; died September 9, aged 47.

James Craven Wood, Cleveland; University of Michigan Homeopathic Medical School, Ann Arbor, 1879; member of the American Medical Association; fellow of the American College of Surgeons; served on the staff of the Huron Road Hospital in East Cleveland; died in Shaker Heights, Ohio, August 29, aged 90, of cerebral hemorrhage and arteriosclerosis.

The Streptomycin Treatment of Tuberculosis

A most important report on the streptomycin treatment of tuberculosis has been published by the Medical Research Council in the *British Medical Journal*. The inquiry was planned and directed by the Streptomycin in Tuberculosis Trials Committee. The work was carried out by clinicians and pathologists in various hospitals. Only once before has any drug been submitted to a controlled trial in this variable and unpredictable disease. This was in 1931, when gold treatment of tuberculosis proved unsuccessful. The present trial was restricted to patients aged 15 to 30 years, with acute progressive tuberculosis of both lungs unsuitable for collapse therapy, a type of case hitherto treated only by rest in bed. Such cases are not common, but 107 patients were chosen in various hospitals. Treatment was carried out at seven centres, 55 patients being allotted to the streptomycin group and 52 to the control group. To avoid any possible bias each patient's group was decided by a statistician using an ingenious system of sealed envelopes. Progress was estimated from the roentgenograms by independent radiologists and clinicians, who did not know from which group the films came.

All the patients were kept in bed on the same general regimen, but the streptomycin group received 2 Gm. of streptomycin daily by intramuscular injection, usually for 4 months. The results were assessed after 6 months. By then 4 streptomycin and 14 control cases were fatal—a difference that would not occur by chance once in 100 times. Considerable improvement was observed in 51% of the streptomycin cases but in only 8% of the controls. This difference was almost entirely accounted for by the remarkable efficacy of streptomycin in patients most seriously ill at the time of the trial. After a year 12 streptomycin patients and 24 controls were dead and the proportion of cases improved had risen to 31% in the controls, whereas in the streptomycin cases the figure was much the same, 56%. The toxic effects of streptomycin, which have been troublesome and dangerous in some other trials, were never severe enough to necessitate cessation of treatment.

Streptomycin can be of great value in acute phthisis, especially early cases before cavities form in the lungs. It is not a "cure" for tuberculosis, nor does it render other treatment obsolete. It must be used with discrimination. Under the treatment the ordinary streptomycin-sensitive bacilli are fairly rapidly replaced by resistant bacilli. This means that the drug may be effective only once during the illness, and the time to give it must be carefully chosen. For the community it means the danger of unsuccessfully treated patients disseminating streptomycin-resistant organisms to others, producing a large number of cases which do not respond to the drug.

Congress of Obstetrics and Gynecology

The twelfth British Congress of Obstetrics and Gynecology will be held in London on July 6-8, 1949, under the presidency of Sir Eardley Holland. The Congress will be declared open by the Minister of Health at 10 a. m. A discussion on modern trends in gynecology will then be introduced by Mr. C. McIntosh Marshall (Liverpool), on "Modern Caesarean Section." At 2 p. m. Dr. Joe Meiggs (Massachusetts) will read a paper. A discussion on pregnandiol will be introduced by Prof. G. F. Marrian, F.R.S. (Edinburgh) and Dr. G. I. M. Swyer (London). On July 7, Prof. G. W. Pickering and Prof. F. J. Browne (London) will introduce a discussion on essential hypertension in pregnancy. At 2 p. m. a discussion on hernia of the pouch of Douglas will be introduced by Mr. C. D. Read (London). One on the management of pregnancy in diabetics will be introduced by Mr. J. H. Peel (London) and Prof. D. M. Dunlop (Edinburgh). On July 8, Dr. J. E. Ayre (Montreal) and Dr. F. G. Spear (Cambridge) will introduce a discussion on the diagnosis and prognosis of carcinoma of the uterus. In the afternoon there will be a discussion on maternal mortality.

The honorary secretaries of the Congress are Mr. A. J. Wrigley, F.R.C.S., and Mr. I. M. Jackson, F.R.C.S., to whom the names of those who hope to attend the Congress should reach by March 31, 1949, at the Royal College of Obstetricians and Gynecologists, 58 Queen Anne Street, London, W.

Organization of Rh Investigation

In 1946 Dr. J. J. van Loghem Jr., one of the cooperating physicians of the Central Laboratory of the Dutch Red Cross blood transfusion service, undertook to bring together physicians who were interested in the Rh question.

The first meeting, which was attended by a great number of specialists, was presided over by Professor Pondman (Groningen) who started the Rh work in Holland during the war, in 1943, after the thesis of Broman (Sweden) had brought the discovery of this new blood group to the notice of the Dutch serologists. Professor Pondman, who was at the time head of the serologic department of the government's Institute of Public Health in Utrecht, had to contend with many difficulties owing to the entire lack of foreign literature.

In this first meeting a committee was asked to set up an organization to keep the Dutch physicians informed of the progress of the investigations and to promote cooperative research. A program was drawn up, and a few months afterward two members of the committee issued a publication in which they summarized facts concerning the Rh question in other countries, especially in America and the United Kingdom. The serologic investigations were concentrated in the Central Laboratory of Blood Transfusion in Amsterdam under the direction of van Loghem.

From July 1946 to July 1948 the blood of 1,958 families presenting a history of suspected erythroblastosis fetalis was examined. In 980 cases the father was found to be Rh positive and the mother Rh negative. In 707 cases Rh antibodies were detected in the serum of the sensitized mothers. Only in a few cases of active Rh antagonism, Rh antibodies were not detected in the serum of the mother. Rh tests were made on 11,840 donors of forty-five blood transfusion centers. The percentage of Rh-negative persons amounts to 14.2 (rr or cde/cde). In 12 cases Rh antagonism was proved to be the cause of transfusion reactions. In a great number of cases, in which repeated transfusion was necessary, the Rh factor was determined preventively.

It was particularly in the application and the study of exchange transfusion that favorable results of close collaboration became manifest. When in the beginning of 1947 it appeared from American publications that the prognosis for newborn infants affected with hemolytic disease was improved considerably by the application of exchange transfusion, the working committee tried to use this treatment in Holland on a large scale. In one year and a half one hundred and twenty-four exchange transfusions were performed by thirty-three pediatricians, gynecologists and internists. The death rate decreased from 63.5 to 14.5 per cent.

Under the auspices of the working committee for Rh investigations about two hundred physicians and technicians from fifty-five different medical centers have received a course of instruction in Amsterdam in order to acquire the technic of determining the D antigen and examining the serum on complete and incomplete antibodies (by means of the serum of Coombs).

To the scientific program of the Rh department of the Central Laboratory in Amsterdam belongs especially the production of rare Rh test serums by means of artificial immunization of volunteer donors.

Recently J. J. van Loghem published in the *British Medical Journal* (Aug. 14, 1948) a preliminary note on influence of heterospecific immunization on production of Rh antibodies. He proved that the production of these antibodies is stimulated by the administration of bacterial antigens (triple vaccine, typhoid and paratyphoid A and B) and tetravaccine (which includes cholera). In general, only those persons who reacted clinically and serologically to the administration of these vaccines produced Rh antibodies.

Especially noteworthy is the cooperation in this scientific program of a group of female volunteers, three nuns belonging to the Congregation of the Divine Child in Amsterdam. One of them formed a pure C antibody of the hyperimmune form after twenty injections over a period of three and a half months with a titer of 1 : 128.

The Jacobaeus Memorial Lecture

Professor Jacobaeus died in the autumn of 1937, only 58 years old. In recognition of his outstanding contributions to medicine, the Nordisk Insulin Fund created in 1939 the H. C. Jacobaeus Memorial, the statutes of which provide for a lecture every year by one who has distinguished himself in some field of medicine. The lecture is delivered in rotation in one of the Scandinavian university towns or some other center of scientific medicine. The first lecture was delivered in 1942 in Sweden by Professor Key, who spoke about the contribution which Jacobaeus had made to the surgery of the chest. The second lecture was delivered in Copenhagen in September 1947 by Professor C. H. Best of Toronto. This year an invitation was given to Professor F. G. Young of University College, London, to lecture on the relation of the pituitary gland to diabetes mellitus. This lecture was delivered on October 5 at the Rikshospital in Oslo. Among the foreign members of the audience were Dr. Hagedorn of Copenhagen and Professor Odin of Gothenburg. Professor Olav Hanssen of Oslo was in the chair.

Vaccinia from Boxing?

On November 3 Dr. Per Hanssen, of the Isolation Department of the Ullevaal City Hospital, gave the Norwegian Medical Society an account of the case which gave rise to a nationwide smallpox scare in Norway late last September. The patient was a young Norwegian soldier who took part in an international boxing competition in London September 15-17. On September 20 he noticed a rash on his face for the first time. He continued to be up and about, feeling well, but on his return to Norway a few days later a pustular eruption on his face, neck and right arm at once aroused suspicion and led to his isolation in hospital on September 25. The experts agreed that the eruption was due to either vaccinia or variola, but they could not say more. Laboratory tests in London of material sent by air from Norway pointed to a vaccinia infection, and the absence of any case of variola among the many persons with whom the patient had came in contact before he was isolated left no doubt as to the infection's being vaccinia. Dr. Per Hanssen suggested that the source of this infection may well have been the boxing gloves of one or other of the patient's combatants, but he has so far been unable to ascertain whether any of them had been recently vaccinated before boxing with the Norwegian. The smallpox scare on this occasion was all the greater for the fact that vaccination has of late been much neglected in Norway, largely on account of the fear of vaccination encephalitis.

BRAZIL

(From Our Regular Correspondent)

Rio de Janeiro, Oct. 8, 1948.

New Technic for Immunization to Yield Rh Antibodies

Drs. Mario P. Mesquita and Vera Leite Ribeiro, of the Blood Bank of the Fernandes Figueira Pediatric Hospital, Rio de Janeiro, published a report describing a new technic for the immunization of guinea pigs to yield Rh antibodies. The inactivated serums of 25 normal adult guinea pigs diluted to 1:4 was used for the agglutinating tests with 2 per cent suspensions of rhesus red cells in final dilution from 1:5 to 1:80. The citrated blood of the monkeys was first filtered through sterilized gauze and then centrifuged and washed, the centrifugation and washing being repeated several times. After each centrifugation the separated red cells were mixed with more isotonic sodium chloride solution and transferred to another tube, the sediment containing some stroma and broken red cells being abandoned in the first tube. The washing of the red cells was continued until the supernatant fluid did not show the slightest trace of albumin. By this technic, a much higher sensitivity of Rh agglutinins was disclosed at 5 C. than at 37 C., which confirms the previous findings of Diamond and Abelson. In addition, absorption tests disclosed that such enhanced sensitivity derives fundamentally from specific properties of Rh agglutinins and not from a nonspecific cold agglutination. The production of serum by the new technic is still under study before its utilization for diagnostic purposes.

While they were waiting for this serum and still using serums of American manufacture, the writers reported that among 220 white adults, Brazilian-born residents of Rio de Janeiro to be selected for the group of blood donors of the Fernandes Figueira Hospital, the Rh factor reaction was negative in 28 cases, or 13.2 per cent. Previous results reported recently in Brazil in similar conditions by Ottensooner and Pasqualin (São Paulo, 1934, 47 examinations), by Lacaz, Ferreira, Malone and Yahn (Rio de Janeiro, 1946, 445 examinations), again by Ottensooner and Pasqualin (São Paulo, 1947, 1,919 examinations), and by the present writers (Rio de Janeiro, 1947, 212 examinations) showed negative percentages of 15.0, 14.2, 14.7 and 13.2, respectively, which gives the general average negative rate of 13.93 per cent for the combined sample of 1,115 persons from the two greatest cities of Brazil.

Sanitary Conditions of Drinking and Eating Utensils

Dr. Dacio A. Christovam, assistant professor of microbiology at the School of Public Health and Hygiene, São Paulo, published a report on the sanitary conditions of drinking and eating utensils in that city's central district. The study included thirty-two cafés and bars and twelve restaurants. A total of 1,568 utensils taken at random from the washed and disinfected material was examined, in lots of 7 each. At the cafés and bars the total bacteria counts of cups and glasses were respectively 3,863 and 85,331, the average per lot reaching 88,400 for cups and 720,000 for glasses, as against the average number of 100 bacteria per utensil, which is the standard proposed by the American Public Health Association. Only 14.1 per cent of the lots of cups could be considered satisfactory, and none of the lots of glasses complied with the standard. The average temperature of the so-called "sterilizers" for cups was 58.4 C., and 42 and 72 C. were the extreme temperatures found. At the restaurants the average number of bacteria in glasses, dishes, forks and spoons were respectively 45,851, 86,527, 6,613 and 9,095. The maximum averages were 224,000 for glasses, 736,000 for dishes, 55,000 for forks and 62,000 for spoons. Only one lot of glasses of all the material examined from restaurants could be considered satisfactory.

Pneumococci were found in 3.1 per cent of the lots of cups from the cafés and bars and in 4.2 per cent of the lots of glasses and forks from restaurants; hemolytic streptococci in 45.3 per cent of the lots of glasses and in 18.8 per cent of the lots of cups from the cafés and bars, and respectively in 8.3 per cent, 16.7 per cent and 8.3 per cent of the lots of glasses, forks and spoons from the restaurants; pathogenic staphylococci in 15.6 per cent of the lots of glasses and in 21.9 per cent of the lots of cups from the cafés and bars, and in respectively 8.3 per cent, 16.7 per cent, 4.2 per cent and 12.5 per cent of the lots of glasses, dishes, forks and spoons from the restaurants. Tubercle bacilli were not isolated. Coliform organisms were found in 40.7 per cent of the lots examined.

The high number of bacteria present in all types of utensils and the high percentages of lots in which pathogenic microorganisms were found reveal a serious public health problem. They are simply the result of the crude methods of washing and the lack of any attempts at disinfection observed in the course of the study. Dr. Christovam proposes the adoption of simple, efficient methods of washing and disinfection, using hot water from 77 to 82 C., and inorganic chlorine compounds in solutions of 50 to 100 parts per million.

BOLIVIA

(From Our Regular Correspondent)

La Paz, Oct. 18, 1948.

Food Problems

Several studies on the subject of diet were made here in Bolivia, the most important one by a mixed Bolivian-American mission, led by the Hon. Alvert Magruder (Boston) and another one by the National Commission of Bolivia. Their figures were based mainly on research on the urban population, the miners, railroad men and other industrial workers, a group comprising about half of the country's population.

According to those investigations the average daily ration contained only 1,200 calories, 72 per cent of which were provided by carbohydrates, 15 per cent by fats and the remaining 13 per cent by proteins, mostly of vegetable origin. According to the relatively optimistic figures of the National Commission the absolute weights of each factor were: 210 Gm. carbohydrates, 12 Gm. animal proteins, 28 Gm. vegetable proteins and 21 Gm. fat. Thus, not only was the protein intake 50 per cent under the accepted standards, but its relation to the amount of carbohydrates was unsatisfactory, too.

Equally unsatisfactory were vitamin values: vitamin A, 5,820 international units; vitamin B_1, 1.1 mg.; vitamin B_2, 0.9 mg.; nicotinic acid, 9.7 mg.; vitamin C, 98.0 mg., and vitamin D, 11 international units.

Calcium contents remained at only 25 per cent of the standard requirements, while iron intakes were only one third of the normal. The average weight of a full day's ration was only about 700 Gm., and the per capita quota of milk 73 Gm. per day. Relatively well fed were miners, who received a daily average of 2,500 calories, which is still an unsatisfactory quantity for a heavy worker. This group at least received proper amounts of proteins and iron. Because of the continual undernutrition of prospective mothers the birth weights of babies remained relatively low too. Between 7 and 37 per cent (according to different surveys) of the babies born at term weighed less than 2,800 Gm.

The principal cause for this continuous undernutrition was the surprisingly low average income, which was sufficient only to cover the cost of 1,200 calories without leaving any additional allowances for other expenses. There was, for example, but 0.5 per cent of the population who could afford 3,000 calories a day for themselves and for their families as well, without interfering with their other living expenses. About 72 per cent of the investigated group did not earn enough to supply 2,600 calories. In the lowest income group, and thus in the worst fed group, belongs the population of the Indian race. The surprising difference between living costs and incomes is partly due to the fact that nearly 90 per cent of all the consumed food had to be imported from abroad in high prices; this situation could be improved only by creating farms in the vast but scarcely inhabited territory. Besides there is a complete lack of any knowledge as to the ways of rational feeding among the common people. Physical conditions among the native Indian population are continually becoming worse, and today's Indian can hardly be compared in any way, either physically or intellectually, to his famous ancestors, the Incas.

The Coca Leaf

According to estimates made by the Minister of Health, there is in Bolivia a yearly production of some 3,000 tons of coca leaves (Erythroxylon coca, also called the "divine plant of the Incas"). The coca leaf has an estimated cocaine content of 0.75 per cent; thus there are yearly some 23 tons of cocaine grown, shipped and sold.

Those natives who habitually chew coca leaves claim to be able to carry heavy loads for long distances without tiring. It is not surprising to see a native carrying a box of some 200 pounds. The natives also claim that the continuous use of the coca leaves improves their visual acuity, preserves their teeth, and helps them to avoid baldness; indeed, their visual acuity is often surprisingly high; few Indians show any caries at all, and it would be hard to find a bald man among the natives of the high plateau, where most of the coca is consumed. Finally, the natives claim that their well known stoicism and resignation is due to the use of coca.

Their claims are, for understandable reasons, strongly supported by the coca producers. This group recently ordered an analysis of the leaves to establish their nutritive values and succeeded in proving that the leaves contain certain amounts of vitamins A, B_1, riboflavin, pyridoxine, biotin, ascorbic acid and vitamin E. Thus the erroneous impression was created that these leaves might eventually serve as food. Unfortunately, the producers forgot to mention that the average workman at the high plateau chews some 50 Gm. of coca leaves a day, with an estimated alkaloid content of some 370 mg. Supposing that only half of this cocaine would be absorbed by the body, there would be still a daily intake of about 180 mg., an amount well above the daily allowances of the U. S. Pharmacopeia, and this amount is being ingested day after day, year after year. Many a man remains thus in a state of continuous and complete anesthesia, and it is not surprising at all to see a workman removing a foreign body from his own cornea by means of a hair without experiencing any pain whatsoever.

There is no manufacturer in this country who would extract the pure alkaloid for commercial or pharmaceutic purposes; thus the producers, who fear for their markets, insist on selling their production to the workmen, their largest consumers, besides exporting small quantities to Argentina. The situation in some of the neighboring republics, especially Peru, is almost identical.

Correspondence

DERMATITIS DUE TO MESANTOIN

To the Editor:—In an article entitled "Fulminating Dermatitis Bullosa Medicamentosa Due to 'Mesantoin'" (in The Journal, July 17, p. 1031), Dr. Dave B. Ruskin reported a fatality presumably due to "mesantoin" (methylphenylethyl hydantoin). As one who introduced this anticonvulsant drug into medicine and who has been continuously studying it clinically since 1943, I wish to comment on this report.

The exceptional dermatologic history of this patient is extremely important to an understanding of the case, and certain points are so significant that they deserve to be reviewed: 1. "At age 4 the patient had whooping cough and another unidentified illness associated with a rash." (Could this have been a drug rash?) 2. At about 6 years of age, she was given diphenyl hydantoin sodium ("dilantin") and phenobarbital, and "a rash and ataxia developed with either drug." 3. When she was approximately 7½ years of age (only six months before her fatal illness) a "rash" had developed from sulfonamide drugs given to her for acute pharyngitis.

This careful history by Dr. Ruskin clearly brings out the fact that this patient had already shown dermal sensitivity to a variety of drugs. It also emphasizes the need for observing the warning given in my interim report (as published in The Journal, Oct. 25, 1947) that the drug ("mesantoin") should be given with caution to patients who have previously had a generalized rash.

I agree with Dr. Ruskin that "this complication does not necessarily depend on the administration of a larger dose." Later experience has shown that extremely small dosages can initiate a rash in skin-sensitive patients. The severity and duration of the rash are dependent, to a large extent, on the degree of the patient's sensitivity and are not necessarily related to the amount of drug ingested.

I disagree with Dr. Ruskin that "all" patients should receive blood examinations during treatment with this drug. This implies that "mesantoin" is primarily toxic to the blood or blood-forming organs. Clinical studies show that the drug is toxic neither to the hemopoietic system nor to the derma when given in appropriate dosage to properly selected patients. It is my opinion that blood changes or skin reactions occurring singly or in combination are due to individual hypersusceptibility. Additional experience is necessary before it can definitely be determined whether severe skin reactions and marked blood changes (as in Dr. Ruskin's case) always occur together or whether serious dermal lesions can occur independently of blood changes.

For the present time, I suggest the following conservative plan of treatment which need be applied only to patients within the following groups: (1) patients giving histories of previous drug reactions, regardless of the type of reaction or nature of the drug; (2) patients having histories of generalized rash, whether due to drugs (as in Dr. Ruskin's case) or to unknown causes; (3) patients who have never taken drugs of the hydantoin or barbiturate groups, and (4) patients requiring over 9 grains (0.58 Gm.) of "mesantoin" daily.

PLAN OF TREATMENT

1. All patients in the group should be given weekly blood examinations for approximately the first sixteen weeks of treatment. To my knowledge, only 1 published case of toxicity has been manifested after this period of time (Dr. R. B. Aird's patient). 2. Not only are the blood examinations important, but these patients must also undergo repeated complete physical examinations, during this initial period of treatment, in order to detect any other early toxic manifestations. 3. This drug or any chemically related drugs should be given "in small doses and increases should be made slowly and in small increments," as suggested by Dr. Ruskin.

In the clinical investigations of "mesantoin," thousands of complete blood studies, done repeatedly on hundreds of patients by myself and many others, do not support the view of subjecting all patients to repeated blood examinations during treatment. Of course, one initial blood examination should be done routinely on all patients before beginning treatment. I am especially concerned in seeing that the facts about individual susceptibility to the drug are not confused with those relating to its therapeutic index: "Mesantoin" has relatively low toxicity, being tolerated in larger doses than either diphenylhydantoin or phenobarbital. An unfounded alarmist attitude may impede the use of a drug which has been shown to be of definite value in the control of grand mal type epilepsy by the following investigators: H. R. Carter, T. H. Harris and J. L. Otto, H. L. Kozol, W. S. Littlejohn and co-workers, K. O. Von Hagen, J. L. Fetterman, and many others. Several additional studies are being prepared for publication which, I believe, will support this opinion.

In conclusion, clinical evidence suggests that some patients exhibit an individual hypersusceptibility to "mesantoin." With proper caution, as already outlined, many of these cases can be managed satisfactorily. Dr. Ruskin should be complimented on the thoroughness of his report and for stimulating a discussion of the actions of "mesantoin" as well as placing an important reemphasis on the precautions to be taken for insuring successful therapeutic results. It should be remembered that cases of hypersusceptibility have been reported with the use of practically every active drug in the pharmacopeia.

Anthony E. Loscalzo, M.D., New York.

Medical Motion Pictures

FILM REVIEWS

Medicine in the Tropics. 16 mm., color, sound, 880 feet (1 reel), showing time twenty-five minutes. Produced in 1948 by the Lewis Sound Films for the Firestone Tire & Rubber Company. Technical adviser, K. H. Franz, M.D. Procurable on loan from: The Firestone Tire & Rubber Company, Department of Public Relations, Akron 17, or Association Films, 347 Madison Ave., New York 17.

This motion picture depicts diseases of the tropics and is based on the medical program of the Firestone plantations in Liberia. A patient is shown with the diagnosis of amebic abscess of the liver which has been made by roentgenogram, but the film is not shown. The patient is submitted to surgical treatment; however, in most cases of hepatic abscess, surgical treatment is contraindicated. A manual of tropical medicine states, "the high mortality previously associated with abscess of the liver was in a large part due to the universal use of open drainage. With the advent of emetine and the use of repeated aspiration of the cavity, the mortality has been reduced to 2 per cent." There is no mention of medical treatment for this condition in the motion picture.

Sleeping sickness is discussed and enlarged lymph nodes demonstrated. A lymph node is aspirated but the organism is not shown. The tsetse fly is mentioned but not illustrated. There are 3 cases of smallpox shown which make an excellent clinical demonstration. For medical students in the United States these smallpox cases alone make the picture worth while. A patient with elephantiasis of the scrotum is demonstrated but neither the causative agent nor the vector is shown.

This film is especially well done; it is artistic and the photography is superb. The geography of Liberia and the customs of its people are well portrayed. Natives tapping drums form a fitting introduction.

The film would be suitable for first and second year medical students and groups of nurses. The demonstration of nude patients makes it unsuited for lay audiences. The main portion of this film could be used as a basis for two separate pictures, one for the laity and one for the medical profession. For the first film simply omit the nude patients. For the medical profession some revision along the lines suggested would convert it into a valuable scientific contribution.

Nursing Care in Poliomyelitis. 16 mm., color, sound, 2,156 feet (4 reels). Produced in 1947 by The University of Illinois, Division of Services for Crippled Children, under a grant from the National Foundation for Infantile Paralysis. Procurable on loan or purchase from The University of Illinois, Division of Services for Crippled Children, 1105 South Sixth Street, Springfield.

The Acute Stage, reel I, 721 feet, showing time twenty minutes.

The nursing care of a patient in the acute stage of poliomyelitis is presented, showing the arrangement of the bed, the manner of giving hot packs, the use of pillows, sand bags, foot boards and other devices to be used in maintaining good posture in bed and the manner of changing the position of the patient when that is necessary. Other details shown are the use of the bed pan, the use of the aspirator for accumulation of mucus, special arrangements in cases of bulbar involvement and the feeding by way of a tube passed through the nose and esophagus. At times the technics become rather elaborate; nevertheless, the care with which every detail is demonstrated deserves commendation.

Treatment of Spasm, reel II, 786 feet, showing time twenty-one minutes.

Excellent illustrations of spastic activity in muscles are shown. Details of administering hot packs are demonstrated. There is an elaborate section on passive motion which is especially commendable for the painstaking detail, in which each part is exhibited. Finally, there are some views showing the use of the tub as a substitute for the hot packs.

Care of the Respirator Patient, reel III, 370 feet, showing time fifteen minutes.

This reel deals with the preparation of the respirator, the processes of introducing the patient into the respirator, the technic of using the bed pan and similar details of nursing care, the technic of catheterization and, finally, the preparations for storing the respirator. The need of testing the various parts of the respirator at regular intervals during storage to make sure that there will be no deterioration is emphasized.

The Convalescent Stage, reel IV, 379 feet, showing time eleven minutes.

This section of the film illustrates the manner of applying splints to prevent deformity, the use of a special type of pillow to permit the patient to read and work in the prone position, the use of the bed trapeze for exercise, the administration of underwater exercise in tanks, the use of balloons and bottles for respiratory exercises and the administration of various neuromuscular tests in order to assess the degree of recovery in the patient before dismissal. The closing scene shows a nurse giving instructions to the parent of a child being discharged from the hospital.

These four reels with emphasis on technic in the care of patients with poliomyelitis are well planned. They should be instructive to physicians, third and fourth year medical students, nurses and physical therapists, who may not always appreciate how elaborate the procedure must be if the patient is to have the best possible care and spared unnecessary suffering.

Photography is good to excellent.

Mother and Her Child. 16 mm., color, sound, 2,100 feet (1 reel), showing time fifty-eight minutes. Produced in 1947 for the Division of Child and Maternal Health, Department of National Health and Welfare by The National Film Board of Canada. Procurable on rental or purchase from National Film Board of Canada, 400 West Madison Street, Chicago 6.

This film is designed to show young women contemplating, or beginning pregnancy, the problems encountered in the nine months of pregnancy and in the first year of the life of the child. The problems are well chosen and their answers well given covering both obstetrics and pediatrics from the point of view of parents of a first baby. The fact that it is produced in Canada for Canadian audiences will not decrease its usefulness for United States audiences in any large degree.

There are a few weaknesses found in this production; however, they cannot be seriously criticized. In the film the father's ineptness is accepted goodnaturedly, though he could just as well be trained to be much more skilful in assisting in the care of the baby. The mixing of the orange juice with the cod liver oil is questionable, although it is successfully done in many instances.

This motion picture is well done and should be useful for showing to groups of prospective parents. Since it is rather long it might have been better to have made the film in two parts showing, first, the prenatal care and, in the second part, the delivery and the after-care of the newborn infant.

Generally speaking, the color quality of the motion picture is fair to good.

Surgery in Facial Cancer. 16 mm., color, silent, 425 feet, showing time seventeen minutes. Prepared 1936-1947 by Tibor de Cholnoky, M.D., Postgraduate Medical School and Hospital, Columbia University, New York. Procurable on loan from the author, 19 East 80th Street, New York.

This motion picture demonstrates 3 cases of recurrent facial cancer treated by electrosurgical excision, following which plastic reconstruction was carried out to correct operative defect. While the therapy of the malignant disease is well demonstrated, the results of the reconstructive procedure leave much to be desired in light of present day accepted standards. This motion picture should be of primary interest to those specializing in the radical cure of malignant disease. The photography and titles are fair to good.

The following 16 mm., color, silent, motion pictures were prepared in 1947 and are procurable on loan from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

Cervical Diverticulectomy (One Stage Operation). 530 feet, (2 reels), showing time twenty-two minutes.

This production shows the surgical technic of a one stage diverticulectomy for a large diverticulum of the cervical esophagus. The anatomy encountered in the approach to the diverticulum is well described and demonstrated, but the dissection of the neck of the diverticulum is not too clearly shown. The use of a Levin tube to locate the opening of the diverticulum and its use as a guide in closing the base to prevent a stricture is a good one. The surgical technic as a whole is commendable. The reproduced roentgenograms are not as clear or informative as they could be.

This motion picture can be recommended for surgeons who wish to review the surgery of cervical diverticulectomy and as a teaching film for medical students and house officers.

The color quality is good. There is evidence that the camera was hand held rather than supported by a tripod. There are sequences where the use of telephoto lens would have improved the film.

Total Colectomy with Ileoproctostomy for Megacolon (Hirschsprung's Disease). 760 feet, (2 reels), showing time twenty-three minutes.

The film depicts the surgical treatment of a spectacular case of congenital idiopathic dilatation of the colon. The anatomy encountered is well demonstrated, and the surgical technic as a whole is good. After division of the terminal ileum, it would have been better to cover the exposed ends of the bowel or close them before proceeding with the resection, in order to minimize contamination. The proximal end is closed with the Kerr-Parker technic after the entire colon has been freed. No attempt is made to reperitonealize the raw surface created by removal of the large bowel. An end to side ileoproctostomy may have been a better procedure than the side to side anastomosis, as complications sometime arise from the blind stump of small intestine.

The caption preceding the postoperative roentgenogram taken at nine weeks should be reedited. The roentgenogram shown does not justify the statement that the small bowel not only resembles large bowel but has assumed the position of the ascending, transverse and descending colon.

The film can be recommended for showing to groups of general surgeons, residents, interns and medical students. The photography is good; however, there is evidence that the camera is hand held rather than supported by a tripod. The field wanders on the screen, and the "panning" on the final scene of the surgical specimen is especially annoying. Color quality is excellent. The titles are clear.

Diagnosis. Danger. 16 mm., black and white, sound, 700 feet, (1 reel), showing time twenty-seven minutes. *Prepared by* Don C. Hawkins, Assistant Secretary, St. Paul Mercury Indemnity Company, with the cooperation of Malcolm T. MacEachern, Director, American College of Surgeons, Chicago. Produced in 1947 by the Chicago Film Studios, Chicago. Procurable on loan from: St. Paul Fire and Marine Insurance Company, 111 West Fifth Street, St. Paul 2.

This motion picture is designed to eliminate unsafe conditions occurring within the hospital. It shows the danger of inadequate equipment in the various departments of the hospital, such as slipping on wax floors, worn out electric cords, the serving of food on chipped dishes, hot water bottle burns, the dispensing and administration of incorrect drugs and many other similar hazards which may result in harm to the patients, visitors or personnel.

The production, somewhat overdone, is suitable for showing to hospital personnel but is not recommended for lay groups. The photography is good.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Practice Acts: Board May Revoke License Only on Substantial Evidence. — The defendant was licensed to practice medicine in Pennsylvania in 1910. He left the state in 1913 but returned to Pennsylvania in 1932 and continued the practice of medicine there until 1944, when the plaintiff, State Board of Education and Licensure, issued a citation against him alleging that he had obtained his medical license through fraud, misrepresentation and deception. The defendant filed a bill in equity to enjoin the board from proceeding with a hearing on such citation on the ground that it was without authority and that it was guilty of laches in permitting thirty-four years to elapse before the issuance of the citation. The court dismissed the bill, and on appeal to the Supreme Court the action of the court below was affirmed. Thereafter the board, following due hearing on the merits, revoked the defendant's license. This order of revocation was affirmed by the court of common pleas of Dauphin County; the defendant then appealed to the Supreme Court of Pennsylvania.

The defendant's license was issued pursuant to the act of May 18, 1893, as amended by the act of April 27, 1909. It is admitted that he received the degree of Doctor of Medicine from the Maryland Medical College on May 3, 1906, and that he successfully passed the appropriate medical examination given in 1910 by the Medical Council of Pennsylvania, the predecessor of the plaintiff board. The sole charge, said the Supreme Court, is that he presented fraudulent credentials to induce the Medical Council in 1910 to issue a license to him.

The plaintiff alleged that the fraud of the defendant in obtaining a license to practice in Pennsylvania consisted of (1) submitting to the Medical Council of Pennsylvania in support of his application for medical licensure a certificate of medical education which was not signed by the then Dean of the Maryland Medical College and (2) submitting to the Medical Council of Pennsylvania a sworn application for licensure to practice medicine which contained false statements that he had studied medicine four years and that he attended the University of Maryland during the year 1902-1903.

The defendant first argued that because thirty-four years elapsed between the granting of his license and the issuance of the citation in 1944, the doctrine of laches should prohibit the board from revoking his license. With this contention, said the Supreme Court, we cannot agree. Laches cannot be imputed by the mere passage of time, but must be determined from all the circumstances of the case. The Supreme Court of the United States has said: "But length of time necessarily obscures all human evidence; and as it thus removes from the parties all the immediate means to verify the nature of the original transactions, it operates by way of presumption, in favor of innocence, and against imputation of fraud." This rule, continued the Pennsylvania Supreme Court, is of particular significance in this case. One of the board's own witnesses testified that most of the academic records of the Maryland Medical College had been destroyed by fire prior to 1944. In addition, a letter, dated March 15, 1911, from W. S. Smith, M.D., the then Dean of the Maryland Medical College to Miss Mary M. McReynolds, clerk of the Medical Council of Pennsylvania, establishes that within eight months of the defendant's licensure an investigation was made of his credentials. As no action was then undertaken to revoke his medical license, the only reasonable deduction possible is that the credentials were found to be authentic and satisfactory at that time. Thirty-four years later we cannot reasonably expect verification of them with the same degree of certainty that was present then.

The defendant then contended that the evidence on which the board acted was legally insufficient. The Administrative Agency Law of Pennsylvania provides, among other things, that on appeal to the courts an agency's adjudication must be affirmed, unless "any finding of fact made by the agency and necessary to support its adjudication is not supported by substantial evidence." Substantial evidence, said the Supreme Court, is more than a mere scintilla; it means such relevant evidence as a reasonable mind might accept as adequate to support a conclusion; it must do more than create a suspicion of the existence of the fact to be established.

With this principle in mind, the Supreme Court continued, it is necessary to consider the evidence on which the plaintiff predicated its finding that the defendant committed fraud in submitting a "Certificate of Medical Education" which purported to be signed by the Dean of the Maryland Medical College. The certificate received by the Medical Council is dated June 2, 1910, and at the end thereof is signed in ink: "Maryland Medical College, C. B. Smith, Dean." The plaintiff's evidence tended to prove that one W. S. Smith was actually Dean in 1910. Even assuming that W. S. Smith was Dean, said the Supreme Court, the alleged fraud of the defendant was not established. If the signature "C. B. Smith, Dean" was not the name or the signature of the then Dean, there still remains the vital question, by whom and at whose direction was the incorrect signature affixed to the certificate? There was no evidence that the questioned document ever passed through the defendant's hands, but it was admitted by the plaintiff's witnesses that it could have been mailed directly from the Maryland Medical College at Baltimore to the Medical Council at Harrisburg. At most the evidence presented by the plaintiff might arouse suspicion, but, concluded the court, it is clearly insufficient to prove the allegation of fraud.

The next question considered was whether or not there was substantial evidence that the defendant committed fraud in submitting a sworn application for licensure which stated that he had studied medicine for four years and that he had attended the University of Maryland during the academic year 1902-1903. The printed catalogue of the School of Medicine of the University of Maryland for the season 1903-1904 does not mention the defendant as a member of the class of 1902-1903; that for the session 1904-1905 lists him as a member of the first year class in 1903-1904, and that for the year 1905-1906 lists him as a member of the second year class in 1904-1905. These catalogues, said the Supreme Court, were not offered in evidence, and no witness was presented to testify to their accuracy. They have little probative value, inasmuch as they were not official school records and the listing of the various students attending the sessions could be incorrect, because of, among other things, the carelessness of those preparing the catalogues for publication or errors of the printer. The plaintiff also offered two matriculation cards from the University of Maryland bearing the defendant's name. The one, dated Sept. 14, 1903, had several unfilled blanks, one of which followed the question "What Medical Courses have you taken and at what college?" The other card, dated Oct. 3, 1904, had, in answer to the same question: "One year University of Md." When the defendant received his degree of Doctor of Medicine from the Maryland Medical College in 1906, that school required a four year medical course for graduation and, therefore, it is a reasonable inference that when he was admitted to senior status in 1905 he established to the satisfaction of the school authorities the record of his first three years in other medical schools. We are convinced, said the Supreme Court, that this negative evidence is no proof that the defendant did not attend the University for the year 1902-1903, as he claims. At most, such evidence is but a mere scintilla, and is insufficient to overcome the presumption in favor of the defendant's innocence.

We have most carefully examined the entire record, said the Supreme Court, and have concluded that the weak and inconclusive evidence adduced by the plaintiff does not rebut the presumption of innocence and that the alleged fraud has not been proved. On the evidence presented, it would be grossly unjust to revoke the defendant's license to practice his chosen profession and thereby deprive him of his means of livelihood.

Accordingly the order of revocation entered by the State Board of Medical Education and Licensure was reversed and the board was directed to reinstate the license of the defendant to practice medicine in Pennsylvania.—*Pennsylvania State Board of Medical Education and Licensure v. Schireson, 61 A. (2d) 343 (Pa., 1948).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Hygiene, Baltimore

48:1-132 (July) 1948. **Partial Index**

Comparative Study of Tellurite Plating Media for Corynebacterium Diphtheriae. M. Frobisher Jr., Elizabeth I. Parsons, Elsie Lankford Yeates and Kathleen L. Gay.—p. 1.
Infection and Immunization of Laboratory Animals with Rickettsia Prowazekii of Reduced Pathogenicity, Strain E. F. P. Gallardo and J. P. Fox.—p. 6.
Trombiculid Mites Affecting Man. D. W. Jenkins.—p. 22.
Titration of Mumps Neutralizing Antibody in Chick Embryos. G. R. Leymaster and T. G. Ward.—p. 45.
Susceptibility of Mongoloids to Infection. M. Siegel.—p. 53.
In Vitro Action of Immune Serums on Cercariae of Schistosoma Mansoni. B. Papirmeister and F. B. Bang.—p. 74.
Immunization of Young Mice with Unmodified M M Mouse Encephalomyelitis Virus Under Passive Protection from Immune Mothers. F. J. Curley and J. E. Gordon.—p. 81.
Poliomyelitis in Uninoculated Rhesus Monkey, and in Orally Inoculated Monkeys, Receiving Desoxypyridoxine. D. Bodian.—p. 87.
Comparative Susceptibility of Cynomolgus and Other Monkey Species to Poliomyelitis Virus by Intracerebral and Oral Routes. J. L. Melnick and H. von Magnus.—p. 107.
*Tonsillectomy in Experimental Poliomyelitis. H. von Magnus and J. L. Melnick.—p. 113.
Factors Affecting Survival of Treponema Pallidum in Vitro. R. A. Nelson Jr.—p. 120.

Tonsillectomy in Experimental Poliomyelitis.—Von Magnus and Melnick demonstrated that after tonsillectomy cynomolgus monkeys are more susceptible to infection after being fed poliomyelitis virus than rhesus monkeys and African green monkeys. The incidence of poliomyelitis in tonsillectomized cynomolgus monkeys increased to 93 per cent (13 positive of 14 fed virus) from a control level of 13 per cent (2 of 15) for the nontonsillectomized cynomolgus groups. The incidence in the other tonsillectomized species of 8 per cent was no different from the incidence of 8 per cent in nontonsillectomized controls of these species. Two of 3 cynomolgus monkeys which contracted poliomyelitis were found to excrete virus with their stools the day before paralysis. Five nonparalyzed monkeys did not excrete virus in the four week observation period. Of 14 tonsillectomized monkeys which subsequently contracted poliomyelitis, only 2 had the bulbar form of the disease. Two other monkeys exhibited facial paralysis together with paralysis of the limbs.

American Journal of Psychiatry, New York

104:513-592 (March) 1948. **Partial Index**

Limitations of Psychiatry. A. Gregg.—p. 513.
The Myth of Psychopathic Personality. B. Karpman.—p. 523.
Neuropsychiatrist and Civil Law. H. L. Kozol.—p. 535.
New Facts on Prognosis in Mental Disease. R. H. Israel and N. A. Johnson.—p. 540.
What Happens to First Admissions to State Hospitals. H. Meyer and G. H. Preston.—p. 546.
Psychiatric Treatment of Veteran Outpatient. J. Hughes and B. E. McLaughlin.—p. 549.
Problems of Social Psychiatry in Palestine. K. Blumenthal.—p. 563.
Outpatient Treatment of Alcoholics. L. E. Wexberg.—p. 569.
Indications for Shock Treatment in Psychiatry. T. Braatoy.—p. 573.
*Acute Alcoholism in Mental Patients Treated with Insulin. S. J. Tillim. —p. 576.

Alcoholism in Mental Patients Treated with Insulin.—Tillim says that when alcoholic addicts are admitted to hospitals they either are intoxicated or present the after-effects thereof, involving psychic, nervous and nutritional disorders. Patients may exhibit psychic clouding to the point of delirium with delusions and hallucinations, nervousness displayed in tremor, ataxia and restlessness, and nutritional defects manifested by dehydration, refusal or inability to accept nourishment, and signs of avitaminosis. Therapeutic indications are for prompt induction of rest and sleep and measures to correct the nutritional deficiency. Insulin-induced hypoglycemic reactions are preeminently effective in providing the rest and sleep and conditioning the patient for the acceptance of nourishment without recourse to force or parenteral administration. Favorable results from the use of insulin in the medical treatment of alcoholism have been reported by others. The author presents 7 cases which provide additional evidence on the efficacy of insulin therapy. He concludes that this method is the quickest for restoration of normal mentation and physical health and more specific in purpose than any other method presently in vogue.

Laryngeal Chondronecrosis Following Roentgen Therapy.—Goodrich and Lenz say that chondronecrosis of the larynx after roentgen therapy for laryngeal cancer is precipitated by infection of cartilage. Laryngeal chondronecrosis following roentgen therapy for cancer of the larynx occurred in 28 of 205 patients treated at the Presbyterian Hospital, New York, between 1932 and 1946. Eight of the 28 have been found to be free of cancer. In most of the others, it was not possible to determine whether cancer persisted microscopically or whether one was dealing only with radionecrosis. In 23 of the 28 chondronecrosis appeared within six months, 2 within one year and 3 more than one year after treatment; the latter 3 recovered, 1 after sloughing, 1 after local removal of the necrotic portion of the epiglottis and 1 after laryngectomy. Laryngeal chondronecrosis occurred chiefly in advanced and extensive carcinomas and exceptionally in those which were early and small. Chondronecrosis involved the epiglottis more frequently than other laryngeal cartilages. When developing in its free portion prognosis was good, as nearly every cured case of epiglottic carcinoma showed a deformity of the healed radionecrotic area. Prognosis was poor when necrosis extended to the base of the epiglottis or the preepiglottic space. The outlook was also poor when the arytenoids or thyroid cartilages were involved. Laryngofissure or partial laryngectomy either before or after roentgen therapy seemed to favor the development of chondronecrosis in the remaining cartilage. The exception to this was the removal of the necrotic free portion of the epiglottis. Total removal of cartilage by laryngectomy avoided this complication. The use of penicillin and sulfonamide drugs seemed to help abort the threat of chondronecrosis, but was less effective when chondronecrosis had fully developed. Laryngectomy should be considered in selected cases with early or impending chondronecrosis.

Use of Radioactive Iodine (I^{131}).—According to Miller and his co-workers radioiodine is capable of spontaneously disintegrating and emitting radiation, either beta particles or beta particles and gamma rays. It is useful in therapy since this radiation may destroy the cells which absorb the iodine, and useful in tracer work since it allows one to follow the fate and metabolism of the iodine by observing the radiations emitted from it. There is no difference in the metabolism of radioactive and nonradioactive iodine. However, there are eleven different radioactive isotopes of iodine which differ enough in radiation action so that they might well be considered as different substances. This is true because the different isotopes have great differences in their half-lives and their radiations have different energies. This is well reflected in the case of I^{130} and I^{131}. The half-life of I^{130} is 12.6 hours and that of I^{131} is eight days. Therefore, I^{130} will act with great effect over a short time and I^{131} will act with less effect per unit time, but will act over a long time. This will make a great difference—as much as fifty times—in the dose administered to accomplish the same end. Radioiodine is useful in the treatment of Graves' disease in which the thyroid is not saturated with iodine. It is not useful in the therapy of Graves' disease in which the thyroid is saturated with iodine, nor is it useful in the treatment of thyroiditis, nontoxic goiter or involutionary nodules in the thyroid. It is occasionally useful in therapy of carcinoma. The studies described here were made in order to determine the uptake of radioiodine in microcuries in the human thyroid in situ after oral administration of I^{131}. From this an estimate of the energy dissipated within the thyroid can be made. The iodine solution is put into about 50 cc. of water, and the patient drinks the entire solution. The iodine is administered in the evening and measurements are made on the patients during the following two days during the daytime. Follow-up measurements are made at one and two week intervals. The patients are reevaluated clinically and with laboratory tests at the end of a month to determine their status and possible need for more treatment. The measurements are made with the Geiger counter. The authors stress the need of caution in the handling of radioactive materials, since all of them are dangerous.

Treatment of Neurosyphilis with Penicillin Alone. B. Dattner.—p. 399.

Diagnosis of Granuloma Inguinale.—According to Dienst and his collaborators the simplest and most reliable laboratory procedure for diagnosis of granuloma inguinale is to determine the presence of intramonocytic Donovan bodies in the tissue smear stained by Wright's stain. After directing attention to Anderson's report in 1943 on the cultivation of Donovan bodies in the yolk sac of the chick embryo, Dienst says that he and his collaborators have been successful in growing the organisms in fresh unincubated yolk medium. The Donovan bodies multiplied in yolk medium prepared from unfertile as well as from fertile eggs. The ability of the plain yolk medium to support the growth of Donovan bodies of a freshly isolated strain depended on a physical property of the medium. The author describes the preparation of the medium to cultivate Donovan bodies. Addition of a small percentage of agar to fresh yolk medium furnishes a factor essential for cultivation in vitro of recently isolated strains of Donovan bodies.

Results of Fenestration Surgery.—Juers and Shambaugh say that after a diagnosis of clinical otosclerosis has been made and routine hearing tests completed, they classify the case as to suitability into one of three groups. Cases are classified as belonging to a class A when there is satisfactory cochlear function as determined by bone conduction audiometry with no level for the 512, 1,024 or 2,048 frequencies below 30 decibels. The Rinne tests with the 256, 512 and 1,024 frequency forks are negative. The Schwabach tests for these forks show a normal or slightly prolonged time as compared to a normal ear. The air conduction curve may be fairly flat or have a slightly better threshold for the high than the low tones. In class B patients the bone conduction audiometric test will show the threshold for one level — usually 2,048 — to be below 30 decibels. The fork tests will be similar to those in class A except that with the 1,024 frequency fork air conduction may be equal to bone conduction and for 2,048 the Schwabach test will usually show a slightly greater degree of impairment. In class C cases the audiometric bone conduction threshold is below the 30 decibel level usually for two of the three speech frequencies. For the 1,024 frequency fork the Rinne reaction is as a rule positive. The Schwabach tests for the 1,024 and 2,048 frequencies are both definitely shortened. The air conduction curve almost always shows more loss for the high than for the low tones. The authors found that in class A patients a fenestration can produce in approximately 75 to 80 per cent of the cases what may be considered a stable level of hearing which is equal to or better than that obtainable by a hearing aid. If there is some associated nerve degeneration and the case comes within class B, the patient has a 40 to 60 per cent chance of attaining a good result, and a class C patient would have a 10 to 20 per cent chance. Class C patients and some class B patients who wear a hearing aid well should be advised not to consider surgical treatment. A two year follow-up indicates that the incidence of complete physiologic closure is 1.4 per cent in patients who at the time of their best hearing improvement had attained a level of 35 decibels or better.

Streptomycin in Rhinoscleroma.—New and his associates report the case of a woman, aged 32, who had been born in Siberia and reared in the Far East. Her chief complaint was bilateral nasal obstruction for fifteen years with hoarseness, a sense of constriction in her throat and slight difficulty in swallowing for one year. A diagnosis of rhinoscleroma had been made in 1938 in Shanghai, China. Treatment with autogenous vaccine apparently arrested the disease process except for a short period in 1941, when there was reactivation. On examination in 1946, both nostrils were found to be almost completely obstructed with granulomatous tissue. There was scarring of the pharynx, with a small opening into the nasopharynx. The posterior surface of the epiglottis and the left side of the larynx were involved with granulomatous masses, Tomographs of the larynx showed almost complete obstruction of the airway at the level of the glottis. Culture of the granulomatous material showed large numbers of Klebsiella. Since organisms of the Klebsiella group had been found sensitive to streptomycin, treatment with streptomycin was begun on Sept. 27, 1946. The patient received 250 mg. of streptomycin intramuscularly every three hours. After the first week the antibiotic was discontinued because of articular pains, a cutaneous rash, malaise and fever. After twelve days' rest it was possible to continue the administration of streptomycin for forty-three consecutive days, or until a total of 97.25 Gm. had been given. After 38 Gm. of streptomycin had been administered, the patient stated that there was only one third as much mucopurulent material and crusting in her nose as there had been before treatment. After 53 Gm. had been used, tomographs of the larynx showed a good airway. The results of culture of tissue removed from the nostrils were negative for Klebsiella. Approximately eight months after the cessation of treatment with streptomycin, examination of the larynx showed no evidence of the disease other than the residual scarring, and the results of culture of tissue removed from the larynx were negative for Klebsiella. This seems to be the first case of rhinoscleroma cured with streptomycin.

Lermoyez's Syndrome — An Allergic Disease. — Eagle directs attention to the fact that in Ménière's and Lermoyez's syndromes the same symptoms are encountered, but their appearance is in reverse order. In Ménière's syndrome the tinnitus and deafness follow a vertiginous attack and remain stationary or become progressively worse, while in Lermoyez's syndrome the tinnitus and deafness precede the vertigo and diminish or completely subside immediately after the vertigo becomes established. Lermoyez attributed his syndrome to a vasospasm of the internal auditory artery without any suggestion of an allergic origin. The author observed 11 patients who demonstrated the typical symptoms of Lermoyez's syndrome, but in each instance an allergic disturbance was found, generally that of urticaria (usually the giant type) sometime prior to the onset of symptoms. The syndrome is believed to be allergic in origin and urticaria probably the necessary etiologic factor. The author presents the histories of 3 of 11 patients with Lermoyez's syndrome observed by him. He emphasizes that in view of the excellent prognosis of Lermoyez's syndrome, compared to Ménière's syndrome, it is essential that Lermoyez's syndrome be recognized when it exists.

*Some Preliminary Observations on Clinical Course of Myasthenia Gravis Before and After Thymectomy. A. M. Harvey.—p. 505.
Influence of Disease on History. G. T. Pack and Frances R. Grant. —p. 523.

Myasthenia Gravis.—Harvey says that his analysis of 125 patients with myasthenia gravis suggests that if significant clinical remissions appear they tend to occur early in the course of the disease. Significant remissions which last for a long period of time appear to be unusual in patients who have received moderate or large amounts of neostigmine for more than six months. Sufficient data are not yet available to evaluate with finality the effect of thymectomy on the course of myasthenia gravis. Preliminary studies indicate that the beneficial results are greater than one might expect from spontaneous remission. This conclusion is further supported by the following: that most of the patients operated on had severe myasthenia, that there had been no tendency for the development of remissions preoperatively and that large doses of neostigmine had been administered in the preoperative period and had to be continued for many weeks after operation. It is not known what role the thymus plays in the pathogenesis of myasthenia gravis, but the author thinks that long term study of the effect of thymectomy early in the course of myasthenia gravis before prolonged therapy with neostigmine may reveal information of importance concerning the physiologic function of the thymus. The magnitude of this type of clinical experiment is evident when one realizes that spontaneous remission may occasionally last for fifteen years.

Chronic Relapsing Pancreatitis. — Gambill and his co-workers report on 27 patients, 19 men and 8 women, between the ages of 10 and 75 years, with chronic relapsing pancreatitis associated with disease of the biliary tract. Painful seizure was the most typical, violent and arresting manifestation of the disease. In 3 of the 27 cases pain was relatively mild, moderate in 1 case and severe in 23 cases. Pain occurred as infrequently as once every four years and as often as once daily or weekly. In 14 patients there was a progressive increase in the frequency of attacks. Painful seizures lasted for one hour to twenty-one days; the duration of pain for days, not for hours, is a characteristic that might point to pancreatitis. Nausea, vomiting and jaundice were associated with the painful seizures of pancreatitis. Most of the patients exhibited evidence of loss of weight. In 26 of the 27 cases one or more surgical procedures were carried out on the biliary tract. Cholecystectomy or cholecystectomy plus choledochostomy was followed by remission of painful attacks of one to eight years' duration in about one third of the cases and of four or more years in about one fifth of the cases, a percentage high enough to justify this approach. The problems of diagnosis of chronic relapsing pancreatitis are increased by the presence of associated disease of the biliary tract; awareness of the possibility of pancreatitis, familiarity with its clinical features, roentgenologic observations and tests of pancreatic function should lead to a correct diagnosis in a high percentage of cases. Comparison of the 27 cases of this series with 29 cases of chronic relapsing pancreatitis not associated with disease of the biliary tract showed that the anatomic and histopathologic features of the disease in the pancreas were essentially the same in the two series. Interstitial fibrosis and residual necrosis were rather constant observations. Cyst and abscess formation and deposition of calcium occurred in both. Alcohol becomes an etiologic suspect in both series. Treatment of chronic relapsing pancreatitis associated or unassociated with disease of the biliary tract is the same, except that there is need for surgical removal of the diseased gallbladder. Certain pathologic observations suggested that in chronic relapsing pancreatitis, disease of the biliary tract may be secondary to the disease of the pancreas.

Treatment of Nonspecific Ulcerative Colitis.—Maratka and Wagner treated 35 patients with nonspecific ulcerative colitis with autovaccine. Injections were given every three to five days in such a way that 0.1 cc. was injected intracutaneously and the rest subcutaneously. The dosage was determined and the injections spaced so as to avoid systemic focal and local reactions. Careful removal of the material from all the infectious foci and also directly from the lesion, serologic and immunologic examination of the pathologic nature of the cultured micro-organisms by autoagglutination and by skin tests, and preparation of the vaccine according to these findings, are of the greatest importance. Results showed that autovaccination is a valuable supportive measure in cases of mild and moderately severe ulcerative colitis in the stage of subchronic suppuration and of persisting ulcers when the general evolution is stationary or regressive. The treatment must not be started either during a violent attack or when the general condition is poor. In suitable cases autovaccine contributes to shortening of attacks and exerts an especially favorable influence on the character of the interval between them. It frequently helps to remove manifestations of persisting infection and thus changes the type of course from the chronic to the periodic. This can give the semblance of a clinical "cure." It may also be capable of preventing the transition of the disease process from a mild to a severe form. Autovaccination probably specifically combats or prevents secondary infection and sensitization.

Effect of Penicillin on Antistreptolysin Formation.—Kilbourne and Loge divided 127 cases of hemolytic streptococcic pharyngitis into three groups. One group served as an untreated control, one group was treated with large single doses of penicillin, and the third received virtually continuous penicillin therapy. Antibody response, as measured by the antistreptolysin titers, was studied in all patients. In the untreated group the proportion of patients exhibiting a rise was comparable to that usually seen in streptococcic pharyngitis and scarlet fever. The antistreptolysin response in the group treated with continuous penicillin therapy was of appreciably lower frequency and magnitude than that manifested by the untreated group. Patients who received intermittent treatment with penicillin manifested an incidence and degree of antibody response intermediate between that of the untreated and continuously treated groups. Analysis of cases in this study in which late complications developed reveals data in agreement with this past experience. In 5 patients definite evidences of late sequelae developed. Two had rheumatic fever, 1 severe arthralgia with elevated sedimentation rate, 1 had microscopic hematuria, and another prolonged fever of nineteen days' duration. In all 5 patients a rise in antistreptolysin titer developed. Three had been treated with intermittent high dosages of penicillin, while the 2 remaining cases were in the untreated group. No late sequelae have been observed in the group treated with sustained penicillin therapy.

Ungual Changes from Undercoats of Nail Polish.—Sulzberger and his co-workers say that a new nail disorder due to a nail polish "undercoat" has recently come to the attention of dermatologists. They believe it a conservative estimate that the actual number of cases extant at this writing is likely to be at least in the hundreds. The solution of phenol-formaldehyde resins and synthetic rubbers in methyl ethyl ketone which caused all the cases is of the type of formula common to several products, all of which have become available recently. The manufacturers of one brand estimate that one million women use their product each week. The authors report 12 cases due to this nail polish "undercoat" seen in their private practices between October 1947 and April 1948. The clinical features common to all cases, were: (1) a discoloration, varying from yellow through red-blue and magenta to brown and almost black, of the distal one to two thirds of every, or almost every, fingernail. This discoloration was diffuse but often also punctate; (2) separation, of variable degrees, of the distal nail from its bed; (3) a variable amount of dark, compact, apparently hyperkeratotic material under the nail; (4) a variable amount of change in the visible skin of the fingertip and perionychium, and (5) subjective symptoms, also of variable degree. The visible cutaneous changes, in general, were minimal and consisted of slight erythema, edema and scaling of the fingertip under the free edge of the nail of one or two fingers. One patient had severe involvement, including pustular paronychia, so that two fingernails were removed for relief. Further studies and additional cases indicate that the subjective symptoms can on occasion be practically absent, so that some patients are unaware of substantial subungual changes until they see them by chance at some time when the nail lacquer is removed. Different samples of the same brand of "undercoat" differ widely in their allergenic properties, so that some bottles may fail to evoke positive reactions to patch tests while others cause strong reactions in the same patient and at the same time.

Vaccination Against Influenza.—Loosli and his associates say that in the fall of 1946 a study was organized at the University of Chicago to test further the usefulness of vaccination for protection against influenza. Two thousand and twenty students were employed in the epidemiologic study. Seven hundred and ninety volunteers were vaccinated and 1,230 served as controls. The vaccination program was carried out over a period from Nov. 6 to Dec. 6, 1946. No more than 50 per cent of the population in a given house were vaccinated. A record was kept of each student and all respiratory illnesses were recorded. A sharp increase in the incidence of acute disease of the respiratory tract occurred among the student population during the first week in March 1947. The majority presented symptoms characteristic of mild influenza. No prophylactic effect was observed after vaccination with combined A and B influenza virus vaccines. The time between vaccination and the onset of the epidemic was probably not important in accounting for the lack of effect of the vaccines. Of most importance was the absence of a close antigenic relationship between the viruses in the vaccine and the strains causing the epidemic; this has been demonstrated by virus isolation and serologic studies. Failure to demonstrate the usefulness of vaccine during the 1947 epi- [illegible]mic should not be taken as a reflection on the vaccine or on [illegible]ous studies during which positive results were obtained. [illegible] made during the 1943 to 1945 epidemics established the [illegible] of vaccination against the disease caused by a virus strain [illegible], related to the strains in the vaccines. However, a com- [illegible]n of data concerning the value of vaccination during this [illegible] 1945 epidemics show clearly that a vaccine [illegible]otection during one epidemic does not insure [illegible] subsequent outbreaks. The efficiency of a [illegible] (1) on its ability to initiate an adequate [illegible] and (2) on a close antigenic relationship [illegible] components in the vaccine and those initiating [illegible]

[illegible] of Pancreatic Ducts on Serum [illegible]—[illegible] and his associates say that experiments of [illegible]dall have become the basis for the clinical use [illegible] test in the diagnosis of pancreatic disease. [illegible]opper and Sorter's results are correct, the serum [illegible] is deprived of its essential experimental confirmation. [illegible]rizing their studies, the authors conclude that serum [illegible]se is of both pancreatic and extrapancreatic origin. Its pan[illegible]eatic origin is proved by the following facts: (1) rise of serum [illegible]pase after ligation of the pancreatic ducts in all 21 dogs; (2) [illegible]crease of the serum lipase after total pancreatectomy, and (3) [illegible]mediate drop of the serum lipase to almost zero in five days [illegible]ter total pancreatectomy, when the level for serum lipase pre[illegible]ously has been raised by ligation of the ducts. The recurrence [illegible] serum lipase two to three weeks or longer after total pan[illegible]eatectomy proves that there is also an extrapancreatic source [illegible]r the enzyme. The liver is a possible source. The mechanism [illegible]hich leads to the rise of serum lipase is absorption of the enzyme into the blood stream after blocking of the flow of the pancreatic juice. When ligation of the ducts is followed by the production of a pancreatic fistula the elevated serum lipase drops to normal levels.

Spontaneous Rupture of Cerebral Ventricles.—Torkildsen describes 5 cases of spontaneous rupture of the cerebral ventricular system. In 4 cases the rupture resulted in the formation of a cyst occupying the interpeduncular space, extending below the tentorium and covering the quadrigeminal plate. In case 1 an aperture was seen in the posterior portion of the lateral ventricle near the midline. This seems to be the most common location, as far as one can judge by the literature. In cases 2 and 5 a rupture of the posterior wall of the third ventricle had taken place. In case 3 there was no postmortem examination. Case 4 differs from the others inasmuch as the rupture did not create a cyst below the tentorium. After the spontaneous rupture the cerebrospinal fluid filled the supratentorial subdural space on the left side, resulting in an accumulation of the cerebrospinal fluid causing cerebral compression. The anamnesis gives information about an episode that probably was related to the actual rupture of the ventricular wall in only 1 of the cases. Stenosis of the sylvian aqueduct is a common cause of spontaneous ventricular rupture, but slowly growing tumors may also play a part. The accompanying intracranial hypertension should be treated by ventriculocisternostomy.

Surgical Management of Metastatic Brain Abscess.—Rizzoli and his co-workers have collected 10 cases of cured metastatic brain abscess. One of these patients died two years later of multiple abscesses elsewhere in the body, but there was no evidence of an intracerebral infection. In 7 of the 10 cases the abscesses were thoracogenic; 2 patients had had tonsillitis. The remaining patient had an abscess of the thigh at the beginning of his illness, but when cerebral symptoms developed, the roentgenogram also showed pneumonitis of the left lung. He was found on postmortem examination to have multiple bilateral chronic abscesses of the lungs. The authors stress that with the onset of cerebral symptoms, vigorous chemotherapy should be instituted, including intrathecal administration of penicillin (5,000 to 10,000 units) every two days and systemic use of penicillin. In addition, sulfadiazine should be administered. Streptomycin may be used if indicated. The patient must be watched and given supportive therapy, including blood, plasma, oxygen, and anticonvulsants if necessary. The primary focus should be treated conservatively but adequately to prevent further debilitation. Intracranial surgical treatment should not be considered for at least ten days after the onset of the cerebral symptoms. When the rate of improvement decreases, the abscess should be tapped through a trephine opening, the pus aspirated with a ventricular needle and penicillin (25,000 to 60,000 units) instilled into the abscess cavity. If the responsible organism is more sensitive to streptomycin, this should be used instead. Occasional patients will be cured by tapping only. They should not be discharged as cured unless this is confirmed by an air study. Removal of the abscess through a craniectomy wound is probably a safer procedure than removal through an osteoplastic bone flap. However, the latter method can be used successfully, if care is taken to preserve the blood supply of the dural flap and the bone flap. The abscess can be aspirated while the enucleation is being done if this is necessary to reduce its bulk. Intramuscular penicillin therapy should be continued for at least three weeks postoperatively. Sulfadiazine may be administered during this peroid of treatment, especially if contamination occurs at operation. The pessimism with which metastatic brain abscess has been viewed in the past is no longer justified.

Streptomycin in Infantile Diarrhea.—In a severe epidemic of infantile diarrhea in 1945 and subsequently, Goettsch and her co-workers found that bacteriologic cultures of the nasopharynx and the catheterized urine showed a predominance of gram-negative organisms of the colon group. Stool cultures were negative. Since the currently used measures were not entirely satisfactory, the authors began to use streptomycin. The effective dose for infantile diarrhea was found to be 0.5 Gm. intramuscularly and 0.5 Gm. orally per day for seven to ten days. The response of seriously ill infants with parenteral diarrhea to streptomycin was dramatic, presumably because of the specific action of the drug against the gram-negative organisms. Suggestions are offered for fluid and electrolyte replacement by means of an oral mixture of "amigen," which permits the introduction of potassium, calcium and nitrogen as well as sodium and chloride by mouth shortly after admission. The use of streptomycin and the oral mixture of "amigen" as an adjunct to the customary routine employed in previous years effectively shortened the hospital stay, decreased the amount of intravenous therapy and reduced the mortality. During the eight month period of observation no deaths were encountered which could be attributed to diarrhea.

Streptococcic Vaginitis in Children.—Boisvert and Walcher say that their attention was first focused on the probable relationship between hemolytic streptococci and vaginitis in children when in 1939 a 21 month old baby was examined because of vaginal discharge. A stained smear of the discharge showed gram-negative diplococci which suggested the diagnosis of gonococcic vaginitis. On culture, a pure growth of hemolytic streptococci was obtained. No gonococcus colonies were present. This study is based on the cultures taken on 286 patients seen on a pediatric inpatient service from 1928 through 1945 and in a pediatric clinic from 1935 through 1945. Five hundred and twenty-four vaginal cultures were examined. There were 37 patients with hemolytic streptococci, 33 with gonococci and 11 with pneumococci. Nasopharyngeal cultures were obtained on 30 of the 37 patients with hemolytic streptococcus vaginitis. The 3 case histories which are presented indicate great variability. The authors stress that the value of culturing all vaginal discharges cannot be overemphasized. Vaginitis due to hemolytic streptococci has been misdiagnosed as gonococcic vaginitis when only a direct smear of the discharge has been utilized for diagnostic purposes. Hemolytic streptococci are frequently found in the nasopharynx of those children with vaginitis due to hemolytic streptococci. In those instances in which grouping and typing of the streptococci from both the vagina and the nasopharynx were done, the same group and the same type were found in both places.

Interdigital Burn Contractures of Hand.—Severe burns of the hand frequently produce contractures of the dorsal aspect of the interdigital webs, characterized by the crescentic fold overlying the web proper. Tanzer explains a method of repair that was introduced in an army plastic center and has since been used with gratifying results. Illustrations show the method of replacement of an interdigital contracture by a rotated pedicle flap from the side of an adjacent finger, combined with a free graft. Photographs show the preoperative status and the condition of the hands two years after the operation.

New Machine for Obtaining Skin Grafts.—Barker points out that Padgett's dermatome advanced the taking of skin grafts tremendously, but it still has certain disadvantages. He describes a new machine which utilizes the principle of a suction cup with a knife attached. The knife can be set at variable distances. During the past nine months this device, the "vacutome," has been used on numerous patients with excellent results. Early it became apparent that unless guides were added a graft of uniform width could not be obtained. The author describes the technic of the "vacutome" and the clinical results obtained with it. He admits that a disadvantage of the technic is that one cannot obtain a graft with the "vacutome" from a thin depressed abdomen. Likewise in a thin and wasted person decided contour changes in the rib area would present a difficulty. Grafts of varying thickness can be taken from nearly all areas of the body. Uniform grafts can be cut from 4 to 15 inches (10.2 to 38 cm.) long, the length being determined by the skin area available. Skin guards prevent gouging of the skin beyond the desired area.

Surgical Treatment of Coarctation of Aorta. O. T. Clagett.—p. 359.

Clinical Features of Coarctation of Aorta.—Christensen and Hines say that adequate records for evaluation were available in 96 of the 119 patients with coarctation of the aorta observed at the Mayo Clinic between 1925 and 1947. The ages of the patients at the time that the diagnosis was first made varied between 4 and 59 years. Although in general surgeons prefer to operate on patients with this disorder prior to their twentieth birthday, only 26 per cent of this group were below that age. Nearly two thirds of the patients, however, were seen prior to the age of 30 years. The untimely deaths in young persons with coarctation may well explain the sharp drop in the age incidence after the third decade. Important features in the diagnosis of coarctation of the aorta are: (1) characteristic *differences in the arterial pulsations and in indirect blood* pressure in the upper and lower extremities; (2) the presence of one or more cardiac or cardiovascular murmurs; (3) the presence of a well developed collateral arterial system that by-passes the coarctation; (4) characteristic erosions seen as "rib notching" on roentgenograms and (5) characteristic direct intra-arterial radial and femoral arterial pulsations and blood pressure differences. The authors discuss the incidence of these *and other diagnostic* signs.

Treatment of Acute Thoracic Empyema.—Brown and Moxon report 2 cases representative of that group of thoracic empyemas which will be cured by repeated thoracenteses with aspiration of pus and instillation of penicillin. In these cases clinical response is dramatically rapid. A 13 or 15 gage needle is used for thoracentesis in order that thick pus may be aspirated without difficulty. Saline irrigations facilitate this. Large doses of penicillin (200,000 to 600,000 units) are instilled at the completion of drainage and irrigation. Penicillin is administered intramuscularly in more conservative dosage of 50,000 units every three hours, and discontinued from four to seven days after the last thoracentesis. At first thoracenteses are performed daily, but as the fluid decreases and becomes negative in culture, the interval between taps is lengthened. The authors present 4 additional cases which illustrate the limitations of the nonsurgical treatment of thoracic empyema. These cases were transferred to their hospital after inadequate treatment elsewhere. Three of the 4 patients were admitted with large, sterile, undrained empyema cavities following eight to sixteen weeks of nonoperative treatment. In view of the strands and clumps of fibrin found at operation and the prompt healing which followed evacuation, the *authors* feel that their operative procedure was justified. If a thoracic empyema does not respond favorably to conservative treatment of one or two weeks' duration surgical intervention is indicated. This can take the form of intercostal drainage, *thoracostomy* with rib resection or decortication. The authors describe a simple method for maintaining relatively high degrees of suction on the empyema cavity in the ambulatory patient.

Controlled Respiration and Curare.—Controlled respiration developed as the result of thoracic surgery and curare as an adjunct in abdominal surgery. Today they are used together in both types of operation, though the reasons for their use differ somewhat in the two cases. Controlled respiration is a form of anesthesia in which a state of apnea is produced and the respiratory exchanges are maintained by periodic inflation of the lungs throughout the duration of anesthesia. In thoracic surgery its use prevents mediastinal "flap" and paradoxic respiration, two of the major hazards of open thorax surgery. It maintains respiratory exchanges in the presence of an open thorax. Controlled respiration possesses advantages over voluntary respiration in thoracic surgery and should be employed during abdominal surgery whenever respiratory depression occurs. By its use normal exchange of oxygen and carbon dioxide is possible in all circumstances. By producing muscular relaxation and abolishing reflexes curare allows the use of light anesthesia and therefore aids in the avoidance of shock. In abdominal surgery, light anesthesia combined with the use of curare and controlled respiration produced minimum disturbance in the patient compatible with adequate muscular relaxation. In thoracic surgery curare controls bronchial reflexes and with controlled respiration gives the most satisfactory conditions for surgery. The use of controlled respiration and of curare demands a high degree of anesthetic skill.

Nerve Anastomosis in Facial Paralysis.—Trumble employed anastomosis of hypoglossal and facial nerve in 18 patients with facial paralysis and in 2 with clonic facial spasm. The twelfth nerve was selected as the donor nerve because of the close relationship between the muscles of the tongue and those of facial expression. Recovery of tone and voluntary power was satisfactory in 18 patients, unsatisfactory in 1. One patient has not been reviewed. Recovery was satisfactory in 2 cases in which there was a delay of nine and a half months between the date of onset of facial paralysis and that of the reparative operation, and also in one other in which the delay was twenty-six months. These observations demonstrate that degeneration of muscle fibers and end plates is not of such importance as is generally believed.

Streptomycin Dermatitis in Nurses.—Crofton and Foreman observed that during a period of eighteen months 4 of a total of 80 nurses handling streptomycin at a London hospital had dermatitis. The exposure of these nurses varied from six weeks to six months. The dermatitis consisted of an itchy papular erythema of the skin around the eyes and over the elbow flexures. The hands were involved in only 1 of the nurses. Tests of cutaneous sensitivity elicited positive reactions in the 4 nurses with dermatitis, but negative in controls. The authors stress that persons handling streptomycin should wear rubber gloves and avoid soiling their skin with the material.

Blood and Bone Marrow in Sprue.—Peripheral blood findings in a series of 63 cases of the sprue syndrome are reported in detail. The series consisted of 17 cases of tropical sprue, 27 cases of nontropical sprue and 19 cases of celiac disease. The characteristic picture in the adult cases was macrocytosis of the erythrocytes, with or without anemia, both macrocytosis and anemia being more severe in the nontropical than in the tropical group. There is a tendency for this macrocytosis to persist in spite of liver therapy. The cases of celiac disease showed a high incidence of anemia which was of the hypochromic microcytic variety and which was extremely resistant to iron therapy. The marrow picture is described in 18 of the adult cases. It was megaloblastic in 9 cases (in 2 of which liver therapy had previously been used), normoblastic in 5 cases and "intermediate" in 4 cases. The marrow was found to be normoblastic in both of the cases of celiac disease in which it was examined.

Intrauterine Penicillin.—The cases reported by Kriseman include 7 of incomplete abortion, 1 case of septic abortion, 2 cases of local uterine puerperal infection and 1 case of functional uterine bleeding. The effect of intrauterine instillation of penicillin was observed in these cases. Two methods of instillation were adopted, the continuous and the intermittent. The author gained the impression that penicillin when instilled into the uterine cavity is capable of being absorbed into the general circulation and thus must exert an adequate local concentration in the uterine wall and in the channels draining the organ; namely, the lymphatics and pelvic veins. The best method of injection is by intermittent instillation. An effective dose is 200,000 units of penicillin in 5 cc. of isotonic sodium chloride solution or distilled water injected at intervals of three hours.

Gamma Globulin for Measles.—Hartley and his associates of the British Committee on Blood Transfusion Research say that the American Committee put at their disposal normal human serum gamma globulin antibodies prepared according to the technic of Cohn. Although tests with this material were carried out in different environments, the committee kept the trials under personal supervision. The following conclusions are stated: 1. Gamma globulin prepared by Cohn's method contains measles antibodies in high concentration. 2. The volume of gamma globulin required for the prevention and attenuation of measles is about half the volume of convalescent measles serum required. 3. Though superior in action to convalescent measles serum, gamma globulin in the doses used in these trials did not give full protection in all cases. Some degree of attenuation was obtained in almost all cases. 4. Though the potency of solutions of gamma globulin cannot be quantitatively estimated, the samples examined nearly two years after their preparation showed high protective and attenuating properties, differing but little from others which had been in circulation for a shorter time. 5. No local or general reactions followed the injection of gamma globulin.

Nylon Darn for Repair of Hernia.—Moloney and his co-workers have used nylon as a darning material to repair hernias, particularly direct and indirect inguinal hernias, both simple and strangulated. They list the requirements of a lattice that is used to reinforce a weak area and show that nylon meets those requirements. They describe and illustrate the technic of the nylon darn and say that it has given satisfaction, especially in strangulated hernia.

*Atelectasis During Collapse Therapy for Pulmonary Tuberculosis: Preliminary Note. J. Cuthbert and M. M. Nagley.—p. 154.
Work Done by Tuberculosis Patients. W. D. Gray.—p. 160.

Atelectasis During Collapse Therapy.—Cuthbert and Nagley have taken atelectasis to mean a ground glass appearance of a lung, a lobe or part of a lobe occurring during collapse therapy and accompanied by clinical manifestations such as rise of temperature, leukocytosis and malaise. This, they feel, is the condition—be it airlessness or not—that is commonly called "atelectasis." Cuthbert, impressed with the finding that the figures given for tuberculous tracheobronchitis in pulmonary tuberculosis would not account as a causative factor for the large number of "opaque lobes" seen in routine sanatorium work, proceeded to turn his attention to the more peripheral bronchial tree and to the bronchus draining the cavity. Postmortem studies on 26 patients revealed that the draining bronchus or bronchi were involved in 21. The usual changes were: swelling, edema and hyperemia of the mucosa and tenacious secretion in the lumen. Microscopically, tuberculous foci are present in the larger draining bronchi, between the epithelium and the cartilage, with no surface erosion at first. Later, deciliation of the bronchial mucosa, formation of granulation tissue with resultant irregularity of the lumen and, in a minority of cases, development of caseous bronchitis or partial fibrous stenosis take place. Nagley was interested in the selective, and often lobular, distribution of atelectasis occurring after artificial pneumothorax induction and carried out bronchoscopies and bronchograms on many patients without being able to demonstrate major bronchial disease. He was of the opinion that atelectasis of this nature was due to factors other than, or in addition to, disease of the major bronchi and almost certainly the etiology lay peripheral to these structures and probably in the small foci of radiologically visible tuberculous parenchymatous inflammation so often seen on the straight roentgenogram. Microscopic studies corroborated this. The authors consider the advisability of the abandonment of artificial pneumothorax when atelectasis of a lobe occurs. They regard a cavity in such an atelectatic lobe as dangerous if collapse is maintained, but this has not been fully proved. The described pathologic changes and their sequels seem to militate against the induction of artificial pneumothorax in the presence of roentgenologic signs of patches of tuberculous pneumonitis.

*Detection of Tuberculosis by Systematic Examination of Groups: Comparison of Results Obtained by Roentgenoscopy and Roentgenography. Mrs. Olbrechts-Tyteca.—p. 172.

Detection of Tuberculosis by Roentgenoscopy and Roentgenography.—Olbrechts-Tyteca says that systematic roentgenologic examination of groups was introduced by the antituberculosis dispensaries in 1935. The group examinations were made particularly in schools. Two forms of examinations were employed, roentgenoscopy and roentgenography. Roentgenoscopy, performed on 45,428 persons, and roentgen photography, performed on 70,357 persons, have revealed an incidence of tuberculosis that was five times higher in the first than in the second group. The superiority of roentgenoscopy over roentgenography was demonstrated again when the material was subdivided according to different types of groups examined and according to age and sex. Nearly two thirds of the patients detected by roentgenologic examinations of groups were not known to be tuberculous before. These persons would probably not have been recognized as tuberculous without the systematic group examinations, as there was no tuberculosis in the families and they did not have symptoms.

Treatment with Nitrogen Mustards in Lymphogranulomatosis Maligna, Polycythemia and Myelomatosis.—Iversen and Kjerulf-Jensen report on 21 cases of disease treated with a total of one hundred and thirty-eight injections. In most of the 9 cases of lymphogranulomatosis maligna, all verified by biopsy, the immediate effect was excellent. The treatment, however, can hardly induce more effective and more lasting remissions than roentgen treatment, but in patients with the disease in the roentgen-resistant form but sensitive to nitrogen mustards the treatment will be a valuable supplement to roentgen treatment and it will also be indicated in cases with disseminated foci. Treatment attempted in 3 cases of advanced sarcomatosis gave brief improvement in the general condition in 1 case. In polycythemia and myelomatosis the preliminary results surpass results published in America; in the 3 cases of typical grave myelomatosis, verified by biopsy and observed for five to eight months, reduction of pain and simultaneous improvement in the general condition resulted and 2 of the patients were able to return to work, while in the 6 cases of polycythemia, observed for up to seven months, there was immediate subjective improvement followed by decrease in the erythrocyte values and hemoglobin percentage and improved general condition.

*Malarial Amaurosis: Case of Malarial Optic Neuritis. A. Pozzi and C. Iandolo.—p. 481.
*Multiple Sclerosis. G. Cerquetelli and C. Cantalano Nobili.—p. 486.

Malarial Amaurosis.—A woman 44 years of age presented a rapidly progressive loss of vision with complete amaurosis within six days. The first tertian malarial attack occurred two days after occurrence of amaurosis. Plasmodium vivax was found in the blood. The malaria was benign and controlled by quinine treatment. The visual condition progressed to bilateral optic atrophy. The case demonstrates possibility of early involvement of the optic tract by P. vivax.

Multiple Sclerosis.—Cerquetelli and Nobili report 3 cases of multiple sclerosis in patients who were seen in the course of the last two years at the Clinica delle Malattie Nervose e Mentali dell' Universita di Roma. The authors believe that the main causative factor in multiple sclerosis is the arteriolar spasm, which is reversible early in the course of the disease by the effect of histamine. The authors report good results from intravenous injections of 0.25 mg. of histamine for seven to fifteen consecutive days during the early period of the disease. The good results have persisted up to the present (between one and two years after discontinuation of treatment). The treatment is harmless and should be resorted to as soon as possible, even if there is still slight doubt as to the diagnosis. In the cases reported by the authors visual symptoms predominated. The aforementioned doses showed favorable effect on the arteriolar retinal spasm.

*Blood Accidents in Course of Treatment with Streptomycin. E. Benhamou and R. Destaing.—p. 517.

Preoperative Management, Resuscitation Carried out During Operation and Treatment of Postoperative Disorders Based on Data Obtained by Phillips and Van Slyke's Method. M. Roux and M. Bucaille. —p. 518.

New Progress in Treatment of Visceral Leishmaniasis. P. Giraud, R. Bernard, R. and Liliane Guerrini-Pélissier.—p. 519.

Untoward Blood Reactions to Streptomycin.—Benhamou and his co-workers treated a child aged 11 with Pott's disease of eight months' duration, who presented meningeal symptoms, with 2 Gm. streptomycin daily by the intramuscular route. The general condition of the child improved, but a generalized purpura appeared on the thirtieth day of treatment with streptomycin. Sternal puncture revealed a considerable number of nonnucleated myelocytes. Penicillin in large doses and blood transfusions did not prevent death, which occurred within forty-eight hours. A child aged 3 with tuberculous meningitis was treated with streptomycin for nine months and was still receiving 0.50 Gm. of the drug daily by intramuscular route. Petechiae were observed at the level of the eyelids after each lumbar puncture. The white blood count revealed 18 per cent polymorphonuclear neutrophils. The petechiae disappeared and the number of the granulocytes increased to 40 per cent after the patient has been given 10 mg. of folic acid daily. Eosinophilia with a ratio of 12 to 36 per cent was observed in 17 of 21 patients treated with streptomycin for five to nine months. It reached its maximum about the third or fourth month of the treatment and subsided four to six weeks after treatment was discontinued. Counts of red and white blood corpuscles and of blood platelets should be repeated frequently in the course of prolonged treatment with streptomycin. Leukopenia and granulopenia should be considered as warning signs; the dose of the drug should be reduced and combined with 10 to 20 mg. of folic acid per day. The occurrence of purpura, abnormal bleeding or unusual pallor is suggestive of an agranulocytic syndrome which may be associated with a myelocytic marrow of the Rohr type. Streptomycin should be discontinued and treatment with transfusions, penicillin and folic acid substituted. Eosinophilia does not suggest an unfavorable prognosis.

Quantitative Determination of Carbon Monoxide in Air. B. Souček. —p. 743.

Blood Cholesterol in Hypophysio-Diencephalic Disorders. H. Zondek, H. Leszinsky and Gerda Wolfsohn.—p. 746.

Nitrogen Mustards in Hodgkin's Disease and Leukemia.—Alder treated 8 patients with Hodgkin's disease and 2 with chronic myeloid leukemia. He preferred the direct injection to the infusion with sodium chloride and dextrose solution. He draws the desired quantity of the nitrogen mustard into a syringe of 20 cc. capacity and then draws up as much blood as possible. The mixture is then injected. Signs of irritation and painfulness of the veins were rare. A total of 50 to 60 mg. was given in the course of one series of treatments. The results obtained can be compared with those of roentgen irradiation, but the treatment with nitrogen mustard has the advantage that not only the irradiated but all lymph nodes are influenced. The temperature usually decreases to normal in eight to ten days after the onset of treatment. The leukocyte count of the blood rapidly decreases, but the leukopenia was never sufficiently severe to necessitate interruption of the treatment. Lymphocyte and granulocytes also show a decrease. Reduction in the size of the lymph nodes becomes evident in about a week. Recent enlargements decrease after three or four injections, but old ones with fibrotic and necrotic changes remain uninfluenced. The author is convinced that nitrogen mustard is a valuable addition to the therapeutic armamentarium.

Semaine des Hôpitaux de Paris

24:1937-1978 (Aug. 10) 1948. Partial Index

*Bilateral Resection of Certain Prefrontal Cortical Areas (Topectomy). J. Le Beau.—p. 1937.

*Treatment of Anxiety States by Topectomy. J. Le Beau, M. Bouvet and M. Feld.—p. 1942.

*Treatment of Irreducible Pain by Topectomy. J. Le Beau, M. Bouvet and M. Rosier.—p. 1946.

Bilateral Resection of Certain Cortical Areas.—Le Beau treated 10 patients with anxiety states and 10 patients with irreducible pain by bilateral fractional resection of cortical areas. "Topectomy," a term coined in the United States for this operation, was practiced first by Pool in New York in 1947. Satisfactory results were obtained in these 2 series of patients by excision of Brodman's areas 9 and 10 and occasionally of area 46. Not more than 13 to 14 Gm. of substance should be excised. The areas 9 and 10 are connected with the medial thalamic nuclei, and area 9 is also connected with the nuclei of the septum of the preoptic region. The most important region is that of the junction of areas 9 and 10; a mechanism may therefore be considered in which the thalamic projection fibers act as intermediaries. Compared with frontal leukotomy, topectomy seems to have the advantages of avoiding deleterious alterations of personality and of intellect. There was much less disturbance of sphincter control than after lobotomy. The ablation of areas 9 and 10 seems to exert an elective action in reducing anxiety.

Topectomy for Anxiety States.—Le Beau and his co-workers treated 10 patients—5 adults, 4 men and 1 woman, between the ages of 25 and 48, and 5 children between 5 and 12 years, who had mental disturbances of anxiety type, by bilateral resection of area 9 and occasionally of area 10. Pool's operative principles were applied. All 10 patients operated on suffered from anxiety associated with brain lesions such as tumor, abscess, encephalitis and epilepsy. The results obtained were satisfactory except for the adult epileptics. The restlessness was allayed in all patients; aggressiveness was neutralized or attenuated. The intelligence was not reduced in any of the patients; the intervention was even followed by a pronounced progress of the intellectual development in one of the children with epilepsy. Not only did the restlessness subside, but the epileptic attacks failed to recur after the topectomy in children. The longest follow-up did not exceed fifteen months, so that the results must still await the test of time.

Treatment of Intractable Pain.—Le Beau and his co-workers treated 10 patients, 7 women and 3 men between the ages of 28 and 67 with facial and perineal neuralgias, by topectomy. In 5 of the patients the pain was definitely organic; 3 patients had anesthesia dolorosa, and 2 presented a chronic neuralgic condition with hypochondriac tendencies. The pain subsided in 9 patients; 1 patient continued to complain about pain, but no longer asked for morphine. The follow-up varied from two weeks to ten months. Topectomy practiced at the level of areas 9 and 10 did not cause any alterations of intellect or personality. It may be preferred to bilateral frontal leukotomy in surgery for intractable pain.

Book Notices

Treatise on Surgical Infections. By Frank Lamont Meleney, M.D., Associate Professor of Clinical Surgery, College of Physicians and Surgeons, Columbia University, New York. Oxford Medical Publications. Cloth. Price, $12. Pp. 713, with illustrations. Oxford University Press, 114 Fifth Ave., New York 11, 1948.

In addition to containing a digest of hundreds of contributions on surgical infections, this book is richly augmented by twenty years' experience of the author, who has been the foremost pioneer in surgical bacteriology in this country. One of the greatest attributes of the book is the excellent manner of presenting historical and fundamental data in a chronologic and practical way. The history of hospital gangrene from the Civil War days up to its conquest by a combination of chemotherapy and surgery is an example of masterful presentation which will give the young surgeon a thorough knowledge and background of these subjects.

The sources of operative wound contamination with proper emphasis on the throat and nose of operating room personnel are effectively presented. It is significant that after years of experience in surgical asepsis the author feels that preparation of the skin for operation, by soap, water, alcohol and ether, is not sufficient, but should be followed by application of 3½ per cent tincture, or an aqueous solution, of iodine. The splendid discussion of the various methods of sterilization with special emphasis on steam and the autoclave should be of great benefit to all operating room supervisors. Details of sterilization of air by the ultraviolet ray in the operating room are given. The author is apparently moderately in favor of this aid in prophylaxis of infection. Antisepsis and disinfection are adequately discussed by Dr. E. J. Pulaski, along with a complete description of the various agents used.

The various factors in operating technic, including gentleness, use of silk instead of surgical gut, proper ligation of vessels, are discussed in a splendid fashion. The results of the various teams appointed by the National Research Council to study infections and chemotherapy are presented; the most important data revealed that local application of sulfonamide drugs is ineffective in preventing development, but is effective in reducing the systemic effects, particularly the mortality rate. The two chapters containing 160 pages contributed by Balbina Johnson on the morphology and cultural characteristics of bacteria and methods for bacterial cultivation are excellent indeed.

Bacterial entrance into the human body and methods of spread are clearly described. The same can be said about bacterial synergism and bacterial antagonism. Appropriately, nearly 60 pages are devoted to a discussion of the various defenses or immunologic mechanisms; this is clearly written and should be readily understandable by recent medical graduates, which cannot be said of all discussions on immunity.

The first disappointment encountered was the 30 pages spent on a discussion of bacteriophage. If this book had been published before penicillin and the sulfonamide compounds were introduced that amount of space for this subject might have appeared justifiable.

The most serious defect in the entire book is found in the last chapter, which deals with antibiotic therapy in surgical infections, and contains only 40 pages, 28 of which are consumed by detailed case reports of the beneficial action of penicillin. Every physician has a variable number of cases representing triumphs of penicillin over previous methods of therapy including chemotherapy with sulfonamide drugs, but has a relatively poor conception as to the relative effectiveness in various conditions such as osteomyelitis, peritonitis, pylephlebitis, cholangitis and the numerous infections discussed in the case reports. It would have been much more informative if this space had been devoted to a discussion of results in various types of infection as influenced by various types of organism, stage of disease, etc. Such a summary is presented but consumes only one and a half pages; obviously, only gross facts now well known to all graduates of medical schools could be presented in this limited space. In this chapter on clinical discussion slightly less than two pages are devoted to streptomycin. The clinical discussion on bacitracin (a drug representing one of the many fine contributions by the author) is justifiably short, since this drug is not yet available to the medical public, although preliminary data on its effectiveness are encouraging.

Diagnostic et traitement des maladies de la colonne vertébrale. Par Jean Saidman. In two volumes. Cloth. Price, 4,750 francs. Pp. 1244, with 1324 illustrations. G. Doin and C^{ie}, 8 Place de l'Odéon, Paris 6^{e}, 1948.

In these two volumes of 1,244 pages the author has tried to present a comprehensive work on diseases of the vertebral column encompassing clinical examination and roentgen technic, interpretation and treatment. It is apparent that a vast amount of clinical material has been combed to present what is in effect an excellent radiologic treatise. If one were to evaluate the book as such it could be considered a most comprehensive and well illustrated work on the subject. Its value from this standpoint is enhanced by the clinical introduction to each chapter and the brief discussion of treatment. However, the orthopedic surgeon and student will find it notably deficient as to therapeutic procedures. This phase is covered in a brief and cursory manner. The illustrations are almost entirely devoted to roentgenograms and outline drawings illustrative of the roentgenographic pathologic changes. The author leans rather heavily toward physical therapy as the chief modality of treatment. Discussion of the orthopedic management falls far short of the mark both as to presentation and coverage of accepted principles as practiced in this country.

Altogether, this is an excellent book for the radiologist and for the orthopedic surgeon interested in a fine presentation of the roentgenographic aspects of vertebral disease.

Handbook of Psychiatry. By Winfred Overholser, A.B., M.D., Sc.D., Superintendent, Saint Elizabeths Hospital, Washington, D. C., and Winifred V. Richmond, B.S., A.M., Ph.D. Cloth. Price, $4. Pp. 252. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1947.

This volume is a book on psychiatry intended essentially for the latiy, the nontechnical reader and the practitioner who needs a simple review and re-orientation on modern thinking in this specialty. It is written by two people of authority, in simple concise language which does not attempt the dramatic but which brings home the lesson well.

These authors review the breadth of the field of psychiatry from simple definitions through the gamut of adult psychiatry, child psychiatry, problems in peace and war and applications to the understanding of ordinary social and criminal behavior. It is amazing how much is encompassed in this short treatise; yet all of it done simply. The reader has a sense of having learned something without being "whipped-up" as is so often the case in books intended for lay consumption.

This is the kind of book that may well be recommended for its fundamental truths, its easy readibility and its storehouse of basic knowledge.

Economic Man in Relation to His Natural Environment. By C. Reinold Noyes. Volumes I and II. Cloth. Price, $15. Pp. 692; 695-1443, with 69 illustrations. Columbia University Press, 2960 Broadway, New York 27, 1948.

Mr. Noyes has attempted to synthesize the results of experimental medicine and psychology into a conceptual scheme of man, alone in the physical world. Before social sciences can become true sciences, Mr. Noyes holds, the social scientist must understand the biologic and physical background of man's social existence. Equally important is the adoption of the technic and methods of the established sciences.

The study is presented as step one of a proposed three part survey of man's economic life. After an understanding has been reached of man's physical existence, the second step would be an examination of the technical methods by which man has adapted himself to his environment. The third step would be an investigation of the social institutions which coordinate and direct the efforts of men.

The body of the study is a discussion of a wide range of physical and psychologic experiments, thoroughly documented in lengthy appendixes, which seek to explain the actions of human beings. Three conclusions are reached as to the fundamental motivation of man. First is the view, also held by many biologists, that organisms are not reaction mechanisms which merely respond to external stimulation. Rather they are "more or less elaborate complexes of processes, in any one of which variations from homeostasis set up corrective balancing responses" (p. 995). Man's integrated behavior stems primarily from these variations. The source of excitation is outside the brain, but the continuous interrelation of the brain and the outside forces is a much more vital one than that of mere external sensory stimuli to an organism.

The second conclusion, which proceeds from the first, is that some organisms—chiefly man—exhibit integrated behavior in the absence of immediate external stimuli. This implies that such behavior is initiated from a secondary source in the brain itself. In this type of behavior memory and volition are essential.

The third conclusion is what Mr. Noyes believes to be the major contribution of his study. He states that the fundamental fact of man's relation to his environment appears to be that nature imposes obstacles to man's efforts to satisfy his wants and that the value of a particular object is how much effort a man is willing to expend to obtain it. This idea of value is in sharp contrast to the classical economist's theory that utility and scarcity create value.

If the components of the means required to satisfy a want could be measured quantitatively, it would be possible to establish a whole new scheme of analyzing economic life. This measurement, however, would require the definition of the criteria by which a want is judged; then the "real" cost of any effort could be recorded in quantitative terms. At this point in the synthesis Mr. Noyes is faced with the same dilemma as has brought previous social scientists to a halt in their search for an exact social science. In the definition of the criteria for judging a specific want, the necessary inconsistencies, and immeasurability and incomparability of many of the magnitudes of the means, make it impossible to assign definite values. Furthermore, the choice of means which man will take to satisfy his wants cannot be determined in advance.

Not much material in this book is directly pertinent to the practice of medicine.

Diseases of Poultry with Specialist Chapters on Poultry Husbandry. By W. P. Blount, Ph.D., F.R.C.V.S., F.R.S.E., Major, Royal Army Veterinary Corps, and various contributors. Cloth. Price, $6. Pp. 562, with 116 illustrations. William Wood & Co., Mt. Royal & Guilford Aves., Baltimore 2, 1947.

Twenty-four contributors from many different countries emphasize the part that the veterinary profession has taken in the poultry industry. Certain diseases of poultry are capable of infecting man, and these are of interest to the physician. Psittacosis, tuberculosis, encephalomyelitis, listerellosis, salmonella infections and swine erysipelas are discussed in more or less detail. The author believes that poultry are of little significance in the epidemiology of brucellosis, which is at variance with the experience of investgators in the United States. Exception will also be taken to the statement that limberneck (botulism) in poultry is fairly common in the United States because of feeding the contents of "blown" cans of foodstuffs to poultry. Nearly thirty years ago, the commercial canning industry solved the botulism problem in this country.

The book, as a whole, makes a valuable contribution to poultry husbandry.

The Yearbook of Psychoanalysis. Vol. III, 1947. Managing Editor: Sandor Lorand, M.D. Editorial Board: Henry Alden Bunker, M.D., Ernest Jones, M.D., Bertram D. Lewin, M.D. and C. P. Oberndorf, M.D. [Reprints]. Fabrikoid. Price, $7.50. Pp. 309. International Universities Press, 227 W. 13th St., New York 11, 1948.

This book represents the third volume of a collection of psychoanalytic papers chosen by the editors as suitable for publication in a "Yearbook." As has been previously noted by at least one reviewer, no reasons are given for the particular choice of selection. There are twenty articles in the present volume with an additional page entitled, "Selected Reading," but here again no explanation is made as to why the particular productions listed were chosen. Most of the articles are well written. They cover the psychoanalytic approach to various fields from the opening paper regarding Freud's place in the history of science and a previously unknown (here reprinted) article entitled, "An Unknown Autobiographical Fragment by Freud," through investigation in melancholia and other types of depression, compulsion neuroses and obsessional ritual to the development in the theory and practice of psychoanalytic technic, mental and physical origins of behavior and modern concepts regarding war neuroses. This book is recommended primarily to psychoanalysts and advanced students of psychoanalysis. It is not recommended reading for the general public or even the medical profession in general because the material chosen is too technical and will not interest many physicians with the exception of those indicated. Nothing relating to psychosomatic problems or research has been incorporated in this issue.

Diagnosis in Daily Practice: An Office Routine Based on the Incidence of Various Diseases. By Benjamin V. White, M.D., Assistant Clinical Profesor of Medicine, Yale University School of Medicine, New Haven, Conn., and Charles F. Geschickter, M.D., Professor of Pathology, Georgetown University Medical School, Washington, D. C., Fabrikoid. Price, $15. Pp. 693, with 360 illustrations. J. B. Lippincott Co., E. Washington Square, Philadelphia 5, 1947.

This unique text should have an appeal to interns, residents and practitioners. Part one, on "The Diagnostic Survey," is designed to give the reader an idea of the probability factor in diagnosis. Unfortunately, this is not especially valuable in individual cases. Part two deals with the differential diagnosis of presenting symptoms as related to the various systems. Part three is an essay on physical diagnosis, while part four embodies common laboratory procedures. In part five, which constitutes one half the book, the diagnosis of various diseases according to systems of the body is dealt with. The book is replete with excellent photographs and drawings. There are many tabulations that make for easy reference.

The Microscope: Its Theory and Applications. By J. H. Wredden, F.R.M.S. With an historical introduction by W. E. Watson-Baker, A.Inst.P., F.L.S., F.R.M.S. Cloth. Price, $5.50. Pp. 296, with 298 illustrations. Grune & Stratton, 381 Fourth Ave., New York 16, 1948.

A book on the microscope and its use is a welcome addition to the literature. However, the author, who had most of his experience in connection with industrial microscopy, does not meet the needs for an adequate treatise on medical microscopy. The illustrations are of old models and not of up-to-date instruments. Many of them are made from English instruments with which the American physician and microscopist is not acquainted.

The discussion of the fundamental principles of the optics involved, of illumination, is technical and adequate. One chapter contains practical suggestions on the proper use and application of the microscope. The polarizing microscope and micrometry are discussed in separate chapters. Another chapter is devoted to photomicrography, largely as it is employed in industry. Similarly, the two chapters on preparation of specimens for microscopy is written for biologists and physicists rather than for medical workers.

This volume may be of interest to certain fields of microscopy but falls short in its practical application in clinical pathology and allied medical fields.

Radium Dosage: The Manchester System. Edited by W. J. Meredith, M.Sc., F.Inst.P. Compiled from articles by Ralston Paterson, M.D., F.R.C.S., F.F.R., and others. Cloth. Price, $4.50. Pp. 124, with 42 illustrations. Willams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1947.

"Radium Dosage," by Meredith, is a detailed presentation from the Manchester group of its system of radiation therapy. Particular reference is made to procedures for calculation of dose. The material is exceedingly complete and highly technical, exceeding considerably in its precision the predictability of location of the disease to be treated.

This work is a tribute to the patience and thoroughness of the Manchester School of Radiation Therapy, as well as to the clinical applicability of biophysics to therapy.

Las enfermedades mentales en Cuba: Estudio estadístico. Por el Dr. José Angel Bustamante. Paper. Pp. 199, with illustrations. Tamayo y Cia, Habana, [1948].

This little book contains statistics on mental diseases in Cuba, concerning 3,449 patients, mainly white persons at the Mazorra Department of the Calixto García Hospital. These statistics enable one to evaluate the progress of psychiatry in Cuba. The carefully prepared statistics represent a national contribution of importance in the field of mental diseases.

Queries and Minor Notes

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

BASIC METABOLISM AND SURFACE AREA

To the Editor:—Please furnish data on basal metabolic studies in relation to surface area, particularly as to corrections, if any, that are to be made because of this factor.

Louis Miller, M.D., New York.

ANSWER.—Clinically the basal metabolic rate is expressed as a percentage above and below the theoretic normal standard for the individual, taking into account his sex, age, height and weight. The basal metabolism is most closely related to the surface area and is less directly related to height or weight. The surface area can be calculated from the following formula if the height and weight are known (Du Bois): $A = W^{0.425} \times H^{0.725} \times 71.84$, where A is the surface area in square centimeters, W the weight in kilograms and H the height in centimeters.

In the average man of normal average build at the age of 25, about 40 calories are given off every hour per square meter of body surface; in the woman about 36 calories. The surface area of an average adult is about 1.8 square meters. The basal metabolic rate varies greatly with age, being considerably higher per square meter of surface area in children than in adults. There is a gradual fall in the metabolic rate as age advances. These facts are well shown in the following table:

	B. M. R. in Calories per Sq. M. per Hour	
Age in Years	Male	Female
2	57.0	52.5
6	53.0	50.6
8	51.8	47.0
10	48.5	45.9
16	45.7	38.8
20	41.4	36.1
30	39.3	35.7
40	38.0	35.7
50	36.7	34.0
60	35.5	32.6

The figures given for metabolic rate are average normal values; average implies that higher and lower values do occur. It is generally accepted that the normal range of metabolism in persons of identical physical status may vary from plus 10 per cent to minus 10 per cent commonly, and rarely by as much as plus or minus 20 per cent.

ALCOHOLIC ANTIFREEZE FLUIDS

To the Editor:—A patient gives the history of losing consciousness on inhaling fumes coming from a leak in an automobile heating line. The radiator contained alcohol antifreeze at the time. Can radiator alcohol cause syncope?

Anthony C. Yerkovich, M.D., Lackawanna, N. Y.

ANSWER.—Alcoholic antifreeze fluids for automobiles are likely to represent methanol, a mixture of methanol and isopropyl, or completely denatured ethyl alcohol. No constituent under the ordinary conditions of automobile heater leaks may be expected to lead to unconsciousness or any severe systemic disturbance. In automobile manufacture at the end of the final assembly line and subsequent inspection work, during cold months, a number of workmen continually fill and drain radiators requiring antifreeze. At times spillage is high. No difficulty arises, and none is expected. Instead, the possibility of carbon monoxide exposure should be explored. Having ruled out carbon monoxide, one might direct attention to exquisite intolerance for antifreeze alcohols and to functional disturbances. The odors of antifreeze fluids while organically harmless, provoke emotional responses in some susceptible persons. Offensive odors may serve as the trigger for convulsive states wholly unrelated to any direct chemical action.

ENCEPHALITIS IMMUNIZATION

To the Editor:—Is there an immunizing vaccine against encephalitis? A patient going to Japan is apprehensive.

Harold B. Keyes, M.D., New York.

ANSWER.—Immunization against the Japanese type of encephalitis is still in the stage of animal experimentation and has not been applied to human beings.

EYE DISABILITY RATINGS

To the Editor:—I wish you would settle a controversy, and, if necessary, give us authority for changing a figure in the "Schedule of Disability Ratings—1945" of the Veterans Administration. This book, our "bible" of disability ratings, mentions that the Industrial Motor Field Chart, made up of 20 squares, each 8⅜ by 10½ inches (21.3 by 26.7 cm.), should be used at a distance of 10 feet (304.8 cm.). This has never seemed right to me. Dr. Albert C. Snell, in his "Treatise on Medicolegal Ophthalmology," 1940 edition, stated that each square should subtend an arc of 20 by 25 degrees. Such an arc is subtended on our Industrial Motor Field Chart, each square being 8¾ by 10½ inches (22.2 by 26.7 cm.) at 2½ feet instead of 10 feet (304.8 cm.). I wish that you would send us an official letter stating the exact distance for testing binocular fixation in which each little rectangle measures 8¾ by 10½ inches. This is a matter of great importance as far as the Veterans Administration compensations are concerned.

Karl D. MacMillan, M.D., Pittsburgh.

ANSWER.—The American Medical Association Industrial Motor Chart is intended to explore a motor field of 20 degrees horizontally and vertically. It is divided into 20 small rectangles 4 by 5 degrees each, to provide a larger (12 degree) motor field below the primary position and a smaller (only 8 degree) motor field above the primary position, and 10 degrees on both sides of it. The dimensions of a 5 by 4 degree rectangle at 10 feet correspond to 10½ by 8⅖ inches (not 8¾ inches). If it is desired to use this chart at 2½ feet the rectangles would have to be reduced to one fourth of these dimensions.

SPECIFIC GRAVITY OF BACTERIA

To the Editor:—What is the specific gravity of the tubercle bacillus?

L. W. Garst, M.D., Catawba Sanatorium, Va.

ANSWER.—Specific gravity determinations of bacteria are not entirely satisfactory because of a number of variables. Such factors as the water content, conditions under which the bacteria are cultured, age of the bacteria, the proportions of such substances as carbohydrates and proteins with specific weight greater than that of water in proportion to light substances, such as fat, account for differences in specific gravity, as well as other factors which can influence all of the physical and cultural characteristics of bacteria. In discussions on this subject tubercle bacilli are usually grouped with those organisms having specific gravity varying from 1.09 to 1.13. An authentic source of information on this subject is: "Bacterial Chemistry and Physiology," by Porter, published by John Wiley & Sons, Inc., New York.

Hr INCOMPATIBILITY

To the Editor:—A patient aged 33, tripara, trigravida, is anxious to have more children. She is Rh positive; her husband is Rh negative. The first two pregnancies were uneventful. About three weeks from term in the third pregnancy eclampsia developed, but she responded to treatment and labor was induced. The toxemic symptoms cleared rapidly, and within four weeks of delivery the patient was normal in all respects. The baby showed signs of distress both before and during labor but survived. The vernix caseosa was stained a deep yellow, but the baby showed no jaundice at any time and is a normal healthy child. Close questioning later revealed that toxemic symptoms had developed about three days prior to the onset of the eclampsia and that for several days before this the patient had eaten large amounts of ham. Would there be any contraindications to future pregnancies on the basis of this history or the Rh factors?

M.D., New Mexico.

ANSWER.—An Rh-positive wife of an Rh-negative man is extremely unlikely to have a baby affected with erythroblastosis due to Rh incompatibility. It would have to be caused by so-called Hr incompatibility—a rare occurrence. Therefore there is no contraindication to future pregnancies on the basis of the Rh factor.

SHORT WAVE DIATHERMY

To the Editor:—I advised a patient to take some short wave treatments for an arthritic condition, and subsequently she went to an orthopedist who cautioned her against short wave treatments, claiming that they dried up the tissues. Please discuss the value of short wave treatments in relation to chronic inflammatory conditions of muscle, joint and nerve.

M.D., New York.

ANSWER.—Short wave diathermy is a valuable type of electrotherapy but is not to be recommended to the exclusion of other thermotherapeutic measures. When it is properly used, "drying up of the tissues" does not result. Short wave diathermy is produced (by means of a vacuum tube oscillator) by an oscillating electric current of a relatively high frequency (from 10,000 kilocycles per second at a wavelength of 30 meters to 100,000 kilocycles per second at a wavelength of 3 meters). Frequencies greater than 10,000 kilocycles per second provide heating without undesirable nonthermal effects. Resistance to the current offered by the tissues is the means by which heating is accomplished.

To obtain clinically useful thermotherapeutic effects in a specific area and at the same time to avoid undue heating of the overlying skin insulation by pads or air spacing between the electrode and the body surface is standard practice. In areas where normal circulation prevails and sufficient soft tissue is present, uniform heating to a depth of 5 cm. (2 inches) may be anticipated.

All the substantiated benefits attributed to use of short wave diathermy can be adequately explained by physiologic effects of heating. When it is properly applied, continued exposure to short wave diathermy has been shown not to produce specific inflammatory reactions or other untoward effects on bodily tissues.

Short wave diathermy is indicated when active hyperemia is desired. Its deeper penetration constitutes the principal advantage of short wave diathermy over most other types of heating. Thus for "chronic inflammatory conditions of muscle, joint and nerve" this method of heating often is useful; however, simpler forms of heating may be equally effective for many superficial lesions of the soft tissue.

It is not always possible to treat widespread areas by a single application of short wave diathermy; the apparatus can be dangerous if not properly used, and it is rarely adaptable to home use. Use of short wave diathermy is contraindicated in regions where circulation or sensation is impaired or the danger of hemorrhage exists, in the presence of profusely draining wounds or when metal approximates skin or deeper structures likely to be within the range of the short wave diathermy.

MACULAR DEGENERATION

To the Editor:—Please give information on the muscular implantation of crystals of methyl testosterone or other orchic substance. A patient, aged 56, has previously had it used for macular degeneration of the eye with improvement.

Lester L. Graves, M.D., East Pepperell, Mass.

Answer.—Macular degeneration in older persons is due, in general, to sclerosis and hyaline degeneration of the choroidal circulation nourishing the macular region. Treatment of the condition is unsatisfactory because of the low vitality of the retina, which does not respond to therapeutic or stimulative measures. Testosterone is a form of substitution therapy and its use is not indicated when the gonads are functional. A review of the titles in the *Quarterly Cumulative Index Medicus* the past five years does not give any reference to this therapy in macular degeneration. The indications and contraindications to therapy with the male sex hormones are well discussed by Werner. (J. A. M. A. **132**:185, 1946).

CHRONIC SINUSITIS

To the Editor:—Please supply information on the following subjects: (1) What is the best present treatment for chronic infection of the perinasal sinuses? (2) What drug is recommended for topical anesthesia of the ear drum when a myringotomy has to be performed as a home or office procedure?

M.D., Maryland.

Answer.—Before outlining treatment for so-called chronic sinusitis, it would be best to define what is meant by the term. In general, the feeling today is that the larger number of cases of so-called chronic sinusitis are really instances of allergic sinusitis accompanied with secondary suppuration. The presence of the first condition makes it difficult for the second one to heal and requires a careful study for the detection of the agents producing the allergic state. This may mean the use of elimination diets, the creation of relatively dust-free bedrooms and careful cutaneous testing to determine which allergens, especially in food, one must avoid and in which cases immunity may be produced by injections of the offending agent.

The patients frequently complain of nasal obstruction and secretion, brought on by sudden changes in temperature. They may suffer from other allergies, especially the seasonal (pollen and mold) types. They have on occasion bouts of sneezing, watery nasal discharge and vague headaches. Cytologic examination of nasal secretion reveals many eosinophils, often in clumps. The nasal mucosa is often pale, though it may be red: frequently it is waterlogged. Polyps may be present, especially in the ethmoid area and roentgen examination reveals cloudiness and mucosal thickness in nearly all of the sinuses.

The onset of a "cold" or mild inflammatory rhinitis in the described situation manifestly finds the course protracted, especially because the ostiums of the various sinuses are blocked by swollen mucosa.

Diagnosis of the underlying allergic causes and their removal, use of effective antihistaminics and the occasional necessary removal of polyps that obstruct the drainage will aid greatly in amelioration of a condition which by its nature can, in the worst cases, never be completely relieved and is prone to frequent exacerbations and recurrences.

Chronic suppurative sinusitis, unaccompanied with nasal allergy, seldom involves all or nearly all of the sinuses on one or both sides of the nose. The antrum on one side, as a rule, is the offending area about 95 per cent of the time, with the frontal sinus sinus next in frequency. The patients often complain of little more than postnasal dripping. Their relatives and friends complain oftener of a foul odor to the breath than does the patient himself, and headaches and pain are not prominent symptoms, except at times of acute exacerbation.

Irrigation of such an involved antrum reveals often thick yellow or green pus with a pronounced odor. The condition sometimes responds quickly to irrigation; often instillation, after irrigation, of sulfathiazol in a suspension, in water or in a vasoconstrictor solution, is helpful. Many today dispense with irrigation and use the methods advocated by Proetz and Parkinson.

A reasonable attempt at the aforementioned treatment with failure should be followed by the performance of an antrum window operation. If this fails, as it does on occasion, then it should be followed by the more radical so-called Caldwell-Luc procedure. Any involved teeth with a persistent infection should, of course, be treated.

Bonain's solution (equal parts of cocaine, menthol and phenol) is the most commonly used topical analgesic. With the patient reclining and the affected side uppermost, a few drops of the preparation dropped into the canal and allowed to remain in contact with the membrana tympani for a few minutes produces a moderately satisfactory anesthesia. The phenol is in all probability the active agent, and a 30 per cent solution of phenol in glycerine would in all likelihood be equally as effective as Bonain's solution.

"BLISTERBUG"

To the Editor:—A 9 month old boy put an insect called a "blisterbug" in his mouth. His mother succeeded in extricating one wing and the head of the insect. The rest was swallowed. About twelve hours later the child vomited and brought up the insect. The child acted as though he had intestinal cramps. About twenty-four hours after the ingestion of the insect, it was noted that his urine stained the diapers pink. About thirty-six hours after the bug was eaten, the urine was no longer macroscopically hematuric, but contained innumerable red blood cells in the uncentrifuged microscopic specimen. Otherwise the child appeared healthy. About one week ago he was "bitten," or otherwise contacted, by a "blisterbug," and a "huge blister" developed at the site of the contact, according to the parents. We wonder whether such hematuria after contact with blisterbugs, especially mucous membrane contact, has been observed before, and what is known about its mechanism.

Heinrich Lamm, M.D., La Feria, Texas.

Answer.—The so-called blisterbug is not a bug but a beetle and not one beetle but any one of a group or family, Meloidae. This family includes the "Spanish fly," Cantharis vesicatoria. Cantharidin is produced from certain species of this family and seems to be the active principle. Some members of the family Staphylinidae (rove beetles) also cause urticaria and blistering. The active principle here is similar to cantharidin but slow in action. In all the urticating properties are in the body fluid. Accidental crushing of a beetle on the skin causes vesication, which can be distinguished from a bite or sting by absence of a puncture mark. Other beetles which cause blistering have been reported, as a night-flying beetle of the family Paussidae (in South East Africa), and at least two sessinid (coconut) beetles of the family Oedemeridae in certain Pacific islands, and Eobia of the same family. These cause burning pain on contact with the body fluid and a fairly harmless large vesicle. Mucosal irritation of the nose and eyes is caused by a gaseous product of the small flour beetle, Tribolium confusum.

Infection of man with beetles has been reported at any stage of their development and is called canthariasis. The location may be intestinal, urinary, ocular, dermal or nasal. While rare, intestinal canthariasis is credited with causing severe diarrhea in children in Ceylon.

In treatment, no drug is available which counteracts the vesicating symptoms. Mild alkaline lotions are recommended and a compress of saturated magnesium sulfate solution may be applied. Avoidance of these beetles is the sure preventive. Entomologic control is possible where they are numerous in fields and forage crops by the use of arsenic sprays and methods applicable to grasshopper control.

Blister beetles have been the subject of numerous reports. The general treatment is symptomatic and supportive. Swartz and Wanamaker (J. A. M. A. **131**:594 [June 15] 1946) stated that "more than 200 species of blister beetles have been found in the United States." They described one, Epicauta cinerea, which may crawl harmlessly on the skin but when pressed by clothing or irritated exudes an irritant fluid which causes blistering in twenty-four hours. Opening the blisters and application of mild antiseptics results in healing without scarring in ten days. A case of intestinal canthariasis due to Tenebrio molitor (meal worm) was reported by Palmer (*J. Parasitol.* **32**:54 [Feb.] 1946) in a child of 4 months. Within the past three years no report has been found of hematuria as a result of blister beetle contact.

BASAL METABOLISM IN LIVER DISEASE

To the Editor:—I have been unable to find any references to basal metabolic rates in conditions associated with hepatic damage. I have been informed that theoretically the basal metabolic rate should be elevated in hepatitis and in conditions associated with hepatic damage. Please clarify this point. Please give references.

Benjamin H. Archer, M.D., New York.

ANSWER.—Basal metabolic rates usually fall within normal limits in parenchymatous hepatic disease, as Aub and Means (*Arch. Int. Med.* **28**:173-191, 1921) demonstrated. An occasional patient, however, presents an elevated rate of the order of magnitude of about plus 25 per cent. This phenomenon has received little attention and is barely mentioned in medical literature. Eppinger noted it in his celebrated monograph (Die Leberkrankheiten, Julius Springer, 1937) but did not explain it. To date, no adequate explanation for the occasional elevation in the metabolic rate in hepatic disease can be offered. Some evidence seems to indicate that it is not due to protein catabolism or acceleration of the specific dynamic action of foodstuffs. In several cases of hepatic disease in which the basal metabolic rate was high, which were studied in one metabolic clinic, there was no evidence whatever of hyperthyroidism. The suggestion has been made that the diseased liver, which is known to lose its capacity to inactivate estrogenic compounds, may similarly fail to deal with compounds originating in the thyroid. No proof of this hypothesis is available at present.

BLINDNESS FOLLOWING HEMORRHAGE

To the Editor:—A white man, aged 52, had severe bilateral atrophy of both optic nerves in 1919. This he attributes to severe diarrhea and hemorrhage, during which he became totally unconscious. The condition developed at Spalato, Jugoslavia, on the Adriatic Sea, in the spring of 1919. He remains blind at this time. Could the blindness be due to pronounced anemia following the hemorrhage and diarrhea?

Joseph J. Hanus, M.D., Austin, Texas.

ANSWER.—Blindness after exsanguination or general collapse is a rare but well known clinical catastrophe. The pathogenesis is retinal ischemia, which determines a noninflammatory degeneration of the ganglion cells and their fibers and sequential optic atrophy. Amaurosis has been noted in the collapse stage of cholera and typhus, but more frequently after recurrent profuse hemorrhages complicating medical conditions such as peptic ulcer, pulmonary tuberculosis, parturition and epistaxis and rarely from wounds and surgical treatment. The blindness is usually, but not necessarily, bilateral, occurs within the first week or two after the hemorrhages and is permanent in half the patients affected. The pupil is always fixed and dilated. The ophthalmoscope shows attenuated vessels, a pale disk and occasionally retinal hemorrhages or fluffy patches of edema. Cerebral ischemia is sometimes also evident, as manifested by sensory and motor anomalies, aphasia, deafness, amnesia, nystagmus and polyneuritis. The logical treatment is prompt transfusion and repeated paracenteses of the cornea.

STERILITY FROM HEAT

To the Editor:—Is it possible to cause sterility in the male by the use of diathermy induced through an orificial electrode, thus causing a temperature elevation in the region of the prostate gland and transference of heat to the testicles?

M.D., Ohio.

ANSWER.—Evidence from various sources shows that heat can easily damage the testicles. Febrile diseases in men sometimes cause pronounced deterioration in the quality of the semen. In laboratory animals even moderate heat applied to the scrotum leads to degeneration of the seminiferous tubules. The poor functioning of undescended testicles is probably due in part to their abnormally warm environment in the groin. Rams have been rendered sterile by the wearing of a red flannel suspensory bandage. In spite of this remarkable sensitivity of the testicles to heat, it seems unlikely that diathermy applied to the prostate through an orificial electrode would produce enough temperature elevation in the scrotum to do any harm. I know of nothing in the literature on this subject.

INFECTIOUS MONONUCLEOSIS

To the Editor:—A patient 23 years of age has swollen glands in the left side of his neck. By blood smear the disease has been diagnosed as acute infectious mononucleosis. Are there authentic reports of specific remedies for this disease? The patient has only a slight fever but is apprehensive.

Francis M. Findlay, M.D., Kingman, Ariz.

ANSWER.—Infectious mononucleosis is thought to be caused by a virus. Penicillin, streptomycin and sulfonamide drugs are of no value in this disease unless there is a secondary bacterial infection. Lassen and Thomsen (*Acta Med. Scandinav.* **104**:498, 1940) used specific convalescent serum in 12 patients with a severe form of infectious mononucleosis. Serum was obtained from convalescent patients within two weeks after their fever subsided and was given intravenously in doses varying from 50 cc. to 300 cc. Objective improvement within twenty-four hours was noted in 11 patients and subjective improvement occurred in all. Nine patients became afebrile within forty-eight hours. In most patients with infectious mononucleosis the disease runs a benign course and requires no specific treatment. If convalescent serum can be obtained, it deserves trial in the occasional case of severe disease.

POSTMASTECTOMY LYMPHEDEMA

To the Editor:—What can be done to relieve lymphedema following radical mastectomy? Edema did not follow the operative procedure immediately but came on three months later. Evidence of recurrence in the scar or in the axilla is absent. The patient had postoperative roentgen therapy.

M.D., New York.

ANSWER.—The treatment of lymphedema following radical mastectomy has been found to be most discouraging. Elevation of the involved arm to a horizontal position for as much of the time as possible, together with gentle massage of the arm from the wrist toward the shoulder, have reduced the swelling in some instances. Modified Kondoleon operations or attempts to establish lymphatic drainage by inserting a subcutaneous thread have had disappointing results. The condition is most likely to occur in obese persons. Perhaps the best treatment would be an attempt to avoid the situation by meticulous dissection during the operation, with particular attention paid the cephalic and subscapular vessels which should be preserved. In the absence of definite evidence of recurrence of the malignant process, roentgen treatment is to be avoided, as this may have a tendency to aggravate the condition.

MONILIA ALBICANS

To the Editor:—What is the preferred treatment of pulmonary moniliasis? Is the insufflation or inhalation of ethyl iodide useful? Culture from bronchoscopic aspiration shows Monilia albicans.

Clifford H. Kalb, M.D., Milwaukee.

ANSWER.—Specific therapy is not available. It is difficult to see how ethyl iodide could be useful. Since moniliasis is often a secondary infection, search should be made for some possible underlying disease, like tuberculosis or carcinoma. Treatment is symptomatic and supportive. It would be important to know whether Monilia cells are present in great numbers or not present in the sputum. Certain persons harbor Monilia normally as saprophytes. The organisms may not be the cause of the disease in question.

VOCAL CORD PARALYSIS

To the Editor:—I noticed in The Journal of Sept. 4, page 103, your answer to the question of Dr. Harry Boatwright, Kingsport, Tenn., regarding a left vocal cord paralysis. In the answer it is stated that not more than 5 per cent of the patients will regain function. I call attention to the work we have been doing at the Post-Graduate Hospital in New York during the past ten years in regard to treatment of this condition. In our material, which comprises about 100 cases, the recovery rate is about 70 per cent with electrotherapy. Our material is now in the process of compilation for publication. In the meantime, may I refer you to an article by Dr. Charles Gordon Heyd (*New York State J. Med.* **44**:17 [Sept.] 1944), in which our technic is described. Further references to our method are found in the *Journal of Nervous and Mental Diseases* (**98**:183 [Aug.] 1943) and in the *Annals of Surgery* (Weeks, C., and Hinton, J. W.: Extralaryngeal Division of the Recurrent Laryngeal Nerve, **116**:251 [Aug.] 1942).

Charles O. Fiertz, M.D.

COLA AND ASPIRIN

To the Editor:—In reference to the query, "Cola and Aspirin" (The Journal, July 3, 1948), may I state that the caffeine content of coca-cola does not exceed 40 mg. per bottle and is uniform everywhere in the world.

SACRIFICE OF BONE LENGTH IN RECONSTRUCTION PROCEDURES

Chairman's Address

J. WARREN WHITE, M.D.
Greenville, S. C.

At the risk of criticism from the perfectionist, I have chosen for his formal discourse a basic principle which, to my knowledge at least, has never before been discussed as an entity in traumatic or orthopedic reconstruction operations.

As some of you will appreciate, in enumerating examples of this principle, the shortening procedures about to be discussed have long been employed by me. I have advocated in several papers technics which I hope have justified their being published in spite of their occasional glaring anatomic compromises.[1]

Oliver Wendell Holmes has given us an anecdote about Benjamin Franklin which seems appropriate for this occasion. Franklin, early in his career, apprenticed to his brother as a printer's devil; one day in going down a steep stairway into the low studded basement beneath the print shop hit his head painfully against the ceiling when he did not stoop enough. His brother who was immediately preceding him into the cellar warned him about holding his head too high, saying that in so doing many a blow would be received in life which by stooping a little could have been avoided. We all must realize the difficulty of attainment in our surgical technics and restrict our activities to that which is within our own capabilities and which can be accomplished with less risk for the moment as well as for the ultimate good of the patient.

Surgery to a greater extent than medicine is associated with risk even in the routine care of patients. Surgical disasters can usually be more definitely traced to the surgeon than medical failures to a physician. No surgical operation has ever been performed that did not carry with it some degree of risk. It is the purpose of this paper, therefore, to discuss certain surgical ways and means to get the best final result for the patient and avoid exposing him to unjustified hazards.

The basic principle to be discussed is the sacrifice of structural length for the purpose of getting safer, surer and speedier results in the treatment of appropriate major deformities. Various typical examples of this surgical reconstruction entity will be cited in this paper. Only five general headings have been listed, though doubtless more could be added.

LEG LENGTHENING

Over 20 years ago I began my work in South Carolina, just after Abbott[2] had perfected the leg-lengthening technic originally advocated by Codavilla in Italy, and naturally employed it on several occasions. It was not long before I realized that I was applying tremendous force in stretching out resistant soft tissues, usually in an already physically damaged limb. The result seldom justified the effort employed. No serious disasters were experienced, but the alternative procedure, i. e., the shortening of the long leg, was resorted to with much more enthusiasm and has, with a few exceptions, been employed ever since in problems of discrepancy in leg length.[1a]

The same conservative sentiment about leg lengthenings has gradually developed over the country, and in spite of the anatomic advantage (the increasing of the height of the patient) few leg lengthenings apparently are being done at the present time.

LEG SHORTENING

Since the time my article on shortening femurs was published thirteen years ago,[1a] the simpler leg shortening procedures have largely displaced the more hazardous lengthenings, for the reasons previously mentioned as well as other arguments enumerated in the article already cited.

After years of observation, I have come to the conclusion that most persons so afflicted readily accommodate themselves to minor discrepancies in leg length and that only in the severer cases is there any definite need for equalization. I feel that during these days of intensive interest in low back pain, too much emphasis has been placed on a minor length discrepancy as an etiologic factor.

Fortunately even this shortening operation, which must still be considered a major procedure, has been largely superseded in children by a relatively minor one, which arrests the growth of one or more of the long bones of the long leg. This valuable idea was conceived by Phemister, next year's president of the American College of Surgeons, who also devised an operative technic which subsequently was simplified and made more certain in his estimation by a procedure published by me twelve years ago.[1c]

Read before the Section on Orthopedic Surgery at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

Bone & Joint Surg. **17:** 597 (July) 1935; (*b*) Carpectomy for Intractable Flexion Deformities of the Wrist, ibid. **26:** 131 (Jan.) 1944. (*c*) White, J. W., and Warner, W. P., Jr.: Experiences with Metaphyseal Growth Arrests, South. M. J. **31:** 411 (April) 1938.

[2] Abbott, L. C.: The Operative Lengthening of the Tibia and Fibula, J. Bone & Joint Surg. **9:** 128 (Jan.) 1927.

A third exemplification of the value of the shortening idea is employed in severe Volkmann ischemic contractures following severe elbow or forearm injuries.[1b] The removal of the entire carpus gives enough soft tissue slack to allow adequate correction of even the severest wrist flexion deformities. In examining the opposing surfaces of the distal end of the radius and the proximal end of the metacarpals, it looks almost as though they were designed for this procedure.

Here again this operation was designed as a last resort for intractable deformities and was advocated in the original article written seven years ago largely for esthetic reasons. Much improvement in the function of the remaining uninvolved musculature has been noted over the years subsequent to operation, which therefore is now being done more frequently in cases that could not be considered as presenting last resort problems. The Steindler operation or forearm shortening procedure advocated for this condition has not been successful in my hands and apparently does not give the slack at the wrist where it is needed.

In my estimation the fourth most important shortening procedure is the sacrificing of length at the ends of long bones, particularly the forearm and lower leg.

The most frequent instance of this is my modification of the Mayo-Heuter hallux valgus operation.[3] Here the length of the first metatarsal is sacrificed to allow the toe to be straightened, held in a valgus position by various overly contracting tendons which act like the string of a bow. In addition to facilitating the correction of the deformity, the actual shortening of the toe, not enough (i. e., the shortening) to be a deformity in itself, serves to prevent its recurrence.

Another relatively frequent instance of bone end excision is the removal of the distal end of the ulna, where, in severe comminuted fractures of the distal end of the radius, or growth disturbance, an unavoidable shortening has resulted in an embarrassed functional and anatomic deformity.

In congenital deformities, such as short or even absent radii, the sacrifice of enough length of the ulna to correct the severe valgus position of the hand and to get good apposition between the distal end of the ulna and the carpus is of real value.

Mumford's[4] excision of the distal end of the clavicle for persistent acromioclavicular dislocations is another instance of the value of the excision of a long bone end.

Smith-Petersen[5] calls attention to the advantage of excising the distal end of the acromion process to relieve supraspinatus pain and improve motion, a procedure which I have not done but which appears logical.

In defects of the tibia, including nonunion, the projecting proximal end of the fibula not infrequently constitutes a real problem, which can be solved by the excision of an amount that appears desirable to allow closure of the defect and positive end to end presure.

Shortening in many other arthroplastic procedures is another example of this instance to get soft tissue slack, comparable somewhat to the hallux valgus operation, which might be considered as being another indication for accepting loss of length. This is particularly of value in elbow procedures in which considerable fibrosis is frequently present about the joint severely disorganized by trauma, sepsis or both.

A fourth length-sacrificing procedure, a distinctive overlap, not yet published but recommended in a paper read before the American Orthopedic Association at their 1947 meeting, was devised for inveterate deformities of the forearm, particularly nonunion or malunion of both bones. It is an operation of last resort designed for those unfortunate persons who have had much unsuccessful surgical treatment but who are willing to go through one more operation if given sufficient encouragement. We all agree that bone grafting for nonunion of fractures of both bones of the forearm is a major procedure and one is happy to be able to offer a simpler surer operation to a long-suffering patient.

This same overlap procedure is valuable in the severe bowing deformities associated with bone softening conditions such as rickets, fragilitas ossium, osteogenesis imperfecta and fibrous displasia, particularly if bilateral. When the correction seems to be indicated at the ends of the long bones, a telescope technic is valuable, which is, in my experience, most useful in deformities in the upper part of the femur.

In major defects of one of the bones of the forearm either from neoplasms, sepsis or trauma, it is frequently more desirable to shorten the other bone than to employ the infinitely more time-consuming process of massive bone grafting associated not infrequently with pedicle grafting to fill in soft tissue defects, as in a gun shot wound of the forearm.

The 1½ to 2 inches (3.8 to 5 cm.) shortening of the extremity as a whole is of more moment to the tailor than to the patient, as the discrepancy in length of the upper extremity is not as serious as in the lower and is not conspicuous to the casual observer. The muscles have been proved to accommodate themselves to the shortening in the upper as well as in the lower extremity.

In acute trauma, particularly extreme compound comminuted fractures in which immobilization is all important, the avoidance of the use of traction and the acceptance of some shortening is felt justified for the sake of discouraging the development of sepsis in a contaminated wound.

SUMMARY

I have attempted in this paper to call attention to a definite surgical procedure which I feel is too infrequently considered as a definite therapeutic entity in solving major surgical problems. I urge the consideration of the sacrifice of length for safer, surer and speedier results in appropriate cases, bearing in mind the inherent ability to compensate possessed by the human frame.

The Surgeon's Responsibility.—The guiding circumstance of a surgeon's life is personal responsibility. He is in charge, he must make decisions and initiate or carry out the line of action those decisions imply, and on the correctness of his decisions and the skill and determination with which the action is carried out depends the welfare and possibly the life of his patient. All the material for a correct diagnosis may not be available, at any rate at a particular time, but there must always be a decision; even though it may not be the right one it is the best that can be made at the time and the one on which action must be based if action is needed.—Ogilvie, Heneage, M.D., A Surgeon's Life, *The Lancet*, July 3, 1948.

NERVOUS FACTORS IN GENERAL PRACTICE

FRANK N. ALLAN, M.D.
and
MANUEL KAUFMAN, M.D.
Boston

Consciously or unconsciously every physician, surgeon or specialist must give attention to the influence of mental, nervous and emotional factors in health, illness and convalescence. More than any other, the general practitioner has always been noted for the consideration given to the feelings and personality of the sick. That his efforts in this field have met with a large measure of success is demonstrated by the loyalty of his patients.

There has been evidence of an increasing desire to learn more about psychiatry and its contribution to medical practice, but when a general practitioner or internist turns to any of the older textbooks written by a psychiatrist, he may fail to secure the help he needs. He will find a lengthy discussion of major mental disorders and relatively little attention given to minor mental and emotional factors. For the average practitioner a psychosis occurs only in an exceptional case. He is likely to see a good many patients with a condition meeting the description of psychoneurosis, but the majority of the mental and nervous disorders he encounters cannot be precisely included in either of these categories.

In confirmation of the common experience of the general practitioner, the inadequacy of traditional neuropsychiatric classifications was emphasized in military practice (Thomas,[1] Strecker[2]). The need for a realistic and practical classification as the foundation for more satisfactory management of a large group of cases has become urgent. It is not just a matter of finding an appropriate diagnostic label, although even this is important. To call every patient with a nervous problem, psychopathic or psychoneurotic is an injustice. In the public mind these terms carry a stigma. The real requirement is to arrive at a diagnosis which can serve as a guide to effective therapy and accurate prognosis.

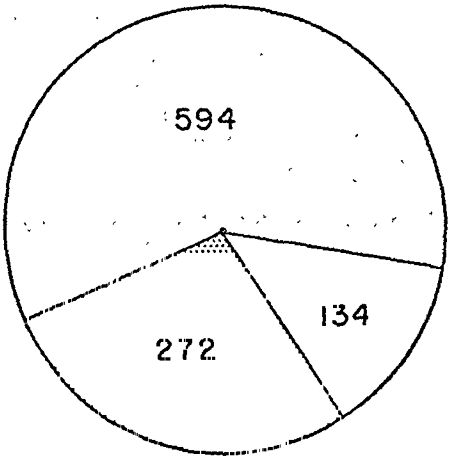

Fig. 1.—Survey of 1,000 general medical cases: 594 of physical disorders only, 272 of nervous and 134 of both physical and mental disorders.

SURVEY OF ONE THOUSAND GENERAL MEDICAL CASES

An analysis was made of the mental, nervous and emotional factors in 1,000 unselected ambulatory cases in which the patients had come to the Lahey Clinic for a general medical examination. The evaluation was made by us at the time of the investigation of each case, and an effort was made to follow a uniform policy of classification. Medical problems of all sorts with complaints relating to every system were included in the group; most of them were chronic. It cannot be claimed that this group is typical of patients seen in general practice or even in clinic practice, but, if not quantitatively comparable to other situations, this survey can at least give a perspective of neuropsychiatric problems in proportional relationship. It must be admitted, too, that the evaluation of neuropsychiatric factors by the physicians responsible for the study would not be confirmed in all respects by others; the nature of neuropsychiatry leads to differences in interpretation. With these allowances the study may serve to illustrate the neuropsychiatric problems of general medical practice, particularly in relation to chronic ill health.

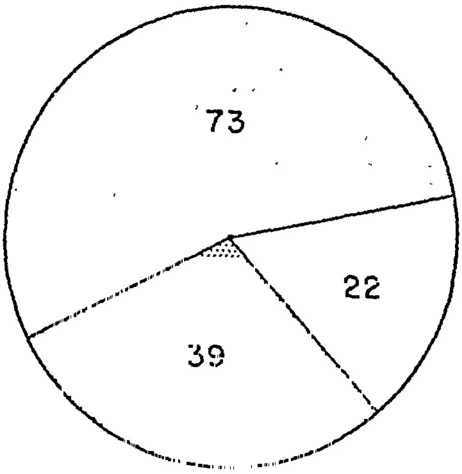

Fig. 2.—Associated physical and psychiatric conditions in 134 cases: 39 independent, 73 with physical disorder affected by nervous state and 22 with nervous state secondary to physical disorder.

INCIDENCE OF NEUROPSYCHIATRIC PROBLEMS

In 594 of the 1,000 cases the complaints were explained entirely by physical disorders (fig. 1). There was no nervous problem of clinical importance. In 272 cases the complaints were purely neuropsychiatric; in 134 a combination of physical disorders and significant neuropsychiatric disorders was encountered. In 39 cases of this last group (fig. 2), independent and unrelated physical and nervous problems coexisted (for example, renal calculus and neurasthenia); in 73 the physical disorder (for example, bronchial asthma) was aggravated or provoked by a primary nervous state, and in 22 the nervous state was considered to be secondary to the physical disorder (for example, an anxiety state in a patient having mitral stenosis).

Even though it may appear to be restricted to a physical disorder, any illness might be considered to have a mental component. The degree of mental and nervous reaction will depend on several factors, including the seriousness of the illness, the degree of suffering,

---

From the Department of Internal Medicine, the Lahey Clinic.

Read before the Section on General Practice at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

[2] Strecker, E. A.; Ebaugh, F. G., and Ewalt, J. R.: Practical Clinical Psychiatry, ed. 6, Philadelphia, The Blakiston Company, 1947.

uncertainty regarding the outcome, interference with work and other plans, financial loss and perhaps most of all the personality of the patient. In the majority of patients as we see them, the nervous reaction does not become a medical problem. In nearly 60 per cent of this group of 1,000 patients, there was no noteworthy nervous condition requiring special treatment. It might be said that nothing was needed from this standpoint beyond expression of the art of medicine as employed by every medical practitioner.

CLASSIFICATION

Further analysis (fig. 3) showed that of the 406 neuropsychiatric cases there were 3 cases of psychosis and 7 borderline cases, including 5 cases of mental depression. In 75 cases the diagnosis of psychoneurosis was made. There remained 321 cases in which the diagnosis neither of psychosis nor of psychoneurosis appeared justified. The characteristics of this group will be discussed later.

DIAGNOSIS OF NERVOUS CONDITIONS

The diagnosis of nervous conditions[3] should not depend merely on exclusion of organic disease; in fact, 1 in 7 of our patients had both physical and nervous disorders of importance. Recognition must depend on observation of the characteristic manifestations of the nervous disorder itself. Some of the somatic complaints are pathognomonic; among these are globus hystericus and sighing respiration with difficulty in getting a satisfying breath. Signs of nervous tension which can be noted on examination include bitten finger nails, flushing of the face and variable tachycardia. The fatigue resulting from nervous tension has special characteristics, described elsewhere. These include variability unrelated to physical activity; it is usually worse in the morning, decreasing after activity. One can learn, sometimes with ease and sometimes with difficulty, of worries, low spirits, inability to enjoy work and social relationships, difficulty in making decisions and disturbing mental conflicts.

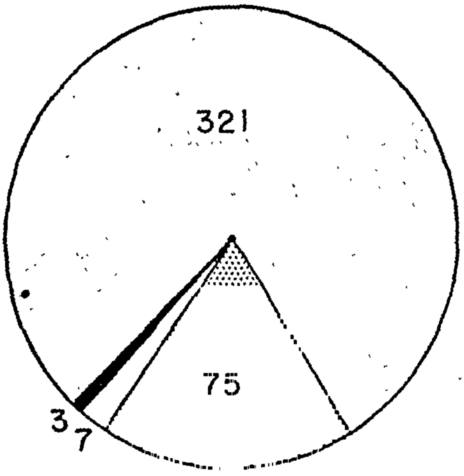

Fig. 3.—Classification of neuropsychiatric cases: 3 cases of psychosis, 7 borderline cases, 75 cases of psychoneurosis and 321 others.

The next step is to distinguish from the neuroses the larger group already mentioned. For these cases of "benign nervousness" there is no diagnostic term which has been generally accepted, but they must be distinguished from the other groups in the consideration of diagnosis, treatment and prognosis. Although there is no clearcut line of differentiation, there is just as much difference from the practical standpoint between the benign nervous conditions and the neuroses as between the neuroses and the psychoses.

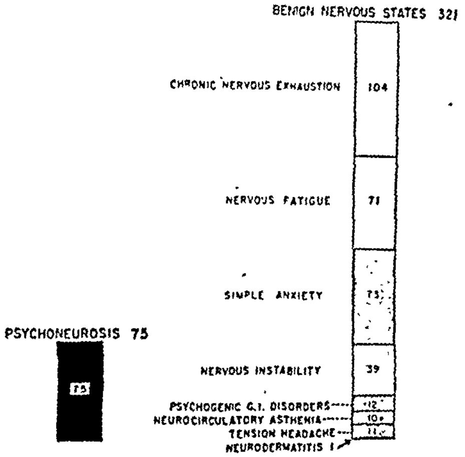

Fig. 4.—Clinical types of nervous disorders.

Several points of difference have been outlined elsewhere. A neurosis is largely dependent on *an intrinsic defect in the personality* of the person[4] and is usually considered to be an expression of subconscious emotional conflicts. There may be a background of constitutional inadequacy. In the family history "nervous breakdown" is of common incidence. Multiple complaints are usual. The history is changeable. The onset of complaints is vague—they frequently date back to childhood. Benign nervousness, on the other hand, is largely the result of *external factors.* The patient is of average constitution. He is more likely to have a single complaint. He gives a consistent history. He can date the onset of his symptoms, and he gives a previous history of average health.

The reaction to reassurance in these two types of cases is decidedly different. The neurotic patient is disappointed when the physician tells him that the physical examination gave negative results. He needs psychotherapy planned to suit his individual circumstances. The patient with benign nervousness expresses satisfaction if informed that there is nothing physically wrong. He can recover without any special psychotherapy other than sufficient time with the physician to ventilate his problems.

NOMENCLATURE

The Committee on Statistics of the American Psychiatric Association classified the psychoneuroses into six separate types—hysteria, psychasthenia, hypochondriasis, anxiety state, neurasthenia, reactive depression (simple situational reaction) and a mixed group. Anxiety state and simple situational reaction would be the appropriate terms in many of the cases in which we have considered the conditions to be benign nervous states, but for the group as a whole it seems to us more important to distinguish a separate clinical problem and not a type or types of psychoneurosis. The distinction is not merely a matter of degree; it concerns the difference in the personalities of those concerned. The management of a case must be planned accordingly and the prognosis modified.

---

[3] Allan, F. N.: The Differential Diagnosis of Weakness and Fatigue, New England J. Med. **231**: 414-418 (Sept. 21) 1944; The Clinical Management of Weakness and Fatigue, J. A. M. A. **127**: 957-960 (April 14) 1945.

[4] Dynes, J. B.: Mental Breaking Points, New Eng. J. M. **234**:42-45 (Jan. 10) 1946.

The unsatisfactory situation in regard to classification led to formulation of separate nomenclature lists for the Army, the Navy, the Public Health Service and the Veterans Administration. As Thomas[1] pointed out, the introduction of a new term for the benign nervous conditions would be undesirable at this time, but if the physician has his attention directed toward therapy and prognosis on a sound basis, the ordinary descriptive terms of clinical types will suffice.

CLINICAL TYPES OF NERVOUS AND EMOTIONAL DISORDERS

Separation of the two main groups of cases into clinical types is often difficult because they tend to overlap, but the effort to subdivide them on a descriptive basis according to predominant characteristics resulted in data of some interest (fig. 4).

Among the cases in which there were nervous and emotional disorders, the diagnosis of psychoneurosis was made in 75 (neurasthenia 60, anxiety neurosis 10, hysteria 5). The diagnosis of a benign nervous state was made in 321 cases. In 104 of these the term applied was chronic nervous exhaustion. The term nervous fatigue was used to describe the same condition when shorter in duration and less severe in degree. This diagnosis was made in 71, making a total of 175 cases of nervous exhaustion or fatigue. The diagnosis was simple anxiety in 73, nervous instability in 39, psychogenic gastrointestinal disorders, including irritable colon and nervous indigestion in 12, neurocirculatory asthenia in 10, tension headache in 11 and neurodermatitis in 1.

The identity of these types was not as clearcut as these figures seem to indicate. There was much overlapping, but in the interest of simplicity each case was classified in one or other of the types according to the predominant characteristic. Actually, tension headaches and functional gastrointestinal disorders occurred also in many of the cases listed under the heading of chronic nervous exhaustion and simple anxiety. When a patient with neurocirculatory asthenia was also neurotic his condition was classified as anxiety neurosis.

TREATMENT

The physician who can readily secure the help of a psychiatrist for his patients is fortunate. The advantages of special training and experience in psychotherapy are unquestioned, although patients often resent the recommendation of a psychiatric consultation and physicians are sometimes reluctant to advise it. The idea that only the person with a major mental disorder is a proper patient to refer to the psychiatrist is still prevalent. There is misunderstanding of the possibilities of psychotherapy, too.

As explained by Appel,[5]

> Psychotherapy is not just talking to patients; it is not just humoring them, neither is it the giving of platitudinous suggestions, nor is it merely the prescription of sedatives and placebos. It is more than removing an irritated, stubborn, temperamental person from the home to give the family relief. Psychotherapy has well defined goals; it has well defined rules and methods (proven for the most part) of reaching these goals. New ideas, attitudes, correlations and perspectives must be woven in the web of the patient's life according to the laws of emotional health.

The patient with a benign nervous condition can usually be treated satisfactorily by any physician who shows interest, tact and patience. Often such a person will get along best with the family doctor, in whom he has confidence. This physician may exert a stronger influence over a longer period of time. Nevertheless, all of us engaged in the practice of medicine can profit by learning new technics in psychotherapy. We must avoid falling into ruts, applying the same technic in every case. We cannot successfully use simple reassurance in all cases. In particular, we must recognize the fact that we cannot expect to help the patients with true psychoneuroses by means of so-called "common sense." It is in these cases that the skill and experience of the specialist are most urgently needed. These are the cases which should be particularly selected for psychiatric consultation and treatment. The psychiatrist should be called on when there is continuing disability. His help is welcomed in these most serious cases. He can also provide leadership in developing and teaching technics for the internist and general practitioner to use in the simpler cases.

MAJOR MENTAL DISORDERS

Only 10 patients with serious psychopathic conditions appeared in the 1,000 cases, and in only 3 of these was there an actual psychosis. Although he may not see patients with psychosis often, the physician must recall in each instance the various physical disorders which might be responsible before he shifts his responsibility to the psychiatrist or institution for mental diseases. When the patient has an acute psychosis, the physician must consider among other conditions drug intoxication, alcoholism, hypoglycemia (spontaneous or induced by insulin) and an epileptic equivalent. When the symptoms are chronic he must consider syphilis, brain tumor, pellagra and also the effects of drugs, especially bromide and digitalis.

The special treatment of the psychoses should be left to the specialist, but it may be pointed out that the prospects of successful therapy have been increased in recent years, in particular by insulin and electric shock and also by frontal lobotomy.

The patient with the so-called psychopathic personality does not show the loss of sense of reality and the abnormal thoughts and behavior of the psychotic patient, but he displays nonconformity with the usual social standards, maladjustments, which lead to difficulties in school and work and in the home, and repetition of harmful behavior in spite of realization of the consequences. There are cases in which the term psychopathic personality seems inappropriate and extreme. In these, the less offensive term, eccentric personality, can be used. Each of these terms was used once in the 1,000 cases.

The psychopathic personality in itself is not often a medical problem, but people with such personality, as well as patients with actual psychosis, come to doctors because of the ordinary ailments. The physician must take the peculiarities of the person into account in dealing with his complaints. One thing that must be recognized clearly is the futility of attempting to change the psychopathic personality by reasoning or by scolding. Recognition of this fact will enable the physician to save his own time and prevent disappointment on the part of all concerned.

MENTAL DEPRESSION

Simple mental depression is a more common problem; it was observed in 5 cases in this series. The common manifestations are low spirits, weeping, self reproach, feelings of guilt, slowing of action, inability to make decisions and sometimes morbid ideas regarding disease and abnormal function. People who have been energetic, buoyant in spirit and successful in their activities show this change in personality, sometimes initiated by grief or disappointment or for no apparent reason.

---

[5] Appel, K. E.: Psychiatric Therapy, in, Personality, and the Behavior Disorders, Edited by J. McV. Hunt, New York, Ronald Press, 1944, vol. 1, p. 1137.

In the milder cases there may be some benefit from reassurance; in the more severe cases, particularly those in which there has been no apparent precipitating factor, efforts at reassurance never help much. In some women at the menopause there may be benefit from estrogenic therapy. Claims have been made for success in treating older men with androgens, but the results are more often disappointing. "Benzedrine" (amphetamine) and desoxyephedrine help in some of the milder cases. In severe cases, electric shock therapy has been promising.

In general, the effectiveness of psychotherapy is limited in dealing with these depressed patients. Reasoning is futile. The physician can be spared wasted efforts and disappointments by recognition of the nature of the type of disorder. There is reason to hope for spontaneous remission of the cycle of despair, but the risk of suicide must be kept in mind. Hints regarding suicide must not be disregarded; institutional care, or at least psychiatric aid, should be secured if possible.

SUMMARY

To evaluate the importance of nervous and mental factors in relation to ill health, a survey was made of 1,000 cases in which a general medical examination was made at the Lahey Clinic. In 60 per cent the complaints were explained entirely by physical disorders; there was no nervous problem of clinical importance. The complaints were purely nervous and mental in 27 per cent. A combination of physical disorders and significant neuropsychiatric disorders required attention in 13 per cent.

Among the 406 neuropsychiatric cases, in only 3 was there a psychosis, in 7 borderline psychotic problems, including 5 cases of mental depression. In 75 cases the diagnosis of psychoneurosis was made. There remained 321 cases in which the diagnosis neither of psychosis nor of psychoneurosis appeared justified. This large group of patients presenting benign nervous and emotional disturbances should be distinguished, to ensure them proper attention from the medical, psychiatric and social point of view. They can usually be managed by any physician, requiring only thoroughness in examination, an understanding attitude, tact and patience. The patients with the more serious, deep-seated nervous disorders deserve the special management of the psychiatrist.

ABSTRACT OF DISCUSSION

Dr. John B. Dynes, Boston: I believe that the figures presented in this paper have particular significance in regard to the relation of psychiatry and general practice. Of 406 patients who had some kind of nervous or mental disorder there were 321 who could not be classified under any definite psychiatric label. Psychiatrists see a relatively small proportion of all the patients with nervous disorders. They draw their conclusions largely from cases which represent a selected group. Sometimes these conclusions do not agree with conclusions which would be reached by general practitioners who see a representative cross section of all types of medical problems and who see a relatively small proportion of patients with serious nervous and mental disorders. In the Section on Internal Medicine, Dr. Henry Thomas, who spoke on "What is Psychotherapy," stressed an important point, namely that the physician who first sees the patient is in a good position to alter that person's attitude for good or ill. You are all familiar with the fact that some patients have been permanently influenced by medical advice in early life. For example, a person given a false diagnosis of heart disease may become a permanent neurocirculatory invalid. The physician is also in a position to exert an unusually potent weapon for good. You are all familiar with the potency of suggestion in dealing with certain persons The general practitioner has great influence in psychotherapy. The mere statement from the physician that the patient has "no nervous or mental disorder" and "no disease" can often quiet the patient's fears. Irregular practitioners (faith healers, chiropractors and so forth) are anxious to take over patients who are given insufficient attention by general practitioners and specialists merely because the trouble is primarily nervous, cases in which the general practitioner can furnish so much more help with his greater knowledge and interest in all the problems of the patient. A psychotherapist is born and not made. Although a natural aptitude is important, another important factor in the handling of patients with nervous disorders is that one must take enough time to find out what ails the patient. Time is costly, but it pays rewards, not so much from the monetary standpoint but from that of helping persons who are disturbed and distressed.

Dr. Frank N. Allan, Boston: Medical education has been inadequate in respect to the attention given the nervous factors in medical practice. Better teaching in psychiatry is needed, but general practitioners should also make their contribution to the education of medical students and interns in the diagnosis and management of the common nervous problems.

CARCINOMA OF THE CERVIX (STAGE I) TREATED INTRACAVITARILY WITH RADIUM ALONE

Five, Ten and Fifteen Year Results; Recurrences After More Than Five Years

JULIETTE BAUD, M.D.
Paris, France

Experience has shown that the rate of cures following radiotherapy of carcinoma of the cervix, stage I, has not risen above 75 per cent despite technical improvements. Co-workers have tried to find the reason for this, with special reference to the action of locally applied radium.

Our study includes the histories of 105 patients with carcinoma of the cervix, stage I, histologically verified in each case, treated from 1929 to 1941 with radium alone at the Curie Foundation.

In fact, during that period the equipment of our departments was insufficient, so that we were not able routinely to combine, as we usually do now, external radiation with intracavitary curietherapy in each case. As a result, out of 228 patients (stage I) only 123 received intracavitary radiotherapy with external irradiation. One hundred and five received only local treatment with radium.

CLINICAL ASPECTS OF THE LESIONS

In the 105 patients observed, the tumors seemed, at the clinical examination, entirely limited to the cervix. They were more or less bulky exophytic growths or endocervical ulcerations with partial destruction around the external ostium. In 5 cases the condition developed in a remaining cervical stump.

These were not necessarily the best cases. Only 5 patients had early lesions; 10 were obese; 14 were 70 to 80 years old; 14 were in bad general condition;

Read before the Section on Radiology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

3 had previously received roentgen therapy for uterine fibroids; 2 patients refused external irradiation, and 55 could not be treated by external irradiation because of the shortage of apparatus. In addition, the treatment in 2 patients, who subsequently died, was interrupted because of septic complications.

TECHNIC OF TREATMENT

The usual technics of the Curie Foundation with some minor technical modifications have been utilized.

Endouterine application is made with a sound of gum lined with a thin aluminum leaf. The external diameter is 6 mm. Depending on the case, two, three, four and occasionally five tubes of radium element filtered with 1 mm. of platinum are placed in the sound. The length of the apparatus is adjusted to the depth of the uterocervical canal which requires radiation. The usual length of the sound is 8 cm., containing two tubes of 13.33 mg. of radium element and one tube of 6.66 mg. of radium element. The 6.66 mg. tube is placed in the distal portion of the sound. We think that it is most important to radiate the uterine canal beyond the isthmus; however, it is not necessary to go too far when the uterine cavity is enlarged to 12 or 14 cm., which is usually the case when fibroids are associated with carcinoma of the cervix. We have occasionally used sounds of 12 to 14 cm. containing four to six tubes. The sound, because of the lining of aluminum, is sufficiently rigid, but is flexible enough to allow articulation between the tubes, and therefore it easily accommodates itself to the direction of the canal.

Intravaginal irradiation is accomplished with the colpostat, in which the spring between the corks is more supple than usual. It is then easy to place the corks containing tubes of 13.33 mg. of radium element in the lateral fornices without undue distention of the vaginal vault. This also facilitates the placement of one or two independent corks containing 6.66 mg. of radium element in front of the cervix. Loose packing with small gauze strips carefully placed assures fixation of the colpostat in the proper position during the time of irradiation and also affords protection to the surrounding structures anteriorly and posteriorly. The suppleness of the spring is advantageous in reducing the trauma to the mucosa in contact with the cork.

In 95 per cent of the cases treatment is begun with placement of the uterine sound immediately after dilation of the uterus. This is done under strict aseptic precautions and with minimal trauma, in order to avoid the complications of infection. Very little dilatation is required, because the external diameter of the sound measures only 6 mm. The sound is left in place for five or six days, and on the second or third day after the beginning of uterine irradiation the colpostat with the medial cork is placed and left for five or six days. It is planned to administer the total dose in seven to ten days.

In 5 per cent of the cases, the cervical ostium is not visible because of a bulky friable lesion. Under those conditions it is more prudent, in order to avoid any unnecessary trauma and the potential complications of infection, to place the colpostat first. Rapid regression of the bulky tumor occurs, and it is usually possible to place the uterine sound after five or six days. The dose delivered varies from 24 to 36 and in exception cases 40 millicuries destroyed (3,200 to 4,700 and 5,230 milligram hours) in the uterine cavity and 24 to 36 millicuries destroyed (3,200 to 4,700 milligram hours) in the vagina.

In the 5 cases of carcinoma of the cervical stump the vaginal dosage was the same as in the other cases; however, the intracervical dose never exceeded 12 millicuries destroyed (1,600 milligram hours).

In general, the dose administered has been smaller for the aged or those patients in poor condition and larger for the young and healthy patients.

POST-TREATMENT REACTIONS

Frequently during the intracavitary application of radium there is a slight rise in temperature. There are no abdominal signs present. The 2 patients who died of septic complications were treated in 1931 and 1933. Since 1936, chiefly because the conditions of hospitalization have improved, we have not seen in patients with the epithelioma of the cervix (stage I) any septic complications serious enough to require interruption of treatment or to endanger the life of the patient. In most of the stage I cases the treatment proceeds without incidence, and frequently the general health of the patient is improved during treatment because the melting away of the tumor causes less bleeding and the superficial infection clears.

There were few rectal reactions. These were chiefly benign. Of the 105 patients treated, 71 had no intestinal complaints, either early or late; 15 manifested rectal symptoms approximately eight to fifteen days after treatment. These symptoms were chiefly diarrhea and occasionally blood-streaked mucous stools. Eight patients had isolated symptoms (short periods of diarrhea, constipation and tenesmus), which appeared during the first year after the treatment. Late symptoms appeared one year or more after the treatment in 10 patients. There were 5 patients with moderate but persistent constipation. Five others had various other benign complications, consisting of alternating diarrhea and constipation, tenesmus and hemorrhoids. In most of these cases intestinal complaints had existed before the beginning of treatment.

Only 1 patient had a serious complication, which was an histologically proved necrotic ulcer on the anterior wall of the rectum, 5 cm. from the anus. The lesion appeared eight months after treatment. Some months later this lesion healed, leaving only a fibrous scar in its place. This complication was explained on the basis of a technical error which could have been avoided. The patient died six years later of local and pelvic recurrence.

RESULTS OF TREATMENT

Of the 105 patients treated, 74, or 70.4 per cent, were alive without evidence of disease after an observation period of five years. Two died of complications of the treatment. Eleven died from intercurrent diseases after a period of observation from six months to four years (1 after six months of pulmonary tuberculosis, 2 after four and 5 months of psychosis which had existed prior to the treatment, 5 after three or four years of cardiac disease and 3 after one to two years of pulmonary disease). Eighteen patients had recurrences from eleven months to four years after the treatment (3, local recurrences; 2, recurrences in the corpus and parametrium; 5, local and pelvic recurrence; 6, recurrences in the pelvis alone, and 2, distant metastases). The earlier recurrences appeared in the parametrium after eight months in a case of carcinoma of the cervical stump, and in another case of exophytic tumor of the cervix a recurrence developed in situ. There were 15 cases of recurrence after two to three years. The latest recurrence occurred locally after four years and nine months in a case of endocervical carcinoma. The recurrence was sudden and the evolution rapid in 17 cases. We had only 1 case in which the condition progressed slowly after recurrence.

Three Local Recurrences.—There was local recurrence in 3 cases: in 1 after eight months, in 1 after eleven months and in 1 after four years and nine months. The dosage delivered in these cases were 30 plus 30 millicuries destroyed (4,000 plus 4,000 milligram hours), 28 plus 33.6 millicuries destroyed (3,700 plus 4,400 milligram hours) and 34.8 plus 34.8 millicuries destroyed, (4,600 plus 4,600 milligram hours).

The first patient, a very obese person, received a second intravaginal application of 28 millicuries destroyed (3,700 milligram hours). Radionecrosis occurred, but in spite of that the disease progressed rapidly and the patient died fifteen months later. The second patient, in whom the recurrence was apparently limited to the cervix, had a radical Wertheim operation performed. At operation, the right side of the pelvis was observed to be involved with neoplasm. Examination of the operative specimen disclosed that the recurrence in the uterus had developed chiefly at the level of the isthmus in a heavily radiated area. A postoperative vesicovaginal fistula occurred, and the patient died of disease six months later.

In the third case, there was recurrence about four years and nine months after treatment. Because of the large dose used in the first treatment, no further local therapy was given. External teleradium therapy was utilized. The cervix healed; however, the patient died of abdominal metastases after six years.

Two Recurrences in the Body of the Uterus and the Parametrium.—There were 2 cases with recurrences in the body of the uterus and the parametrium, which appeared suddenly after one and three years, respectively.

The first patient had a carcinoma of the endocervix and received a dose of 28.2 plus 32.4 millicuries destroyed (3,750 plus 4,300 milligram hours). Several weeks before the recurrence the patient had a cerebral hemorrhage with deterioration of her general condition; therefore it was not possible to give her any further treatment, and she died sixteen months later. The second patient, aged 71, was treated with a low dosage, 21.4 plus 28.4 millicuries destroyed (2,850 plus 3,700 milligram hours). There was a recurrence three and a half years later. The evolution of the process was rapid, and the patient died four months later.

Five Local and Pelvic Recurrences.—There were 5 cases of local and pelvic recurrence, in 3 of these patients after fifteen to twenty months. These were cases of endocervical carcinoma. The doses used were 36 plus 30 millicuries destroyed (4,700 plus 4,000 milligram hours) and 30 plus 33.6 millicuries destroyed (4,000 plus 4,400 milligram hours). The progression of the disease was rapid, and the patients died two and two and a half years after the beginning of treatment. The fourth recurrence was in a case of adenocarcinoma of the cervical stump, in spite of a rather significant dose, since it has been possible to give, by means of an intracervical applicator, 15.6 millicuries destroyed in addition to the vaginal dose of 26.4 millicuries destroyed (2,140 plus 3,500 milligram hours).

The fifth patient had a late recurrence, the lesion having been treated with an unsatisfactory technic. There was recurrence after four years, and death followed two years later.

Six Pelvic Recurrences.—There were 6 cases of pelvic recurrence, with early recurrence after eight months in a case of exophytic carcinoma of the remaining cervix (12 plus 36 millicuries destroyed) and after one year in the case of a bulky cervical tumor (30 plus 30 millicuries destroyed).

There were recurrences after two, three and four years in 4 other patients: 2 with endocervical carcinoma and 2 with exophytic tumor. Progression of the disease was rapid, and death occurred four to five months after the recurrence. It was possible, with roentgen treatments, to slow the progression of the disease in the case of the cervical stump carcinoma; however, the patient subsequently succumbed to the disease.

Two Distant Metastases.—Metastases to the liver and generalized metastases occurred after one year in a case of a highly undifferentiated carcinoma in a very obese patient. Metastasis to the vertebral column occurred after four years in a patient treated for endocervical carcinoma.

FATE OF CURED PATIENTS AFTER FIVE YEARS

Of the 74 patients in good condition five years after treatment, 55 were alive and well at the time of writing: 4 for eighteen years, 5 for seventeen years, 4 for sixteen years, 9 for fifteen years, 8 for fourteen years, 11 for thirteen years, 2 for twelve years, 3 for eleven years, 3 for ten years, 2 for nine years, 3 for eight years and 1 for seven years.

Twelve died of intercurrent disease from six to fifteen years after the treatment. Nine of them were over 70 years old: 1 patient was 70 years old; 1 was 73; 2 were 77; 2 were 78; 1 was 79; 1 was 82, and 1 was 89. They died of cardiac disease and acute pulmonary congestion. Three others died younger, at ages 65, 59 and 63 years, respectively, of uremia, pulmonary disease and other indeterminate cause. One patient was untraced after six to seven years. There were 6 cases of recurrence after six, seven, eight and eleven years.

Local Recurrences.—There was 1 case of local recurrence after six years, which was a small endocervical lesion. The dosage had been 33.6 plus 27.6 millicuries destroyed (4,400 plus 3,670 milligram hours). A Wertheim operation was performed in another country in 1940. The patient was alive and well at the time of writing. Unfortunately, we have no description of the operative observations.

Two Abdominal Recurrences Involving the Intestine.—In 2 patients abdominal recurrences involving the intestine were seen after six and seven years. The patients had bulky exophytic tumor of the cervix. The dosage was 30 plus 25.2 millicuries destroyed (4,000 plus 3,350 mililgram hours) for the first patient, age 70, and 33.6 plus 30 millicuries destroyed (4,400 plus 4,000 milligram hours) for the second patient. The progression of the disease was rapid.

Two Local and Pelvic Recurrences.—Two patients died after eight and a half years and eleven years. This occurred during the German occupation, and it was necessary for us to receive information indirectly about these patients; however, from the data received, it was assumed that local and pelvic recurrences had developed.

One Pelvic Recurrence After Six Years.—An obese patient was treated for an endocervical carcinoma with a dosage of 36 plus 34.2 millicuries destroyed (4,788 plus 4,500 milligram hours). Six years after treatment she presented a slowly progressive pelvic recurrence. This grew to involve the whole pelvis, and the patient died one year and ten months after the appearance of the recurrence.

GENERAL REVIEW OF THE RECURRENCES

The beginning of recurrences before or after the fifth year was sudden in 20 cases, less sudden in 2 cases and undetermined in 2 cases.

Progression was rapid in the nontreated patients, and the survival was six to ten months for 15 patients and fifteen to twenty-six months for 5 other patients.

Of the 4 patients treated a second time, 1 patient died four months after the operation, and 2 patients who received roentgentherapy and telecurietherapy, respectively, died fifteen and twenty-seven months after the onset of the recurrence. The last patient was actually cured by a Wertheim operation performed for a local recurrence six years after intracavitary curietherapy.

It is difficult to explain the recurrences on the basis of the dosage delivered; in fact, there were local recurrences in 4 patients who received large doses: 33.3 plus 24 millicuries destroyed, 30 plus 30 millicuries destroyed, 34.8 plus 34.8 millicuries destroyed and 33.6 plus 27 millicuries destroyed, respectively, in a place where the tissue dose was high. In addition, 2 cases of recurrence in the body and surrounding tissues began in the uterine canal alongside the uterine sound.

There was pelvic recurrence in an obese patient who had received 36 plus 34 millicuries destroyed (4,788 plus 4,400 milligram hours).

Other patients have been cured with smaller doses. Actually, 1 patient who has been living and well for seventeen years received only 24 plus 30 millicuries destroyed. Two other patients, living and well after sixteen years, received, respectively, 24 plus 31.2 millicuries destroyed and 21.6 plus 32.4 millicuries destroyed.

The failures observed in this series of 105 cases cannot be attributed to any special anatomic clinical type of lesion. They have essentially the same frequency in the endocervical carcinoma and in the exophytic tumors. The histologic examination of the specimens disclosed the same varieties in the cured and noncured patients. In only 1 case, that of a wholly undifferentiated carcinoma, did the histologic aspect of the primary lesion give a foreboding of the development of early metastasis. The origin of these tumors is perhaps in isolated cancerous cells not destroyed by radiation, which remain quiet for a variable length of time and suddenly become active in situ or give birth to more or less remote new foci. One may postulate that isolated cancerous cells already scattered through the parametrium or pelvic glands suddenly become active after a latent period.

We feel that cure of epithelioma of the cervix uteri, stage I, can be obtained by treatment with radium alone, as well as with radium plus roentgen rays, and that perhaps the roentgen rays are not necessary. However, rather than undertake such a program too soon, we have started to treat a series of patients by performing a Wertheim operation six weeks after the intercavitary therapy. In removing the uterus, the dangers of local recurrence are taken away. In addition, this permits us to study the effects of radium therapy and to verify the condition of the pelvic glands.

ABSTRACT OF DISCUSSION

Dr. Harry H. Bowing, Rochester, Minn.: The officers of the Section on Radiology of the American Medical Association have extended to me the privilege of opening the discussion of this outstanding contribution by Dr. Baud and her co-workers at the Radium Institute of Paris, undoubtedly the most scientific center of radium therapy in France or in the world. Madam Curie and Professor Regaud, co-directors of the Curie Foundation, and their collaborators, have explored the unknown field of radioactivity and have waged war on cancer by research and therapeutics. The immense prestige of the Radium Institute of Paris, gained through thirty years of proficient and remarkable work in radium therapy, is constantly recognized by zealous therapeutic radiologists all over the world. The reliability of the statistical information presented by Dr. Baud is exceptional, as is the series of 105 cases reported in this study, in which the lesion appeared clinically to be limited to the cervix uteri. The 70 per cent rate of cure obtained in this series likewise is uncommon and exceptional. To consider post-treatment surgical intervention as an aid to increase the rate of five-year cures is fundamentally sound. It is evident that the surgeon will have no little task in attempting to improve on this high rate of salvage by his methods. Personally, I have always been in agreement with Dr. Regaud's statement, made twenty years ago, ". . . radium and roentgen therapy cannot and should not be divorced from surgery in the modern treatment of cancer." My experience in radium therapy and supplemental roentgen therapy in the care of patients with stage I cancers of the cervix uteri is indeed limited. However, in the consideration of post-treatment surgical intervention there are certain principles that seem to be in the realm of good judgment: 1. The initial radium treatment should be adequate for the control of the primary lesion. 2. When the patient, who has had an apparently satisfactory initial result from radium treatment, has a recurrence of the uterine discharge after an interval of three months or longer, she is a candidate for consideration of some type of surgical method rather than for a repetition of radium therapy. 3. The interval between radium therapy and surgical intervention should be sufficiently long to permit complete healing or the disappearance of any gross change in the tissue in the field of treatment. 4. The surgical method of treatment should meet the individual requirements of the patient.

Dr. Edwin C. Ernst, St. Louis: In the past there has been a tendency to employ variable sources of pelvic and uterine radium radiations, to the extent that the intensities were relatively increased in one or more capsules and correspondingly decreased in others. Thus, the distribution of the radium sources frequently was not employed according to the physical principles of uniform radiation. In my experience, equal spacing of equal radiation intensities is a technical physical requisite for reasonable protection of the normal bladder and rectal structures of the pelvis with maintenance or increase of the total radium dose specifically indicated in special cases. Pathologic analysis of uterine specimens that had been treated with radium has demonstrated the value of uniform distribution of the radiation. Unless one employs a sufficient number of cross fire areas or individual sections of radiation, one cannot hope to obtain a uniform and effective dose distribution to all of the potentially malignant structures, especially the areas behind or lateral to the cervical os region toward the parametrium. The two opposite planes of radiation, namely, the cervical canal and the vaginal vault fields, must be accurately and uniformly spaced; otherwise "hot spots" will develop. The distribution of the radiation sources within the cervical canal is less important and complicated than for the vaginal vault. The greater the number of sources of radiation in the vaginal vault, provided that these radiation sources are equally distributed with equal intensities, the more effective and more uniform will be the radiation throughout the entire pelvis, particularly the lateral fields. My co-workers and I have clinically diagnosed the condition in supposedly early cases as stage I, but, after surgical removal of diseased tissue, found that the line of metastasis extended laterally to such an extent that, if only two or even four sources of radiation had been employed in the vaginal vault, recurrence would have been inevitable unless a wide-angled radium bomb or large radium capsules (1.5 cm. in diameter), similar to those employed by some of our British colleagues, had been substituted. However, when six radium capsules are employed by means of an expanding colpostat, the distant fields are in closer contact with the radium sources. The average radiotherapist would not employ two or more radium needles in a single location, but rather places uniform sources of radiation intensities at equal distances, preferably 1 cm. apart. In either case, one either underradiates or overradiates certain portions of the pelvic uterine triangle.

PRIMARY PNEUMONITIS IN INFANCY

JOHN M. ADAMS, M.D.
Minneapolis

The epidemic occurrence of pneumonitis in newborn and premature infants has been reported previously,[1] but it is the purpose of this communication to emphasize for the first time the sporadic occurrence of this disease. Further, its relationship to other mild diseases of the respiratory tract in older persons or adults is more clearly understood at the present time.

Primary pneumonitis was first recognized in January 1937 as a severe epidemic disease of newborn babies. It was evident at that time, although little emphasis was accorded to the fact, that all stages of involvement of the respiratory tract occurred in the various patients in the same ward. Some of the babies manifested sneezing and cough only; others had pronounced cough with inspiratory dyspnea, while the majority were severely ill with attacks of cyanosis and considerable dyspnea, leading to death in 28 per cent of the patients.

In the sporadic cases which co-workers and I have observed, the same symptom pattern of cough, dyspnea

---

[1] Adams, J. M.: A New Form of Virus Pneumonitis Occurring Epidemically Among Newborn Infants, Proc. Soc. Exper. Biol. & Med. **46:** 114, 1941; Primary Virus Pneumonitis with Cytoplasmic Inclusion Bodies: Study of an Epidemic Involving Thirty-Two Infants with Nine Deaths, J. A. M. A. **116:** 925 (March 8) 1941. Adams, J. M.; Green, R. G.; Evans, C. A., and Beach, N.: Primary Virus Pneumonitis: A Comparative Study of Two Epidemics, J. Pediat. **20:** 405, 1942.

and cyanosis has been manifested in the most acutely ill patients with pneumonitis. However, cases of mild disease with only minimal involvement of the respiratory tract occur. There may be little or no evidence of infection in the lower respiratory tract as determined by our usual methods. The age and maturity of the patient appear to be responsible in the main for the variations which are met with. In the epidemics which we have studied, the morbidity and mortality have been extremely high in prematurely born babies as contrasted with normal full term infants. The same striking difference in morbidity is observed when these babies are compared with older children and adults. The disease may be extremely mild or even latent in older persons.

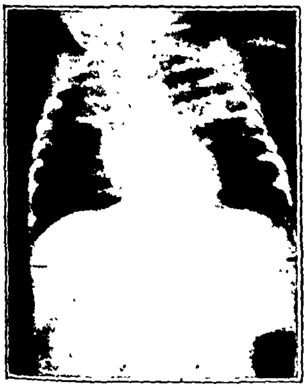

Fig. 1.—A roentgenogram of the lungs of a patient with primary pneumonitis, showing infiltration in the upper lobes of both lungs and minimal shadows in the lower lobe of the right lung.

In the typical sporadic case a history of mild disease of the respiratory tract in one or both of the parents is frequently elicited. It is difficult to define this illness in the contact person because of its mild or latent character, but usually there is subjective evidence of a "scratchy" sore throat, few nasal symptoms and mild or low grade febrile responses. The onset of the illness in the baby is rather abrupt, and at times the pulmonary symptoms may be the first observed. Sneezing and cough are the first symptoms in most of the patients. The temperature response is usually slight but may rise for a short time to 102 F. or 103 F. There are few physical findings in the cases of milder disease, but the more severely ill have marked dyspnea with retraction of the soft parts of the chest and some cyanosis. The latter signs may be severe, occurring in attacks usually at the time of handling or feeding of the patient. The exudate in the pharynx is abundant, whitish, thick and tenacious in character. Rales may be heard over the lung fields on careful examination. The roentgenogram of the lungs reveals diffuse shadows which are bronchial in distribution and usually widespread, but may be confined to a single lobe of the lung. A typical roentgenogram is shown in figure 1.

The diagnosis is made by the symptom pattern and by the rather characteristic shadows seen in the roentgenograms of the lungs. The diaphragms of the patient are depressed and there is evidence of emphysema in the typical case of primary pneumonitis. The white blood cell count is usually normal or only slightly elevated, with a predominance of lymphocytes.

Pharyngeal smears made from these patients in the acute stage of the disease reveal a great predominance of epithelial cells which contain typical cytoplasmic inclusion bodies. This finding is considered as helpful in the diagnosis, particularly when the inclusion bodies occur in large numbers in patients who satisfy the other criteria for primary pneumonitis. When stained with hematoxylin and eosin in the routine manner, the inclusion bodies are bright red or eosinophilic. There is a clear zone or halo about the inclusion body; they lie next to the nucleus of the cell and frequently indent it slightly.

The following report is that of a patient with a moderately acute respiratory illness which occurred sporadically in February 1947.

REPORT OF A CASE

The mother had a mild respiratory illness ten days prior to the first symptoms of the patient, and the father reported a similar illness which began six days prior to that of the baby. The parents' illnesses were marked by "scratchy" sore throats which lasted only a few days, and no temperature response was evident.

The baby, aged 5 months, was first observed to be "stuffed up" on Feb. 3, 1947, about 5 p. m. Sleep was fretful, and the parents were aroused at 3 a. m. on February 4 by severe coughing and choking by the patient. Its temperature at that time was 103 F. (rectal). The respiratory rate was 40 per minute and the pulse rate was 160 per minute. Sneezing, cough and fretfulness were the main symptoms. The temperature fell that morning and returned in the afternoon to 101.4 F. On February 4 the highest temperature recorded was 100.2 F.; on February 5, 100.8 F., and on February 6, 100.4 F. The temperature was normal by February 8. Most of the symptoms had subsided but some cough was present until February 10.

A white blood cell count on February 4 showed 6,250 cells with neutrophils 44 per cent and lymphocytes 56 per cent. No therapy other than control of humidity in the room was employed. The patient had a fair appetite throughout the illnesss.

Pharyngeal smears made from the patient on February 4, the first day of illness, revealed sheets of epithelial cells, many of which contained characteristic cytoplasmic inclusion bodies. A photomicrograph of a pharyngeal smear from this patient is shown in figure 2. The pharyngeal smears of the father and mother were both positive for inclusion bodies. The father's pharyngeal smear was almost identical with that of his baby, showing a rather high incidence of inclusion bodies per epithelial cell on the smear biopsy. There is a striking absence of leukocytic cells or bacteria in most of these pharyngeal smears from patients. Subsequent smears made from the patient and father showed a decreasing incidence of cells with inclusions during the next ten days.

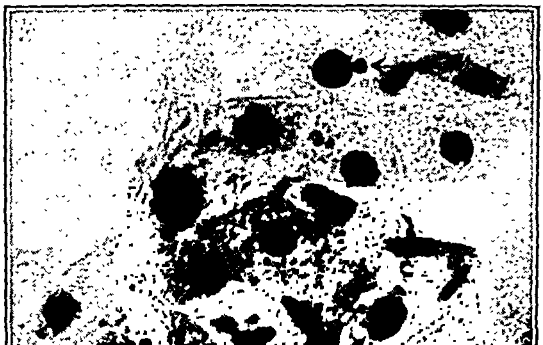

Fig. 2.—A photomicrograph of a pharyngeal smear from the patient described in the text, showing epithelial cells with cytoplasmic inclusion bodies, indicated by the arrows.

The treatment of babies with pneumonitis of mild or severe degree is largely symptomatic. Continuous oxygen has been beneficial to the infants who have signs of involvement of the lower respiratory tract. This is administered best by means of the small oxygen tent. The sulfonamide drugs and antibiotics have not been very useful, although they are sometimes employed to combat possible bacterial complications.

COMMENTS

Pneumonitis early in life presents a major problem to the physician. The first attack should logically be directed toward the prevention of this disease. Strict isolation of premature and newborn babies is the best and most practical method of control available today. The clinical and pathologic association of primary pneumonitis in infants with mild or latent disease of the respiratory tract in adults appears to be significant. Anatomical, physiologic and immunologic differences may account for the severity of this disease in premature and newborn babies, although within the same epidemic we have observed all degrees of involvement of the respiratory tract.

The question of immunity in some diseases of the respiratory tract is seriously questioned by reports now in the literature. The Commission on Acute Respiratory Diseases[2] demonstrated little or no protection in human volunteers when they were rechallenged with a bacteria-free filtrate some three weeks after recovery from their initial challenge with this material. If any immunity to this particular agent were present in the cases investigated, it was short lived or weak. On the other hand, they were able to show that human subjects were protected against rechallenge by a second and distinct agent which also caused mild primary disease of the respiratory tract. Prematurely born infants appear from our previously reported studies to be much more susceptible than newborn babies, suggesting strongly that the full term newborn infant is more highly protected, probably because of passive transfer of protective substance from its mother. Conclusive evidence is not yet available, but clinical experience strongly suggests that concentrated gamma globulin may contain prophylactic or protective substances against the agent responsible for primary pneumonitis in infancy.

Some comments on the pathologic changes in this disease are pertinent to the discussion. Many postmortem studies have revealed a distinct pathologic picture in the lungs of infants dying from the epidemic form of this disease. The prominent features are destruction and proliferation of bronchial and bronchiolar epithelium with peribronchial infiltration of mononuclear cells. Typical cytoplasmic inclusion bodies are found in the epithelial structures of the pulmonary tree. This includes the nasal, pharyngeal, trachial, bronchial and alveolar tissues. Because of the probable ubiquity of this agent, the interpretation of the finding of inclusion bodies must be made with caution. The same point of view must be assumed as is now held regarding the beta hemolytic streptococcus. The finding of this organism in the nose or throat does not always mean that the patient is suffering from invasion by the coccus. Likewise, the finding of inclusion bodies may or may not be significant. It seems to depend in the main on the correlation of this finding with clinical evidence of a characteristic disease, and whether they are found in large numbers exclusive of other findings in carefully prepared pharyngeal smears. The age of the patient probably plays a large role, also, in the occurrence of these bodies. They have not been described in lung sections from adults dying of nonbacterial pneumonia.

Experimental studies directed toward the causation of this disease are now in progress in our laboratory.

SUMMARY

Primary pneumonitis in infants occurring sporadically is described, and clinical and pathologic evidence is presented which appears to relate this disease directly to epidemic primary pneumonitis of infancy with cytoplasmic inclusion bodies.

The diagnosis and treatment of this disease are discussed briefly, with comments on the significance and interpretation of inclusion bodies in pharyngeal smears.

ABSTRACT OF DISCUSSION

Dr. C. B. Conklin, Washington, D. C.: Dr. Adams and his collaborators have brought to our attention a type of disease of the respiratory tract in infancy, often fatal, which has a high degree of communicability and gives evidence of having an etiologic agent heretofore not stressed. I shall consider first the clinical features and general pathology. Co-workers and I had occasion to study a sporadic outbreak of pneumonia in early infancy on the obstetric wards of a Washington Hospital. Cyanosis and dyspnea, preceded by running nose, sneezing and cough, were familiar phenomena, and Staphylococcus albus hemolyticus was the etiologic agent. The protocols of the necropsies corresponded in considerable detail with what was presented today. Dr. Adams in one of his papers calls attention to the similarity of the pathologic changes caused by the staphylococcus. Farber, who made a study of "inclusion disease," points to their occurrence in pneumonia, stating further that they are found in 25 per cent of pediatric autopsies. In 12 per cent of 183 autopsies they were found in salivary glands. Of significance are findings of Broadhurst, McLean and Taylor, who in 87 per cent of the throats of 100 students in Teachers College found inclusion bodies within epithelial cells. It was pointed out that the Bond-Mann stain, used for Negri bodies, was effective in staining the inclusions, suggesting a virus origin. Just before leaving Washington, through the courtesy of Colonel Ash at the Army Institute of Pathology, I had the opportunity of viewing slides obtained from a 2½ month old child that died with pneumonia. There were cells in lung tissue containing inclusions similar to those described. It may be observed that diseases associated with filtrable virus known at present are rare during the first year. I should like to ask whether the term "endemic" in Dr. Adams' series of cases would not perhaps be more appropriate? In view of the frequently reported finding of inclusions in cells of other organs such as salivary glands, it would seem of interest for Dr. Adams to report on other than the tissue of lungs. I am hopeful from the painstaking research now being pursued under Dr. Adams' direction that there will be found a pneumotropic virus the presence of which is strongly suggested.

Dr. Adams (closing): I am glad that Dr. Conklin brought up the subject of whooping cough because these babies do act clinically like many patients with pertussis. They have a spasmodic type of cough which is often brought on by handling. We have never heard a whoop, however. Of course, many persone with whooping cough do not whoop. Dr. Goodpasture described intranuclear inclusion bodies in pertussis, but nobody has observed, as far as I know, these bodies in our material. In Dr. Conklin's question about the endemic character of this disease, he may be referring to the endemics which undoubtedly have occurred.

AUREOMYCIN THERAPY IN HUMAN BRUCELLOSIS DUE TO BRUCELLA MELITENSIS

WESLEY W. SPINK, M.D.
and
ABRAHAM I. BRAUDE, M.D.
Minneapolis
M. RUIZ CASTANEDA, M.D.
and
ROBERTO SYLVA GOYTIA, M.D.
México, D. F., Mexico

Experimental and clinical investigations have shown that a combination of streptomycin and sulfadiazine provides a specific therapy for human brucellosis.[1] The clinical material available at the University of Minnesota Hospitals has been restricted to those cases in which the disease was due to Brucella abortus. Because the combination of drugs altered favorably the clinical course of disease caused by Br. abortus, arrangements were made to treat a group of patients in México, D. F., Mexico, having the more malignant form of brucellosis due to Brucella melitensis. The plan was to treat 100 patients with streptomycin and sulfadiazine. Previous trials with sulfadiazine alone at the Mexico General Hospital had shown that only an occasional case of brucellosis was improved after treatment. Only those patients were to be selected from whose blood cultures Br. melitensis was isolated. The studies began early in 1948. In general, a standardized schedule of doses was employed. Streptomycin was injected intramuscularly in a dose of 0.5 Gm. every six hours for two weeks. Sulfadiazine was simultaneously administered orally with an initial dose of 1 Gm. and then 1 Gm. three times a day for the same period of time. At the conclusion of this period of fourteen days of treatment blood cultures were made, and also at monthly intervals thereafter. To date this combination has been used in treatment in 65 bacteriologically proved cases of acute and chronic brucellosis due to Br. melitensis, and the details of this clinical experience will be presented elsewhere. After approximately one-half the patients had been treated, it became apparent that with the doses used streptomycin was causing vestibular dysfunction in a significant group of cases and that the clinical results were not as satisfactory as had been obtained in infections with Br. abortus in the United States. Because streptomycin had to be administered intramuscularly hospitalization was desirable, and hospital beds were always at a premium. It became obvious that in a country like Mexico, where brucellosis involved thousands of persons and where there were few hospital beds, a more satisfactory form of specific therapy would be one that included a drug or drugs which could be given orally and which would induce no serious toxic reactions. For these reasons, aureomycin was substituted for streptomycin in the therapy of a group of patients.

Aureomycin is an antibiotic which Duggar of the Lederle Laboratories obtained from the mold Streptomyces aureofaciens. The late Dr. Y. Subbarow, Director of Research of Lederle Laboratories, placed aureomycin at our disposal in March 1948, for experimental studies on brucellosis at the University of Minnesota Hospitals. Preliminary studies by Dr. James Shaffer showed that aureomycin did possess definite antibrucella activity against strains isolated from human beings. These investigations were extended in our laboratories by Dr. Ellard Yow and Dr. Robert Magoffin, who made comparative studies with aureomycin and streptomycin. Both in vitro and in the experimentally infected chick embryo, it was shown that weight for weight streptomycin was more active against the Brucella of all three species than aureomycin. These studies will be published in detail elsewhere. It could be deduced, then, that streptomycin would be more effective in brucellosis in human beings than aureomycin. Aureomycin, however, could be administered orally to ambulatory patients and had been found to produce only mild side effects in patients treated earlier with this antibiotic for other diseases. Because of these properties, the oral administration of aureomycin with sulfadiazine was begun in July 1948 in a group of patients with infections due to Br. melitensis. The clinical results far surpassed the expectations, and it later became evident that aureomycin alone, in relatively small oral doses, altered the clinical course of the disease in a most dramatic way. Though a longer follow-up period is essential for the complete evaluation of aureomycin, a report of the experience to date with this antibiotic is warranted because of the remarkable clinical results that have been obtained. It should be emphasized that prior to evaluation of treatment with aureomycin the clinical course of melitensis infections had been observed in hundreds of untreated persons, in those receiving vaccines, in patients receiving sulfonamide drugs, and in patients receiving streptomycin with and without sulfonamide drugs. A consistent and abrupt change in the clinical course of the disease for the better had been observed only in patients receiving aureomycin.

METHODS OF STUDY

This report is based on observations made in 24 patients from whose blood one or more cultures of proved Br. melitensis was obtained. The ages of the patients varied from 4 to 54 years. There were 16 female and 8 male patients. The duration of the illness varied from a few days to one year. Some of the patients were extremely ill, hospitalization being required; 1 patient (case 15, table) was so critically ill that little hope was held out for her eventual recovery. Six of the 24 patients had previously been unsuccessfully treated with a combination of streptomycin and sulfadiazine. Thirteen of the 24 patients received aureomycin as ambulatory outpatients. The results of treatment in the ambulatory group were as satisfactory as those obtained in the hospitalized patients and demonstrated the effectiveness of aureomycin in the absence of bed rest.

Since aureomycin was being substituted for streptomycin and initial experimental studies indicated that aureomycin was less active against Brucella than streptomycin, the first 16 patients treated received both aureomycin and sulfadiazine. At first, the dose of aureomycin was 0.5 Gm. every six hours for nine to thirteen days, with 1 to 3 Gm. of sulfadiazine daily for a similar period of time. When it became apparent that unusually

good therapeutic results were being obtained with this combination, a group of 8 patients received only aureomycin, with equally good results. The initial doses of aureomycin were reduced because of undesirable side reactions, which will be described shortly. On the first day of treatment, a total of 0.1 Gm. was given in divided doses; on the second day the total dose was 0.6 Gm.; on the third day it was 1.6 Gm., and treatment with 2 Gm., the maximum total daily dose, was begun on the fourth day. Treatment was carried out for a total of eleven days. That the aureomycin was being absorbed from the intestinal tract was proved by observation of the drug in the cerebrospinal fluid of 1 patient and in the urine of several patients. Blood cultures were made at the conclusion of therapy and then at weekly intervals thereafter.

RESULTS

The pertinent clinical features relating to these patients are presented in the table. Every patient was febrile before therapy was instituted, and it is to be noted that within two to three days after treatment was started the temperatures usually became normal. It is seen that 2 patients each received two courses of therapy with aureomycin. Although considerable improvement resulted from the first course and the blood cultures remained sterile, a second course was given because of recurrent fever. Case 22 was an example of a case of severe and chronic brucellosis that had persisted for one year. The patient was severely debilitated. She apparently recovered completely from active infection after treatment with aureomycin. One patient (case 8) was a riding instructor, and his illness had incapacitated him for five months. Within one week after completing treatment he was afebrile and was able to resume riding on a horse. Another patient (case 14) was a young housewife who was acutely ill and pregnant six months. Abortion was avoided probably as a result of treatment, since this is a common complication of bacteremic melitensis infections occurring during pregnancy. The most dramatic recovery was observed in case 15. A 23 year old housewife became critically ill six days post partum. She continued to deteriorate for six and a half months, with temperature as high as 105 F., purpura hemorrhagica, splenomegaly and anemia. Five days after treatment with aureomycin the temperature became normal, the purpura subsided and the spleen was no longer palpable. After the completion of therapy, blood cultures became sterile. Another critically ill patient (case 17) was extremely emaciated and had been ill for five months. During this time, five cultures of blood were positive for Br. melitensis. Recovery from the disease had not followed treatment with streptomycin and sulfadiazine. She was given only aureomycin in a dose of 18.8 Gm. over a period of fourteen days. She became asymptomatic two days after treatment was started, and during the month following the completion of treatment, two cultures of blood remained sterile; she was afebrile and had made a pronounced gain in weight and in strength. A complication of melitensis infections that is seen rather frequently is severe pain radiating down one or both sciatic nerves. This is usually totally incapacitating, so that the patients are unable to walk. Cases 19 and 21 represent instances of this complication in which prompt and complete recovery followed aureomycin therapy. Case 20 was an instance of severe brucellosis occurring in a woman with thyrotoxicosis. Prompt recovery from her infection occurred after treatment with aureomycin, but the evidence of thyrotoxicosis persisted.

It is significant that prompt improvement occurred in every one of the patients treated. Blood cultures taken after the completion of therapy had remained sterile in 10 of the patients, where enough time had elapsed to make such information of value, and in only one instance were organisms recovered. There is some doubt in this one positive culture, since it might indicate a contaminant. The patient from whom this culture was obtained had remained well as of the time of reporting.

SIDE EFFECTS FROM AUREOMYCIN

Besides the remarkable immediate benefit that the patients obtained soon after treatment was started, there were no serious toxic complications resulting from aureomycin. One reaction that can be ascribed only to the drug was seen so frequently that it must be detailed. It was seen in 12 of the 24 patients about eight to twelve hours after the first oral dose of aureomycin. The patients experienced an abrupt rise in temperature over that which had been present previously. This single spike in temperature was occasionally accompanied by a shocklike picture with a drop in blood pressure and tachycardia. Although some apprehension was attached to these phenomena, no serious consequences followed. It was observed that this type of reaction occurred when a dose of 0.5 Gm. was given every six hours. When smaller doses of aureomycin were administered initially, fewer of these effects were seen. This is the reason that, as time went on, an initial total daily dose of only 0.1 Gm. was given, but gradually increased so that the total daily dose was 2 Gm. on the fourth day of treatment.

The only other side effects pertained to the gastrointestinal tract. These consisted of nausea, vomiting and mild diarrhea. However, the manifestations were transitory and not severe enough to warrant discontinuation of therapy.

COMMENT

In the search for specific therapy in brucellosis in human beings the objective has been to utilize a drug or drugs that would eradicate the Brucella from the tissues. The ideal agent would be one that could be administered orally and that provoked no serious toxic effects. Besides accomplishing its primary purpose, such a drug would permit the treatment of outpatients or patients in the home, making hospitalization not mandatory. As far as the treatment of brucellosis in human beings in Mexico is concerned, aureomycin may fulfil the requirements of a much needed specific drug. Few beds in the hospitals are available for these patients, and even if beds were available the average patient could not afford the expense. Many of the patients are already critically ill, and serious toxic reactions from a drug are not desirable. To date, aureomycin appears to fulfil the requirements of a more satisfactory therapeutic agent. Whether aureomycin will prove to be equally effective in infections due to Br. abortus remains to be seen. One report has stated that a patient seriously ill with an infection due to Brucella suis recovered after the use of aureomycin and remained well.[1f]

From a biologic point of view one of the remarkable features of aureomycin is that it should be more effective than streptomycin in the most serious type of brucellosis in human beings, and yet in vitro and in the infected chick embryo aureomycin does not inhibit the multiplication of Brucella as effectively as streptomy-

cin. Experiments are now under way comparing these agents in larger infected animals, utilizing all three species of Brucella.

We should like to emphasize that this report is concerned only with the immediate therapeutic value of aureomycin in brucellosis in human beings caused by Br. melitensis. In such a disease, a long follow-up study will be necessary to evaluate the drug completely, and evaluation of treatment of the disease due to the other two species will be necessary. But the immediate results of treatment have been so encouraging and so unexpected that this report is being made.

The recommended doses of aureomycin for melitensis infections is as follows: a total of 0.1 Gm. given the first day in four divided doses, a total of 0.6 Gm. the second day, 1.6 Gm. the third day and 2 Gm. the fourth day. The drug should be administered for a total of ten days. This schedule is recommended until more information is forthcoming concerning the "Herxheimer-like" reactions and the amounts necessary to produce permanent recovery. Similar doses may be necessary in the cases of severe infections due to Br. suis and Br. abortus. A few patients treated at the University of Minnesota Hospitals have been given from 0.5 to 1.5 Gm. every six hours for ten days without ill effect and without an initial spiking of temperature and drop in blood pressure, but these infections were relatively mild. To date, we have had no experience with aureomycin given parenterally for brucellosis.

SUMMARY

Aureomycin has been administered orally to 24 patients having bacteriologic proved acute and chronic brucellosis due to Br. melitensis. The immediate therapeutic results have surpassed those obtained with any other specific therapy, including a combination of streptomycin and sulfadiazine. The toxic reactions due to aureomycin have been mild. Unless small initial doses of the drug are used, a febrile reaction associated with a drop in blood pressure may be observed. The severity and frequency of these phenomena have been reduced with the administration of small doses of drug at the beginning of treatment. It is emphasized that these encouraging results in the therapy of human brucellosis are concerned only with the immediate effects on the clinical course. These patients are being followed closely for clinical and bacteriologic relapses, and only after a lapse of several months can a definitive statement be forthcoming.

ADDENDUM

Further bacteriologic studies have been carried out over a period of one to three months following therapy. A total of eighty-two cultures of blood from the 24 subjects have been studied. One patient (case 9) has had no symptoms, but there has been slight fever and one of four cultures taken after treatment showed Brucella melitensis. Another patient (case 15) has had fever; the spleen has been palpable, and one of four cultures yielded Br. melitensis. It is to be recalled that this patient had an extremely severe infection and was not expected to live before treatment was started. One patient (case 14), who is now pregnant eight months and who had no fever or symptoms of brucellosis, had one of four blood cultures positive for Br. melitensis.

It is possible that the use of larger doses of aureomycin will prevent bacteriologic relapses. It is now recommended that a total daily dose of 4 to 6 Gm. for two weeks to be used rather than 2 Gm.

PANCYTOPENIA FROM "MESANTOIN"

Report of Two Cases

CHARLES W. FRANK, M.D.
and
JAMES F. HOLLAND, M.D.
New York

"Mesantoin" (3-methyl-5,5-phenylethyl hydantoin) is one of the newer anticonvulsant drugs and is chemically and pharmacologically related to "dilantin" (diphenylhydantoin sodium). Kozol[1] and Loscalzo[2] reported that this drug is effective in the control of grand mal seizures and may be useful in patients who are refractory or intolerant to "dilantin." They noted no serious toxicities, although "in about 40 per cent of the cases the lymphocytes were moderately increased at the expense of the neutrophiles."[2] Cutaneous eruptions have occurred in 4.5 to 14 per cent of the cases,[3] and Ruskin[4] recently reported a fatal case of dermatitis bullosa medicamentosa due to "mesantoin." A search of the literature reveals only mention of 1 case of serious blood dyscrasia ascribed to "mesantoin" alone.[5] On review of the case of fatal aplastic anemia following the use of "tridione" (trimethadione) reported by Harrison and his co-workers;[6] it is noted that "mesantoin" was concomitantly employed.[7]

During the past year, 1 fatal and 1 reversible case of profound pancytopenia have been observed in patients receiving "mesantoin," and they form the basis of this communication.

REPORT OF CASES

CASE 1.—I. T. L., a 16 year old Negro school boy, was admitted to the Presbyterian Hospital on Jan. 26, 1948, complaining of fever and joint pains of six weeks' duration. Since the age of 7, he had had epileptic equivalents characterized by attacks of periumbilical pain and amnesia. Phenobarbital was used for three years with moderate success, and "dilantin" was taken during the succeeding four years, despite which grand mal seizures had appeared at the age of 15. Because of undesirable nonhematologic toxicities, treatment with "dilantin" was stopped and "mesantoin" therapy, 0.3 Gm. daily, was started on June 9, 1947. During the summer of that year he experienced a generalized erythematous eruption, which subsided with local therapy given by his private physician. In September, severe pruritus and several small ulcers appeared around the ankles. During early December, he experienced the onset of cough, pains in the left side of the chest and left arm, fever, chilliness, night sweats and anorexia. In the next four weeks he lost 8 pounds (3.6 Kg.) of weight. His physician prescribed penicillin tablets and codeine cough syrup, which were taken intermittently. On December 22, the "mesantoin" dosage was increased to 0.4 Gm. daily, and he remained at home for the next month. In this interval, his constitutional symptoms persisted, and he experienced pain and swelling of the wrists and ankles, as well as nodules on the forearms. He was next seen on Jan. 26, 1948,

7. Since submission of this paper, another case of pancytopenia following "mesantoin" has been reported: Bloom, N.; Lynch, J. P., and Brick, H.: *"Mesantoin" Poisoning with Aplastic Anemia and Recovery,* J. A. M. A. **138:** 498 (Oct. 16) 1948.

when he was admitted to the Presbyterian Hospital. At no time had he taken "tridione."

Physical examination on admission revealed an acutely ill youth with a temperature of 103 F., pulse rate of 110 and respirations 22 per minute. The wrists, ankles and right elbow were swollen and tender. There were several erythematous tender nodules, ½ cm. in diameter, on the dorsal surfaces of the forearms. The heart and lungs were normal; no abdominal organs were palpable, and there was no significant lymphadenopathy.

Laboratory studies revealed hemoglobin of 10.5 Gm. per hundred cubic centimeters and red blood cells of 3,380,000 per cubic millimeter. The leukocyte count was 1,400 per cubic millimeter, with a differential count of neutrophils 34 per cent, lymphocytes 62 per cent and eosinophils 4 per cent. The platelet count was 70,000 per cubic millimeter, bleeding time 2.5 minutes, venous clotting time 3.5 minutes and prothrombin time 17.8 seconds (normal: 14 seconds). The reaction to the sickling test was negative; red blood cell fragility was normal; Westergren erythrocyte sedimentation rate was 95 mm. after one hour. Urinalysis revealed albumin (1 plus), a moderate number of red cells and a few white cells per high power field. The guaiac test for occult blood in the stool was negative in result. Other results were: bilirubin 0.2 mg. per hundred cubic centimeters, negative Kline reaction, antistreptolysin titer 625, heterophil agglutinin dilution 1:16 and negative agglutinations with typhoid, paratyphoid, Brucella abortus, Bacillus proteus X19 and Bacillus tularense. Repeated blood cultures were sterile during the first ten hospital days. Thereafter, hemolytic Bacillus pyocyaneus was isolated from three successive cultures.

In spite of large doses of penicillin from the first day, streptomycin from the fourth day and sulfadiazine from the twelfth day, his condition deteriorated rapidly with sustained temperatures between 103 and 105 F. He received five transfusions of whole blood, which satisfactorily maintained his hemoglobin and red blood cell count. Nevertheless, the leukopenia, neutropenia and thrombocytopenia progressed. Moderate epistaxis, bleeding gums, hematemeses, melena and gross hematuria appeared. He became jaundiced on the tenth hospital day. Two days later the liver became enlarged to 5 cm. below the costal margin and the serum bilirubin rose to 13.8 mg. per hundred cubic centimeters. The cephalin flocculation reaction was 4 plus, thymol turbidity 4 plus and alkaline phosphatase 7.1 Bodansky units per hundred cubic centimeters. On the twelfth hospital day the hemoglobin was 8 Gm. per hundred cubic centimeters, white blood cell count was 500 per cubic millimeter, neutrophils 6 per cent, lymphocytes 90 per cent and monocytes 4 per cent. No platelets were seen on the smear or in the platelet count. Smears made from sternal marrow aspiration performed at this time were compatible with marrow aplasia. On the afternoon of the twelfth hospital day pulmonary edema developed; he died the following morning.

At autopsy, submucosal hemorrhages were found in the bronchi, intestines and renal pelves. Subepicardial and subpleural hemorrhages were also present. The liver weighed 2,400 Gm., but was essentially normal, grossly and microscopically. The spleen weighed 400 Gm. and was histologically normal. There was moderate pulmonary edema as well as necrotizing pneumonia involving both lower lobes. The bone marrow was brick red in appearance. Microscopically, there was increased fat and a definitely decreased number of cellular elements, most striking in the myeloid series. The erythrocyte was the predominant cell, and although normoblasts and metamyelocytes were noted, few immature forms were present. Megakaryocytes were rarely found. The anatomic diagnosis was aplasia, bone marrow, myeloid and thrombocytic elements.

Case 2.—F. P., a 31 year old white male store clerk, entered the Presbyterian Hospital on April 7, 1948, complaining of increasing malaise for one month, with sore throat, shaking chills, fever and epistaxis for two weeks.

He had been in good health except for petit mal epilepsy since 1936, associated with grand mal attacks since 1939. Complete neurologic and medical studies in 1943 were normal except for the electroencephalographic pattern, which was mildly abnormal and consistent with a convulsive disorder. Routine blood studies at that time revealed hemoglobin of 15.4 Gm. per hundred cubic centimeters, red cells 5,250,000 per cubic millimeter and white cells 4,050 per cubic millimeter, with 54 per cent neutrophils, 33 per cent lymphocytes and 13 per cent monocytes. The peripheral blood smear was described as normal. He was treated with "dilantin," 0.3 Gm., and phenobarbital, 0.09 Gm., daily. These medications resulted in the satisfactory control of his epilepsy, but on Oct. 17, 1947, because of the increasing frequency of grand mal seizures, treatment with "dilantin" was discontinued and "mesantoin" was taken in dosage of 0.3 Gm. daily. He continued the same phenobarbital dosage and took both "mesantoin" and phenobarbital daily until his admission to the hospital approximately five months later. He had never taken "tridione."

One month before entry to the hospital, the patient noted the insidious onset of weakness and malaise with mild sore throat. These were steadily progressive until two weeks later, when he had a shaking chill and fever and soon persistent epistaxis and oozing gums developed. He was given penicillin and sulfadiazine by his private physician for four days, with only slight and transient benefit. Two days before entry, epistaxis became brisk and tarry stools were observed for the first time. Because of rapidly progressive weakness, fever and pallor, he was referred to this institution.

The patient appeared gravely ill, with considerable pallor, weakness and diaphoresis. His temperature was 104.2 F.; pulse rate 110 and respirations 26 per minute. Blood pressure was 130 systolic and 70 diastolic. There was a slow ooze of blood from nose and gums and in the pharynx, as well as fresh and old hemorrhages in the eyegrounds. There was no enlargement of the lymph nodes, liver or spleen. The results of the remainder of the physical examination were essentially normal.

Laboratory studies revealed hemoglobin of 4.8 Gm. per hundred cubic centimeters and a red blood cell count of 2,100,000 per cubic millimeter. The leukocyte count was 300 per cubic millimeter, with 100 per cent lymphocytes. The platelet count was 10,000 per cubic millimeter, reticulocytes 0.5 per cent; hematocrit 14.5 per cent and Westergren sedimentation rate 150 mm. in one hour. The urine contained albumin (1 plus) and rare red cells. The stools were dark black and strongly guaiac positive. The venous clotting time was 25 minutes, prothrombin time 16.0 seconds (normal: 14 seconds) and capillary fragility decidedly increased as judged by tourniquet test. Cultures of nose, throat and blood were negative. The roentgenogram of the chest revealed no abnormalities. Sternal marrow aspiration revealed a decrease in cellularity, with granulopoiesis arrested at the myelocyte level. Erythropoiesis was qualitatively normal, and the lymphocytes were relatively increased.

Ten liters of blood were administered during the first two weeks in order to maintain his hemoglobin near 7 Gm. per hundred cubic centimeters. Penicillin and streptomycin were given prophylactically and phenobarbital was continued as an anticonvulsant. Rutin, ascorbic acid and pentnucleotide were administered empirically.

The patient remained critically ill, with persistent spiking temperatures from 101 to 105 F. during the first two hospital weeks. In the third week there was an abrupt change in the clinical picture. Fever disappeared, bleeding ceased, appetite increased and strength returned. The peripheral blood picture, however, did not reflect this improvement. No neutrophils were apparent on examination of the blood smear until the end of the third week. By the seventh week an increase to a total leukocyte count of 1,500 per cubic millimeter, with 27 per cent neutrophils, had occurred.

At the time of discharge, after three months of hospitalization, his hemoglobin was 12.7 Gm. per hundred cubic centimeters, red blood cell count 4,700,000 per cubic millimeter and white blood cell count 1,850 per cubic millimeter, with neutrophils 46 per cent, lymphocytes 52 per cent and eosinophils 2 per cent. There were 36,000 platelets per cubic millimeter. Four weeks later, on a clinic visit, his general condition was maintained, and the hemoglobin was 14.5 Gm. per hundred cubic centimeters, red blood cells 4,830,000 per cubic millimeter and white blood cells 5,000 per cubic millimeter, with neutrophils 51 per cent, lymphocytes 43 per cent and monocytes 5 per cent. The platelet count was 202,000 per cubic millimeter.

SUMMARY

Two patients are reported in whom profound pancytopenia occurred following the use of the anticonvulsant agent "mesantoin" (methylphenylethyl hydantoin).

COMBINED CALCIFEROL AND STREPTOMYCIN IN LUPUS VULGARIS

THEODORE CORNBLEET, M.D.
Chicago

After viosterol was made available, French investigators,[1] mindful of the beneficent action of sunshine, used vitamin D and found it useful in the treatment of some forms of tuberculosis. This train led Charpy[2] to use calciferol (vitamin D_2) with calcium in a series of patients with lupus vulgaris. His results were astonishingly brilliant. During the war years when Charpy's work was prosecuted, Dowling and Thomas,[3] independently in England, treated cutaneous tuberculosis, too, with calciferol. They reported approximately the same good results that Charpy had achieved.

The latter had insisted that the calciferol had to be administered in alcoholic solution according to a certain schedule in conjunction with calcium. Dowling and Thomas, while using calciferol, administered it differently and yet obtained comparable results. Calciferol in this country is available in two forms, in propylene glycol or in sesame oil solution. The sesame oil solution is easier to use because it is more concentrated and can be administered in gelatin capsules. It appears that alcoholic solutions, exclusively, such as Charpy insisted must be used for good effects, are unnecessary. Equally good results seem to attend the administration of calciferol in oil, the medium available to Americans.

Feldman and Hinshaw[4] investigated the use of streptomycin in tuberculosis of animals and human beings. Later these same authors with O'Leary and Ceder[5] reported on the use of this drug in various forms of cutaneous tuberculosis. This study included observations on the use of "promizole" (4,2′-diaminophenyl-5′-thiazolylsulfone), a sulfonamide drug, in some of the subjects of this group. They felt that "promizole" was ineffective, but they were encouraged by the results from the use of streptomycin. Smith and McClosky[6] combined the use of "promin" (sodium p,-p′-diaminodiphenylsulfone-N,N′didextrose sulfonate) and streptomycin with promising results. They obtained in guinea pigs infected with experimental tuberculosis a greater therapeutic effect than the sum of the effects of the individual drugs.

My colleagues and I had been using various preparations of vitamin D for the treatment of different forms of tuberculosis of the skin for several years. The results at times were encouraging, but in the main were mediocre. When the work of Charpy and that of Dowling and Thomas became known, we began the use of calciferol. Our method was to use calciferol in doses of 100,000 to 150,000 units daily continuously for a number of months. We soon found, like the original authors, that most of the good results to be expected occurred during the first nine months.

Only 1 patient was intolerant of this form of treatment, and it had to be abandoned. He had severe gastrointestinal symptoms and a blood calcium level of 13.1 mg. per hundred cubic centimeters. Observations were made on the blood with regard to the levels of calcium, phosphorus and protein, as well as other matters. None of these, however, helped to explain the means by which calciferol exerted its beneficient action. This work will be reported elsewhere.

The use of calciferol in cutaneous tuberculosis is one of the important medical advances that came out of the war period. It was found by the original investigators and other observers, as well as by us, that many patients adequately treated as to dosage and for sufficient lengths of time were left with residual activity in the lesions. (Charpy cauterized these remaining loci.) When streptomycin became available, we combined its use with that of calciferol. Its cost and the somewhat extended period required for its effectiveness in tuberculosis forbid its free use in charity patients. The latter class, though, is the one in greatest need, in whom cutaneous tuberculosis is most prevalent. We compromised this excessive cost by using calciferol until the cutaneous lesions no longer showed improvement and only then added the administration of streptomycin. We believe that streptomycin and calciferol should be used together from the beginning if this regimen can be afforded.

REPORT OF CASES

Case 1.—S. W. B., a white young woman 21 years old, had had lupus vulgaris for fifteen years. The right side of the face and ear, the lower half of the nose and the anterior part of the neck were involved down to the manubrium sterni. There was considerable scarring, with a few ulcerated sites covered by crusts and small hypertrophic patches mixed with plane areas barely raised above the normal skin. During September 1946, she began treatment with 100,000 units of calciferol daily. Her progress was slow for the first three months, but she showed a great deal of improvement after six months. From then on until May 1947, further improvement was less evident and her lesions seemed to be stationary. There was about 60 per cent improvement. At this time the use of streptomycin was begun and the calciferol therapy continued. One gram of the former was given daily in divided doses at four hour intervals. Healing of the remaining lesions was notable after two weeks. The patient remained on this regimen for two months, when healing seemed to be complete. Only pigmented scars were apparent. Previously hypertrophic sites were leveled, and the scars were neither corded nor contractile.

Case 2.—J. C. R., a Negro man 38 years old, had had lupus vulgaris for over twenty-five years. There was extensive involvement of the face, left ear, neck, shoulders, back, right side of the thorax and right forearm. The patches for the most part were flat, but there was a fungating lesion on the neck plus some keloid formation with contractile scarring. He began the use of calciferol in July 1946, with 100,000 units daily. After nine months there was great improvement and his lesions were estimated to be 70 per cent improved. In

Biol. & Med. **64**: 261 (Feb.) 1947.

April 1947, the use of streptomycin was begun, together with calciferol. One gram of the antibiotic was given daily intramuscularly, in divided doses every four hours. This combined treatment was continued for seven weeks, when it appeared that all the lesions were clear. Only pigmented scars remained. The scars were unusually smooth and free of contractures. After the first week of treatment, the patient complained of vertigo and nausea and vomited three times. Nevertheless, the therapy was continued, with the consent of an internist and an otolaryngologist.

Case 3.—S. M., a white woman 48 years old, had had lesions a number of years on the parts adjacent to the left elbow, over the sternum and along the right nasolabial fold. They were typical of lupus vulgaris which had undergone considerable scarring, though numerous apple jelly nodules could be demonstrated. In April 1946, she began treatment with calciferol, 100,000 units daily. After two months, the dose was increased to 150,000 and continued for six months, making eight months in all for this form of therapy. There was about 50 per cent improvement. There seemed to be little progress at this time. It was then that streptomycin therapy was begun and used in conjunction with the calciferol. The antibiotic was given intramuscularly in doses of 1 Gm. a day at intervals of four hours. After nine weeks of this combined treatment, all the lesions appeared to be inactive. Only pigmented scars remained, and no nodules were apparent.

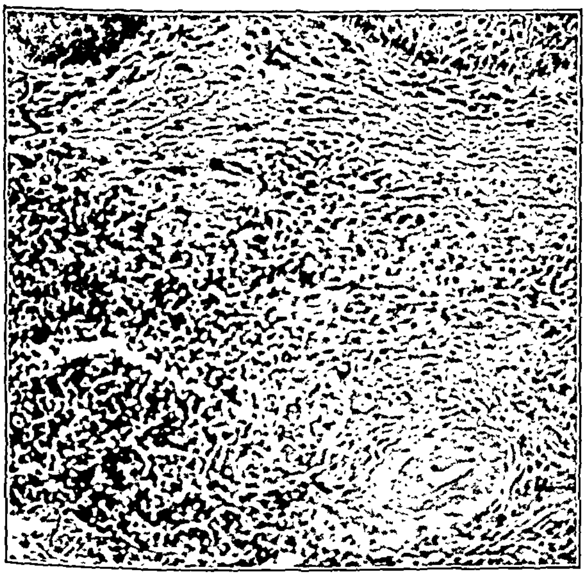

Fig. 1 (case 4).—Low power photomicrograph of section.

Case 4.—F. G., a 60 year old white woman, had had changes of the skin of the right side of the face, nose, upper lip and both ears, which began to appear at the age of 15 years. There was pronounced ectropion of the right lower eyelid. There had been surgical treatment of the lesions on two occasions, the first time many years previously, to remove an ulcer that had formed. Later, a tumor was removed, but this was said not to be malignant. In November 1946, calciferol therapy was begun with 150,000 units daily. After two months the dose was reduced to 100,000 units, which was tolerated better. In July 1947, after seven months, there was about 20 per cent improvement and it was decided to add the use of streptomycin. One gram was given intramuscularly daily at intervals of four hours. The combined streptomycin and calciferol therapy was continued for seven weeks, when the patient had to leave the hospital. It was estimated that her lesions were about 90 per cent healed. A biopsy was made of site which appeared to be almost entirely well. Dr. M. R. Caro studied the sections from this and found that the "histologic examination showed a flattened epidermis. In the upper part of the corium the connective tissue was edematous, the blood vessels were dilated and there was a diffuse infiltrate of lymphocytes, plasma cells and connective tissue cells. Throughout the rest of the corium there were many circumscribed granulomas composed largely of lymphocytes and epithelioid cells, with a few plasma cells and connective tissue cells, an occasional eosinophil and a few giant cells. Several of these granulomas were about blood vessels the walls of which were thickened to the point of occlusion of the lumen. Smaller blood vessels were dilated, and there were several areas of erythrocytes lying free in the tissues. The Weigert stain showed a few strands of elastic fibers just beneath the epidermis, but these fibers were almost entirely absent from the rest of the corium. The Ziehl-Neelsen stain *failed to show any acid-fast bacilli.*"

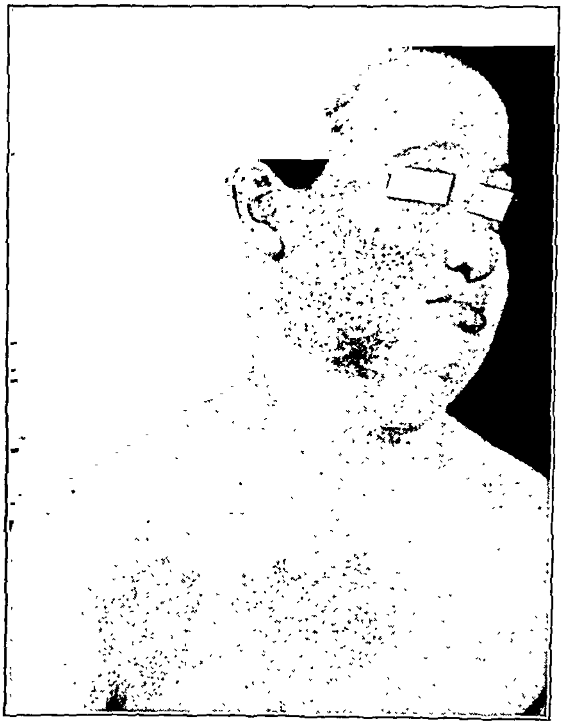

Fig. 2 (case 5).—The photograph shows clinical healing with pigmentation and scarring.

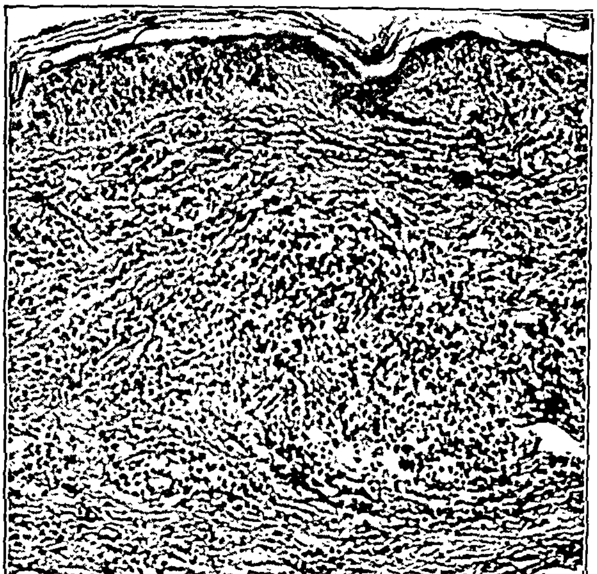

Fig. 3 (case 5).—Low power photomicrograph of section.

CASE 5.—A. D., a young white woman 23 years old, who was mentally deficient, had had an eruption on the skin since childhood. Patches of lupus vulgaris were present on the cheeks and left ear, about the nose and on the neck, chest and back. There were typical apple jelly nodules at all the affected sites, and the latter were edematous and abruptly raised above the surface of the skin. In September 1946, the use of calciferol was begun in doses of 100,000 units daily, and this was continued until September 1947. At that time there was about 70 per cent improvement when streptomycin was added. The streptomycin was given in daily doses of 1 Gm. at four hour intervals. Combined streptomycin and calciferol were used for six weeks, when all the lesions appeared to be inactive pigmented level scars. Tissue was taken from an area which appeared entirely well. Dr. M. R. Caro studied the sections from this and found that the "histologic examination showed the epidermis to be flat and atrophic. In several places there was edema of the basal layer to the point of liquefaction degeneration. There was dense fibrosis in the upper part of the corium, with dilatation of the superficial blood vessels and a diffuse infiltrate composed largely of lymphocytes, histiocytes and connective tissue cells and a few chromatophores and plasma cells. There was considerable edema in the infiltrated zone, and there were several foci of free hemorrhage into the tissues. There were narrow mantles of infiltrate about the deeper vessels. The Weigert stain showed the elastic fibers to be missing from the infiltrated areas but normal in the rest of the corium. The Ziehl-Neelsen stain failed to show any acid-fast bacilli."

COMMENT

These patients represent that considerable group with lupus vulgaris that does not attain a complete cure with calciferol alone. Most investigators have found that maximum benefits from this vitamin are obtained within nine months, though some feel that they have seen only minor improvements after five months. At any rate, it is common for some residual activity to remain in the patches of lupus vulgaris. Other forms of tuberculosis of the skin respond even more slowly. Scrofuloderma is one of them. If one includes some forms of sarcoidosis among the Koch infections, the period before maximum improvement becomes evident is much more prolonged.

The experience with calciferol therapy in the cutaneous tuberculoses is still too short to say that the improvements from it will be permanent. One must keep in mind, however, that the diseases for which lupus vulgaris is the prototype are noted for extremely slow evolution. It will take considerable time to pass final judgment as to the permanent efficacy of this new form of treatment.

Therapeutics has numbers of examples in which a disease is amenable to some form of treatment short of cure. As in syphilis, it is better not to let any particular therapeutic program of lupus vulgaris gel before many other modifications are tried in an attempt to discover optimum uses and methods. Perhaps it would be better to try calciferol intensively in short periods with sufficient rest intervals. On the other hand, it may be that smaller doses for prolonged periods might be better.

These questions must be left to the future and to the ingenuity of the clinical investigator. It would be helpful in the pursuit of these various exploratory lines if one knew the mechanism by which calciferol effects its benefits. As yet, this is not known. Of course, it is thought that calcium metabolism and mobilization are in some way concerned. Our investigations in this direction have not helped to substantiate this hypothesis. Certainly, clinical results do not parallel blood levels of calcium. We have noted that, in a few patients who obtained more spectacular degrees of improvement, there were initial toxic reactions. Do these latter represent a kind of paradoxic effect or variety of Herxheimer reaction? On the other hand, they may represent reactions of impurities contained in the calciferol, such as toxisterol. If so, it might be worth while to try toxisterol itself, cautiously. Charpy[7] has stated the belief that a certain amount of calciferol increases the activity of intestinal phosphatases and that with stronger doses there occur, moreover, activation of other phosphatases in the kidneys and in the bones, which produce intoxication. He expressed the belief that calciferol reacts on the lupus not by itself but through products of the hydrolysis of the intestinal phosphatase transferred to skin by means of the circulation.

In the use of a drug as potent as calciferol, it is needless to say that proper precautions must be exercised to prevent unnecessary untoward reactions. The calcium and phosphorus blood levels should be watched. Intolerance of calciferol does occur, and cognizance of it must be taken. We have observed that a rest period may permit resumption of the drug. The dose at this time should be reduced considerably and not raised hastily. Some patients seem to improve satisfactorily with smaller quantities of calciferol. One should watch for evidence of metastatic calcium deposits, as in the kidneys. A few well documented and proved cases with such unhappy changes have been reported with doses of vitamin D within the treatment schedules that our patients used. These aberrant subjects must, it seems to us, represent highly exceptional patients, to be found among any group receiving any form of treatment, however innocuous we may think such therapy. It would seem, however, that in so baleful a disease as lupus vulgaris, the small risk, as represented by the meager group with untoward results, is worth while taking, in view of the general good to the large number.

Streptomycin, like other drugs and antibiotics, is not without dangers. These ill effects, such as to the ears, have become familiar to physicians. These must be anticipated in the patient and nipped as early as possible, before much damage occurs or irreversible changes take place. Fortunately, our observations with the combined calciferol and streptomycin program show that large doses of the latter are not required. These smaller amounts of antibiotics are far less apt to produce accidents, though a few will still occur.

When treatment with streptomycin is continued over a prolonged period, resistance to this drug tends to develop. It is hoped that the combination of streptomycin with calciferol will shorten the time for improvement or cure and forestall the development of such resistance. The excellent results obtained in this small series of cases of lupus vulgaris were made possible perhaps by the brief interval during which the antibiotic needed to be used. It may be that calciferol sensitized the tubercle bacilli to the action of streptomycin. There is considerable question as to whether the improvement our patients have shown will be permanent. Lupus vulgaris is notorious for its recrudescence in apparently healed areas. Moreover, histologic examination of the skin casts further doubt on hopes for complete cure, although no tubercle organisms were found in the tissue.

---

7. Vitamin D_2 in the Treatment of Lupus Vulgaris, Foreign Letters, J. A. M. A. **135**: 528 (Oct. 25) 1947.

This report has suggested that the combination of the two drugs was of benefit in lupus vulgaris and it was emphasized that optimum effects must be sought through investigations of the dosage, the intervals of use and other variables. It would seem evident in one of these trials that streptomycin should be begun simultaneously with calciferol long before the improvement from the latter is at its crest. Some of our patients will receive this and other subjects still other variations. It would seem that in some patients there could be local injections or topical applications. It is possible that some form or combination of therapy, such as was used in these patients, may be of value in other forms of tuberculosis.

SUMMARY

The cases of 5 patients with lupus vulgaris are reported, in whom combined treatment with calciferol and streptomycin was used. Calciferol alone was employed until it ceased to be of benefit. This period lasted from five months to a year. Streptomycin was then used in combination with the calciferol until the lesions appeared to be inactive. This required from six to nine weeks. One patient terminated her treatment before she had fully recovered, though her lesions were almost entirely inactive.

The combined attack by these two drugs was so effective as to suggest that they are synergists. It is suggested that the brief period required for the use of streptomycin in the present group of patients forestalled the development of resistance, which otherwise tends to occur in tubercle organisms as a response to this antibiotic with longer regimens.

ADDENDUM

One patient (case 4) continued to improve spontaneously in the months after leaving the hospital. She was seen at intervals, but received no further treatment. All activity in the lesions appeared to be entirely gone, leaving thin pliable atrophic scars.

Two more patients with lupus vulgaris have been treated with combined calciferol and streptomycin. One subject, a white woman 66 years old, with lesions on the forehead and scalp, unlike the patients reported, was given 1 Gm. of streptomycin daily from the beginning of her treatment with calciferol (100,000 units daily) for a period of seven weeks. All her lesions regressed rapidly, leaving pigmented and mottled scars. She had been observed for over two months since leaving the hospital, but she had had no further treatment. The scars had become thinner and as of the date of writing, were thin, atrophic and supple. There appeared to be complete cure.

The second patient under observation since the completion of this paper was a Negro man, 48 years old, with lesions on the face, neck, trunk and left forearm. His treatment was started with streptomycin and calciferol simultaneously and was given for eight weeks. Drug dosages were the same as for the previous patient. All his lesions cleared rapidly, so that when he left the hospital there appeared to be no activity in them. In the six weeks after, he had no therapy. The resulting scars became thinner and lost much of their pigment. In this group of patients, a striking feature, besides the rapid and uneventful healing of the lesions, has been the thin even atrophic character of the scars, which are relatively inconspicuous.

Clinical Notes, Suggestions and New Instruments

EXTENSIVE VISCERAL DIVERTICULOSIS

DAVID FISKE, M.D.
and
LEONARD M. ASHER, M.D.
Los Angeles

Although diverticulosis involving a hollow viscus is not an uncommon medical observation, the existence of multiple diverticula of numerous viscera is infrequent. Review of the literature reveals no report of extensive diverticulosis involving several hollow organs.[1] For this reason, it is felt that the following case report is of interest

REPORT OF A CASE

The patient, W. B. M., was a 52 year old white man who first entered the hospital Dec. 14, 1940, with a complaint of chronic bladder trouble for many years. For several years prior to his admission he had had recurrent pain and burning on urination and was able to void only small amounts of urine with great effort and straining. The patient denied ever having had gonorrhea. Cystoscopy performed four days after admission disclosed the wide orifice of a diverticulum, above and to the left of the trigone. The bladder neck was thickened, but there was no evidence of trabeculation. Two weeks after admission, cystotomy was done and a large bladder diverticulum was resected.

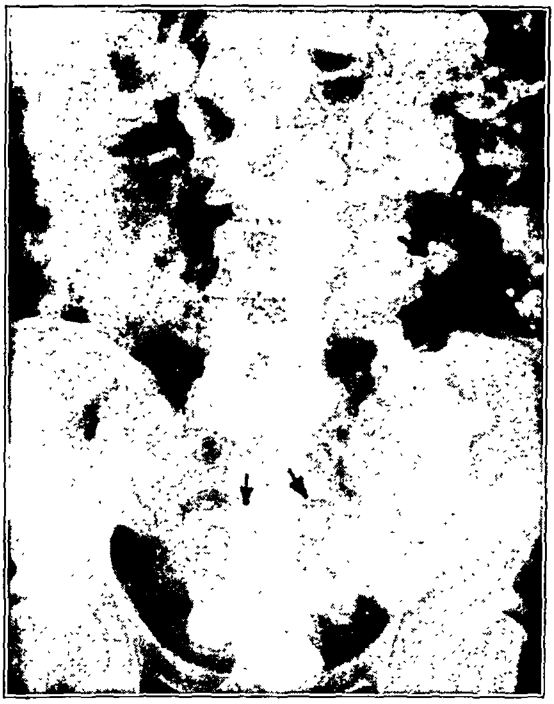

Fig. 1.—Arrows indicate small bowel diverticula.

The patient again entered this hospital June 18, 1942, with fecal impaction, and was discharged June 24, six days after

L.: Gastroenterology, Philadelphia, W. B. Saunders Company, 1944, vol. 2, p. 107. Hatchette, S.: Multiple Diverticula of the Jejunum, Duodenum and Colon, Radiology **34**: 577 (May) 1940.

entry, the only significant observation on this admission being diastasis recti and a large ventral hernia.

On April 2, 1945, the patient again entered the hospital. His complaints on this admission were bloating, vomiting, belching, epigastric pain of a vague nature and alternating diarrhea and constipation of two to three years' duration. Roentgenograms of the upper part of the gastrointestinal tract showed extrinsic pressure leading to incomplete obstruction of the small bowel. An exploratory laparotomy was done on April 30. The patient was operated on April 30. The surgical report read: There was a diastasis of the recti muscles and a large ventral hernia in the midline. . . . There were many diverticula, some the size of a lemon, scattered through the jejunum and proximal ileum for a distance of about 5 feet (12.7 cm.) along the mesenteric border (fig. 1). The diverticula were extremely thin walled and could be easily emptied. Numerous scars over the diverticula showed evidence of fibrosis following previous inflammation. The hernia was repaired, but no bowel resection was done because of the extent of the lesions. The patient was discharged May 17.

On his fourth admission, Oct. 22, 1946, the patient was treated for chronic cystitis; he was discharged November 20. At that time the patient was observed to have a small left inguinal hernia.

The patient was rehospitalized July 24, 1947. He had been working in his yard on the day of admission, without the truss that he generally wore, and his inguinal hernia descended. He could not replace it and soon severe cramps and nausea developed, but no vomiting. In the hospital the hernia was readily reduced.

Because of the patient's gastrointestinal complaints, a series of roentgenograms of the upper part of the gastrointestinal tract was taken July 25, which showed a filling type defect of the pyloric antrum. At that time it was also noted that the patient had diverticulosis of the small intestine and a gastric diverticulum (fig. 2). To rule out a malignant condition, gastroscopy was attempted on August 8. However, resistance was encountered at the cardia and it was felt that the instrument was in a diverticulum, so that the examination was abandoned. Another series on August 20 showed diverticula of the duodenum (fig. 3), diverticulosis of the small intestine and indeterminate diverticula along the lesser curvature of the pars media of the stomach. Several roentgenograms with barium sulfate enemas revealed no abnormalities. A cystoscopic examination was performed on September 18, which showed a small prostatic urethral diverticulum just to the right of the verumontanum.

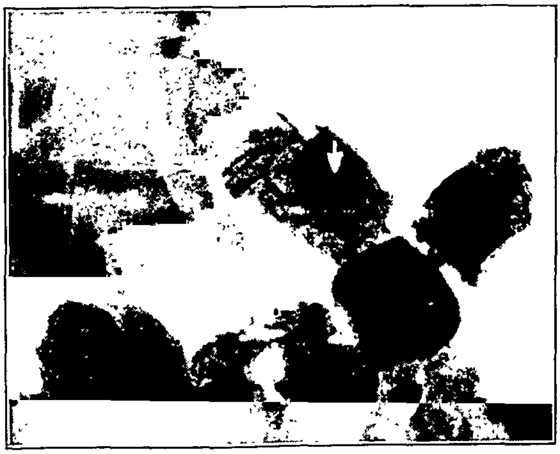

Fig. 2.—Arrow indicates gastric diverticulum.

It was felt that the patient was not a good candidate for herniorrhaphy because of his poor condition, and particularly because of his apparent muscular weakness, and he was discharged September 15 on a medical regimen.

COMMENT

Diverticula of the gastrointestinal tract are classified as true or false, depending on whether or not they are clothed in muscularis. It is generally recognized that true diverticula, of which the classic example is Meckel's diverticulum, are congenital in origin.[2] The causation of false diverticula is more controversial. Many factors have been indicted. These include: fecal impaction, fermentation and gas formation, venous stasis, degenerative and inflammatory processes, old age and constipation. Also mentioned are: frequent purgation, poor nutrition, disturbances of sympathetic innervation and an inherent muscular weakness, particularly around the points of entrance of blood vessels where it is found that the muscularis is sparsely distributed.[3]

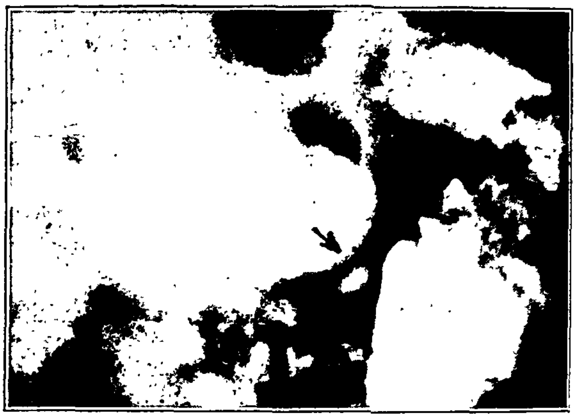

Fig. 3.—Arrow indicates duodenal diverticulum.

The theories most frequently cited are those of Klebs, Edel, Hausemann and Edwards, who favored the idea of herniation along the paths of blood vessels[4]; of Fraser, who explained diverticula on increased intestinal pressure,[4] and of Hartwell and Cecil, who stated that inherent muscular weakness is the cause of diverticula formation.[3b] Difficult for Klebs and his proponents to explain are the observations of Erdman and others that diverticula are often found along the antimesenteric border of the intestine.[5]

Probably, as is so often the case, the truth is not at any of the extremes postulated, but rather is a compromise between several or all of the theories mentioned. For example, increased intestinal pressure, when directed at a weakened musculature, such as occurs along the courses of blood vessels or at weakened interstices of the intestinal muscular strands (locus minoris resistentiae), in a person suffering from emaciation or in an elderly person with widespread senile degenerative processes, could conceivably result in an intestinal diverticulum. Fecal impaction could contribute its share to increasing intestinal pressure. In any particular person, one or another of these factors could be of major importance. As regards "inherent muscular weakness," a study of the coincidence of diverticula and the myopathies might be of interest.

Diverticula have been seen along the entire length of the gastrointestinal tract, but with a decided difference in incidence. They occur occasionally in the esophagus, stomach, jejunum and ileum and more commonly in the duodenum and colon.[6] The sigmoid and descending colon show an incidence greater than that of the rest of the gastrointestinal tract combined,[1c] varying from 0.8 to 1 per cent of cadavers.[2] Diverticula in the stomach have been reported in only 150 cases prior to July 1946. In the small intestine, excluding the not uncommon true congenital Meckel's diverticulum (incidence of 2 per cent),[7] diverticula are comparatively rare.[8] Edwards reported 9 cases of jejunal diverticula in 2,820 autopsies, an incidence of 0.31 per cent.[9] At the Mayo Clinic, until 1932, only 52 cases of small bowel diverticula were found, of which 39 were in the jejunum.[4] Until 1945, less than 100 cases of jejunal diverticula were reported in the literature.[4] Diverticula of the gastrointestinal tract were reported by Martin and Adsit [5] as occurring 33 per cent oftener in female patients than in male, and reported by Mora [2c] as being twice as frequent in male as in female patients. The most frequent age incidence was between 50 and 70 years.[2c] It is interesting to note that Larimore reported the common colonic diverticula as rare in Negroes.[3b] Diverticulosis is seldom suspected clinically; most cases of the disorder are discovered accidentally during routine studies, as occurred in the case presented. No reports have been seen concerning the coincidence of gastrointestinal diverticula with bladder or urethral diverticula or with multiple hernias.

[7] Mottram, M. E., and Garland, L. H.: Meckel's Diverticulum, Am. J. Roentgenol. **53:** 142 (March) 1945.

This is an unusual instance of multiple diverticula involving stomach, small intestine and urinary bladder. The diverticula both in the intestine and bladder became foci of recurrent infection. This resulted in incomplete small bowel obstruction, on at least one occasion, and recurring bouts of cystitis. Strangely enough, in this case, there were no diverticula in the colon, the usual site of this condition.

Associated with the diverticula, there was development of ventral and inguinal hernias. The combination of these two disorders strongly suggests the existence in this patient of an inherent defect in the structure of both smooth and striated muscle. Unfortunately, no biopsies are reported which might further elucidate this syndrome.

SUMMARY

A case is reported of multiple diverticulosis involving stomach, duodenum, jejunum, ileum, bladder and urethra, without diverticulosis of the colon. Associated with the diverticulosis of the hollow viscera, there existed multiple abdominal wall hernias. It is felt that this is a clinical entity based on a weakness of both smooth and striated muscle structure. The literature is reviewed.

Council on Foods and Nutrition

ACCEPTED FOODS

The Council on Foods and Nutrition has voted to accept the following food products as conforming to the rules of the Council for special purpose foods and for fruit juice.

James R. Wilson, M.D., *Secretary.*

The Borden Company, New York, N. Y.

Gerilac—Powdered Modified Milk for Special Dietary Uses, consists of a mixture of whole milk, skim milk, dried brewers' yeast fortified with riboflavin concentrate, vitamins A and D concentrate from fish liver oil with added irradiated ergosterol, ascorbic acid, nicotinamide, monosodium phosphate, iron and ammonium citrate.

Analysis (submitted by manufacturer).—Water 2.5%, milk fat 10.0%, milk proteins 33.0%, milk sugar (lactose) 47.0% and minerals 7.5%.

Vitamins and Minerals	Per Hundred Grams
Vitamin A	7,927.00 U.S.P. units
Thiamine	2.70 mg.
Riboflavin	3.30 mg.
Nicotinamide	22.00 mg.
Ascorbic acid	104.00 mg.
Vitamin D	854.00 U.S.P. units
Calcium (Ca)	1,012.00 mg.
Phosphorus (P)	975.00 mg.
Iron (Fe)	19.00 mg.

Calories.—4.10 per gram; 116 per ounce.

Use.—A fortified milk product for use in persons of advanced years.

Charles Killgore Company, Inc., Yonkers, N. Y.

Dietician Brand Diet-Mix consists of government standard patent flour, soy flour, gluten flour, vegetable shortening, leavening, salt, dicalcium phosphate and soluble saccharin. The product is enriched to approximately whole grain levels with sodium iron pyrophosphate, thiamine, riboflavin and niacin. Vitamin D is added.

Analysis (submitted by manufacturer).—Protein 30.0%, fat 9.2%, available carbohydrates 36.0%, iron 0.81 mg. per ounce and calcium 31.2 mg. per ounce.

Calories.—99 per ounce; 3.49 per gram.

Use.—For carbohydrate-restricted diets.

Charles Killgore Company, Inc., Yonkers, N. Y.

Dietician Brand Gluten Spaghetti Curls consists of gluten and semolina flours.

Analysis (submitted by manufacturer).—Protein (N × 5.7) 36.0 per cent, fat 1.0 per cent, available carbohydrates 40.0 per cent, H_2O 10.0 per cent.

Calories.—93 per ounce; 3.3 per gram.

Use.—For carbohydrate-restricted diets.

American Fruit Growers, Inc., Los Angeles.

Blue Goose Brand Orange Juice. This product consists of California Valencia orange juice (A. F. G. grade A).

Use.—For use as a wholesome beverage and wherever orange juice is intended to provide or supplement the intake of vitamin C in the normal or special diet.

Vitamin C Content.—Evidence has been submitted to the Council indicating that the company is capable of producing with a high degree of regularity an orange juice which contains, immediately after canning, 40.0 mg. or more of ascorbic acid per hundred cubic centimeters of juice. This meets the standard established by the Council.

Average Caloric Value.—15 calories per ounce.

Council on Physical Medicine

REPORT OF THE COUNCIL

The Council on Physical Medicine has authorized the following report for publication on the recommendation of its Consultants on Contraceptive Devices. The Council wishes to express its appreciation for the valuable assistance rendered in the preparation of this report to its consultants: Drs. Walter W. Greulich, Andrew C. Ivy (Chairman), Walter J. Meek and Pendleton Tompkins.

Howard A. Carter, *Secretary.*

REQUIREMENTS FOR ACCEPTABILITY OF CONTRACEPTIVE DEVICES

The following requirements for the acceptability of contraceptive devices of a physical nature, such as diaphragms and caps, stems and rings, tampons and sponges, devices for insertion, condoms and sheaths, have been proposed by the Consultants on Contraceptive Devices of the Council on Physical Medicine. These have been adopted by the Council, but it should be emphasized that they may be changed from time to time as the evidence indicates.

I. *Acceptable Evidence:*

A. Medical evidence to be acceptable must have been collected by physicians with special experience in the field of contraception or obstetrics and gynecology.

B. Evidence regarding the physical and chemical characteristics of the device must have been collected by individuals competent in the field.

II. *Efficacy:*

The device shall meet the following test of effectiveness: Each patient shall be observed for a minimum of twelve months. The minimum patient-years' experience shall be seventy-five years. This may be obtained by observing 75 patients for one year, 50 patients for eighteen months or preferably 38 patients for two years or 25 patients for three years. Only patients pronounced as presumably fertile shall be used. If patients are excluded from the series on the basis of their being irregular users, the number excluded and the nature of the evidence justifying their exclusion shall be provided. The device shall provide a degree of protection as great as is consistent with good practice concerning the article under consideration, the protection to be obtained in women who have been compared with others habitually practicing no contraception.

---

[8] d'Abreu: An Unusual Case of Diverticulum of the Small Intestine, Brit. J. Surg. **31**: 408 (April) 1944.

[9] Devegney, F. E., and Bailey, H.: Diverticulum of the Jejunum, Brit. M. J. **2**: 98 (July 25) 1942.

III. *Harmlessness:*

A. Evidence shall be submitted showing that 100 or more couples have used the device on six or more occasions without subjective injury or sensations of pain, distress or discomfort. The refusal rate and the cause thereof shall be provided for this group of 100 patients and for the group of patients used for obtaining seventy-five or more patient-years of experience.

B. Evidence shall be submitted showing that 20 or more patients inserted, used and removed the device on each of twenty-one successive days without irritation or injury or evidence of physical damage as disclosed by examination with a speculum. This evidence is to be supplied in addition to similar evidence obtained on the group of patients used to establish efficacy in seventy-five patient-years of experience.

C. Where the device is a brand of a type previously known to or accepted by the Council on Physical Medicine, such as contraceptive diaphragms of standard design or condoms, the evidence required by the two preceding paragraphs may be waived.

IV. *Design:*

A. The design of the device and accessories shall be satisfactory to the Council.

B. If a syringe applicator or nozzle is furnished for use in connection with a jelly or cream, it shall be sufficiently translucent to permit the detection of air which might lead to inadequate dosage.

V. *Durability:*

A. Condoms must have a shelf life of at least one year, and the date of expiration shall be stamped on the package so as to be readily seen by the purchaser. The shelf life test shall be conducted at a temperature of 37 C. and a humidity of from 10 to 30 per cent. At the end of the test or the expiration date stamped on the package, the condom shall not permit the passage of water during a period of ten minutes when filled with water so that the height of the water column in the condom shall be 15 cm. (6 inches).

B. The package containing a diaphragm shall be stamped with the date of manufacture. The instructions packed with the diaphragm shall show the date of manufacture, and the instructions shall provide the life expectancy on the basis of evidence submitted to the Council regarding the shelf life and the use life in combination, and when used with a known and acceptable jelly or cream. At the end of the life expectancy claimed, the diaphragm shall not permit the passage of water or a methylene blue solution under a pressure of 26 mm. of mercury (½ lb. per sq. in.), the test being conducted so as to detect leaks about the rim.

VI. *Directions to Users and Advertising:*

A. The directions shall include a warning that the user should not expose the device to agents such as ordinary oils and greases or hot water, which will damage the device. Evidence shall be submitted showing the ordinarily available agents which damage and do not damage the device.

B. The directions shall include the appropriate means for cleansing the device.

C. The directions packed with each device whose performance depends on an intact membrane shall direct the user to inspect the device for holes and tears and to discard it if one is found.

D. The advertising and directions of the manufacturer shall make it clear that contraceptive diaphragms (and caps), tampons and sponges are intended for use in conjunction with spermicidal jelly or cream and should direct attention only to those accepted by the Council on Pharmacy and Chemistry.

E. The advertising and directions must not state or imply that the appropriate diaphragm or cap, or other device, can be chosen without the aid of a physician.

F. The advertising and directions and other printed matter packed with the device shall be satisfactory to the Council.

REPORTS OF THE COUNCIL

The Council on Physical Medicine has authorized publication of the following reports. Howard A. Carter, *Secretary.*

NATIONAL HEARING AID, MODEL D (DUPLEX) ACCEPTABLE

Manufacturer: National Hearing Aid Laboratories; 815 S. Hill Street, Los Angeles 14.

The Duplex model of the National Hearing Aid is a metal-cased instrument with a separate leather-cased battery compartment connected to the hearing aid case by a cloth-covered cord with plugs at both ends. A crystal receiver is connected to the case with a plastic-covered cord. Neither cord is reversible. Two wheel type controls at the top of the case provide (1) a volume control and (2) an on-off 3 position tone control. The wearing clips are permanently attached to the front side of the case.

The instrument, including batteries, weighs 348 Gm. (12¼ ounces) and measures 69 by 65 by 28 mm. (2¾ by 2½ by 1⅛ inches). One 1.5 volt zinc-carbon type of cell is required for the A battery; the B battery must give 30 volts. The power consumption was measured in a laboratory acceptable to the Council and was found to be 39 milliamperes at 1.4 volts for the A battery. For the B battery at 28.5 volts it was 0.99 milliampere when quiet and 0.54 milliampere in the presence of sound.

Table 1.—*Frequencies*

Tone	250	500	1,000	1,200	2,200	3,000	4,000
1	33	43	55	54	38	39	45
2	27	36	46	44	27	30	33
3	27	36	46	44	23	30	23

Table 2.—*Approximate Values of Maximum Sound Pressure Levels*

Frequency	Input Level	Maximum Output Level
500	85	131
1,000	90	137
2,000	90	125

Table 1 lists typical results obtained for seven different frequencies at three settings of the tone control, with the volume control set for full gain.

Table 2 gives approximate values of maximum sound pressure levels (at three frequencies) set up in the 2 cc. coupler with the volume set for full gain and tone control set at position 1.

The Council on Physical Medicine voted to include the National Hearing Aid Model D (Duplex) in its list of accepted devices.

CONTINENTALAIR ICELESS OXYGEN TENT, MODEL NO. 3000, ACCEPTABLE

Manufacturer: Continental Hospital Service, Inc., 18636 Detroit Avenue, Cleveland 7.

In the February 21 issue of The Journal, page 555, there was announced the acceptance of the Continentalair Iceless Oxygen Tent with Automatic Temperature Control. The type of apparatus there referred to is now known as Model 2000, and has been followed by a modification to be known as Model 3000. The latter is the subject of the present report.

It employs the same "freon" refrigerant as the previous model, and the changes have been made primarily for greater physical convenience. It has a smaller and more compact cabinet and a housed compressor. An oxygen regulator holder has been added for the convenient storage of regulators that are not in use at the moment, and new handles and extra large casters have been provided.

The total weight of the new model is 96 Kg. (211 pounds); the shipping weight is 146 Kg. (323 pounds). The dimensions are 102 by 56 by 44 cm. (40 by 22 by 17½ inches). Accessories include one permanent type canopy or three Visionaire disposable type canopies, one canopy holder, one regulator and one air director. The motor requires a 110 volt alternating current supply, and draws 528 watts (4.8 amperes).

In actual use it was found that the tent will operate at a concentration of 50 per cent oxygen, provided (1) that a flow of 15 liters per minute be maintained for twenty minutes, (2) that a basic flow of 10 liters per minute be maintained and (3) that the motor be turned off when the patient is examined or given food, and the motor turned on after the tent has been closed following these procedures. Under these circumstances there is adequate provision of oxygen and adequate elimination of carbon dioxide.

The Council on Physical Medicine voted to include the Continentalair Iceless Oxygen Tent, Model No. 3000, in its list of accepted devices.

GENERAL ELECTRIC GERMICIDAL LAMP ACCEPTABLE

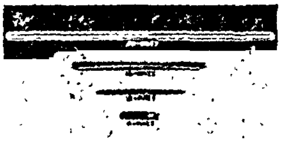
Manufacturer: General Electric Company, Lamp Department, Nela Park, Cleveland 12.

The General Electric Germicidal Lamp is an ultraviolet source for disinfecting purposes. It is used in a fixture which is designed to screen the eyes and the skin of the occupants of an inclosure from its direct radiation. The total amount of direct and scattered ultraviolet radiation incident on the occupants must be kept below the level that will produce conjunctivitis, erythema and any other unforeseen injurious physiologic effects that may arise from prolonged exposure. Hence, the ultraviolet energy for the most part is directed horizontally across the upper portion of the inclosure (room), roughly within the limits between the ceiling and the head of a tall person in standing position. The Council on Physical Medicine agrees that, by using a sufficient number of lamps, approximately 95 per cent of the organisms which are within the lethal area of radiation are killed.

However, the restriction imposed by the aforementioned dangers of personal injury prevents effective ultraviolet irradiation of the principal areas in the lower part of the room in which droplets, expelled from the mouths of occupants, might pass directly from person to person. Outside of this zone of direct droplet infection, however, there is some protection against cross infection for occupants because the air in an interior is continuously circulating and some evidence is available to show that this process dilutes the germ concentration.

The Council accepts ultraviolet lamps for disinfecting air in hospitals, nurseries and operating rooms (relatively free from dust) in which the occupants are regimented, as practiced by the present day empirical methods of sanitation.[1]

On the other hand, the Council does not accept ultraviolet lamps for disinfecting air in schools, waiting rooms, industrial plants, barracks, assembly halls, refrigerators or other industrial applications. In the opinion of the Council the available evidence is not sufficient to warrant advertising claims that the ultraviolet radiation will eradicate infection spread by droplets, or prevent absenteeism in schools, factories and office buildings due to infections of the respiratory tract.



G. E. Germicidal Lamp

Other fields of application recommended by the General Electric Company include installations for poultry and dairy husbandry, brewing establishments and the meat packing industry. In the opinion of the Council critical evidence to substantiate the value of the disinfecting lamp in these installations does not appear to be available.

The physical characteristics of the General Electric Germicidal Lamp are as follows: G-E Germicidal Lamps are made in four standard sizes—30 watt, 36 inches; 15 watt, 18 inches; 8 watt, 12⅛ inches, and 4 watt, 5¾ inches.

Technical Description

	G-30 T-8	G-15 T-8	G-8 T-5	G-4 T-4
Rated watts	30	15	8	4
Over-all length *	36″	18″	12⅛″	5¾″

Standard package quantity	24	24	24	12

* Including standard lampholders.
† Under specified test conditions.
‡ Where lamps are operated continuously (essentially without current interruption), the rated life is 4,000 total burning hours.
§ An Angstrom unit (A) is a length of one ten-millionth of a millimeter or four billionths of an inch. Wave-lengths of radiant energy are measured in terms of Angstrom units.
‖ For circuit voltages 110-125 (50 or 60 cycles), 199-216 (60 cycles), and 220-250 (50 or 60 cycles).
¶ For circuit voltage 110-125 (50 or 60 cycles).
# Average at 100 hours life, initial rating 25% higher.
▲ Multiply by 10,000 for microwatts per cm.^{2} at one meter.
+ Bent tube construction makes lamp approximately one inch in width.

The physical characteristics of the General Electric Germicidal Lamp meet the requirements of the Council for acceptance. This lamp is used by manufacturers of different styles of fixtures, requiring separate and individual consideration.

The Council on Physical Medicine voted to include the General Electric Germicidal Lamp in its list of accepted devices.

D & C DIAPHRAGM ACCEPTABLE

Manufacturer: Diaphragm and Chemical Company, 235 E. Ontario Street, Chicago.

The D & C Diaphragm is a contraceptive device available in sizes from 55 to 95 mm. in gradations of 5 mm. Laboratory tests of the device indicate that it conforms to the requirements announced by the Council in The Journal, Dec. 21, 1946, page 991.

The Council on Physical Medicine voted to include the D & C Diaphragm in its list of accepted devices.

HOLISTIC MEDICINE

The growing significance of the holistic or totalistic concept of medical approach to disease has raised problems of importance to physicians generally, but important particularly to authorities responsible for medical education. The average medical graduate finds himself equipped after internship with grounding in the basic sciences of medicine and enough diagnostic acumen to search for and recognize objective disorders of body organs. With the aid of many laboratory devices he can establish a diagnosis and prescribe treatment for obviously pathologic conditions. Beyond this, methods of establishing a single diagnosis may meet with failure in the face of many seemingly unrelated signs and symptoms. Functional and psychosomatic factors have now been repeatedly demonstrated in most of the disease or predisease conditions affecting man, including diabetes, hypertension, ulcers of the stomach and lesser ills. Physicians recognize that they are not being faced with incipient conditions to control but with end results to patch. The establishment of a single diagnosis, which is often assumed to be the proper effort, followed if possible by prescription of a specific remedy, fails to meet the total problem of the patient. This method may frequently cure the lesion but not the person. Commenting on the relative futility of this accepted approach, Karl Menninger[1] states:

> What shall we call the "disease" represented by a man who has always been frail but has worked very hard to support his widowed mother, did not feel he could afford to get married, buries himself in the details of a complicated job, develops paralyzing headaches, loses time at the office for which pay is deducted from his wages, worries about this so much that he loses sleep and begins vomiting after each meal? Just to make it complicated he has a leukocytosis and an enlarged spleen. Does not such a case defy diagnosis?

Equally pertinent is the question: What is the effective treatment that lies within present biologic or chemical therapeutics?

Disorders of this nature and their treatment are totalistic. Effective treatment requires the establishment of a close personal doctor-patient understanding by physicians who have a concept of the dynamics of total personality. Here is a reversal of emphasis away from specialism and toward rebirth in training and prestige of the general practitioner. General physicians of the future must be visualized as practitioners whose training included a thorough grounding in the psychodynamics of personality and general physiology and who are aware of the effects of social, industrial and political impact, and impact of environment generally, on health. Increased availability of time for study of each patient will be essential to success. In contrast to present trends this visualizes the general physician as the central figure of a coordinated service; in such a situation specialists will function in solving special objective pathologic problems.

Discussing future aspects of medicine from the point of view of the educator, Lester J. Evans[2] has said:

> Medicine is caught on the horns of a dilemma which its own progress has forced upon it. As it becomes more and more precise and scientific, specialization is inevitable. Specialization in turn adds to fragmentation and segmentation in medicine. For the patient, whether well or sick, this means added difficulty in obtaining comprehensive medical care when defined in terms of continuity, quality and completeness of service. No short cut to the integration of specialized knowledge and skills into comprehensive medical care has yet been devised, but until this problem is solved, medicine—and the training for medicine—will be inadequate.

Signs of revamping of medical education toward integration have already appeared in several medical schools, among others the Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, N. C.[3] However, these have been mostly at late fourth year and intern levels. Pressure of medical school curriculums can be eased to make room for newer training methods by dropping memory studies and details of anatomy related to minor landmarks on bones and the relative merits of methods for stewing arsenic free of the stomach mucosa and the like. Most physicians neither remember nor use such material. Greater emphasis can be shifted to internal medicine, pediatrics and modern dynamic psychiatry.

Among physicians in practice there is need for reorientation toward the newer concepts. Literature and opportunities for postgraduate study are becoming increasingly available.

Medical reorientation such as has been proposed is additionally hampered by attempts to mechanize diagnosis and treatment. Medicine, which has always occupied a place between pure science and philosophic morality, must seek its own proper level for progress. The heavy swing of the pendulum toward the coldly scientific, represented by increased degrees of specialization and fragmentation of the patient-doctor relationship, has reversed itself toward an integrated approach to the sick person as being in a state of mental, moral and physiologic imbalance with his environment.

Current Comment

VITAMIN E

The popular press and a few medical periodicals have noted the supposed curative powers of vitamin E in various forms of heart disease. The evidence thus far submitted, most of which has appeared in the *Medical Record*,[1] indicates that claims for the efficacy of this drug in the treatment of heart disease are based on almost purely subjective evidence in a large group of elderly patients treated with large doses of vitamin E after a failure to control symptoms with other usual methods of cardiac therapy. Objective evidence that the drug provides any real benefit in heart disease is lacking. Electrocardiographic changes either are not cited or show no true evidence of physiologic improvement. Evidence that vitamin E prolongs the life of cardiac patients as compared with control groups of patients treated by usual methods is entirely lacking. In a panel discussion on cardiac therapy at the June 1947 meeting of the American Medical Association, the following statement was made: "Vitamin E is of no value in coronary heart disease, hypertension or rheumatic heart disease." Vitamin E has no known pharmacologic action supporting the belief that it has a vasodilating action, a myotonic effect or an ability to repair damaged heart muscle in human beings. Reports of animal experimentation of the activity of vitamin E on cardiac musculature are so far inconclusive.[2] The most that can now be said relative to vitamin E treatment is that doses being prescribed appear relatively nontoxic and that subjective benefits claimed may justify a series of well controlled experimental studies in human heart disease to determine whether purely psychologic or real physiologic changes are involved.

GENERAL PRACTITIONER'S AWARD

William Lowry Pressly, M.D.

At the interim session of the American Medical Association held in St. Louis the gold medal of the Association "for exceptional service by a general practitioner" was awarded by the House of Delegates to Dr. W. L. Pressly of Due West, S. C. His career is the prototype of the many thousands of general practitioners who are devoting their lives to the care of the sick in rural communities and in large cities all over the United States. Dr. Pressly was born in Due West and left there only for his medical education, internship and residency. He was born in 1887 and graduated at Erskine College in his home town in 1908. He then received his medical education at Emory University and served as intern and resident at Jefferson Hospital in Roanoke, Va., from his graduation in 1912 to 1915. Incidentally, he played professional baseball both before and after his graduation in medicine and was also manager of a baseball team. After his return to practice in Due West thirty-two years ago, he served as president of the Abbeville County Medical Society. He was a councillor of the South Carolina Medical Association from 1933 to 1940, when he was elected president. He has been chairman of the General Practice Section of the Southern Medical Association and of the South Carolina Academy of General Practice. Since 1939 he has been a member of the executive committee of the South Carolina State Board of Health and during World War II he was state head of the Procurement and Assignment Service. The general practitioner's award this year was selected in an unusual manner in that twenty-four individual states made nominations, from which the Board of Trustees selected three and the House of Delegates elected one. Second in the selection were Dr. Lyle Hare of Spearfish, S. D., and third, Dr. Charles Manley Horton of Franklin, La.

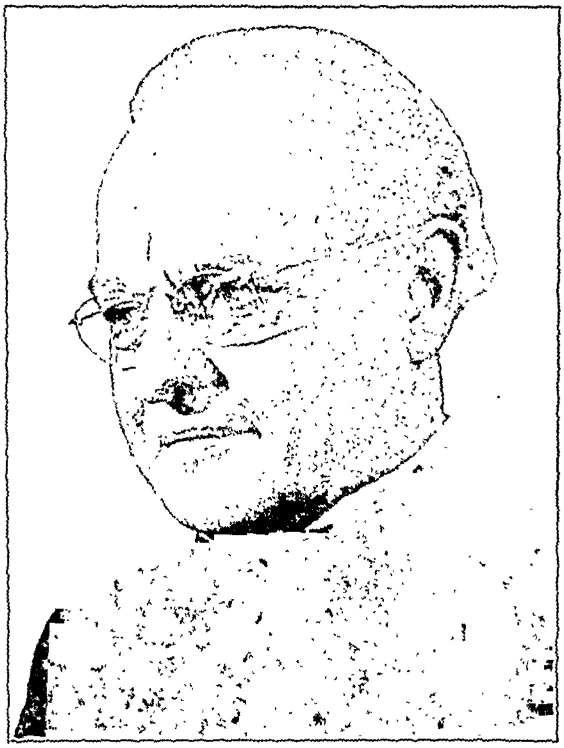
FATHER SCHWITALLA HONORED

For the first time in the history of the American Medical Association a gold medal and a citation were awarded at the interim session in St. Louis to a distinguished layman who had served to advance the ideals of American medicine and who had contributed notably to the public welfare. Father Alphonse Mary Schwitalla, thus distinguished, is known to many thousands of physicians and workers in the field of the hospital and of medical care. He was born in Beuthen, Upper Silesia, Germany, Nov. 27, 1882. With his parents he came to the United States in 1885. After graduation from St. Louis University in 1907 with the degree of bachelor of arts, he received his master's degree in 1908 and the degree of doctor of philosophy in zoology at Johns Hopkins University in 1921. In 1900 he joined the Jesuit order, and was ordained a priest in 1915. After his graduation from St. Louis University, he was instructor in chemistry at St. Xavier College, Cincinnati, and became instructor in biology and physiology in his alma mater in 1910. He served as instructor of chemistry at Rockhurst College, Kansas City, Mo., from 1916 to 1918 and as associate professor of biology at St. Louis University from 1921 to 1924, becoming professor of biology in 1924 and continuing his teaching in this field until 1946. In 1927 he became dean of the School of Medicine of St. Louis University, in 1928 also dean of the School of Nursing and in 1924 regent of the School of Dentistry. Father Schwitalla has been honored by many medical and hospital organizations for his magnificent services, particularly to medical education but also toward sustaining the ideals of freedom which characterize American medicine. He was president of the Catholic Hospital Association from 1928 to 1947, president of the North Central Association of Colleges and Secondary Schools and honorary vice president of the American Social Hygiene Association. During the war he served on many councils and committees dealing with education and with public health. He has been a member of the Advisory Board on Health Services of the American Red Cross and of the Advisory Committee of the Council on Medical Education and Hospitals. During World War I he was a major and served as a chaplain in the United States Army. His scholarship earned membership in Phi Beta Kappa, Sigma Xi and Alpha Omega Alpha. He has been editor of *Hospital Progress* since 1928 and of the *Linacre Quarterly* since 1945. His writings have served to inspire and stimulate many others in the medical field. He was a member of the original Committee on the Costs of Medical Care and signed the minority report for sustaining freedom in medicine. Father Schwitalla has appeared frequently before Congressional committees in behalf of sound practice in medical care. He has spoken brilliantly on many platforms throughout the nation. Because of ill health, which has incapacitated him largely for almost a year, Father Schwitalla resigned his deanship of the St. Louis University College of Medicine on December 12. Certainly no one merits more than does he the distinguished honor that was conferred on him by the American Medical Association.



Father Alphonse Mary Schwitalla, S. J.

CONGRESS ON INDUSTRIAL HEALTH

The Ninth Annual Congress on Industrial Health is now being organized jointly by the Industrial Hygiene Division of the Public Health Service and the Council on Industrial Health of the American Medical Association. Other organizations have helped in the planning or will participate in the sessions of the Congress. The meetings will be held January 18-19 at the Drake Hotel in Chicago, with preliminary panel committee conferences the previous day. The opening general session on Tuesday morning, January 18, will define the purposes of the Congress. The keynote address of the worker's interest in health will be presented by an outstanding labor leader. A symposium will be conducted on "New Horizons in Industrial Health" to be participated in by Surgeon General Leonard A. Scheele of the Public Health Service, President Ned Dearborn of the National Safety Council and President Joseph G. Norby of the American Hospital Association. The Congress will then resolve itself into four panels: Scope and Distribution of Medical Service in Industry, Environmental Hygiene, Medical Aspects of Industrial Human Relations, and Health Education. Representation from labor, management, insurance and others interested will be invited, in anticipation of later conferences to define closer relations between the worker, the employer and medical-health facilities. To further this objective, January 16-22 will be officially proclaimed "Industrial Health Week" in Chicago and unusual effort will be made to concentrate community interest on the health of those who work for a living.

ORGANIZATION SECTION

Proceedings of the St. Louis Interim Session

MINUTES OF THE INTERIM SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN ST. LOUIS, NOVEMBER 30-DECEMBER 1, 1948

HOUSE OF DELEGATES

First Meeting—Tuesday Morning, November 30

The House of Delegates convened in Assembly Room 2 of the St. Louis Municipal Auditorium, Fourteenth Street at Market Street, St. Louis, and was called to order at 10:00 a. m. by the Speaker, Dr. F. F. Borzell.

Preliminary Report of the Reference Committee on Credentials

Dr. H. B. Everett, Chairman, stated that 129 delegates had registered up to the present time, and the speaker announced that that constituted a quorum.

Roll Call

The Secretary called the roll.

Adoption of Proceedings of Chicago Session in June 1948

On motion of Dr. Walter E. Vest, West Virginia, seconded by several and carried, the House adopted the Proceedings of the Annual Session in Chicago in June 1948 as published.

General Practitioner's Award

Dr. E. L. Henderson, Chairman, Board of Trustees, presented the following statement:

Twenty-three nominations for the General Practitioner Award were submitted to the Board of Trustees by twenty-three different state medical associations. All twenty-three nominees are distinguished general practitioners, noted in their respective states for their long and devoted service. The Board of Trustees was confronted with an extremely difficult task in attempting to eliminate twenty of these nominees in order to present to you the three nominations which were finally selected.

The only basis on which the Board of Trustees made its selection was the material presented in support of the candidate from each state. In several instances, the material presented was too insufficient in the sense of providing supporting data for the Board to reach any conclusion; for example, here is a telegram received from one state which is the sole information transmitted to the Board of Trustees—no supporting data whatever were forwarded for the Board to consider. Here is a letter from another state which, again, constitutes the sole material presented. On the other hand, here is the material presented from one state, which, as you see, is voluminous and provides sufficient material for a thorough analysis.

The three candidates selected from those submitted by the state associations, Dr. Lyle ("Bunny") Hare of Spearfish, S. D., Dr. Charles Manly Horton of Franklin, La., and Dr. W. L. ("Buck") Pressly of Due West, S. C., are all strongly recommended by their respective state medical associations and have earned the love and respect of the public which they have so loyally served. It will not be possible to read the specific testimonials received for each of these distinguished general practitioners, but I can assure you that the degree of warm feeling for and the professional and community support of these men, as evidenced by the material submitted, are tremendous.

I present, for your information, in alphabetical order, the following brief biographic sketches of the three general practitioners whose names the Board of Trustees herewith presents in order that the House of Delegates may select the recipient of the American Medical Association's General Practitioner's Award:

Dr. Lyle ("Bunny") Hare, Spearfish, S. D., was born in Cedar Rapids, Neb., Nov. 26, 1885. His family moved to Hill City, S. D., when he was 4 years old. He graduated at the University of South Dakota in 1907 and at the University of Illinois College of Medicine in 1911. He interned at University Hospital, Chicago. He has held numerous public and professional positions. He was secretary and president of his local district medical society and at one time was mayor of his town. He served as a captain in the Medical Corps in World War I and was a post commander of the American Legion. He has contributed a considerable amount of his time to the stimulation of the Boy and Girl Scout organizations, the Red Cross and the growth and improvement of his original alma mater, the Black Hills Teachers' College, which in October 1947 honored him by naming its new stadium "The Lyle Hare Field." "Bunny" Hare has been a general practitioner in Spearfish for 37 years.

Dr. Charles Manly Horton, Franklin, La., was born in Lowndesville, S. C., Oct. 23, 1879, the son of a country doctor. He graduated at Furman University with an A.B. degree. Dr. Horton worked his way through the Tulane University School of Medicine; he was a telegrapher and train dispatcher for local railroads in New Orleans. He interned at New Orleans Charity Hospital and began practice in Franklin, La., in September 1911 and has continued there in general practice to the present time. He has been president of the Louisiana State Medical Association and is a member of the Louisiana Academy of General Practice and the American Academy of General Practice. He is also a member of the Louisiana State Board of Medical Examiners and the Louisiana Physicians' Service. He is a past president of the Franklin Rotary Club, a member of the Elks Club and a Mason.

Dr. W. L. ("Buck") Pressly, Due West, S. C., was born in Due West in 1887, graduated with an A.B. degree at Erskine College in 1908, received his medical degree from Emory University School of Medicine in 1912, and served as intern and resident at Jefferson Hospital, Roanoke, Va., from 1912 to 1915. Dr. Pressly has held numerous offices, including that of president of the Abbeville County (South Carolina) Medical Society, 1920; the Third (South Carolina) District Medical Association, 1926, and the South Carolina Medical Association, 1940. He served as a councillor of his state association from 1933 to 1940, when he was elected president. He was chairman of the General Practice Section of the Southern Medical Association in 1943-1944 and is at present chairman of the South Carolina Academy of General Practice. Dr. Pressly has been a member of the executive committee of the South Carolina State Board of Health since 1939, and was state head of the Procurement and Assignment Division of Selective Service during World War II. He is noted for his achievements in the field of public health as well as in general practice and has been called the "Father of Public Health" in the county where he practices. He sponsored an early campaign against typhoid and initiated "Well Baby Clinics" and is considered an authority on rural health and sanitation in his state. "Buck" Pressly has been in general practice in his home town of Due West, S. C., for thirty-two years.

The Speaker requested the tellers, who had previously been informed of their appointment, namely, Drs. Roland W. Stahr, Nevada, chairman, George P. Johnston, Wyoming, John H. Moore, North Dakota, William M. Skipp, Ohio, and James Stevenson, Oklahoma, to distribute the ballots.

Presentation of Dr. A. S. Fernando, Secretary of the Philippine Medical Association

While the tellers were distributing the ballots, the Secretary presented Dr. A. S. Fernando, Secretary of the Philippine Medical Association, who took a bow.

General Practitioner's Award (Continued)

The ballots were collected and computed, indicating that Dr. Hare had received 52 votes, Dr. Horton 17 and Dr. Pressly 97, and the Speaker announced that Dr. W. L. Pressly, Due West, S. C., having received the majority of the votes cast, had received the General Practitioner's Award of the American Medical Association.

Address of the Speaker, Dr. F. F. Borzell

Dr. James R. Reuling, New York, Vice Speaker, took the chair.

Dr. F. F. Borzell presented the following address containing a request for the confirmation of the appointment of reference committees, which was referred to the Reference Committee on Reports of Officers:

Gentlemen:—I approach this, the third interim session and my initial session as Speaker, with prayerful contemplation. There have been few, if any, sessions of the House of Delegates as momentous as this one. You will be called on to make decisions that may have far reaching effects on the future of America and especially American medicine. May God give us the wisdom we need to guide us aright.

You are the legislative body of American medicine. It is your responsibility to determine policies and so direct the affairs of the American Medical Association that the high standards of medicine are perpetuated, sustained progress is insured and the fundamental principles of our profession defended. This session will undoubtedly present problems of major proportions.

Our system of reference committees provides effective mechanisms for sober deliberation and free expression.

Each delegate and member of the House should see to it that these committees have the benefit of your opinions in formulating their decisions. It is hoped that tomorrow morning may be given over to reference committee hearings.

The Vice Speaker will meet the chairmen of these committees immediately after this morning's session to discuss with them details of procedure.

Your attention is called to the fact that at our last session we adopted a revised Constitution and By-Laws by which we are now governed. The Speaker would request that the House consider the advisability of clarification of Division Three, Chapter IX, Sec. 3 (C), of the By-Laws, referrable to Executive Session. As presently written, the Speaker must rule that each person other than the constituted members of the House of Delegates who wish to be granted the privilege of attendance at Executive Sessions must be admitted separately and by a majority rule.

You have all received a communication from the Speaker. It is anticipated that our business will be expedited by your cooperation along the lines suggested. The Speaker would also caution the House to weigh carefully all decisions having an impact on the public. In other words, we should weigh carefully the public relations effect of all our deliberations. Certain events and social trends cannot be overlooked. The Speaker would suggest that the reference committees utilize freely the advisory facilities of our public relations services in the formulation of pronouncements with public relations implications.

In accordance with the By-Laws the personnel of our standing reference committees was announced and published in The Journal of the American Medical Association of October 30. As is to be anticipated, a number of changes must be made because of changes of delegates. I find it necessary, therefore, to read the appointments as of today. They are as follows:

Reference Committees

SECTIONS AND SECTION WORK

Henry S. Ruth, Section on Anesthesiology, Chairman.
Jean Paul Pratt, Section on Obstetrics and Gynecology.
Benjamin H. Minchew, Georgia.
Homer L. Pearson Jr., Florida.
Thomas A. Foster, Maine.

RULES AND ORDER OF BUSINESS

Philip W. Morgan, Kansas, Chairman.
Stephen R. Monteith, New York.
Edward H. McLean, Oregon.
Ivan Fawcett, West Virginia.
Wyman D. Barrett, Michigan.

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Creighton Barker, Connecticut, Chairman.
Coursen B. Conklin, District of Columbia.
Samuel J. McClendon, California.
Hans H. F. Reese, Section on Nervous and Mental Diseases.
Fred H. Muller, Illinois.

MEDICAL EDUCATION

George W. Kosmak, New York, Chairman.
William Bates, Pennsylvania.
Mather Pfeiffenberger, Illinois.
Louis A. Buie, Section on Gastro-Enterology and Proctology.
Warde B. Allan, Maryland.

LEGISLATION AND PUBLIC RELATIONS

Thomas K. Lewis, New Jersey, Chairman.
Clifford C. Sherburne, Ohio.
John W. Cline, California.
Charles H. Phifer, Illinois.
Edward H. Cary, Texas.

HYGIENE AND PUBLIC HEALTH

Stanley H. Osborn, Section on Preventive and Industrial Medicine and Public Health, Chairman.
W. Palmer Dearing, U. S. Public Health Service.
Gerald V. Caughlan, Iowa.
Karl S. J. Hohlen, Nebraska.
Albert F. R. Andresen, New York.

AMENDMENTS TO CONSTITUTION AND BY-LAWS

Floyd S. Winslow, New York, Chairman.
James P. Wall, Mississippi.
William R. Brooksher, Arkansas.
Val H. Fuchs, Louisiana.
Donald Cass, California.

REPORTS OF OFFICERS

James Z. Appel, Pennsylvania, Chairman.
Joshua B. Lukins, Kentucky.
Willis I. Lewis, Illinois.
Deering G. Smith, New Hampshire.
E. Vincent Askey, California.

CREDENTIALS

Hiram B. Everett, Tennessee, Chairman.
Carl A. Lincke, Ohio.
Edward P. Flood, New York.
Raymond F. Peterson, Montana.
Charles F. Strosnider, North Carolina.

INDUSTRIAL HEALTH

Thomas K. Gruber, Michigan, Chairman.
Homer G. Hamer, Indiana.
William L. Benedict, Section on Ophthalmology.
Theodore H. Harwood, Vermont.
H. B. Mulholland, Virginia.

EXECUTIVE SESSION

J. Stanley Kenney, New York, Chairman.
Jesse D. Hamer, Arizona.
Claude R. Keyport, Michigan.
Erling W. Hansen, Minnesota.
Walter G. Phippen, Massachusetts.

MISCELLANEOUS BUSINESS

Walter E. Vest, West Virginia, Chairman.
Herbert H. Bauckus, New York.
Britton E. Pickett Sr., Texas.
James P. Kerby, Utah.
J. Wallace Hurff, New Jersey.

SERGEANTS-AT-ARMS

James L. Whitehill, Pennsylvania, Chairman.
Stephen E. Gavin, Wisconsin.
Hugh P. Smith, South Carolina.

TELLERS

Roland W. Stahr, Nevada, Chairman.
George P. Johnston, Wyoming.
John H. Moore, North Dakota.
William M. Skipp, Ohio.
James Stevenson, Oklahoma.

The Speaker requests authorization for the appointment of two reference committees with personnel as follows:

MEDICAL SERVICE AND PREPAYMENT INSURANCE PLANS

Raymond L. Zech, Washington, Chairman.
William H. Halley, Colorado.
Leland S. McKittrick, Massachusetts.
Joseph F. Londrigan, New Jersey.
Forrest J. Pinkerton, Hawaii.
Howard E. Griffin, Section on General Practice.
William L. Estes Jr., Pennsylvania.
F. J. L. Blasingame, Texas.

EMERGENCY MEDICAL SERVICE

Thomas F. Thornton, Iowa, Chairman.
James Beebe, Delaware.
William A. Coventry, Minnesota.
Howard B. Goodrich, Missouri.
F. S. Crockett, Indiana.
George E. Armstrong, United States Army, Consultant.
Joel T. Boone, United States Navy, Consultant.

It was moved by Dr. James Q. Graves, Louisiana, seconded by several and carried, that the House approve the appointment of the two special reference committees.

On motion of Dr. Val H. Fuchs, Louisiana, seconded by several and carried, the House confirmed the appointments to reference committees as read by the Speaker.

Dr. E. Vincent Askey, California, reported that Dr. John H. Green of California, appointee to one of the reference committees, was unable to be present, and the Speaker announced that he would reappoint at a later time.

Remarks of President, Dr. R. L. Sensenich

Dr. Sensenich, the President, presented a few remarks.

Presentation of Dr. Ernest E. Irons, President-Elect

The Speaker presented Dr. Ernest E. Irons, Chicago, President-Elect, who stated that he had no remarks to make.

Report of Secretary

Dr. George F. Lull, Secretary, presented his report as contained in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

Report of Board of Trustees

Dr. E. L. Henderson, Chairman, presented the report of the Board of Trustees as contained in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary with the following exceptions: The report of the Executive Assistant, pages 50 to 55 inclusive in the Handbook, was referred to the Reference Committee on Legislation and Public Relations; the report of the Council on Industrial Health, pages 67 to 69 inclusive, to the Reference Committee on Industrial Health, and the report of the Council on National Emergency Medical Service, pages 70-71, to the Reference Committee on Emergency Medical Service.

Supplementary Report of Board of Trustees

Dr. E. L. Henderson, Chairman, presented the following supplementary report:

PROGRESS REPORT OF THE COMMITTEE ON HOSPITALS AND THE PRACTICE OF MEDICINE

The analysis of the laws of the various states concerning what constitutes the practice of medicine has not yet been completed by the Bureau of Legal Medicine and Legislation of the Association. Until these laws are collected, studied and appraised by both the Bureau and the Committee on Hospitals and the Practice of Medicine it seems absurd to attempt to make a report on the subject assigned to this committee. However, certain observations are definitely in order. This report will be, or could be, used as a background for our thinking until the above-mentioned information is available and for action after there has been an opportunity to study the legal wordings of the various state laws. It is assumed at the beginning that all of the laws will differ somewhat and that many things will be legal, not necessarily ethical, in one state and illegal in another. The interpretation of the various state laws will have to be studied in the light of judicial actions, if any, that have been made in the application of the laws to specific cases.

The American Medical Association has often been severely criticized for its lack of aggressive action in certain matters that have been brought before it. At the time of writing this report, the Chairman received a letter from a prominent physician who rather doubts the willingness of the American Medical Association to take any specific action in a disciplinary fashion toward those institutions which, in his opinion, violate his conceptions of the principles of medical ethics. Again, it must be insisted that every physician should know exactly what are and what are not the duties and obligations of the parent body and what are the legal requirements necessary for the American Medical Association to continue to live and have its being and to serve the medical profession. The first thing necessary for a thorough understanding of rights and privileges of its members is to know how and for what the American Medical Association was created.

Article I of the Constitution states: "The name of this corporation is the American Medical Association. It is a federacy of its constituent associations." In other words, the American Medical Association receives whatever of authority it has from its constituent state medical associations, which, in turn, are federations of their local component county or district and territorial medical societies whence all the authority comes.

Article II says: "The objects of the Association are to promote the science and art of medicine and the betterment of public health." A simple statement but thoroughly specific. The object is, to put it another way, to encourage the education of medical students and physicians so that the American people may live longer, more comfortable and better lives, no more—no less.

In the By-Laws, Chapter IX, Section I, the Judicial Council's duties are completely outlined. It is specifically stated that this Council shall have authority in all matters of ethics and also in controversial matters between individuals and groups, et cetera, but only when these matters are properly brought before it through proper channels. If the situation cannot be adjudicated at the level at which it occurs and if through the good offices of the Judicial Council the various differences cannot be settled, then formal charges may be presented and those charges prosecuted before the Judicial Council, and the Council then has the power to acquit, admonish, suspend or expel the accused.

An example is worthy of discussion: A physician is employed by a hospital. He has signed a contract. He then becomes dissatisfied with his arrangement with the institution and believes that the hospital is exploiting him. He must, of course, satisfy not only the hospital management but the medical staff of the institution. This man, the staff or the institution, separately or individually, may have a real or fancied grievance. The logical place for a physician to go in such a case would be the proper committee of his county medical society. If for one reason or another redress is not forthcoming, he may appeal to his state association, and then, if redress is not his, he may appeal to the Judicial Council of the American Medical Association. In all three instances all parties to the controversy, hospital, employed physician or staff should be brought together in an attempt through proper channels to settle their differences.

The Judicial Council at the national level is set up, first, to try to settle differences; secondly, it is one place where charges may be brought against a member for unethical conduct. The machinery is all set up, ready to go, but the methods have seldom been used for the settlement of these various ills that are the basis of complaint by many physicians.

It must be admitted that in many places in the Principles of Medical Ethics the wording is such as to make many things confusing. However, we are living in a modern, practical world and some things are done, if the Principles were literally translated, that would be ethically questionable. The key to the Principles, however, is one sentence, which is contained in Article VI, Section 3: "The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole." This statement is so broad that the final interpretation can only be the opinion as to whether certain practices are or are not good for the people. Who can make such an interpretation except:

1. A committee of the local county medical society?
2. A committee of the state medical association?
3. A committee from the American Medical Association (the Judicial Council)?
4. The Judicial Council acting as a jury?

The membership of the American Medical Association comprises medical men of as many different colors as are in the spectrum. At one end is the physician who is not connected in any way with any organized business. He practices private medicine alone. He pays his own rent, maintains his own fees and depends for his livelihood on his own individual professional and business methods. He is dependent on no one but the patient who consults him. At the other end of the spectrum is the physician employed by an industrial organization on a fulltime salary, who does all of the medical work of the plant and even runs a temporary hospital with x-ray and laboratory services to care for immediate emergencies around the plant and supervises the physicial health for employment and continued health during such employment of the employees. Between these two extremes are all sorts of arrangements with all their gradations of employment, salary, bonus or what have you, from the doctor who employs a young doctor to help him to the clinical group employed as salaried men or on a salaried and commission basis. This includes the Army, Navy and Public Health Service. The American Medical Association has recognized all of these persons as eligible to Fellowship if they are members of their component county and constituent state medical organizations or are members of the government services, et cetera. Therefore, it is necessary that the Principles of Medical Ethics be broad enough to cover and protect all these persons so long as the work they do is to the public benefit.

In order to answer the critics of the American Medical Association on some of these matters which are causing dissension and controversy, such as "the hospitals and medical schools practicing medicine," it must be remembered that when such institutions violate that which we think is the "Code," some physician is guilty of unethical conduct or he is not, and he is the one to carry before the Judicial Council with charges of unethical conduct against him. The decision can only be made on the evidence presented.

Then it must be remembered that while we as physicians have our own Principles of Medical Ethics, those Principles may be the cause of our doing something which, under the laws of a state, is illegal, subjecting us as organizations or as individuals to prosecution in the civil courts. A thing may be unethical according to our interpretation but may be perfectly legal.

Until the laws of all of the states are available for study and until recommendations can be made that will hold water, both ethically and legally, it behooves us to attempt to settle at the local level all matters of controversy between medical men and the various institutions where they work and practice. This can be done if personalities can be forgotten and physicians are men of good will and will sit down around a table and find out, first, on what points agreements can be reached; secondly, what points exist where differences of opinion are slightly divergent; thirdly, what points are of maximum disagreement, and finally, if it can be resolved to compromise everything but broad general principles concerning that which is for the public good. It will be for the good of every physician.

Respectfully submitted,

Elmer Hess, Chairman.

THE FUTURE OF MEDICINE IN THE UNITED STATES

The Board of Trustees has given long and careful consideration to some of the problems which intimately concern the future of the medical profession of the United States. The Board is aware of the proposed legislation relative to the nature of medical practice, of legislation for the establishment of a department of health, education and welfare, of legislation for the expansion of the Social Security Act and of several other matters of extreme significance.

The funds of the American Medical Association at this time are adequate to meet promptly any contingency that may arise, and the Board of Trustees is not averse to the expenditure of its total funds if need be to oppose any enslavement of the medical profession or any effort to attack the fundamental principles of liberty and democracy which are characteristic of the American nation. We are confident of the honesty, sincerity and altruism of our position. We are earnest in our effort to maintain standards of medical science and medical care which are responsible for the high position that American medicine occupies in the world today. We propose to resist determinedly any attempt at deterioration of these standards, and we shall give to this effort all of the strength and the courage of conviction that the American Medical Association, through its officers, its House of Delegates and its membership, can muster.

Conceivably additional funds in large amounts may be required to present to the American people the fullest possible information relative to American medicine and its point of view so that we may have the complete public support that we merit. If the Board of Trustees should find that such additional funds are required, the Board knows that it can rely on the House of Delegates to take any action that may be necessary under the Constitution and By-Laws of the Association to develop such funds. The proposal has been made that the House of Delegates authorize the Board of Trustees at this time to take such action as the Constitution and By-Laws of the Association permit in order to meet an emergency. That decision rests, of course, with the House of Delegates. We know that we can rely on your full support.

ESTABLISHMENT OF A PLANNING COMMITTEE

The Board of Trustees has adopted a recommendation of the Executive Committee to establish a Planning Committee.

That committee, the Board feels, should consist of seven members: four from the Board of Trustees and officers and three from the House of Delegates, with the President, the Chairman of the Board and the Secretary and General Manager as ex officio members, all of whom shall be voting members, and at each annual meeting the Board shall reconsider the personnel of this committee and make such appointments or changes as may seem necessary.

At this time, the Board announces the appointment of the committee as follows:

Louis H. Bauer, New York	Board of Trustees
Gunnar Gundersen, Wisconsin	
Edwin S. Hamilton, Illinois	
Walter B. Martin, Virginia	
William Bates, Pennsylvania	House of Delegates
John W. Cline, California	
R. B. Robins, Arkansas	
President	
Chairman of Board of Trustees	
Secretary and General Manager	

WORLD MEDICAL ASSOCIATION

Dr. Henderson called on Dr. John W. Cline, California, to present a report on the World Medical Association, which reads as follows:

Mr. Speaker, Mr. Chairman, Members of the House: In keeping with the original remarks of the Speaker, I shall make every effort at brevity.

As you probably are all acquainted, the second meeting of the World Medical Association was held in Geneva in September. The first meeting, the organization meeting, had been held in Paris in 1947. At that time the organization was set up. Dr. Louis Bauer became Secretary General; the members of the Council were chosen from various nations, and our representative on that Council was Dr. E. L. Henderson.

The delegates to the World Medical Association were Dr. E. L. Henderson and Dr. R. L. Sensenich. The alternate delegates were Dr. Creighton Barker of Connecticut and myself, and we attended those meetings.

I do not propose to go into any detailed discussion of the various things which happened there, but I think it is of some importance to know that there is much closer relationship between the medical men of the world than there is between most other groups, perhaps. There is a tendency for a similarity of thinking—not a uniform thinking but a similarity of thinking—by medical men.

The problems which confront medicine throughout the world bear some relationship in the various countries. Some of them are identical.

A large portion of the time of this meeting was taken up with setting up twelve points or, rather, principles by which governmental insurance schemes should be governed for the protection and welfare of the people of those countries in the maintenance or improvement of the standard of medical care.

The aims of the World Medical Association, I think you would agree, are entirely laudatory. They are, first, to promote closer ties among the national medical organizations, among doctors of the world, by personal contact and by all other means available; second, to maintain the honor and protect the interests of the medical profession; third, to study and report on professional problems which confront the medical profession in different countries; fourth, to organize an exchange of information on matters of interest to the medical profession; fifth, to establish relations with and to present views of the medical profession to the World Health Organization, Unesco, and other appropriate bodies; sixth, to assist the people of the world to attain the highest possible level of health, and seventh, to promote world peace.

I think you will agree, all of you, that those are laudable ambitions.

When I mention the World Health Organization, I should like to point out the distinction between it and the World Medical Association. The World Health Organization is a group of governmental agencies primarily interested in public health, and the World Medical Association is an association of national medical associations. It bears about the same relationship to the World Health Organization that our American Medical Association would bear to official organizations of public health officers in this country.

Briefly, what has been accomplished so far by the World Medical Association has been the investigation of war crimes and the publishing of the report on that; the issuing of a new oath relative to the conduct of physicians under any circumstances such as we have recently seen during the war, and the status of the medical profession in twenty-three countries to date. One of the by-products has been the institution of strong medical associations in certain countries which had weak associations before; the establishment of national medical associations in some countries where none previously existed. Those of you who remember, or if you will think back to, the influence the American Medical Association has had on the standards of medical education and the standards of medical care in this country, I think will realize the great potentiality that an organization such as this, encouraging and aiding in the establishment of strong medical associations in other countries may have.

Without strong medical associations, the standards of the practice of medicine are low and the standards of medical education are poor.

It has concerned itself not only with undergraduate education. There is an extensive program on foot in studying the undergraduate education of all the countries of the world. I speak of undergraduate medical education, but there is also a program to study the graduate education of all of the countries of the world.

There is an effort made to improve the level of medical advertising throughout the world. There are few countries that have standards comparable to ours. The national medical journals of many of the other associations carry advertising of a character and type that would not be tolerated by any of us in our journals. Progress is being made in that direction.

There also is the effort to control nostrums and quackery in the rest of the world. These are just some items. I do not think that I need to continue any further but I think that it is incumbent on us, as Americans who occupy a more favored position—just as we do in the world economically and in every other respect, so do we in medicine—I think it is incumbent on us to extend the hand of fellowship and aid to the doctors of the other countries of the world to assist them where we can to improve their standards, and the standards of care and the lot of the peoples in those countries.

I do not think that this is an entirely visionary scheme. It is one which has great practical application, and it will affect the whole world extremely favorably, if we are able to do this. The exact, practical steps might be difficult to conceive, but in any new organization progress must be made slowly.

The organization of the World Medical Association was initially made possible by the generosity of certain industrialists in this country who provided the funds. It is not reasonable to expect, as time goes on, these persons whose interest in medicine is indirect, and not direct, as is ours, to continue that support indefinitely. We probably are going to have to look for financial support, largely, to our membership. The medical profession in most of the countries is impoverished. It is not reasonable to expect most of these medical associations to be able, in large measure, to finance it. They all seem willing to contribute in the measure possible for them to do so. Certain countries which are better off than others have certain restrictions which do not permit them to send money out of the country. Therefore, I think it falls on us, as members of the medical profession in this country, to make it possible for the continuation of the World Medical Association.

Dr. Bauer has asked me to announce that a secretary from the World Medical Association is here and would be happy to enrol any of you who would care to take out memberships and that he hopes that every member of the House of Delegates will feel that this is a sufficiently worthy project to warrant his support.

SUPPLEMENTARY REPORT OF COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE ON ATTITUDE OF AMERICAN MEDICAL ASSOCIATION TO POSSIBLE RETENTION OF MEDICAL OFFICERS

Dr. Henderson presented the following report:

The executive committee of the Council on National Emergency Medical Service has received and reviewed a letter addressed to Dr. Roscoe L. Sensenich, President of the American Medical Association, dated Oct. 15, 1948, in which the question is raised as to the attitude of the American Medical Association on the possible retention of medical officers in the Army who were deferred during the war years to complete their education and who are now on active duty and will in the next months complete twenty-four months of obligated duty.

Inasmuch as this involves officers now on active duty, it is believed that the question can only be resolved by the Secretary of Defense. It is assumed that the Armed Forces Medical Advisory Committee to the Secretary of Defense will have sufficient information at its disposal to give an answer should the need for retention of medical officers become urgent.

The Council on National Emergency Medical Service desires to inform the Board of Trustees and the House of Delegates that there are being considered numerous proposals for the amendment of the Selective Service Act of 1948 to provide special legislation for the registration and drafting of doctors and other professional personnel in a special category above the age limits established for other U. S. citizens. The Selective Service Act of 1948 provides for the registration of male citizens of the United States up to the age of 26 years, including doctors of medicine. Physicians in this age group, because of their professional training, are eligible for a commission in the armed forces; hence there can be no question of hardship, dependency or professional deferment.

1. It is recommended by the Council on National Emergency Medical Service to the House of Delegates that the American Medical Association favors the call-up and commissioning of the number of physicians in this age group already registered under the Selective Service Act of 1948 that are required by the armed forces to accomplish their primary mission of the defense of our country.

2. The Council further recommends to the House of Delegates that it reaffirm its support of the democratic principles of our country and in so doing object to any special legislation which directly or indirectly singles out the medical profession for registration or draft in categories other than those established for their fellow citizens.

3. It is further recommended that the House of Delegates of the American Medical Association authorize and urge the Council on National Emergency Medical Service, the officers and Trustees of the Association, as well as its constituent organizations operating through their committees on emergency medical service, to initiate and support a program for the recruitment of a sufficient number of qualified physicians for the armed forces.

4. The Council on National Emergency Medical Service recommends to the House of Delegates that the resolution passed by it in June 1948 relative to the development of a *resident* training program in the Department of Army and the Department of Navy, be clarified. Such a program represents the highest type of medical education but cannot be supported as to recruitment program for the regular service of a government agency. Full utilization of civilian teachers and civilian clinician and hospital facilities for such a graduate training program of the armed forces or any other government agency is essential to our national economy and the maintenance of the established high level of medical educational standards and training. Such a graduate training program for the armed forces or for any other government agency must be limited by the actual needs of its peacetime establishment and the support of its primary mission as established by Congress. In our

democratic form of government an adequate number of medical specialists always have been and always will be available to serve in the defense of our country.

CIRCULATION OF BULLETINS AND OTHER INFORMATION FROM HEADQUARTERS OFFICE

It has been voted by the Board of Trustees that all messages to state and county societies shall emanate from the office of the Secretary and General Manager and that all bulletins issued by independent offices in the headquarters shall constitute portions of the Secretary's News Letter.

REPORT OF COMMITTEE ON VETERANS AFFAIRS

Dr. H. H. Bauckus, Chairman of the Committee on Veterans Affairs, at the request of Dr. Henderson, presented a report, as follows:

Your Committee on Veterans Affairs has functioned without specific instructions from this House of Delegates.

It has been our purpose to function in the interest of veterans, the public and the system of medical care in this country, which has functioned so well for so long.

The first formal meeting of the committee took place in Washington, D. C., in early May 1948. It was a joint meeting with the Committee on Veterans Affairs of the American Hospital Association. We should say, also, that all subsequent actions were joint actions by the two committees. In the course of this meeting a number of facts were developed. Among those important to mention at this moment are the following:

The medical and hospital service program of the Veterans Administration, as it relates to the care of veterans with non-service-connected disabilities, is making an impact of tremendous magnitude on the civilian hospital program that is being developed under the provisions of the Hill-Burton Bill and the developments that have taken place independent of federal aid.

It was learned that leaders in this expansion movement contemplate the expansion of veterans hospitals to a total of 300,000 beds.

There are now approximately 18,860,000 veterans, a large percentage of the adult population of the nation. We learn that over 80 per cent of all admissions to veterans hospitals of all classes are for disabilities not due to service; that the veterans hospitals already in existence are sufficient for the care of all service-connected cases; that the expansion of veterans facilities beyond the present capacity is for the benefit of veterans with non-service-connected disabilities. We learn that Congress has made available a little more than $1,000,000,000 to carry forward this expansion program, and that the cost of operating the present veterans hospital facilities in 1948 is $375,000,000.

The medical and hospital benefits are not equally available to all veterans.

There is a growing conflict and competition between the expansion program of the Veterans Administration and the expansion program of the civilian hospitals. There is competition for personnel, for operating funds, materials, etc.

The laws governing the rights of veterans with non-service-connected disabilities were reviewed. As many of you know, the 68th Congress passed an amendment to the World War Veterans Act in 1924. This amendment gave to veterans the right to admission to veterans hospitals for disabilities not due to service. It provided that preference be given to veterans financially unable to pay for hospitalization. This amendment was not sponsored by the American Legion, but by agencies administering veterans affairs. In the first administration of the late President Roosevelt this provision of the World War Veterans Act was repealed by an act "to maintain the credit of the United States Government."

The same Congress, however, passed a law which gave to veterans with non-service-connected disabilities the right to free service in veterans hospitals (Section 706, Chapter 12, Title 38, U. S. Code, 1940 edition).

Under the provisions of this statute veterans have the right to the following benefits under the conditions set forth in the act. The benefits are: (1) necessary hospitalization; (2) necessary transportation to and from the hospital, and (3) medical and surgical care in the hospital.

The following is a statement from the Act:

"The statement under oath of the applicant on such form as may be prescribed by the Administrator of Veterans Affairs shall be accepted as sufficient evidence of inability to defray expenses."

This provision of the Act is enforced by the Administrator of Veterans Affairs by having the veteran sign form P 10 when he makes application for admission to a veterans hospital.

This provision of the law is interpreted by Mr. J. W. Holloway, Director of the Bureau of Legal Medicine and Legislation of the American Medical Association, to mean that the Administrator of Veterans Affairs is compelled to accept without question such a statement by a veteran.

The federal government has by these acts assumed a liability for these medical and hospital benefits to veterans with non-service-connected disabilities on the basis thus defined.

NUMBER OF VETERANS INVOLVED

General Bradley, when Administrator of Veterans Affairs, gave testimony to a Congressional Committee to the effect that approximately 80 per cent of the 18,860,000 veterans can qualify for free medical care, free hospital care and free transportation to and from a hospital.

Your Committee has not at any time subscribed to the methods employed at the present time in determining the ability of the individual veteran to pay the cost of medical and hospital care. We do recognize, however, that any alteration of the methods employed at the present time for determining this question will require an amendment to the law now in effect. We recognize, also, that there is a wide difference of opinion as to the methods by which this question should be determined. We recognize, further, that these differences of opinion, in so far as they are related to veterans, will be resolved finally by an Act of Congress.

The hospital expansion program of the Veterans Administration now going forward and which is sponsored by the American Legion is based on the laws, regulations and estimates above referred to. These are some of the facts that were developed in the first phases of our activity.

The next question naturally to arise was, What action can our committee take which may bring about an alteration in this expansion program?

It was, of course, our purpose to find a solution, if possible, in line with the established policies of this House of Delegates.

ACTIONS BY THE HOUSE OF DELEGATES REVIEWED

Our work at this point was simplified by reference to previous actions by the House of Delegates.

In 1931, this House of Delegates adopted resolutions on this same subject which read as follows:

> *Resolved,* That the House of Delegates of the American Medical Association petition the Congress of the United States and the American Legion to abandon the policy of rendering hospital and medical benefits to veterans of the World War with non-service-connected disabilities, and substitute therefor a plan of disability insurance benefits with the following provisions:
>
> First, the creation of a Bureau of Disability Insurance in the Veterans Bureau as now constituted.
>
> Second, the issuance of a disability insurance policy to each veteran with a disability benefit clause, as follows:
>
> (*a*) The payment of a weekly cash benefit during a period of total disability, and
>
> (*b*) The payment of liberal hospital benefit sufficient to cover the hospital expenses of a veteran during a period of hospitalization for any disability, such benefits to be paid to a veteran on satisfactory proof of total disability, and
>
> (*c*) Such other provisions as are necessary for the proper administration of the act.
>
> Be is further
>
> *Resolved,* That the proper officers of this Association be instructed to approach the officers of the American Legion with the view to securing the adoption of the policy above set out as a part of the legislative program of the American Legion; and be it further
>
> *Resolved,* That each state medical association be requested to form a committee whose duty it will be to approach the state and local Legion Posts throughout the country with a view to securing the adoption of this program by them.

The above resolutions were referred to the Reference Committee on Legislation and Public Relations, which reported as follows:

"Your Reference Committee on Legislation and Public Relations has had under consideration the resolutions offered by

Dr. H. H. Shoulders, Tennessee, pertaining to medical and hospital benefits to veterans of the World War with non-service-connected disabilities. The purpose of these resolutions and the plan advanced therein appeals to this committee as being in line with the heretofore expressed policies of the American Medical Association pertaining to such matters, in addition to which it has the advantage of offering something very definite for the consideration of all parties concerned. It is, therefore, recommended that the resolutions be adopted."

The House of Delegates took the following action on the report of the Reference Committee:

"Doctor Taylor moved that the first section of the report, pertaining to the resolution submitted by Doctor Shoulders relative to the policy of rendering medical and hospital benefits to veterans with non-service-connected disabilities, be adopted. The motion was seconded by Dr. H. B. Everett, Tennessee, and after discussion by Drs. Donald Macrae Jr., Iowa; H. H. Shoulders, Tennessee; H. M. Johnson, Minnesota—who suggested that the report be amended so that the American Hospital Association be invited to cooperate with this committee—J. Norman Henry, Pennsylvania; B. F. Bailey, Nebraska, and Holman Taylor, Texas, this section of the report was amended as suggested by Dr. Johnson and adopted."

Also, in June of this year, this House of Delegates adopted a resolution submitted by the Board of Trustees which reads as follows:

> Whereas, Point seven of the Ten-Point National Health Program of the American Medical Association states: "The veteran shall be entitled to the highest available quality of medical care in accordance with existing law, and preferably in his home community with a physician and hospital of his own choice"; and
>
> Whereas, The Veterans Administration has the authority under certain conditions in service-connected disability and disease to make use of private practitioners and hospitals, thus allowing free choice; and
>
> Whereas, The Veterans Administration is in urgent need of its presently available full time and part time personnel for pension and compensation examinations, for veteran hospital care and for authorization and administrative duties; and
>
> Whereas, Proposed increases in the military services including those added by new draft provisions will tend to reduce the number of physicians available for Veterans Administration personnel; and
>
> Whereas, Hospital care in private hospitals and the additional beds to be provided under the Hill-Burton legislation may limit the building of additional veterans hospitals beyond our present day needs and available personnel; and
>
> Whereas, Numerous veterans in many states have requested the right to make their own choice of physician and hospital in the treatment of their service-connected disability or disease; be it therefore
>
> *Resolved*, That this House of Delegates of the American Medical Association request the Veterans Administration to put into uniform practice a free choice regulation for medical and hospital treatment in service-connected cases; and be it further
>
> *Resolved*, That we urge state medical societies or associations to conform to this principle when making contracts or agreements with the Veterans Administration.

The Committee recognized that it would be not only futile but unjust to seek a repeal of these particular benefits and thus deny a veteran who is unable to pay for medical and hospital care the right to such care.

Then the Committee after much consideration determined on the following policies and procedures:

1. That we supply the Hoover Commission with the facts concerning these several developments and reactions to them that are taking place. This was done.

2. It was decided that we should approach the American Legion with a positive proposal to alter the form of these particular benefits in such a way as to enable veterans to obtain admission to civilian hospitals of their own choice and to obtain the services of physicians of their own choice.

We therefore prepared the following positive proposal and submitted it, together with a lengthy discussion of the subject, to the Medical Advisory Committee of the American Legion in September 1948, as a proposal for their consideration and further discussion:

The Proposal

1. Program of benefits:

(*a*) That the Veterans Administration be authorized by Act of Congress to issue to each veteran who is eligible for hospital service benefits for non-service-connected disabilities under existing laws and to all veterans who may hereafter become eligible for such benefits, a hospital and medical service contract with benefit provisions sufficient for coverage of the cost of *necessary* hospital and medical expenses incurred in rendering such service in a hospital which is approved for service to veterans by the Veterans Administration; or that the Veterans Administration be authorized to purchase such contracts from a nonprofit corporation issuing and administering such contracts.

(*b*) That veterans qualify for such service contract in the manner required at present for admission to a veterans hospital for non-service-connected disability.

(*c*) That the contract cover all disabilities except: (1) service-connected disabilities; (2) chronic illness (in excess of ninety days); (3) disabilities which require only domiciliary care; (4) disabilities which are covered by compensation laws.

(*d*) That veterans with the above named disabilities be eligible for care in veterans hospitals already in existence.

2. The present program of hospital benefits to veterans with non-service-connected disabilities be discontinued in favor of the proposed plan.

We were cordially received, and this committte of the Legion manifested much interest in this proposal and the discussion.

Dr. L. G. Rowntree, Chairman of the Medical Advisory Committee of the American Legion, submitted this proposal to the Rehabilitation Committee of the American Legion during the sessions of the Legion convention in Miami. Again Dr. Rowntree says that much interest was displayed, but that no action would be taken for or against it until the subject had received thorough study.

Two members of the Medical Advisory Committee to the American Legion are also members of the Medical Advisory Council to the Veterans Administration. Dr. C. W. Mayo is chairman of this group, and we understand a joint meeting between the two medical groups has been arranged for December 6 (next week) and the committee of the American Medical Association and the committee of the American Hospital Association have been requested to appear before these groups.

Your committee does not presume to know what the action of the Hoover Commission will be. It is due to report to the Congress in January 1949. Nor do we presume to know what will be the ultimate effects of these efforts on future policies. We do know that the American Legion is one of the largest and most potent organizations in this country and that it is opposed to Communism as much as is the American Medical Association. We know also that it is committed to these medical service benefits to veterans and to the present expansion program of the Veterans Administration. We feel also that if this group can be convinced that the present program is unwise from the point of view of veterans and the point of view of freedom of veterans and that benefits can be made available to veterans in a different form that will preserve the freedom of the veteran and the freedom of the medical profession and at the same time accomplish economies to the taxpayers, it is our belief they will cooperate in such an effort.

In conclusion, we would like to say our association with the representatives of the American Hospital Association has been most pleasant and cordial. Rear Admiral Sutton, Director of Study, Government Hospital Relations, has done a magnificent job in developing vital facts in this matter and is entitled to much credit for the accurate information with which the committee has been supplied.

It is our opinion that this problem is far greater and more far reaching than one realizes at first glance and that it is a major problem before the American Medical Association, the American Legion and the entire population of the United States.

The Committee recognizes that this approach to the question, on the basis of the earlier action of the House of Delegates, involves the acceptance by the Federal Government of responsibility for non-service-connected disabilities of veterans.

The Committee would invite your attention to the fact that the use of the insurance principle, based on our interpretation of previous actions of the House of Delegates, and based on indigency to be determined on a basis yet to be defined in advance of the illness of the veteran, is a basic issue for your consideration. It might be feasible to render these services to the non-service-connected cases entitled to service under plans already in existence in service-connected cases.

Respectfully submitted,

H. H. Bauckus, Chairman.
Elmer Henderson.
H. H. Shoulders.
R. L. Sensenich.
George F. Lull.

The Speaker referred the Supplementary Report of the Board of Trustees to the Reference Committee on Reports of Board of Trustees and Secretary, with the following exceptions: The Supplementary Report of the Council on National Emergency Medical Service was referred to the Reference Committee on Emergency Medical Service and the Report of the Committee on Veterans Affairs, to the Reference Committee on Legislation and Public Relations.

Report of Judicial Council

Dr. E. R. Cunniffe, Chairman, presented the Report of the *Judicial Council* as printed in the Handbook on pages 98-101. The Vice Speaker, who had assumed the Chair, referred the report to the Reference Committee on Reports of Officers.

Report of the Council on Medical Education and Hospitals

Dr. H. G. Weiskotten, Chairman, presented the Report of the Council on Medical Education and Hospitals as printed in the Handbook on pages 102-110 inclusive and a supplementary report on (*a*) Essentials of a Registered Hospital, (*b*) Essentials of an Approved Internship, and (*c*) Essentials of Approved Residencies and Fellowships, copies of the Essentials being distributed to the members of the House, all of which were referred to the Reference Committee on Medical Education by the Speaker, Dr. F. F. Borzell, who had resumed the Chair.

Report of Council on Scientific Assembly

The Chairman referred to the Reference Committee on Sections and Section Work the *Report of the Council on* Scientific Assembly as printed in the Handbook on pages 111-114 inclusive.

Report and Supplementary Report of Council on Medical Service

Dr. James R. McVay, Chairman, presented the Report of the Council on Medical Service as printed in the Handbook, pages 115-128 inclusive, and the following Supplementary Report on the A. M. C. P. (Associated Medical Care Plans) Proposal to Form a National Insurance Company:

Decision up to the House of Delegates: Decision as to whether or not it is desirable to form a national insurance company or a reciprocal enrolling agency to supplement the present prepayment program is now before the House of Delegates for action at this present session. The Council on Medical Service has accomplished the principal purpose of its preliminary report of Oct. 2, 1948, namely, guarding and guaranteeing the right of the House of Delegates to speak for American medicine on this important subject. (A copy of the October 2 report, approved by the Board of Trustees, was sent to each member of the House previous to this meeting.) The right of the House of Delegates to determine its own and medicine's course of action was sustained by representatives of the Council on Medical Service and representatives of various state plans at the A. M. C. P. meeting at French Lick, Ind., in October.

Physicians Should Study Proposal: The second purpose of the October 2 statement of the Council was to make it possible for physicians throughout America to have an opportunity to study thoroughly the proposal for a national insurance company.

Although many state medical associations and county medical societies and groups have considered the insurance proposal and both proponents and opponents have been active in presenting their claims, the medical profession is not yet fully informed in regard to the scope of the proposal. Less than three months ago the printed proposal of the Blue Cross—A. M. C. P. insurance company was distributed to the Blue Cross and Blue Shield plans. The printed proposal was not sent to all state medical associations and county medical societies at that time and, therefore, few state medical organizations have had the opportunity to take action.

An Enrolment Agency Still Should Be Considered: At the June 19 meeting of representatives of state and territorial medical associations, it was evident that more complete agreement could be reached by the profession for the development of a national enrolment agency than for the formation of a national insurance company. The Council reported this fact to the House of Delegates at its Annual Session in Chicago in June 1948.

Sufficient detailed, concrete evidence has not yet been presented; therefore it is not possible to rule out further consideration of an enrolment agency at this time. The Council is of the opinion that an enrolment agency, if it received the wholehearted support of the officers of A. M. C. P., would gain the acclaim of a great majority of physicians and not raise the doubts and cause the repercussions resulting from the present proposal.

Bill of Particulars: Proponents claim a national insurance company is necessary to underwrite large national accounts. In answer to a request for specific information concerning these accounts the Council received the following letter from Dr. Hawley:

> "I have just received a letter from Mr. Frank Van Dyk, Manager of the National Enrollment Division of Blue Cross. When I requested this information from him, I also asked him to send it to you; but, in case he has not, I am furnishing you a summary.
>
> "In the files of the National Enrollment office are recorded 10,955 national employers. We do not believe this list to be complete.
>
> "Within the past two or three years, Blue Cross has competed in the bidding for the coverage of 22 national employers, who have a total of 214,450 employees, without success. These have all chosen commercial insurance instead of nonprofit.
>
> "In the same period Blue Cross has lost 42 accounts of national employers, which they had previously had, and these accounts total 456,800 employees."

A statement from Mr. Van Dyk has not been received and the Council is of the opinion that the data so far supplied are inadequate and hence suggests that the House should receive the answers to the questions set forth in the Bill of Particulars before arriving at a decision. (A copy of the Bill of Particulars is attached, see addenda, number 1.)

Alternate Proposal: The Council suggests that the House give consideration to further study of this entire subject by some impartial group such as the Brookings Institution.

Findings of Council: The Council is making independent inquiries relative to demands for national contracts. (Findings of the Council to date appear in addenda, number 2.)

The Council reminds the House that the Council's promotion of prepayment plans predates the activation of A. M. C. P. A. M. C. P. has been in operation only since December 1946.

The cumulative experience and data pertaining to the individual plans, together with those of A. M. C. P., are not yet sufficient to warrant the inauguration of such an irrevocable step as contemplated in the A. M. C. P. proposal.

The Council is convinced that the primary strength of the voluntary plans lies in their flexibility. The present plans are meeting local needs for which they were developed. This is evidenced by the acceptance of these plans by the public. The Council is further convinced that the A. M. C. P. proposal would have an adverse effect on the autonomy of the local plans.

Political Phase: The whole subject must be considered in the light of two national developments which in a way off-set each other:

(1) The reelection of President Truman with his program for compulsory sickness insurance. According to adherents of the A. M. C. P. plan this strengthens its belief that the creation

of a national insurance company is now obligatory to further the voluntary prepayment movement and thereby offset "socialized medicine."

(2) The proceedings of the Department of Justice against medical organizations in Oregon and California and rumored investigations elsewhere. This should be a warning to those who propose a national insurance company involving the present state medical association and county medical society plans in interstate business, thereby making them vulnerable to government prosecution.

Conclusion: In conclusion the Council points out the fact that in its opinion neither the election results, nor demands by any group, nor the fact that Blue Cross is going ahead with its own insurance company regardless of action by the American Medical Association, has materially changed the fundamental principles and philosophy expressed by the Council in its statement of October 2.

It does believe that whether or not the House decides to approve a national insurance company clarification of the functions and relations of the American Medical Association and the A. M. C. P. is vital to the future progress of the voluntary prepayment movement in America. The Council believes that a definite statement of the House delineating the functions of A. M. C. P. as a trade organization, which it was set up to be, and of the Council as the policy-making body, is essential to a smooth running combination to moment and impel the voluntary prepayment health movement which is so vital in the battle against "socialized medicine." Hence, the Council recommends that the House of Delegates (1) approve the formation of a national enrollment agency and disapprove the proposal for the formation of a national insurance company; (2) approve the statement delineating the field of operation of the Council and A. M. C. P. which was presented to the Board of Trustees in December 1946, and approved by the Board, but not approved by the A. M. C. P. Commission. (Copy is attached, addenda, number 3.); (3) recommend that A. M. C. P. make necessary changes in its constitution and by-laws which would take A. M. C. P. out of the policy-making field, and (4) reaffirm the Council's authority to promote the voluntary prepayment plan program in America.

Respectfully submitted,

James R. McVay, Chairman.
Elmer Hess, Vice Chairman.
Jesse D. Hamer.
J. D. McCarthy.
Thomas A. McGoldrick.
H. B. Mulholland.
R. L. Sensenich.
Walter B. Martin.
Edward L. Bortz.
George F. Lull.
Mr. Thomas A. Hendricks, Secretary.

ADDENDA, NUMBER 1

Bill of Particulars in Regard to National Enrolment

Those who advocate a national Blue Cross–Blue Shield insurance company (Blue Cross–Blue Shield Health Service, Inc.) have made general statements that hundreds of companies and groups demand health coverage on a national, rather than a state or local basis. The Council on Medical Service believes that specific information should be made available to support these general claims.

Proponents for "Proposals for the Blue Cross–Blue Shield Association and Blue Cross–Blue Shield Health Service, Inc." have stated repeatedly that these organizational structures are necessary. They claim they are necessary for two reasons: First, in order to bid successfully for the enrolment of employees of national employers, and second, to conserve and continue to service those national accounts which are now enrolled. National accounts are said "to be those firms which have groups of employees in areas not served by a single plan." This may be an unsatisfactory definition, but nevertheless it is used in the proposals.

There are many medical and nonmedical persons (including some who have had the most extensive and comprehensive experience with prepayment medical care plans) who do not believe the agencies to be created by these proposals are necessary. There are others who believe that a national enrolment agency might be desirable in order to assist in enrolling employees who may reside in areas served by more than one plan. Those in this category state that some enrolling agency, other than an insurance company, could coordinate enrolling and servicing activities and still retain the autonomy of state and local plans. When literally interpreted, these "proposals" are far reaching and constitute great concentration of corporate powers as well as powers to determine professional and other policies.

Before any further efforts are made toward forming either the organizations called for in the proposals or an enrolling agency to which local plans could subscribe on a voluntary basis, it seems that certain information is desirable. Documentary evidence is considered necessary in order to formulate sound planning.

The answers to the following items are minimal in determining a course of action:

1. Names and number of "National Accounts" which now have their employees enrolled in Blue Cross Plans and which will discontinue such enrolment in the absence of the formation of Blue Cross–Blue Shield Health Service, Inc.
2. Number of employees and the number of dependents who will be affected by number 1.
3. Names and number of "National Accounts" which now have their employees enrolled in member A. M. C. P. plans and who will discontinue such enrolment in the absence of the formation of Blue Cross–Blue Shield Health Service, Inc.
4. Number of employees and the number of dependents who will be affected under number 3.
5. Names and number of "National Accounts" which do not now have their employees enrolled in Blue Cross plans but which would enroll their employees if Blue Cross–Blue Shield Health Service, Inc., became operative.
6. Number of employees and number of dependents who would be affected under number 5.
7. Names and number of "National Accounts" which do not now have their employees enrolled in member A. M. C. P. plans but which would enroll their employees if Blue Cross–Blue Shield Health Service, Inc., became an operating insurance company.
8. Number of employees and number of dependents who would be affected by number 7.
9. Number and names of "National Accounts" which demand that all benefits (surgical, medical and/or hospital) for employees shall be uniform regardless of the residence of the employee.
10. Number of employees and number of dependents involved in number 9.

All of the listed items involve primarily the attitudes of employers, since the majority of such coverages are made available to employees by virtue of employer cooperation and in most cases employer contribution toward the costs.

Not so many years ago, the employer (or a committee representing management only) decided what, if any, types of social insurance benefits the employees would be eligible to receive. Management selected the plan or plans, determined the amount to be contributed by the employer and announced the plan or plans and the net costs to the eligible employees. The employees were then free to participate or not participate as they wished.

More recently, many of these employee benefits have become the subject of negotiation between management and labor. Sometimes the negotiations are carried on by a committee representing both labor and management. The labor members of such committees are selected by the employees themselves. In other cases, unions (representing union leaders rather than union members) make specific demands relative to insurance benefits and employer contributions.

In addition to getting specific data on the ten listed items it might be well to attempt to secure similar information with regard to employee and union demands.

SUGGESTED SOURCES

To obtain expressions of the reactions of management and employers, it is suggested that the following agencies be contacted: United States Chamber of Commerce, American Management Association, Industrial Relations Association and the Federation of Employee Benefit Associations. As some of these sources are contacted, it is probable that many other valuable sources may be discovered and explored.

In order to make any undertaking complete, factual data should also be requested from all recognized labor and employee organizations which are interested in the problems under consideration.

ADDENDA, NUMBER 2

FINDINGS OF THE COUNCIL TO DATE

In addition to inquiries directed to A. M. C. P., the Council is exploring other sources of information relative to "National Accounts."

Some of the organizations contacted include the Industrial Relations Association, the United States Chamber of Commerce and certain insurance companies and associations. Time has not permitted a complete or thorough study of all possible sources of information.

To date, replies to inquiries seeking specific data indicate that there is no uniform pattern nor a uniform demand for social insurance benefits.

Some national employers have indicated a desire for uniform social insurance benefits for all employees, regardless of residence, for the following reasons: (1) lower costs; (2) the company transfers many of its personnel from branch to branch, and where uniform coverage is in effect, such benefits are not disturbed, and (3) many company employees and executives travel extensively; these employees and executives know they are entitled to stipulated benefits regardless of where they may be when these benefits are needed.

One large employer indicated that it was company policy to deal with insurance companies rather than Blue Cross. This company established this policy several years ago because the company did not believe in the avowed policy of Blue Cross, i. e., service benefits. This company operates in several areas and the branches are more or less autonomous. The branches are permitted to negotiate their own social insurance programs.

Insurance companies which operate in all states are in a position to underwrite uniform benefits for employees of national employers. Certain information received from one large insurance company indicates that it receives bids from employers to underwrite varying benefits for different employees.

Recently an insurance association chose twenty-five representative business firms to determine the existence of uniformity of benefits pertaining to national accounts. Of these twenty-five firms, twelve companies, employing some 426,000 persons, had nationwide surgical benefit programs. The remaining thirteen firms, employing over 2,160,000 persons, did not have a nationwide surgical benefit program.

A recent publication entitled, "The Experience of 123 Companies Having Employee Benefit Plans," published by the Dartnell Corporation, also indicates a lack of uniformity of benefits among the corporations included in that study.

The Council on Medical Service has received numerous letters and telegrams stating opposition to the Blue Cross–A. M. C. P. proposal for a national insurance company. In addition, the Council has received copies of resolutions from several county and state medical societies expressing disapproval of the proposal. Some resolutions have approved the October 2 statement of the Council and the Board of Trustees. Other resolutions have urged serious consideration of the proposal by the House of Delegates of the American Medical Association before any action is taken. One resolution encouraged "the formation of a National Agency for Voluntary Health Service Plans"; but did not approve the specific proposal under consideration. There is a wide difference between the total enrolment of most Blue Cross plans and the total enrolment of coordinated prepayment medical care plans.

In the aggregate, Blue Cross enrolment exceeded coordinated prepayment medical care plan enrolment by approximately 18,000,000 on June 30, 1948.

ADDENDA, NUMBER 3

RECOMMENDATIONS OF THE COUNCIL ON MEDICAL SERVICE WITH REGARD TO A. M. C. P.

The A. M. C. P.: An organization of the plans themselves, primarily interested in the internal problems of organization and administration.

Its function might well be to assist plan managers in specific problems concerned with the details of actual plan operation and cooperation with the Council in the over-all program.

Some of the subjects and problems with which A. M. C. P. should be primarily concerned are: (1) physical set-up of plan offices and service equipment; (2) personnel set-up of plans; (3) standardization of methods or systems of keeping actuarial data on plan experience; (4) standardization of forms used by plans; (5) uniformity of contracts and provisions for reciprocity among plans, and (6) methods and mediums to be employed in selling, etc.

The Council: The Council should assume the major role of promoter, director and coordinator on a nationwide basis.

Promotion includes: (1) urging all areas through the state and county medical societies to make some sort of adequate program of prepayment available to the public; (2) providing consultation and field service to the state and county medical societies, including A. M. C. P. in this field service where needed; (3) assisting the state and county medical societies in educating the doctors (and the public) to the need for prepayment programs; (4) providing publishable data and information on all of the plans to state and county medical societies, to national publications, groups and conferences and to American Medical Association publications, and (5) striving for a basis of cooperation among all voluntary agencies.

Direction includes: (1) over-all studies on growth, specific contract provisions (x-ray etc.), enrolment practices and other items in which over-all suggestions and exchanges of ideas might be applicable; (2) setting of standards for plans and issuing the "Seal of Acceptance," including nationwide recognition of the Seal as the emblem of doctor-sponsored medical care plans, and (3) studying other programs of medical service, including indigent care, contract practice, cooperatives, etc., to evaluate them and to determine their place, if any, in the American Medical Association medical care program.

Coordination includes: (1) providing a clearing house for ideas and data, including central file on factual information, and (2) assisting A. M. C. P. in selling its recommendations to the doctors and the plans.

Approved by the Board of Trustees December 1946.

The Speaker referred the Report of the Council as printed on pages 115 to 118 of the Handbook referring to community leadership, regional conferences, News Letter and special projects, and as printed on pages 126 to 128 inclusive dealing with the Washington Office, to the Reference Committee on Legislation and Public Relations. The balance of the report of the Council as printed in the Handbook and the supplementary report were referred to the Reference Committee on Medical Service and Prepayment Insurance Plans.

Supplementary Report of Council on Scientific Assembly

Dr. Henry R. Viets, Chairman, presented the following Supplementary Report of the Council on Scientific Assembly, which was referred to the Reference Committee on Sections and Section Work, together with the report of the Council as printed on pages 111 to 114 inclusive of the Handbook:

Allocation of Section Meetings at the 1949 Annual Session: Further consideration of the problem of allocating units to sections for the 1949 Annual Session in Atlantic City was discussed at a meeting of the Council held in St. Louis, Nov. 30, 1948. At the Annual Conference of Section Secretaries on Nov. 13, 1948, the Council was impressed by the quality of the programs submitted by the section secretaries and, in some instances, particularly in those situations where units for joint sessions were requested, the Council felt that additional units to those already assigned were justified and so ordered.

Having in mind that the goal aimed at by its decision to restrict some sections to two units had been attained at least partly by the demonstrated increased interest in developing vital programs on the part of the section secretaries, the Council was glad to accede to the wishes of the secretaries as far as practicable. An essential part of the function of the Council is to gage the temper of section work and to change rulings promptly to conform with new situations. Thus, a reallocation of section units, based on current reports, is quite in accord with the thinking of the Council. Indeed, the Council hopes to keep in such close touch with section work and the problems faced by section secretaries as to be ready at all times to mold its decisions to fit the immediate situation. At Atlantic City room can be found for all section meetings in adequate quarters. In other cities the problem may be harder to meet in an entirely satisfactory manner and the allotment of units will of necessity be guided in part by the availability of rooms, even though the program under consideration by a section secretary be one of outstanding merit.

Enlargement of the Council: The Council on Scientific Assembly as now constituted consists of five Member or Service Fellows elected by the House of Delegates on nomination by the Board of Trustees (By-Laws, Division Three, Chapter X, Sec. 4. Standing Committees.—[B] Membership). Due to the increasing amount of work devolving on the Council by virtue of an additional Scientific Assembly at the Interim Sessions and because of the enlarged scope of the activities of the Council under the new By-Laws, a request is made to the House of Delegates to give consideration to enlarging the membership of the Council from five to seven. The Council also suggests, if the request for enlargement be granted, that, when feasible, one of the additional members be a general practitioner or a Fellow who has intimate knowledge of the needs of general practitioners in relation to arranging the programs for the Scientific Assembly at the Annual Sessions and at the Interim Sessions.

Respectifully submitted,

HENRY R. VIETS, Chairman.
CHARLES H. PHIFER.
L. W. LARSON.
STANLEY P. REIMANN.
ALPHONSE MCMAHON.
ERNEST E. IRONS, President-Elect.
MORRIS FISHBEIN, Editor, THE JOURNAL. } Ex officio.
GEORGE F. LULL, Secretary.
ERNEST B. HOWARD, Assistant Secretary.

Motion to Recess

Dr. Philip W. Morgan, Chairman, Reference Committee on Rules and Order of Business, moved that the House recess at 12:30 p. m. to reconvene at 2 p. m. The motion was regularly seconded and carried.

NEW BUSINESS

Statement of Policy of American Medical Association

Dr. E. Vincent Askey, California, presented the following statement, which was referred to the Reference Committee on Medical Service and Prepayment Insurance Plans:

The American Medical Association reaffirms its belief in the application of the principle of medical care insurance on a voluntary basis. The American Medical Association has encouraged and assisted the development of voluntary prepayment plans. Coverage is now provided throughout the country and protection is being extended rapidly to an ever increasing proportion of our population.

The American people now enjoy the highest level of health, the finest standards of scientific medical care and the best quality of medical institutions thus far achieved by any major country of the world.

The great accomplishments of American medicine are the result of development by a free profession working under a free system, unhampered by governmental control.

The experience of all countries where government has seized control of medical care has been progressive deterioration of the standards of that care to the serious detriment of the sick and needy.

The American medical profession is unalterably opposed to the institution of any system of medical care which would result in damage to the American public. Our carefully considered opinion is that any scheme of political medicine would be a catastrophe for the American people.

Compulsory sickness insurance, notwithstanding misleading bureaucratic propaganda, is a variety of socialized medicine or state medicine and possesses the evils inherent in any politically controlled system. It is contrary to American tradition, and is the first and most dangerous step in the direction of complete state socialism. The American Medical Association rejects any such scheme as a method of the distribution of medical care. We are equally certain that when the people understand the facts they also will reject it with the same finality.

On the basis of experience, we are convinced that voluntary medical care insurance, with the continued support of the American medical profession, can and will solve the economic problem of the distribution of medical care within the existing framework of private enterprise.

It has been demonstrated that the voluntary method provides a better and less costly service and avoids the imposition of enormous taxation.

The continuing purpose and determination of the American Medical Association is to maintain and improve the standards of medical care and to make that care available to all our people.

Resolutions on Diabetes Week and Efforts in Behalf of the Undiscovered and Untreated Diabetic Patient

Dr. Walter G. Phippen, Massachusetts, presented by title resolutions dealing with diabetes, which were referred to the Reference Committee on Hygiene and Public Health.

Resolutions on Citation to Distinguished Layman

Dr. Walter E. Vest, West Virginia, presented the following resolutions:

WHEREAS, The Interim Session of the House of Delegates of the American Medical Association convened in St. Louis, Mo., presents an unusual opportunity for the recognition of service to the public and to American medicine rendered by a distinguished and nationally known layman; therefore be it

Resolved, That the House of Delegates of the American Medical Association award to Rev. Alphonse M. Schwitalla, S. J., Dean of the Medical School of St. Louis University, a certificate of appreciation and a gold medal emblematic of outstanding effort for the public welfare on a national level; and be it further

Resolved, That the award be made during this session at a time to be specified by the Speaker of the House of Delegates.

Dr. John W. Cline, California, moved that the resolutions be acted on immediately without reference to a committee. The motion was seconded by Dr. Mather Pfeiffenberger, Illinois, and carried and the resolutions were adopted.

Resolutions on Support of Diabetes Week

Dr. F. S. Crockett, Indiana, presented by title Resolutions on Support of Diabetes Week, which were referred to the Reference Committee on Hygiene and Public Health.

Resolutions on Compulsory Hospital Staff Attendance

Dr. F. S. Crockett, Indiana, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The welfare of the medical profession, its general scientific advancement and the furtherance of public interest are paramount in the affairs of the Indiana State Medical Association; and

WHEREAS, The welfare of the profession and the public is placed in jeopardy by the continuing demand on the time of physicians for their compulsory attendance at medical meetings; and

WHEREAS, Physicians are unable to find the hours to attend the constantly growing number of medical meetings and, at the same time, minister to the health needs of their patients; therefore be it

Resolved, That the house of delegates of the Indiana State Medical Association go on record as requesting that the American Medical Association no longer give its actual or implied approval of organizations which demand compulsory attendance at medical meetings; and be it further

Resolved, That the delegates of the Indiana State Medical Association to the American Medical Association be instructed to present this resolution to the House of Delegates of the American Medical Association at the next meeting of that body.

On motion of Dr. Mather Pfeiffenberger, Illinois, duly carried, the House recessed at 12:30 p. m. to reconvene at 2 p. m.

Tuesday Afternoon

The House reconvened at 2 p. m., with the Speaker, Dr. F. F. Borzell, presiding.

Change in Reference

The definition of the term "public health" in the Report of the Council on Medical Service, which had been referred to the Reference Committee on Medical Service and Prepayment Insurance Plans, was now taken from that committee and referred to the Reference Committee on Hygiene and Public Health.

NEW BUSINESS

Proposed Amendment to By-Laws Division Three, Chapter IX, Sec. 3 (C)

Dr. William Bates, Pennsylvania, presented the following proposed amendment to Division Three, Chapter IX, Sec. 3 (C) of the By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Division Three, Chapter IX, Sec. 3 (C) reads at present: "Executive Sessions.—The House of Delegates may convene in executive session at any time on a majority vote of its members. Only members of the House of Delegates as defined in Article 6, Section 2, of the Constitution shall be present at an executive session. The House, by a two-thirds majority vote, may invite any other person who in its judgment might assist in the deliberations."

It is suggested that Sec. 3 (C), Chapter IX, Division Three be amended to read:

"(3). Open, Closed or Executive Sessions.—Sessions of the House may be (1) Open, (2) Closed, or (3) Executive. (1) The House of Delegates may meet in open session to which any person may be admitted. By majority vote of the seated delegates, an open session may be moved into either a closed or an executive session. (2) A closed session shall be restricted to Fellows and members of this Association, and to attachés of this Association, of constitutent state medical associations and of component county medical societies. (3) An executive session shall be limited to the members of the House of Delegates as defined in Article 6, Section 2, of the Constitution and to such administrative employees of this Association and of the House of Delegates necessary for the functioning of the House. (4) The House of Delegates in any session by unanimous consent, may extend an invitation to address the House to any individual who in its judgment might assist in the deliberation."

Resolution on Federal Subsidization of Medical Education

Dr. Samuel J. McClendon, California, introduced by title a Resolution on Federal Subsidization of Medical Education, which was referred to the Reference Committee on Executive Session for determination of its disposition.

Resolutions on Voluntary Participation in Any Form of Compulsory Governmental Medical Insurance

Dr. Samuel J. McClendon, California, presented by title Resolutions on Voluntary Participation in any form of Compulsory Governmental Medical Insurance, which were referred to the Reference Committee on Executive Session.

Resolutions on Medical Service Plans

Dr. Thomas K. Lewis, New Jersey, submitted by title only Resolutions on Medical Service Plans, which were referred to the Reference Committee on Executive Session.

Resolution on Executive Session

Dr. H. B. Goodrich, Missouri, presented by title a Resolution on Executive Session, suggesting an amendment to the By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

Resolution on Presentation of Facts Concerning Health Care to Members of Congress

Dr. C. R. Rountree, for the Oklahoma delegation, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, There has been for several years a constantly growing threat to the voluntary method of rendering medical care to the people of the United States, and,

Whereas, The significance of that threat has been greatly increased by the issuance of "The Nation's Health," a report to the President of the United States by Oscar R. Ewing, Federal Security Administrator; and

Whereas, The recommendations of the Ewing Report have been recommended to the people of the United States by leaders in government and Congress; and

Whereas, There is an ever increasing sentiment among certain pressure groups throughout the nation favoring governmental interference and control in the health field; and

Whereas, An effort to combat all the above influences will require the closest cooperation and coordination by the American Medical Association and its constituent state medical associations and societies; and

Whereas, If the complete facts concerning compulsory health insurance are to be properly presented to the Congress of the United States, it is believed that such presentations must, to be the most effective, be given to the Senators and Representatives by conferees from their own states; now, therefore, be it

Resolved, That the Board of Trustees request each state medical association and society to make known to the Secretary and General Manager of the American Medical Association the names of at least five members of the respective state medical associations and societies who have intimate knowledge and experience concerning the programs of the American Medical Association for the extension of medical care, and who can be depended on to present the facts concerning health care to their respective state delegations in Congress, these representatives to be available on call for any and all types of consultations.

Resolutions on Proposed Veterans Hospital Near Ann Arbor, Mich.

Dr. L. G. Christian, Michigan, presented by title Resolutions on Proposed Veterans Hospital near Ann Arbor, Mich., which were referred to the Reference Committee on Executive Session.

Resolutions on Compulsory Health Insurance

Dr. L. G. Christian, Michigan, submitted by title Resolutions on Compulsory Health Insurance which were referred to the Reference Committee on Executive Session.

Resolution on Supplying Doctors for the Armed Forces

Dr. David B. Allman, New Jersey, presented the following resolution, which was referred to the Reference Committee on Medical Education:

Whereas, The American Medical Association recognizes that there is a serious deficit of medical officers to meet the anticipated needs of the armed forces, and that there appears to be no prospect, under present methods, of overcoming this deficit; and

Whereas, the American Medical Association recognizes its responsibility to aid the government in obtaining a sufficient complement of young physicians and qualified specialists for the armed forces; therefore be it

Resolved, That the American Medical Association suggest that the National Security Resources Board be given adequate statutory authority to meet the requirements of the armed forces for medical personnel under a plan embodying the following principles: (1) deferment of recent graduates until completion of an internship not to exceed two years; (2) deferment of medical students to complete their medical education and an internship, the latter not to exceed two years; (3) obligation of the physicians constituting both the above groups, at completion of internship to accept one year of service in the armed forces regardless of their attained age at completion of internship; (4) acquisition of the needed complement of specialists and other especially qualified physicians on a contract basis without regard to age limitations and on a salary sufficient to attract such personnel, and (5) institution of a survey of the personnel of medical teaching institutions to the end that each institution release one or more of its staff for a period of at least one year for service with the armed forces.

Resolutions on Gathering and Dissemination of Information Relative to Health Legislation

Dr. Clark Bailey, for the delegates from Kentucky, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Whereas, The private practice of medicine and thereby the entire structure of free enterprise and the American way of life is in imminent danger; and

Whereas, There is a need for urgent action and a lack of sufficient time to counteract this threat without a central authority with power of official action; and

Whereas, There is a need for a central agency to express the views of the medical profession concerning actual and proposed federal legislation relating to public health and medical care; and

Whereas, There is an urgent need for a central agency to inform and coordinate as well as stimulate action by the medical profession and all other groups interested in preserving free enterprise and the American way of life; now therefore be it

Resolved, By the House of Delegates that the Board of Trustees of the American Medical Association be hereby authorized to take whatever action it may deem necessary to establish a central committee or agency of the American Medical Association to study all actual and proposed federal legislation concerning public health and medical care in the United States and to express the official opinion of the American Medical Association concerning such legislation; and be it further

Resolved, That the Board of Trustees of the American Medical Association be instructed to establish a committee to review at frequent intervals all proposals of national health legislation and all other material pertinent to the welfare of the medical profession and the people it serves, and to furnish to each constituent state association a sufficient digest of such material with the urgent request that a committee be established in each state association to disseminate such material to each of its members, thus insuring complete enlightenment of every doctor in these United States of America of the menace to their profession.

Resolutions on a Public Relations Program

Dr. Robertson Ward, representing many states, presented the following resolutions which were referred to the Reference Committee on Executive Session to determine their disposition:

Resolved, That this House of Delegates instruct the Board of Trustees to implement a "Statement of Policy" as adopted by the House at this session; and be it

Resolved, That the House of Delegates declare that the Board of Trustees of the American Medical Association has its complete confidence in its intention and ability to carry out the objectives and execute the mandates of the House of Delegates; and be it further

Resolved, That, since necessary funds must be provided in order to execute an effective program now, the dues for this year be set at twenty-five dollars ($25) per member; and be it further

Resolved, That this House of Delegates hereby directs the immediate expansion of the Washington office and its placement directly under the supervision, direction and control of the Board of Trustees; and be it further

Resolved, That we recommend the immediate employment of suitable public relations counsel to assist in the execution of this program; and be it further

Resolved, That in order to coordinate the activities of the public relations phase of this program at all levels the public relations counsel shall disseminate information to (*a*) the general public, (*b*) the Congress of the United States and (*c*) state and county medical societies and individual physicians; and be it further

Resolved, That it be the unanimous expression of the medical profession, as represented by the House of Delegates, that we are firmly united behind the positive and constructive program as outlined by the House of Delegates; that we are confident in the ability of our leadership; that we are determined to protect and foster the high standards of medical care for the public; that we are steadfastly opposed to the regimentation and socialization of American medicine, and that we are confident that an intelligent and informed public will join us in our crusade to ever improve the health and welfare of the American people.

Resolution on National Publicity

Dr. William H. Halley, on behalf of delegates from several states, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, The people of the United States rightfully look to the American Medical Association for leadership in all matters affecting the health of this nation; and

Whereas, Much erroneous information has been given to the public on the subject of standards, costs and distribution of medical care and it has become imperative that this widespread false propaganda favoring governmental management of medical practice be immediately contradicted by factual information disseminated to all citizens of this country; therefore be it

Resolved, By the House of Delegates that the American Medical Association, through its Board of Trustees, forthwith undertake the preparation of a dignified and wholly factual national publicity and advertising campaign to accomplish this purpose, the campaign to be presented simultaneously and uniformly in both the national periodical press and, by distribution to the constituent state associations and component county societies, in the newspapers of the entire United States.

Resolutions on National Health Insurance

Dr. T. K. Gruber, Michigan, presented the following resolutions, which were referred to the Reference Committee on Medical Service and Prepayment Insurance Plans:

Whereas, There are continuing demands for National Health Insurance by one of the major political parties of our country, and a modified form of the same has already been urged by powerful elements in the other major political party, so we must conclude that the danger that some such legislation will be passed by Congress is very real; and

Whereas, The doctors of the State of Michigan believe that a successful voluntary prepayment plan for medical care is a most constructive effort to improve human relations and safeguard the public health in a democratic manner; and

Whereas, The doctors are fully aware that to oppose compulsory health insurance by voluntary prepayment plans these plans must be available and enthusiastically supported by all the states in the unified effort (which is far from the fact) and that this effort can only be made at the national level; and

Whereas, The seventy odd medical care plans listed by the Council on Medical Service of the American Medical Association represent worthy efforts in certain parts of the country, at the city, county and state level, and yet as a whole they lack strength because their individual fields are too narrow and, lacking coordination, they do not meet the national need; and

Whereas, Dr. Paul Hawley, head of the Blue Shield and Blue Cross Commission, a man whose driving energy in both war and peace has been proved, and who now has suggested a National Service Agency for securing a coordination of effort and uniformity of detail in these seventy odd plans which will serve greatly to strengthen their position and reasonably answer some of the criticism directed against the voluntary insurance system; therefore be it

Resolved, That this House of Delegates of the Michigan State Medical Society advise the Board of Directors of Michigan Medical Service to encourage and proceed to the formation of a National Agency for Voluntary Health Service Plans, keeping in mind the best interests of the doctors of medicine and of the people of the State of Michigan; and be it further

Resolved, That the Michigan delegates to the American Medical Association be instructed to present a resolution to the House of Delegates of that Association, urging the American Medical Association to exert its support and encouragement to extend Voluntary Health Service Plans in areas not now served and the inclusion of such plans into a National Agency.

Resolutions on Selective Service

Dr. H. P. Ramsey, District of Columbia, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, The traditional position of the American medical profession has been to serve local draft boards without compensation; and

Whereas, The House of Delegates in June 1948 adopted a resolution calling for compensation for this service; and

Whereas, The Selective Service System has ample assurance from American physicians that they will continue to serve without fees; and

Whereas, Procedures established under the authority of the Selective Service Act of 1948 require fewer examinations than under the previous acts; and

Whereas, The continuance of the aforesaid resolution puts the physician in an unfavorable light which is not truly expressive of his feelings; therefore be it

Resolved, That the House reconsider the Resolutions on Paying Physicians Engaged in Examination for Armed Forces referred to above; and be it further

Resolved, That the action of June 23, 1948 on those resolutions be rescinded.

Resolutions on Health Units for the Nation

Dr. H. P. Ramsey, District of Columbia, presented the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health:

Whereas, No amount of medical care of persons already sick will seriously reduce the incidence of illness; and

Whereas, The traditional position of the American Medical Association has been one of firm support of preventive public health services; in fact, this constitutes part 2 of the 10 point health program of the American Medical Association; and

Whereas, Large numbers of local areas and counties in the United States are not now and never have been covered by adequate sanitary and preventive services; and

Whereas, The Surgeon General of the United States Public Health Service has announced that one of his first major objectives is assistance in development of local health units throughout the nation to meet this fundamental need; and

Whereas, The medical profession has now an opportunity to exert constructive leadership in this matter; therefore be it

Resolved, That the House of Delegates reaffirm its abiding interest in the necessity for the provision of adequate public health preventive services at the local and community level, including sanitation and all the services usually considered essential for the preservation of the public health; and be it further

Resolved, That the Surgeon General of the United States Public Health Service be commended for, and encouraged in, his efforts for the further development of local health units for these purposes; and be it further

Resolved, That the Board of Trustees be instructed to pursue actively all proper procedures to the end that local public health service shall become adequate throughout the nation.

Resolution on Accident Prevention

Dr. H. P. Ramsey, District of Columbia, presented the following resolution, which was referred to the Reference Committee on Industrial Health:

Whereas, The American Medical Association has in the past cooperated with the National Safety Council in its efforts to reduce the incidence of deaths and injuries from accidental causes; and

Whereas, The studies that have been made by the Bureau of Medical Economic Research of the American Medical Association have established the fact that fatal accidents cut off more years from the working lifetime of the American people than any one natural cause of death; and

Whereas, In the recent report made to the President by the administrator of the Federal Security Agency, it was stated that 40,000 deaths annually from accidents were preventable; therefore be it

Resolved, That the Board of Trustees be instructed to cooperate in every possible way with the National Safety Council and with every other agency, both public and private, concerned with accident prevention, to the end that research in accident prevention be further stimulated; that this excessive drain on hospital and medical facilities be lessened, and that the appalling loss of working years be reduced.

Resolutions on Reorganization of Council on Medical Service

Dr. J. Morrison Hutcheson, Virginia, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, The By-Laws of the American Medical Association enumerate the functions of the Council on Medical Service as follows:

(*a*) To make available facts, data and opinions with respect to timely and adequate rendition of medical care to the American people;

(*b*) To inform constituent associations and component societies of proposed changes affecting medical care in the nation;

(*c*) To inform constituent associations and component societies regarding the activities of the Council;

(*d*) To investigate matters pertaining to the economic and social aspects of medical care;

(*e*) To study and suggest means for the distribution of medical service to the public consistent with the principles adopted by the House of Delegates, and

(*f*) To develop and assist committees on medical service originating from constituent associations and component societies of the American Medical Association; and

Whereas, The Council on Medical Service, at the time of its creation in 1943, met and devised its own rules of operation in accord with Chapter X, Section 4, paragraph E of the By-Laws of the Association; and

Whereas, These rules of operation, while adequate for the Council's first few years of operation, should now be amplified to allow the Council to carry out its functions efficiently and with promptness; and

Whereas, Chapter X, Section 4, paragraph F of the Association's By-Laws provides that "each Council shall have authority to appoint committees subject to the approval of the Board of Trustees for any purpose within the functions of the Council"; and

Whereas, From time to time the study and direction of certain phases of medical care have been assigned to special committees; and

Whereas, It is clear that a coordinated plan for the medical care of the American people should be developed and directed through a single channel; and

Whereas, In the interest of efficiency and economy it seems desirable to coordinate the activities that relate to medical care under the Council on Medical Service; therefore be it

Resolved, That the present problems of medical care be divided into the following divisions, each of which can be solved only when considered with each of the others and integrated in a community basis: (*a*) prepayment hospital and medical service; (*b*) extension of hospitals and other facilities; (*c*) medical care of veterans; (*d*) medical care of industrial workers; (*e*) medical care of the indigent; (*f*) medical care of children, and (*g*) cooperatives; and be it

Resolved, That in order to implement this plan the Council be authorized to set up committees under the Council to study each of these problems; and be it

Resolved, That a member of the Council serve as a member of each of these committees and that the activities of the committees be coordinated by the Council as a whole; and be it

Resolved, That the Council be authorized to select the members of these committees so as to represent various areas of the United States or particular interests involved in the committees' work; and be it

Resolved, That the Council be authorized to empower these committees to assist the Council in much of its detailed work, thus leaving the Council as a whole free to devote more of its attention to broad problems of policy; and be it

Resolved, That the existing committees now dealing with subdivisions *a, b, c, d, e, f* and *g* in the first resolved in the body of these resolutions be dissolved and reconstituted under the Council on Medical Service.

Resolution on Executive Sessions

Dr. W. A. Coventry, Minnesota, presented the following resolution, which was referred to the Reference Committee on Executive Session:

Resolved, That Division Three, Chapter IX, Sec. 3 (C) of the By-Laws, relating to those that may be in attendance at executive sessions of the House of Delegates, be amended so that this paragraph, as amended, would read

(C) EXECUTIVE SESSIONS.—The House of Delegates may convene in executive session at any time on a majority vote of its members. Only members of the House of Delegates as defined in Article 6, Section 2, of the Constitution, *and Presidents, Presidents-Elect, and Chairmen of Councils and Secretaries of state medical societies* shall be present at an executive session. The House, by a two thirds majority vote, may invite any other person who in its judgment might assist in the deliberations.

Resolution on Increase in Number of Students Graduated at Medical Schools in Michigan

Dr. Wyman D. Barrett, Michigan, presented the following resolution, which was referred to the Reference Committee on Medical Education:

Whereas, There is general agreement as to the need for a larger number of physicians; and

Whereas, The facilities for teaching are not sufficiently increased to provide hope in the near future of answering the need for a larger number of physicians; and

Whereas, The number of persons other than Doctors of Medicine licensed to practice the healing art in the State of Michigan has increased materially; therefore be it

Resolved, That the Michigan State Medical Society, through its officers, support any reasonable means to increase the number of students graduated from medical schools in this state, and that the delegates to the American Medical Association take similar action at the next meeting of the House of Delegates of the American Medical Association.

Resolutions on Favoring Enactment of Legislation on Establishment of Medical Advisor

Dr. James C. Sargent, Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Emergency Medical Service:

Whereas, It is the opinion of the Council on National Emergency Medical Service that the present position of the Surgeon General of the Army and the Medical Department as set forth in Circular 342, paragraph 12 b, dated November 1948, Department of the Army, in the *organizational structure of the Army, is unsatisfactory and detrimental to* the health and medical activities of the Department of the Army; and

Whereas, This Circular specifically states that the Director of Logistics, a layman, "directs and controls the operations and administrative activities of the heads of the technical services," which means that a layman untrained in any type of medical care is directing the professional medical program of the Department of the Army; and

Whereas, The establishment of such a mechanistic type of administration cannot provide adequate, scientific and professional medical service for the Army; therefore be it

Resolved, That the Council recommend to the Board of Trustees and to the House of Delegates that the American Medical Association go on record in favor of the enactment of legislation to establish the Surgeon General of the Army as Medical Advisor to the Secretary *of the Army and to the Chief of Staff of the Army, and that the Surgeon General of the Army* be *empowered to exercise management* control, professional control and technical control in all medical and health matters throughout all levels of command within the Department of the Army. To accomplish this, the Surgeon General of the Army must have direct and unobstructed access at all times to the Secretary of the Army and to the Chief of Staff of the Army. Only by such legislative action can the health and high standards of medical and professional care be maintained in the Department of the Army; be it further

Resolved, That this recommendation be forwarded by the Secretary of the American Medical Association to the President of the United States, to the Secretary of Defense and to the Chairmen of the Armed Services Committees of the Senate and House of Representatives, and that an informative copy be sent to the Secretary of the Army.

Resolutions on Position of Surgeons General

Dr. James C. Sargent, Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Emergency Medical Service:

Whereas, The chief medical officers of the Army, Navy and Air Force have a great responsibility in connection with the prevention as well as the treatment of diseases and injuries in members of the armed forces, and the modern unconventional weapons of war have serious medical and health implications both in defense and offense; and

Whereas, The effective execution of the medical mission in peace as well as in war demands that the chief medical officer in the three respective services have a voice in the planning and other activities affecting the health and the treatment of the sick and injured; therefore be it

Resolved, That in peace as well as in time of war the Surgeon General of the Army, the Surgeon General of the Navy and the Air Surgeon be so placed in the respective organizational set-up of the Army, the Navy and the Air Force that he is directly under the Chief of Staff of the Army, the Chief of Naval Operations or the Chief of the Air Staff, as the case may be; be *it further*

Resolved, That these chief medical officers have the responsiblity directly under the Chief of Staff of the Army, the Chief of Naval Operations and the Chief of the Air Staff in all matters pertaining to health, hospitalization, evacuation and sanitation in their respective services; be it further

Resolved, That a copy of these resolutions be sent to the President of the United States, the Secretaries of National Defense, Army, Navy and Air and the members of the Committee on Armed Forces of both the Senate and the House of Representatives.

Resolutions on Interns

Dr. Joseph F. Londrigan, New Jersey, presented by title Resolutions on Interns, which were referred to the Reference Committee on Medical Education.

Change in Reference

The Speaker, with the permission of the House, withdrew from the Reference Committee on Executive Session the Resolution on Executive Sessions introduced by Dr. W. A. Coventry, Minnesota, and referred it to the Reference Committee on Amendments to the Constitution and By-Laws.

Supplementary Report of Board of Trustees

REPORT OF LIAISON COMMITTEE TO CONSIDER RED CROSS BLOOD BANK PROGRAM

Dr. E. L. Henderson, Chairman, requested Dr. L. W. Larson, Chairman of the Liaison Committee to Consider Red Cross Blood Bank Program, to present the report of that committee, as follows, which was referred to the Reference Committee on Miscellaneous Business:

Unfortunately, Dr. A. S. Giordano, Chairman of the Committee on Liaison with the Red Cross Blood Program, was forced to resign because of ill health. Insufficient time remained after his successor was chosen and the four new members authorized by the House of Delegates last June were appointed, for the committee to meet prior to November 29.

Your attention is directed to the report of the committee, as published in the May 8, 1948, issue of The Journal, which states: "The need for blood procurement falls into three general categories: (1) local procurement for local continuing needs; (2) procurement for disaster relief in peacetime, and (3) procurement for single or multiple wartime disaster." The committee believes that, as never before in peacetime, it is our solemn duty to encourage the development of, and participate in, a plan which will insure an adequate supply of blood, and blood derivatives, in the event our country is suddenly, and possibly without warning, plunged into another world war. The committee is convinced that because of its pattern of nationwide organization and its experience and record in the procurement and processing of blood during the last world war, the Red Cross is the logical agency to assume this responsibility.

Sixteen Red Cross Blood Centers are in operation at the present time. They are located in: Massachusetts (State Program); Washington, D. C.; Atlanta, Ga.; St. Louis; Wichita, Kan.; Tucson, Ariz.; San Jose, Calif.; Great Falls, Mont.; Rochester, N. Y.; Charlotte, N. C.; Detroit; Springfield, Mo.; Omaha, Neb.; Stockton, Calif.; Los Angeles, and Yakima, Wash.

A center at Columbus, Ohio, is to open Dec. 7, 1948. Nine centers are expected to begin operation during the winter months. They will be located in: Norfolk, Va.; Asheville, N. C.; Nashville, Tenn.; Mobile, Ala.; Louisville, Ky.; Lansing, Mich.; St. Paul; Boise, Idaho, and Portland, Ore.

In addition, eight centers located in New Haven, Conn.; Syracuse, N. Y.; Philadelphia; Johnstown, Pa.; Baltimore; Wilkes-Barre, Pa.; Savannah, Ga., and Madison, Wis., are in the preliminary stages of development. They are expected to open before July 1, 1949. Therefore it is contemplated that a total of thirty-four Red Cross Regional Blood Centers will be in operation by June 30, 1949.

No formal complaints have been submitted to the committee since last June. The House of Delegates, in Chicago, defined its "Approval in Principle" of the Red Cross Blood Program as follows:

"First, local control must be by the county medical society.

"Second, the local medical society should be the contact in the initial contemplation of inauguration of a new blood bank.

"Third, no publicity or news releases shall be released except by mutual consent of the local county medical society and the local chapter of the American Red Cross.

"Fourth, difference of opinion in establishment or operation of a blood bank in either administrative or technical detail shall be arbitrated at state levels by joint committees from the state medical society and the American Red Cross."

The committee believes the American Red Cross is sincere in its acceptance of these principles, and that the recent "Statement of Policy" as contained in the agreement between the Multnomah Medical Society, Portland, Ore., and the American Red Cross justifies this confidence. The Portland agreement conforms to the first, third and fourth points in the definition of "Approval in Principle" referred to. Its contents, a copy of which is appended to this report, should be studied carefully by those county medical societies which are in the process of developing a Red Cross Blood Center or contemplate doing so.

Officials of the American Red Cross have assured the committee that they will respect point 2 of the "Approval in Principle," which states: "The local medical society should be the contact in the initial contemplation of inauguration of a new blood bank." As evidence of their willingness to do so, they have submitted a copy to each member of the committee of their "Chapter Administrative Manual—National Blood Program," which contains the following statement:

"Initial contacts must be made with each of the communities in the contemplated regional program to determine the need for blood in the region. These contacts should be made jointly by representatives of the county medical society and the Chapter, assisted, if desirable, by members of the area office staff."

The committee has reason to believe that this directive is being respected by regional and state representatives of the American Red Cross.

The policy of the American Red Cross prevents it from making a charge for the blood and its derivatives, which it supplies to physicians and to hospitals through its Regional Blood Centers. The Chapter Administrative Manual contains the following statement:

"The only charges to the recipient are those charges made by the physician or hospital in connection with the administration of the products." The committee recognizes that the provision of the blood, or its derivatives, without charge, would seriously jeopardize those private blood banks which are now in operation and must, of necessity, make a charge for the products. However, the Red Cross will initiate blood centers only where there is a need for the program, and the determination of need, as well as approval of the program, is the joint responsibility of the county medical society and the local chapter. Evidence has been submitted to the committee of the willingness of the Association of Blood Banks and the Red Cross to cooperate in order that the over-all objectives of the Red Cross Blood Program may be realized. Private blood banks which, in the opinion of the county medical society, are meeting the community need for blood, will continue in operation and the Red Cross will not establish a center in the community. It is of interest to note that several Red Cross Centers have been established, or are contemplated, where the private blood banks have found it impossible to meet the growing demand for blood and have requested the establishment of a Red Cross Center.

The committee recommends that a statement including this report, if approved by the House of Delegates, be published in an early issue of The Journal; also, that copies be forwarded to all state and county medical societies, in order that their officers and appropriate committees may know the policy of the American Medical Association and the developments in the Red Cross Blood Program.

The committee believes that it should be continued as long as conditions warrant, and that its continuity of personnel be insured.

A letter from Dr. G. Foard McGinnes, Vice President for Health Services, American Red Cross, addressed to the committee, reads as follows:

"The American National Red Cross, through the officers of its medical department, its Advisory Board on Health Services and its Committee on Blood and Blood Derivatives, desires at this time to express its appreciation of the cordial cooperation maintained by your Committee in furthering the development of the American National Red Cross Blood Program. The American Medical Association Committee has been of great assistance in guiding the American National Red Cross in the early development of its regional centers for blood procurement and in aiding in the maintenance of the highest technical standards of blood processing and distribution.

"So valuable to the American National Red Cross has been the assistance of the American Medical Association that the Red Cross hopes your Committee can be maintained on a permanent basis, with continuity of personnel insured by infrequent changes in its membership.

"The developments in the expansion of the program of regional centers to cover the needs of the country, where adequate facilities are not now available, the ever present possibility of the disclosure of new and valuable blood derivatives or the modification of now established fractions of blood and the potential needs of blood for national security are matters of immediate concern to both the American Medical Association and the American National Red Cross.

"In the next few years, to keep pace with an ever changing problem, the American National Red Cross welcomes a close association with your Committee in building its National Blood Program, so that the American people may be assured of its maximum benefits in time of peace, in national disaster or in time of war."

Tentative plans are being made for a joint meeting in February of the committee with the appropriate committee of the Red Cross. A report of this meeting, in addition to any other meetings the committee may have, and the progress made by the Red Cross Blood Program, will be submitted to the Board of Trustees and the House of Delegates prior to the next annual session of the House.

Respectfully submitted,

Statement of Policy Regarding Operation of a Blood Program at Portland, Multnomah County, Oregon

(Copied from the *Bulletin* of the Multnomah County Medical Society, July 1948)

WITNESSETH:

Whereas, Red Cross and Society desire to set up a blood program at Portland, Oregon, with a central laboratory at Portland, Oregon, and distribute blood to approved agencies in Oregon and southern Washington, all in accordance with the policies stated herein; and

Whereas, Parties hereto recognize that the medical profession is particularly qualified to supervise and control the technical operation of such blood program and its related activities; now therefore

Parties hereto agree that the operation of such a blood program shall be conducted in accordance with the following policies:

1. The Council of Society shall appoint a Technical Supervisory Committee (hereinafter called "Committee") of five members of Society, two of whom shall be pathologists, one an internist, one a surgeon and one a general practitioner, each of whom shall serve until his successor shall be appointed by the said Council.

2. The duties of said Committee shall be as follows:

(*a*) The direct supervision and control of the blood program, central laboratory or laboratories and blood products, including, but not confined to, the specific duties set forth herein.

(*b*) The selection of a Technical Director, who shall be a physician and surgeon with special qualifications to administer the blood program and related activities. Through the Technical Director, the Committee shall select the other technical personnel in the blood program and its related activities. The Technical Director shall be directly responsible to the Committee.

(*c*) The establishment of technical standards for such blood program and related activities, which standards are to conform to those set forth in the National Blood Program Technical Manual of the American Red Cross and all state and federal governmental requirements, provided that more exacting technical procedures may be prescribed by the Committee when the Committee deems it advisable.

(*d*) The establishment of technical standards for hospitals which are to be serviced under the program, in relation to such program, also the selection of such hospitals and establishment of quotas for each hospital. Hospitals shall be required to have adequate facilities for storage, typing, crossmatching, investigations of reactions, and shall supply the blood without charge except for a nominal charge for the administration of the blood, including additional typing and cross matching, which charge shall be uniform for all hospitals.

(*e*) The Direction, through the Technical Director, of all volunteers in such program, when their duties involve the technical aspects of the blood program.

(*f*) The review and approval of all publicity controlled by the Red Cross relating to the program, prior to release, in order to insure its conformity to the professional standards.

3. The Red Cross shall be the sole donor recruitment agency and shall procure volunteer donors to the best of its ability.

4. The Red Cross shall provide and pay for all physical facilities, equipment, supplies and other functions necessary to carry on the program.

5. The Red Cross shall pay the salaries of all paid personnel engaged in the program.

6. The Red Cross shall secure and pay for adequate malpractice and other insurance to cover the liability of the members of the Committee, Technical Director and other employees arising out of the operation of the program, so far as is obtainable.

7. The program shall be operated in such a manner as not to provide any monetary return to Society or Red Cross.

8. The Red Cross agrees to furnish the Committee with copies of all reports and correspondence relating to the technical phases of the blood program which are sent to, or received from, the Pacific Area Office or the National office of Red Cross.

9. Red Cross will be permitted to draw upon the reserves of blood and blood derivatives in this program as occasion may arise for use in connection with disasters and other emergencies.

10. As soon as practical a written administrative procedure shall be prepared, to be approved by the Committee and Red Cross.

11. Either party hereto may terminate participation in the above program upon giving to the other party thirty days' notice in writing.

In Witness Whereof, the parties hereto have caused this statement of policy to be executed in quadruplicate by their duly authorized officers the day and year first above written.

American National Red Cross.

REPORT OF COMMITTEE ON REBATES

Dr. Frank R. Ober, Chairman of the Committee on Rebates, at the request of Dr. Henderson, presented the following report, which was referred to the Reference Committee on Miscellaneous Business:

Adequate resolutions have been passed previously by this House of Delegates which definitely declare rebates in all forms to be unethical. (Example: Action taken by the House of Delegates on the dates June 11, 1942, and June 11, 1947.)

Report of Reference Committee on Amendments to the Constitution and By-Laws on Resolutions on Rebates:

"Resolution on Rebates: Your reference committee has given very serious consideration to these resolutions. It is the opinion of your reference committee that the practices referred to in the resolutions are beneath the dignity of the learned profession, are basically dishonest and are a violation of the Principles of Medical Ethics. Your reference committee therefore recommends that the following substitute resolutions be adopted:

"Whereas, It has been brought to the attention of the House of Delegates that the unscrupulous practice of rebates to physicians is being engaged in by various commercial organizations, laboratories, supply houses and in some professional relationships between certain physicians; and

"Whereas, All such practices are clearly in violation of the Principles of Medical Ethics; therefore be it

"*Resolved*, That the House of Delegates of the American Medical Association express stern disapproval of the practices by any of the members of its component societies of referring patients to commercial organizations, laboratories or other physicians who advertise to the public and others than the medical profession, who employ so-called steerers or cappers or who pay, or offer to pay, rebates or commissions in any guise whatsoever, or who in any other manner violate the Principles of Medical Ethics of the American Medical Association; and be it further

"*Resolved*, That any member violating these resolutions be subject to such disciplinary action as is deemed advisable by the county society in which such physician holds membership; and be it further

"*Resolved*, That the Secretary of the American Medical Association be instructed to send a copy of these resolutions to each state and county society accompanied by a letter to the secretary of each setting forth that all such unethical practices are disreputable and unscrupulous and, if not controlled, may soon besmirch the reputation of the entire medical profession."

Resolutions on Rebates: Resolutions on rebates presented by Dr. William Weston, Section on Pediatrics, which were referred to the Reference Committee on Miscellaneous Business (Excerpt from Proceedings of House of Delegates, Atlantic City, 1947):

"WHEREAS, Complaints have been made from time to time by individual members of the American Medical Association and by constituent associations of the existing practice of accepting rebates by members, and especially has this practice been emphasized in regard to oculists and opticians in which it has been charged that many oculists conspire with opticians by accepting rebates on prescriptions for glasses; and

"WHEREAS, The knowledge of this practice has become so widespread that it has been the subject of criticism by the lay press and by politicians unfriendly to the American Medical Association; and

"WHEREAS, The American Medical Association through the House of Delegates has officially condemned all rebate practices in whatever shape or form they may exist and has distinctly expressed the opinion that such practices are in violation of the ethics of the American Medical Association; therefore be it

"*Resolved*, That the House of Delegates reiterate its condemnation of this practice by any member accepting rebates; and be it

"*Resolved*, That the Secretary of the American Medical Association communicate this action to the various county societies forming the constituent associations and request that members accepting rebates be removed from the roll of membership, unless such member or members promise to desist from such practice in the future, and that the secretaries of the various county societies communicate their action in this matter to the Secretary of the American Medical Association."

In the opinion of this Committee on Rebates, the enforcement of these resolutions is the sine qua non of the successful elimination of these practices. It recommends that each component county society be urged to employ an auditor to examine the books and records of at least 10 per cent of its membership, chosen by lot, each calendar year. The audits must then be presented to the governing body of the county or district society within sixty days of the completion of the audit. A report of the action taken by the county society shall then be sent within thirty days to the governing body of the constituent state society.

[The Reference Committee on Miscellaneous Business in 1947 reported on the Resolution on Rebates as follows, and the report of the reference committee was adopted:

"Resolutions on Rebates: The fact that accepting rebates by ophthalmologists has year after year been declared unethical by the Judicial Council, and such declaration has been approved by each House of Delegates to which the Council reported, seems convincing evidence that the House of Delegates frowns on this practice. Furthermore, at this very session of the House of Delegates, you have approved a most forceful enunciation of this principle in the present report of the Judicial Council. Your reference committee can only reaffirm this principle and recommend that it be adopted.

"Your reference committee, however, believes that the American Medical Association should not 'request' constituent societies to expel members under any circumstances. This procedure is suggestive of and might be interpreted as dictatorship. It therefore, with the approval of the author of these resolutions, has amended them so that the last paragraph shall read:

"'*Resolved*, That the Secretary of the American Medical Association communicate this action to the various county societies forming the constituent associations and advise them again that members accepting rebates are violating our Principles of Medical Ethics and recommend that each component society take appropriate action whenever this situation exists.'

"It further amends these resolutions, without the knowledge of their author, that another 'resolved' be added to it as follows:

"'*Resolved*, That the Board of Trustees of the American Medical Association appoint a committee to investigate all phases of this subject, including the alleged arbitrary control of the retail price of optical appliances by manufacturers, which committee is to report its findings to the House of Delegates at the next supplemental session.'

"In conclusion, your committee believes that the Section on Ophthalmology of the American Medical Association could and should stop this practice."]

Your committee also recommends that the constituent state associations shall endeavor to have legislation introduced with the purpose of making the practice of rebating to or by physicians illegal.

Respectfully submitted,

FRANK R. OBER, Chairman.
E. V. L. BROWN.
LAWRENCE T. POST.
E. VINCENT ASKEY.

Resolution on Blue Cross-Blue Shield Proposals

Dr. C. C. Sherburne, Ohio, presented by title a Resolution on Blue Cross-Blue Shield Proposals, which was referred to the Reference Committee on Medical Service and Prepayment Insurance Plans.

Resolution on Associated Medical Care Plans Incorporated

Dr. E. H. McLean, Oregon, presented the following resolution, which was referred to the Reference Committee on Medical Service and Prepayment Insurance Plans:

WHEREAS, Associated Medical Care Plans, Incorporated, derived its initial financing from the American Medical Association, and subsequent financing is now derived from a per capita tax on subscribers of physician-sponsored prepaid medical care plans; and

WHEREAS, Associated Medical Care Plans program was established as and intended to be a clearing house for information, statistics and other similar aid to the medically sponsored prepaid care plans; and

WHEREAS, Associated Medical Care Plans has consistently failed to pursue these objectives, but instead has devoted itself to making and attempting to enforce policy of its own determination and for its own objectives; and

WHEREAS, Associated Medical Care Plans, Incorporated, continued to engage in these activities after the disapproving action of the Council on Medical Service of Oct. 2, 1948; and

WHEREAS, It has failed to equalize the distribution of a majority and minority report of its Commission on the subject of Blue Cross Amalgamation National Insurance Company, giving a wide circulation to the majority report but no distribution of the minority report; and

WHEREAS, It has succeeded in having articles favorable to its views appear in *Medical Economics* without any opposing point of view being similarly presented; and

WHEREAS, It subsequently widely disseminated reprints of this article but again failed to distribute any opposing point of view; and

WHEREAS, This involved the use of funds derived from subscribers which has been characterized as a misuse of funds; therefore be it

Resolved, That the American Medical Association withdraw its approval and support of Associated Medical Care Plans, Incorporated, and deny responsibility for any future activities of Associated Medical Care Plans, Incorporated.

The House recessed at 3:10 p. m. and reconvened at 4:30 p. m., with the Speaker, Dr. F. F. Borzell, in the Chair.

Report of Reference Committee on Emergency Medical Service

Dr. Thomas F. Thornton, Chairman, presented the following report, which, on motion of Dr. Thornton, duly seconded and carried, was adopted:

Resolutions on Favoring Enactment of Legislation on Establishment of Medical Advisor: Your committee recommends adoption of the resolution.

Respectfully submitted,

THOMAS F. THORNTON, Chairman.
JAMES BEEBE.
F. S. CROCKETT.
W. A. COVENTRY.
H. B. GOODRICH.

Report of Reference Committee on Executive Session

Dr. J. Stanley Kenney, Chairman, presented the following report:

Your Reference Committee on Executive Session had referred to it seven resolutions. After careful consideration of all of these, there is only one which, in the opinion of your Committee, should be reported in Executive Session.

This report therefore is in the nature of a preliminary report.

1. Resolution on Executive Sessions: This resolution has already been referred to the Reference Committee on Amendments to the Constitution and By-Laws.

2. Resolutions on a Public Relations Program: These resolutions, introduced by Dr. Robertson Ward, California, should be rereferred.

3. Resolutions on Compulsory Health Insurance: Your committee recommends rereferring the following resolutions introduced by Dr. L. G. Christian, Michigan:

Whereas, We believe that compulsory health insurance will be proposed when our National Congress convenes in 1949; and

Whereas, Great pressure will be brought to bear to force a hurried approval of a form of medical care to which there are major objections; and

Whereas, The acceptance of compulsion in medicine has been but a forerunner to the socialistic state; and

Whereas, There are other methods of obtaining complete medical care for every one everywhere other than by compulsion; and

Whereas, The time has come when the American Medical Association, a powerful organization of 134,776 physicians, must present a united front capable of speaking for its membership as to what constitutes good medical care for our citizens; therefore be it

Resolved, That such organizational changes be made, if necessary, at once so that our national organization can present a united front against compulsion; and be it further

Resolved, That an assessment of $10 be levied on each Doctor of Medicine in order that an efficient public relations department, including an office in Washington, can be established at this time; and be it further

Resolved, That the well trained staffs of the National Physicians committee and the American Association of Physicians and Surgeons be employed to implement these activities thereby uniting all Public Relations under one head; and be it further

Resolved, That the Board of Trustees be requested to place these directives in effect by February 1, 1949.

4. Resolution on Federal Subsidization of Medical Education: Your committee recommends that the following resolution be rereferred:

Whereas, The policy of the American Medical Association on federal subsidization of medical education has been clearly defined by its Council on Medical Education and Hospitals; and

Whereas, It is apparent from the recent action taken by affiliated specialty academy that this policy is not being observed; be it

Resolved, That the American Medical Association through its Council on Medical Education and Hospitals reaffirm its statement on this matter and disseminate this statement to the responsible officials of all affiliated organizations and specialty groups.

5. Resolutions on Medical Service Plans: Your committee recommends that the following resolutions be rereferred:

Whereas, The American Medical Association is cognizant of the fact that a large segment of the people of America, otherwise self supporting, are experiencing increasing difficulty in meeting the cost of medical care largely due to more efficient but more expensive methods and technics of diagnosis and treatment demanded by modern medicine; and

Whereas, The American Medical Association is sympathetically aware of the desperate need, particularly of the low income group, of assistance in financing such care; and

Whereas, Assistance to the public in meeting the cost of adequate medical care in catastrophic illness constitutes the most serious problem in the field of medical economics; and

Whereas, The experience in operation of voluntary medical service plans, established by units of organized medicine, during the past five years has demonstrated the fact that the care of serious illness in hospitals, covering medical, surgical, maternity, anesthesia and consultative services, is a sound and practicable insurance risk; and

Whereas, These voluntary medical service plans have proved to be a most effective means of increasing the economic availability of adequate medical care in catastrophic illness for their policy holders; therefore be it

Resolved, That the American Medical Association reiterate to the public its approval of these medical service plans and stress the desirability of their rapid expansion; and further be it

Resolved, That the American Medical Association urge, with moral support and where necessary with financial assistance, every constituent state society to undertake the organization and operation of medical service plans, covering the services mentioned above, as expeditiously as possible; and further be it

Resolved, That the American Medical Association urge the rank and file of the profession to participate in and give whole hearted support to the operation of these duly authorized and approved medical service plans; and further be it

Resolved, That the American Medical Association announce to the public the availability of such plans and give the widest possible publicity as to the purpose of and the benefits to be derived from nonprofit voluntary prepayment medical service plans.

6. Resolutions on Proposed Veterans Hospital near Ann Arbor, Mich.: Your committee recommends rereferral of the following resolutions:

Whereas, The Veterans Administration proposes to establish and operate a five hundred bed general hospital near Ann Arbor, Mich., in conjunction with the Medical School of the University of Michigan; and

Whereas, This proposal is part of an over-all plan of the Veterans Administration to establish throughout the United States for veterans' care hospital facilities to a total of 300,000 hospital beds; and

Whereas, The number of hospital [illegible] 118,000, now available for veterans' care is far in e[illegible] sonably [illegible] anticipated future needs for care of [illegible] and

Whereas, The majority of the persons now occupying Veterans Administration hospital beds have no service-connected disability or illness whatsoever; and

Whereas, The present facilities of the University Hospital at Ann Arbor are adequate for the care of indigents referred there under state law; therefore be it

Resolved, That the Veterans Administration should provide veterans with the best of medical and hospital care in all cases of service-connected disability, and with the ultimate in hospital accommodations and equipment necessary to facilitate such care; and be it further

Resolved, That medical or hospital care in other than service-connected disabilities should be furnished our citizens at government expense on the basis of economic need only and without reference to service with the armed forces; and be it further

Resolved, That based on these principles, the number of hospital beds in Veterans Administration Hospitals should be limited to the number required to care for service-connected disabilities only; and be it further

Resolved, That to establish a Veterans Administration General Hospital near Ann Arbor at this time is not necessary and not in the best interest of the public; and be it further

Resolved, That a copy of these resolutions be sent to the Regents of the University of Michigan, to the Dean of the University of Michigan Medical School, to the Dean of Wayne University College of Medicine and to its governing body, to each state medical society and to the Board of Trustees of the American Medical Association; and be it further

Resolved, That our delegates to the American Medical Association be instructed to present or support similar resolutions to the House of Delegates of the American Medical Association at its next session.

7. Resolutions on Voluntary Participation in Government Plans: Your committee will report on these resolutions later in Executive Session.

Respectfully submitted,

J. Stanley Kenney, Chairman.
Jesse D. Hamer.
Claude R. Keyport.
E. W. Hansen.
Walter G. Phippen.

The Speaker rereferred the resolutions indicated as follows:

Resolutions on a Public Relations Program to the Reference Committee on Legislation and Public Relations.

Resolutions on Compulsory Health Insurance to the Reference Committee on Legislation and Public Relations.

Resolution on Federal Subsidization of Medical Education to the Reference Committee on Medical Education.

Resolutions on Medical Service Plans to the Reference Committee on Legislation and Public Relations.

Resolutions on Proposed Veterans Hospital near Ann Arbor, Mich., to the Reference Committee on Miscellaneous Business.

On motions of Dr. Kenney, duly seconded and carried, the first six sections of the report of the reference committee were adopted.

Dr. Kenney stated that the committee would report on the Resolutions on Voluntary Participation in Government Plans in Executive Session on Wednesday, and moved the adoption of this section of the report. The motion was regularly seconded and carried.

Presentation and Address of Dr. W. L. Pressly, Due West, S. C., Recipient of the General Practitioners' Award

Dr. E. L. Henderson, Chairman, Board of Trustees, presented Dr. W. L. Pressly, Due West, S. C., Recipient of the General Practitioner's Award, who spoke as follows:

Dr. Sensenich, Dr. Lull, Dr. Henderson, Mr. Speaker and Members of the House of Delegates: If I have overlooked anyone, I apologize, but to all I am deeply indebted.

I appreciate, from the depth of my heart, this honor that you have bestowed on me. I realize the responsibilities, also, that go along with this honor, and I assure you that I will use this honor to the furtherance of medicine, especially as it relates to the field of general practice, and I accept this honor with the greatest of humility. I pledge to you my best service in whatever way I can use this during the coming years. I thank you.

Dr. Philip W. Morgan, Chairman, Reference Committee on Rules and Order of Business, moved that the House recess to reconvene at 1:15 p. m., Wednesday, Dec. 1, 1948. The motion was duly seconded and carried, after discussion by Dr. T. K. Gruber, Michigan, and the Speaker.

The House recessed at 4:45 p. m., to meet Wednesday, Dec. 1, 1948, at 1:15 p. m.

(To be continued)

Washington Letter

(From a Special Correspondent)

Dec. 13, 1948.

Rep. Dingell Derides American Medical Association Health Education Campaign

Representative John D. Dingell (Democrat) of Michigan, who will lead efforts to get a compulsory sickness insurance bill through the House in the 81st Congress, unleashed a new attack on American Medical Association and National Physicians Committee in mid-December. He told the press that the $25 membership assessment voted by the House of Delegates in St. Louis is, in his opinion, "a tribute to the American Medical Association medical front and the fake front of National Physicians Committee." He predicted that fewer than one-half of the Association's members will pay the assessment and charged that the decision to make it constitutes a "declaration of war" on the people. "The people will take up that challenge," said Dingell. "The average citizen will go up to his doctor and say, 'I'm paying you. Are you for or against me?' Whether that doctor will hold or lose that patient will depend on the answer he gives."

The Congressman claimed that he has received many anonymous letters from physicians proclaiming their partisanship to compulsory sickness insurance. He told of having invited thirty practicing physicians to an informal conference held recently in a Washington hotel room, but only 17 came. Professional calls prevented a few of the others from attending, but most of the other absentees stayed away because they could not risk possible repercussions, Dingell asserted.

He expressed the belief that the Murray-Wagner-Dingell bills to be introduced in both houses of Congress next month will not differ appreciably from S. 1320, on which hearings were conducted in 1947 and 1948 before the Senate Committee on Labor and Public Welfare.

Rep. Harness Noncommittal on Future Plans

The Journal's Washington correspondent interviewed Representative Forest A. Harness of Indiana, chairman of the House Committee on Publicity and Propaganda (Mr. Harness, a Republican, was defeated for reelection last month) on his return from St. Louis, where he addressed the Conference of State Medical Association Secretaries and Editors. In his speech, Mr. Harness said: "Although I have been denied the opportunity to serve in that body (81st Congress), it shall be one of my principal objectives to see that this work is carried on informally in the 81st Congress by the Republican minority. In every way possible, also, I shall devote my own efforts to the cause." His reference was to combating federal "propaganda" activities.

13 Nuclear Energy Volumes Nearing Publication

Thirteen volumes of the National Nuclear Energy Series will be published in the next several months, according to Atomic Energy Commission. The first, now ready for release, is "Histopathology of Irradiation from External and Internal Sources," edited by William Bloom, Department of Anatomy, University of Chicago. Among other titles now in final stages of editing are "Industrial Medicine," edited by Robert S. Stone, University of California, and "Pharmacology and Toxicology of Uranium and Fluorine Compounds," edited by Drs. Carl Voegtlin and Harold C. Hodge, University of Rochester. The National Nuclear Energy Series, which will run to about sixty volumes when completed, is being published by McGraw-Hill under a contract with Columbia University, the latter representing Atomic Energy Commission and its research contractors.

Pollution Control Field Offices Selected

Locations of drainage basin area offices throughout the country have been announced jointly by the U. S. Public Health Service and the Federal Works Agency. Under the Water Pollution Control Act enacted last June by Congress, the Surgeon General will provide financial and technical aid to the states and the fourteen basin offices will be operating centers for federal-state cooperation. The areas and headquarters cities are as follows: area 1, New England, Boston; 2, North Atlantic, New York City; 3, Middle Atlantic, Washington, D. C.; 4, Southeast, Atlanta; 5, Ohio-Tennessee, Cincinnati; 6, Great Lakes, Chicago; 7, Upper Mississippi River, St. Louis; 8, Missouri River, Kansas City; 9, Southwest Lower Mississippi, Little Rock; 10, Western Gulf, Dallas; 11, Colorado River, Boulder City, Nev.; 12, Great Basin, San Francisco; 13, California, San Francisco; 14, Pacific Northwest, Portland, Ore.

"Measurement of Radioactive Isotopes" Published

A 12 page pamphlet intended to assist users of radioactive isotopes, with particular reference to accurate measurement, has been published by the National Bureau of Standards. In preparation of the guide, the Bureau distributed identical samples of radioactive materials to about forty hospitals, universities and research laboratories. The range of values reported by them varied as much as 80 per cent from the average. Directions for overcoming difficulties in measurement are given in the pamphlet, entitled "Measurement of Radioactive Isotopes" (NBS Circular 473). It is obtainable, at 5 cents a copy, from Supt. of Documents, Govt. Printing Office, Washington 25, D. C.

Federal Study of "Smog" Incident

Early in December the Industrial Hygiene Division of U. S. Public Health Service launched an investigation of the "smog" disaster in Donora, Pa., which was blamed for 20 deaths. A team comprising physicians, nurses, engineers and analysts were sent to the Pennsylvania community to study clinical, environmental and meteorologic conditions. Medical data will be collected on smog casualties, and a survey will be undertaken of materials and processes used in industrial plants. Meteorologic conditions in the area, which were responsible for the enveloping blanket of smog, will also be investigated.

Intensify Hunt for Better Insecticides

The Department of Agriculture, concerned by the failure of DDT (dichlorodiphenyltrichloroethane) as a fly killer in certain sections of the country, is intensifying its research to find a replacement. To date twenty-one analogues of DDT and nineteen other closely related materials have been tested by the Bureau of Entomology and Plant Quarantine. "The steadily increasing resistance of flies in nature to the residual killing effects of DDT insecticides is a problem demanding prompt solution," said Dr. F. C. Bishopp, in charge of the Bureau's research program. We hope to find an adequate alternative for DDT, where necessary, for fly control by spring."

State Health and Safety Legislation Discussed

Reports on prospective state legislation in such fields as health and safety, child labor, wages and hours and workmen's compensation, were presented at the fifteenth annual National Conference on State Labor Legislation held in Washington from November 30 to December 2. Delegates appointed by governors of about forty states attended the meeting, which was called by Secretary of Labor Maurice J. Tobin. (Forty-four state legislatures will convene in 1949.)

Coming Medical Meetings

Annual Congress on Medical Education and Licensure, Chicago, Palmer House, Feb. 7-8. Dr. Donald G. Anderson, 535 N. Dearborn St., Chicago 10, Secretary.

National Conference on Rural Health, Chicago, Palmer House, Feb. 4-5. Dr. F. S. Crockett, 535 N. Dearborn St., Chicago 10, Chairman.

American Society for Surgery of the Hand, Chicago, Jan. 21-22. Dr. Joseph H. Boyes, 1401 S. Hope St., Los Angeles 15, Secretary.

International Post-Graduate Medical Assembly of Southwest Texas, San Antonio, Jan. 25-27. Dr. John J. Hinchey, P. O. Box 2445, San Antonio, Secretary.

Southeastern Allergy Association, Durham, N. C., Washington-Duke Hotel, Jan. 22-23. Dr. Katharine B. MacInnis, 1515 Bull St., Columbia, S. C., Secretary.

Southeastern Surgical Congress, Biloxi, Miss., Jan. 24-27. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.

Western Section American Urological Association, Coronado, Calif., Hotel del Coronado, Jan. 17-19. Dr. Adolph A. Kutzmann, 1930 Wilshire Blvd., Los Angeles 5, Secretary.

GOVERNMENT SERVICES

ARMY

POSITIONS OPEN IN PANAMA CANAL SERVICE

The Surgeon General announced December 1 that permanent Civil Service appointments for physicians are available in the Panama Canal Medical Service with salaries ranging from $5,599 to $7,794, with transportation to the Canal Zone provided for physicians, their families and household goods, and return transportation on completion of a minimum of one year's service. Medical officers accepted under this program will serve as physicians in outpatient treatment centers maintained by the Panama Canal Health Department. These centers, some large, some small, are adequately staffed with graduate nurses and pharmacists. Housing is assured at rentals less than in cities in the United States. The public school system is American in type with a fully accredited high school in Balboa and in Cristobal as well as a junior college in Balboa. Living conditions generally are comparable with those in a small town in the United States except for a tropical climate and the fact that food, clothing and some other necessities are obtained through government commissaries.

ACCEPTED FOR TRAINING IN CIVILIAN INSTITUTIONS

The Surgeon General's Office announces that the following medical department officers have been accepted for training by civilian schools and hospitals:

Officer	School or Hospital	Subject
Col. Charles J. Farinacci	Columbia University New York	Surgical pathology
Col. Carl M. Rylander	University of Michigan Ann Arbor, Mich.	Orthopedic surgery
Lt. Col. H. C. Harrell	University of Minnesota	Cardiovascular roentgenology
Lt. Col. Robert H. Holmes	Duke University Durham, N. C.	Pathology
First Lieut. William A. Abele	Grace-New Haven Community Hospital	Internal medicine
First Lieut. Mason R. Baker	Methodist Hospital *Indianapolis*	Intern training
First Lieut. Stephen H. Deschamps	Grace-New Haven Community Hospital	Internal medicine
First Lieut. William C. Hedberg	Evanson Hospital Evanston, Ill.	Intern training
First Lieut. James M. Keegan	City Hospital, Welfare Island, New York	Intern training
First Lieut. Adam S. Kowalczyk	Oak Ridge Institute of Nuclear Studies, Oak *Ridge, Tenn.*	Radioisotope technics
First Lieut. Vol K. Philips	New York Hospital New York	Intern training

PROCUREMENT OFFICE LABORATORY

Medical equipment destined for United States armed forces throughout the world is tested in a unique laboratory of the Procurement Office in Brooklyn at the rate of 1,134 samples a month. The laboratory, established three years ago, serves a $50,000,000 purchasing program for the current fiscal year and is the only military laboratory in the country that makes such tests routinely. Similar tests are made by private laboratories and the Bureau of Standards in Washington on a request basis. The armed forces laboratory in Brooklyn also tests all medical dental and veterinary supplies and equipment for the Veterans Administration and for the European and Asiatic aid programs. According to the *New York Times,* the laboratory has found that about 9 per cent of the items tested are defective in some way. The manufacturers of such items then receive an opportunity to rework their products. The joint overseers of the laboratory are Lieut. Col. Bernard Korn and Lieut. Comdr. Claude V. Timberlake.

COMMISSIONS FOR TOXICOLOGISTS

Reserve commissions in the Army of the United States are available to qualified toxicologists. The commissions range from those of first lieutenant up to and including colonel, depending on the applicant's qualifications and experience. Applications will be considered from persons up to 55 years of age. All must be citizens of the United States. No previous military experience is required.

For appointment in the grade of first lieutenant, applicants must meet one of the following three requirements: (1) possess a doctor's degree from a school acceptable to The Surgeon General in any of the medical allied sciences listed below; (2) possess a master's degree from a school acceptable to The Surgeon General and have a minimum of two years of professional experience in any of the medical allied sciences listed; (3) possess a bachelor's degree from a school acceptable to The Surgeon General and have a minimum of three years of professional experience in any of the medical allied sciences listed or in other related sciences for which there is a demonstrated need in the Medical Department: bacteriology, biochemistry, parasitology, serology, entomology, nutrition, toxicology, industrial hygiene, industrial hygiene engineering.

For appointment in the grades of captain through colonel, applicants must have met any one of the requirements for first lieutenant and, in addition, have had further experience in the medical allied sciences as follows: for captain, four years; for major, nine years; for lieutenant colonel, fourteen years, and for colonel, nineteen years. Applicants who possess bachelor's degrees in any of the nine fields mentioned but who lack the specified professional experience to attain eligibility may qualify for a commission in the field of pharmacy and medical supply and administration specialist.

Details of the program are provided in Department of the Army Circular No. 210, dated July 14, 1948, which may be obtained from The Adjutant General, Department of the Army, Washington 25, D. C., from local Reserve Unit Headquarters or from Army Headquarters at New York, Baltimore, Atlanta, Chicago, Houston or San Francisco.

ENCEPHALITIS OUTBREAK IN JAPAN

The epidemic of encephalitis which developed in Japan during the summer is said to have been the worst epidemic of encephalitis reported. The peak occurred in August and it was practically over by the end of September. The number of cases is said to have been 6,867, of which 964 were fatal. Only 3 deaths occurred among American personnel. The Surgeon General of the Army requested Dr. William M. Hammon, epidemiologist of the Hooper Foundation for Medical Research and the School of Public Health at the University of California, to proceed to Japan to investigate the outbreak. Dr. Hammon reported to the Surgeon General the results of his investigation early in October. This was the sixth trans-Pacific flight which Dr. Hammon had made in his study of this disease. Lieutenant Colonel William D. Tigertt of the Army Medical Corps, commandant of the 406th Medical General Laboratory, was in charge of the studies at the start of the season in Tokyo. Dr. Grant Taylor of Duke University, Durham, N. C., was in Japan as consultant to the Army Commission on neurotropic virus disease when the epidemic occurred. While this epidemic was larger than the previous record epidemic of 1924, the virulence of the infection was less. The Japanese gave the name type B to this form of encephalitis in 1924 to distinguish it from the von Economo type which followed the influenza pandemic in 1918 and which the Japanese called type A.

NAVY

ADMIRAL BOONE PRESIDENT OF MILITARY SURGEONS

The Association of Military Surgeons of the United States at its recent meeting in San Antonio, Texas, elected Rear Admiral Joel T. Boone of Washington, D. C., president of the organization for the forthcoming year. Admiral Boone, now General Inspector of the Medical Department, is the eleventh Navy medical officer to be elected to this office. He entered the Navy in 1914. For extraordinary heroism in World War I, he was awarded the Congressional Medal of Honor and the Army's Distinguished Service Cross. In addition to the Silver Star Medal with five Oak Leaf Clusters, the Purple Heart with two Oak Leaf Clusters awarded in World War I, the Bronze Star, and Secretary of Navy citation ribbon awarded in World War II, he holds many other decorations. From 1922 until 1933, he was personal physician to President Harding, President Coolidge and President Hoover. During World War II, Admiral Boone served at the Naval Air Station, San Diego, Calif., and as Medical Officer in Command of the Naval Hospital, Seattle, later serving as Fleet Medical Officer on the staff of Admiral Halsey.

NEW NAVY INTERNS IN CIVILIAN INSTITUTIONS

Thirty-one lieutenants (jg) in the Medical Corps Reserve have reported for their first active duty as interns in civilian medical institutions under the Navy Medical Training Program. On completion of the internship, these officers will serve on active duty at Naval medical facilities; they are: Francis B. Adams Jr., Seneca, S. C.; Thomas M. Auerbach, Chicago; James K. Avery, Memphis, Tenn.; William E. Barnes, Waukegan, Ill.; Joseph Bartos, Bethlehem, Pa.; Jack H. Baur, Cincinnati; Jesse A. Bowers, Charleston, S. C.; Carlin V. Chenoweth, Chicago; Francis L. Conwell Jr., Tarentum, Pa.; James W. Daly, White Plains, N. Y.; Philip J. Dorman, Cambridge, Mass.; Samuel I. Etz, Trenton, N. Y.; Hector H. Filardi, New Orleans; Melvin A. Goldberg, Chicago; Myron Gordon, Brooklyn; Robert M. Hidey Jr., Detroit; James B. Ivers, Beaumont, Texas; William B. Johnson, Ellaville, Ga.; Lloyd L. Lancaster, Wayne, Pa.; Donald L. Martin, Louisville, Ky.; Russell J. McIntire, Hastings, Neb.; George C. Moran, Oak Park, Ill.; Hobart M. Proctor, Denver; Andrew Raetzsch, Seguin, Texas; Howard B. Russman, Chicago; Walton E. Stevens, Baltimore; Jack O. Stoffel, Chicago; Harry W. Vandever, Enid, Okla.; Silas L. Warner, Chicago; Trevor G. Williams, Jersey City, N. J., and Park W. Willis III, Seattle.

FIRST ACTIVE DUTY

Reserve medical officers reporting for their first active duty at Naval medical facilities indicated are: Lieutenants (jg) Wayne J. Foster, Cedar Rapids, Iowa, to the Naval Training Center, Great Lakes, Ill.; Robert P. Gorman, Burlington, Wash., to the Naval Hospital, Oakland, Calif., and Mack A. Kellett Jr., of Marmaduke, Ark., to the Naval Training Center, San Diego, Calif.

TRANSFER TO REGULAR NAVY

Four medical officers on active duty in the Naval Reserve have recently transferred to the Regular Navy; they are: Commander Clifford A. Stevenson, Bowling Green, Ohio; Lieutenants (jg) Leo J. Frank Jr., Chicago; James H. Holmes, Little Rock, Ark., and Jay D. Wilson, Oklahoma City, Okla.

PERSONALS

Lieut. (jg) Philip O. Geib, M.C.R., U.S.N.R., of Manheim, Pa., has been voluntarily recalled to active duty and assigned to instruction in a residency in general surgery at the Naval Hospital, Philadelphia.

Lieut. (jg) Richard H. Lee, M.C.R., Northfield, Minn., has reported for his first active duty in a residency in psychiatry at the State University Hospital of Iowa, Iowa City, under the Medical Training Program.

Comdr. James C. Kimball, M.C., Retired, of Burbank, Calif., has requested recall to active duty and has been nominated for duty at the Naval Recruiting Station, Los Angeles.

PUBLIC HEALTH SERVICE

ADVANCE TRAINING FOR MEDICAL OFFICERS

Senior Assistant Surgeon P. J. Pesare has been assigned to the Peter Bent Brigham Hospital for a special postgraduate course in clinical heart disease.

Surgeon Clarence L. Hebert is taking a postgraduate course in anesthesiology at New York University College of Medicine.

Surgeon Joe M. Chisholm is attending Johns Hopkins for a special course in gynecologic pathology.

Surgeon Robert E. Miller, now attached to the Baltimore Marine Hospital, is being assigned to the Johns Hopkins School of Medicine next January for a six month period of graduate study.

Senior Assistant Surgeon James J. Thorpe is receiving psychiatric training at the Washington (D. C.) School of Psychiatry, and Senior Surgeon James V. Lowry, at the Washington School of Psychiatry and the Washington-Baltimore Psychoanalytic Institute.

Assistant Surgeon Robert Greenfield is receiving his second year of advanced training in biochemistry at the University of California, on completion of which he will return to the National Institutes of Health to do research.

MENTAL HEALTH PROGRAMS

The Mental Hygiene Division of the Public Health Service reports that grants-in-aid to states for mental health activities paid during the first quarter of fiscal year 1948-1949 totaled $945,321 as compared with a total of only $39,954 paid during the first quarter of the fiscal year 1947-1948. Although still handicapped by personnel shortages, most states are getting their programs into operation. Plans for 1949 have been completed by all territories and by all states except Pennsylvania and Wyoming. Budgets already submitted call for $2,981,554 out of the total available fund of $3,550,000.

During the fiscal year 1947-1948, mental health programs were initiated in twenty-two states and two territories and expanded in twenty-two states. Only areas not participating in the national program by the end of the year were Alabama, Missouri, Indiana, Pennsylvania, Wyoming, Puerto Rico and the Virgin Islands. In thirty-four states, one hundred and three clinics were organized or expanded. Federal expenditures for clinics and for other phases of state programs—such as training of state and local mental health personnel, professional services, preventive and educational activities and administration—totaled $1,164,218 during the fiscal year 1947-1948. Both Mississippi and Montana made biennial appropriations of $50,000 last year, their first appropriation of specific funds for noninstitutional mental health services.

PERSONAL

Dr. Will H. Aufranc has been appointed assistant chief of the Venereal Disease Division of the Public Health Service. Dr. Aufranc formerly was Venereal Disease Consultant for the Public Health Service in the region embracing four Western states and Alaska and Hawaii with headquarters in San Francisco.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ALABAMA

Organ Dedicated to Physician's Memory.—An organ, given to the Methodist Church at Camp Hill by his widow, was dedicated in August in memory of the late Dr. Wiley D. Wood, for 32 years a family physician of the village and surrounding territory. A brief address paid tribute to Dr. Wood and to Mrs. Wood, who has devoted a lifetime to interpreting classical music to the community.

ARKANSAS

Cancer and Tuberculosis Clinic.—A new clinic has been opened at Davis Hospital in Pine Bluff to provide facilities for the diagnosis and treatment of cancer and for weekly clinical consultation in tuberculosis under the auspices of the Jef- f[illegible] Tuberculosis Association. The clinic is designed [illegible] for indigent patients who may avail themselves [illegible] inical treatment on recommendation of their family [illegible]. Funds for the treatment of indigent patients will [illegible] ied by the Arkansas Cancer Control Commission [illegible] istance from the Arkansas Division of the American [illegible] Society.

CALIFORNIA

[illegible] **on Cerebral Palsy.**—The California State [illegible] Education reports the availability of a booklet, [illegible] for Parents of Cerebral Palsied Children," by [illegible] ackie. Copies are being sent to county, city and [illegible] intendents of schools and to directors of special [illegible] Sections of the book are entitled "Facts about [illegible] Palsy," "Training the Child" and "Sources of Aid [illegible] ral Palsied Children." It will also be sent on request [illegible] to the Department of Education, Library and Courts [illegible] ding, Sacramento 14.

COLORADO

Sanitarian Training Center.—Establishment of a sanitarian training center at the University of Colorado has been announced as a cooperative effort of the U. S. Public Health Service local district, the Colorado State Health Department, the City of Denver and the university's medical school. The center, designed to aid in overcoming a shortage of personnel trained in sanitation, will accept trainees from Colorado, Wyoming, Utah and Montana for a three month course of intensive study. Qualified young men and women will be selected by public health agencies in these states to participate in the program. Although classes will be held to a maximum of twelve trainees, trainees from other states will be accepted if possible. The sanitarian training center will be headed by Clyde F. Herring, sanitation engineer with the U. S. Public Health Service. The staff will include four full time members, and part time instruction will be given by personnel of the state and city departments of health. The first three month course will begin late this winter. Various places in Colorado will be used for field experience in restaurant and water sanitation and other phases of the program.

DISTRICT OF COLUMBIA

Aniseikonic Clinic.—An aniseikonic clinic has been established at the new George Washington University Hospital. The clinic makes use of a space eikonometer, purchased this year by the university. Patients are accepted for examination in the clinic through the hospital eye department, of which Dr. Ernest A. W. Sheppard, professor of ophthalmology at the George Washington University School of Medicine, is head.

ILLINOIS

Radio Broadcasts on Venereal Disease.—The benefits of early detection and proper treatment of venereal disease are being featured in fifteen minute broadcasts over Station WLPO in LaSalle every Friday at 1:30 p.m. The programs will continue through December, January and February. Sponsored jointly by the state department of public health and the Hygienic Institute of LaSalle, Peru and Oglesby, these broadcasts are in line with the national program of radio education in venereal disease. Station WLPO is the first in Illinois to present this health program as a public service, according to the state department of health. The transcriptions, which are available through the department to any radio station in the state, have been prepared by Columbia University and the U. S. Public Health Service.

Chicago

Free Chest X-Ray Center.—Michael Reese Hospital has opened a Chest X-Ray Center, which will give free examinations of the chest. The combined chest service of Michael Reese Hospital and Winfield Sanatorium, directed by Dr. Edwin R. Levine, will administer the program. The U. S. Public Health Service and the Illinois State Department of Public Health have made equipment and technicians available.

Dr. Sweany Awarded Medal.—Dr. Henry C. Sweany, medical director of research at the City of Chicago Municipal Tuberculosis Sanitarium and a member of the board of directors of the Tuberculosis Institute of Chicago and Cook County, received the Dearholt Medal awarded annually by the Mississippi Valley Conference on Tuberculosis. Dr. Sweany was cited for his research on bacteriology and pathology of tuberculosis and associated conditions.

Increase in Cost of Hospital Care.—The cost of hospital care in Chicago has increased an average of more than 116 per cent in the last eleven years, according to Roy Gibbons, whose story appeared in *The Chicago Tribune* November 21. Hospital care in 1947, he said, cost $42,000,000 in Chicago. In 1938 a patient could obtain care in a semiprivate room in most of Cook County's eighty-five hospitals for an average of $5.63 a day, including room, board, service and medicine. Today in the same hospitals, the average cost for the same care is $12.17, while private rooms now cost on the average of $17.94. Hospitals in the survey are accredited by the American College of Surgeons, and eighty-three are nonprofit organizations, which operate tax free. The survey showed that the highest rate charged by one tax-free hospital was $21.40 a day to patients receiving care in semiprivate rooms. Another hospital in a different city area, offering what was said to be a comparable kind of care, charged $8.30 a day. One of the two hospitals operating for profit charged an average of $12.93 a day for semiprivate care and another $13.31 a day. These private hospitals pay income, real estate and social security taxes while they pay a dividend or at least break even. Some of the nonprofit institutions show a collective deficit of $5,000,000 to $6,000,000 a year despite their tax-free status. Spokesmen for the Council of Social Agencies of Chicago, the Community Fund, the subscription investigating committee of the Chicago Association of Commerce and the Chicago Hospital Council say that what Chicago's hospitals need most of all is further adoption of a uniform accounting system.

INDIANA

Special Society Election.—The Indiana Health Officers' Association at the annual meeting in October selected Dr. John W. Palmeier, Sanborn, as president; Dr. Morris Balla, South Bend, secretary, and Dr. William D. Weis, Crown Point, treasurer.

Acting Chairman of Anatomy Department.—Richard L. Webb, Ph.D., professor of anatomy, has been named acting chairman of the department at the Indiana University School of Medicine, Bloomington, succeeding Dr. Edwin N. Kime, who has been transferred to the Indianapolis campus to supervise postgraduate work. Dr. Webb received his Ph.D. degree from the University of Illinois School of Medicine in 1931.

KANSAS

Academy of General Practitioners.—The Kansas Academy of General Practitioners, which was organized November 14 in Wichita, expects to work closely with the Kansas University Medical School in the university's program for refresher courses for general practitioners. Dr. Clyde W. Miller, Wichita, was chosen president; Dr. Louis B. Gloyne, Kansas City, president-elect; Dr. George L. Thorpe, Wichita, treasurer, and Dr. Albert C. Harms, Kansas City, secretary.

MASSACHUSETTS

Dr. Lowell Appointed Assistant Dean.—Dr. Francis C. Lowell, a member of Boston University School of Medicine faculty for eight years, has been appointed assistant dean of the school. Dr. Lowell, a graduate of Harvard Medical School, 1936, has been associate professor of medicine.

Centennial of Women's Medical College.—Among the medical centennials observed this year is that of the Boston Female Medical College, first medical institution in this country for women. Three years after it opened it changed its name to the New England Female College, inaugurating a complete graded course leading to a degree of Doctor of Medicine in 1852, and in 1874 merged with Boston University School, thus making the university coeducational.

MINNESOTA

Dr. Lundy Receives Award.—The Distinguished Service Award of the American Society of Anesthesiologists has been conferred on Dr. John S. Lundy, Rochester, for his contribution to anesthesia in introducing an intravenous anesthetic, his comprehensive textbook and the high caliber of his students. Dr. Lundy is head of the department of anesthesia at the Mayo Clinic and associated hospitals and professor of anesthesiology at Mayo Foundation Graduate School at the University of Minnesota.

MISSOURI

Chamber of Commerce Honors Nobel Prize Winners.—St. Louis, the home of more Nobel Prize winners in the field of science than any other city in the world, paid high tribute to these five eminent residents November 30 at a testimonial dinner tendered by the St. Louis Chamber of Commerce at the city's Hotel Jefferson. Nobel Medal winners who were honored were Arthur H. Compton, chancellor of Washington University; Edward A. Doisy, Sc.D., director of the department of biochemistry at St. Louis University, and three scientists at Washington University: Dr. Joseph Erlanger, professor emeritus of physiology; Drs. Carl F. Cori and Gerty T. Cori, man and wife team of biochemistry professors. Also honored was Frank C. Rand, who was awarded a citation and honorary membership in the American Hospital Association at the organization's convention last September as "an outstanding benefactor of health and hospitals." He is chairman of the board of International Shoe Company in St. Louis. Those paying tribute at the dinner included business leaders, scientists, educators, physicians and officers of the American Medical Association, including Dr. Morris Fishbein, Editor of The Journal, Dr. Roscoe L. Sensenich, South Bend, Ind., President, and Dr. Elmer L. Henderson, Louisville, Ky., Chairman of the Board of Trustees. New York City has two Nobel winners in the field of science, Boston three, Princeton, N. J., two, and various other cities, but one. St. Louis has five, and a sixth, Dr. Herbert S. Gasser of New York, won the coveted award for work done in St. Louis. Dr. Compton won the 1927 award in physics, Dr. Doisy in 1943 in medicine and physiology, Dr. Erlanger and Dr. Gasser in 1944 in medicine and physiology and the Coris in 1947 in the same field. Another native St. Louisan, now a citizen of England, Thomas S. Eliot, won the award in literature just recently, the thirty-third person born in the United States to receive the award.

MONTANA

Study of Encephalitis.—A study conducted at the U.S. Public Health Service Rocky Mountain Laboratory in Hamilton is being made to trace the exact species of mosquito presumably responsible for transmitting the disease to man. The highest incidence of encephalitis since 1938 has been found in North Dakota and adjacent parts of Minnesota, South Dakota, Montana and the Canadian provinces of Manitoba and Saskatchewan. In 1941 more than 3,000 persons were attacked by the disease in this area. The Public Health Service will endeavor to determine the incidence of human infection as accurately as possible.

NEW YORK

Rehabilitation Center for Alcoholic Addicts.—The formal opening of the University of Buffalo Rehabilitation Center, Clinic and Information Bureau for the diagnosis, treatment and reclamation of persons with chronic alcoholism was held December 2. Dr. Kenneth Goldstein, Buffalo, is medical director of the center, which will function in close cooperation with the Edward J. Meyer Memorial Hospital and other Buffalo area hospitals. The center has been made possible through joint efforts of the School of Medicine, the Erie County Medical Society and the profession at large, the state departments of health and mental hygiene, the Erie County Health Department, the Buffalo area hospitals and other local groups. Income will come largely from both national and state health department funds. Among the purposes of the center are reduction of incidence of chronic alcoholism through public educational methods, provision of adequate facilities for medical and institutional care and acquisition of further information regarding the clinical, physiologic and sociologic aspects of alcoholism through inauguration of adequate research studies. A fee of $10 a patient will be charged unless the patient's social credit rating determines that he cannot pay. Persons may be referred by their physicians or may come without referral.

New York City

Serving More Than Fifty Years.—A group of doctors who have practiced in or about New York for fifty years or more were honored at ceremonies December 7 marking the fiftieth anniversary of the merging of the former Bellevue Hospital Medical College into New York University College of Medicine. In attendance were more than fifty doctors who were undergraduates of one of the two schools during the years immediately preceding or following the merger, as well as officials of Bellevue Hospital, the city's Department of Hospitals and members of the faculty and administration of the New York University-Bellevue Medical Center.

Joint Meeting.—The Metropolitan Chapter of the Association of Military Surgeons of the United States and the New York Academy of Medicine will meet jointly at the Academy January 31 for the following program:

Major General Raymond W. Bliss, Washington, D. C., Military Responsibility for Civilian Health in War.
Vice Admiral Ross T. McIntire, Washington, D. C., American Red Cross National Blood Program.
Edwin J. Cohn, Cambridge, Mass., Fractionation of Blood.
Louis K. Diamond, Boston, The *Rh* Factor.
Colonel Elbert DeCoursey, Washington, D. C., Effects of Atomic Radiations on Blood-Forming Elements.

Edwin Smith Papyrus Presented to Academy.—Presentation of the Edwin Smith Papyrus was made December 2 to the New York Academy of Medicine by Dr. Fenwick Beekman, president of the New York Historical Society, and Mr. Sidney Davidson, chairman of the Governing Committee of the Brooklyn Museum. The papyrus, acquired by the Brooklyn Museum from Egyptian collections of the Historical Society, had been lodged with the Brooklyn Museum for over ten years. The society and museum decided that, in view of the outstanding accomplishments of the New York Academy of Medicine and the eminent position which its library holds, the academy should be custodian of this famous papyrus, estimated to be 5,000 years old. It was discovered and purchased in 1862 by Edwin Smith, who was probably the first American citizen to have studied the Egyptian language. After his death in 1906, the papyrus was translated by the late James H. Breasted of the University of Chicago. The contents deal with wounds and injuries of the face, neck and spine. The author follows a regular plan in his presentation of each surgical subject: first, a name for the injury; then the result of his examination followed by a diagnosis, and, finally, the appropriate treatment. Both the original papyrus and a considerable stock of the two printed volumes, the translation and a facsimile, were presented to the academy. Much of the beginning and the end of the papyrus is missing.

OHIO

University News.—A department of preventive medicine, which would cover public health, nutrition and industrial hygiene, has been established by the Ohio State University College of Medicine, Columbus. In addition to coordinating the instruction of medical students in the three fields, the program will emphasize health conservation as well as the control of disease.

Public Relations and the Doctor's Receptionist.—The Ohio State Medical Association, Department of Public Relations, has developed a 14 page booklet entitled "Date With the Doctor: Some Helpful Hints for His Receptionist." It is designed to point out public relation implications of the work of a receptionist, and material is attractively presented. Copies may be obtained from the association's office at 79 East State Street, Columbus 15.

PENNSYLVANIA

Central Blood Bank.—Plans for establishing a Red Cross Regional Blood Center for Philadelphia and vicinity have been approved by the Philadelphia County Medical Society, the Hospital Council of Philadelphia, the director of public health and the medical societies in Bucks, Chester and Delaware counties following nearly two years of planning by members of the medical profession and the Red Cross. The center probably will open shortly after January 1 in the Red Cross headquarters. Bloodmobiles staffed with doctors, nurses and technicians, and equipped to set up stations on the spot, will travel to outlying sections on regular schedu' [illegible] present plans, hospitals in Philadelphia and [illegible] will eventually be supplied with blood from the center. Blood will be supplied free by the Red Cross and its donors; the only charge to be made to the patient will be one by the physician or hospital for professional services in administering the blood.

Philadelphia

Gifts to Women's College.—The Women's Medical College, Philadelphia, has been named the beneficiary of three legacies, two of alumni: $47,000 by the will of the late Dr. Margaret J. Delmore, 1899, the income of which is to be used for scholarships; $17,000 by the will of the late Dr. Grace W. Sherwood, 1904, for scholarship purposes, and a gift of $5,000 from a trust fund of Redwood F. Warner.

Lankenau Hospital to Move.—Lankenau Hospital, a city landmark for eighty-eight years, has purchased a new site on a 92 acre tract at City Line and Lancaster Avenue in Overbrook. The hospital is coordinating its plans with the program of the Hospital Planning Agency of the Citizens Conference on Hospital Capital Requirements. No definite date has been set to begin construction on the new building. Trustees of the hospital are reported to have said that the decision to move the hospital was influenced by the concentration of fourteen hospitals within a mile of its present site and by the trend toward decentralization. In its new location the hospital will be able to serve important parts of west Philadelphia, Delaware and Montgomery counties.

VIRGINIA

State Medical Election.—The Medical Society of Virginia recently installed Dr. M. Pierce Rucker, Richmond, as president and chose Dr. Walter C. Caudill as president-elect for the coming year.

Dr. Lehman Honored.—Dr. Edwin P. Lehman, who has been on the faculty of University of Virginia since 1928, was recently honored by former students, residents and house officers on completion of twenty years as professor of surgery and gynecology. Dr. Lehman is a graduate of Harvard University Medical School, Boston, was an officer in the Army Medical Corps overseas during World War I and was teaching surgeon at Washington University School of Medicine, St. Louis, before he went to the University of Virginia.

WYOMING

Offer Training in Psychiatry.—The director of the Wyoming State Department of Public Health, Dr. Franklin D. Yoder, Cheyenne, is interested in corresponding with a Wyoming physician interested in the field of neuropsychiatry. The state department has funds with which to train physicians in postgraduate specialty training. Dr. Yoder is interested in developing a mental hygiene program in the public health department, and this would depend on the availability of specially trained persons. There are said to be no certified specialists in psychiatry in private practice in the state.

GENERAL

Fellowship Available.—Radcliffe College invites applications for the Helen Putnam Fellowship for Advanced Research, which is open to postdoctoral fellows in the field of genetics or of mental health. The stipend will be $2,600 a year, with possibility of renewal. Application blanks may be obtained from the secretary of the Graduate School, Radcliffe College, Cambridge, Mass. Completed applications should be returned not later than April 1, 1949.

Incidence of Poliomyelitis.—A total of 524 cases of poliomyelitis was reported by the U. S. Public Health Service for the week ending November 27, as compared with 651 the previous week, 366 for the corresponding week in 1946 and a five year median of 221 for the week. Of interest is the late persistence of the disease in California, where 192 cases, or more than one third of the total, were reported for the week. The next highest figures were for South Dakota, 59 (65 last week), and Minnesota, 27 (45 last week). The total to date is 26,216, as compared with 24,261 for the corresponding period of 1946, and a five year median of 13,102 for the period. The total to date this year now exceeds the total for the entire year 1946 (25,698, final figure, total from the monthly reports).

College of Physicians Fellowships.—The American College of Physicians has appointed eight young physicians to research fellowships in medicine for the year beginning July 1949. The recipients and their studies are James K. DeVore, Cleveland, determination of action of adrenal steroids in patients with hypertension; Stefan S. Fajans, Ann Arbor, Mich., the physiologic mechanisms capable of stimulating or depressing the islets of Langerhans; Horace W. Gerarde, Rockford, Ill., the histochemistry of certain liver diseases; John C. Laidlaw, Toronto, Canada, continuation of studies on the metabolism of cholinesterase inhibitors in regard to myasthenia gravis; James Metcalfe Jr., Pigeon Cove, Mass., investigation of the dynamics of circulation; Samuel M. Peacock Jr., Bryn Mawr, Pa., cytochemical studies of nervous tissues during growth and other physiologic activity; Jack L. Strominger, St. Louis, the microchemistry of brain tissue, and Edgar Woody Jr., Nashville, Tenn., continuation of studies on the combined effect of potassium iodide and streptomycin in tuberculosis.

The Five Leading Causes of Death.—The U. S. Public Health Service reports that for 1947 the crude death rate in the United States was 10.1 per 1,000 population as compared with 10.0 in 1946. The five leading causes of death and the number of deaths caused by each were: heart diseases (460,580), malignant tumors (189,811), intracranial lesions of vascular origin (131,039), nephritis (80,288) and accidents excluding motor vehicle (66,882). The number of deaths from heart diseases increased to 31.9 per cent of the total number of deaths as compared to 30.8 per cent in 1946. While deaths from other chronic diseases increased, the mortality from the major infectious diseases set new low records during 1947. The number of deaths from poliomyelitis and polioencephalitis (580) and measles (472) were the third and second lowest, respectively, ever recorded for the United States. The number of deaths from whooping cough rose from the record low of 1,241 in 1946 to 1,954 in 1947. The deaths from pneumonia and influenza (combined) decreased from 62,324 to 61,836 in 1937, and those from tuberculosis decreased from 59,011 to 48,064. Deaths from motor vehicle accidents decreased from 33,411 in 1946 to 32,697 in 1947. This was the first decrease in the annual number of deaths due to this cause since 1943. However, deaths due to other types of accidents rose from 64,622 in 1946 to 66,882 in 1947. Fewer maternal deaths associated with pregnancy and childbirth (4,978) occurred than in 1946 (5,153), despite the large increase in the number of births. Deaths from diabetes mellitus increased to 37,515, an increase of 2,784 over the number for 1946. However, deaths from nephritis (80,288) were 1,413 fewer than in the previous year. All rates shown are crude death rates, and all figures shown are exclusive of deaths among armed forces overseas.

CORRECTION

Tuberculin Allergy.—In an editorial by this title in The Journal, Nov. 13, 1948, page 823, reference was made to research by several investigators including that of A. B. Stavitsky which, the latter states, is misinterpreted. Dr. Stavitsky writes that he never has transferred tuberculin hypersensitivity from tuberculous guinea pigs by a massive transfer of whole blood. These animals, he writes, were given injections of heat-killed tubercle bacilli and were tuberculin sensitive but not tuberculous. Dr. Stavitsky states also that he never expressed the opinion that circulating lymphocytes in this whole blood were responsible for this transfer. What he said was as follows: "The positive results employing suspensions containing about 95 per cent lymphocytes are indicative of the possible preeminence of this cell in the transfer of sensitivity. The specific lysis of a portion of small mature lymphocytes from blood or spleen of tuberculous mice and guinea pigs upon contact with tuberculin may be related to the ability of lymphocytes to transfer sensitivity."

Dr. Stavitsky's name was misspelled in the body of the editorial and in the footnote. His name is spelled as it appears in this correction.

Marriages

Theodore Crandall Alford Jr., Washington, D. C., to Miss Patricia Anne Tully at Fort Myer, Va., October 12.

Benton McQueen Montgomery, Wilmington, N. C., to Miss Inge Schulla of Salzburg, Austria, September 27.

Aubrey Robert Furnas Jr., Jacksonville, Fla., to Miss Mary Elizabeth McGauley of Palatka, September 26.

Mark Samuel Reed, Shamokin, Pa., to Miss Marsha J. Bretthauer at Muhlenberg, Pa., October 23.

Carlton Allen Keck, Urbana, Ill., to Miss Betty Ratcliff Gray of Shreveport, La., October 23.

Wilfred Thomas Small, Milton, Mass., to Miss Muriel Y. Gratton at Pittsfield, September 25.

Floyd R. Sanders, Decatur, Ga., to Miss Marion T. Rutland of Atlanta, recently.

Deaths

Stuart McGuire ⊕ emeritus professor of surgery at the Medical College of Virginia, Richmond, died at his home October 27, aged 81, of pneumonia. Dr. McGuire was born in Staunton, Sept. 16, 1867. After graduation from the University of Virginia Department of Medicine in Charlottesville in 1891, he took postgraduate work in New York and then began his professional career in Richmond, where he was associated with his father, the late Dr. Hunter Holmes McGuire. A short time later he became a member of the faculty of University College of Medicine, where for many years he held the chair of principles of surgery. After the death of his father in 1900, Dr. McGuire was elected to the chair of clinical surgery and carried on the famous "Saturday Surgical Clinic." In 1905, when elected to the presidency of the University College of Medicine, he took an active part in the movement which led to its merger with the Medical College of Virginia, which he served as president from 1914 to 1925. At the time of his death he was emeritus professor of surgery, member of the executive committee and chairman of the board of visitors, which in 1930 established the Stuart McGuire Lectures in recognition of his services to the college, to medical education and to surgery. Dr. McGuire was a member of the House of Delegates of the American Medical Association in 1903, 1904, 1906, 1907 and 1908. He was past president of the Richmond Academy of Medicine, Medical Society of Virginia, Tri-State Medical Association, Southern Surgical and Gynecological Association and the Southern Medical Association. In 1918 he went to France as chief surgeon of the Medical College of Virginia Unit (Base Hospital number 45), of which he was commanding officer. He was awarded the French Medaille d'Honneur, the Distinguished Service Medal and other decorations. He was head surgeon of St. Luke's Hospital and on the staff of the Memorial Hospital, Richmond. He received the LL.D. degree from Richmond College in 1916. Dr. McGuire was the author of "Principles of Surgery," published in 1908, and "The Profit and Loss Account of Modern Medicine," published in 1915.

Clarence Morton Trippe ⊕ Asbury Park, N. J.; born in Versailles, N. Y., Sept. 23, 1884; North Carolina Medical College, Charlotte, 1911; Columbia University College of Physicians and Surgeons, New York, 1916; specialist certified by the American Board of Psychiatry and Neurology, Inc.; fellow of the American College of Physicians; at one time practiced in Charlotte, N. C., where he was on the staffs of Presbyterian, St. Peter, Good Samaritan and Mercy hospitals; formerly affiliated with the Vanderbilt Clinic in New York and Monmouth Memorial Hospital in Long Branch; at one time attending neuropsychiatrist for the U. S. Public Health Service War Risk Insurance, U. S. Veterans Bureau and the Veterans Administration Facility in Lyons; died in Good Samaritan Hospital in West Palm Beach, Fla., August 25, aged 63.

Andrew Baptiste Rivers ⊕ Rochester, Minn.; born in Rolling Stone, Minn., Dec. 10, 1894; John A. Creighton Medical College, Omaha, 1917; associate professor of medicine at the (Mayo Foundation) University of Minnesota Graduate School; specialist certified by the American Board of Internal Medicine; member of the American Medical Association, Central Society for Clinical Research and the American Gastroenterological Association; fellow of the American College of Physicians; served in the U. S. Navy during World War I; consultant in medicine at the Mayo Clinic; died October 3, aged 53, of coronary thrombosis.

Frederick Bryan Wishard ⊕ Anderson, Ind.; born in Teheran, Persia, Aug. 24, 1894; Indiana University School of Medicine, Indianapolis, 1923; member of the American Trudeau Society and the American Association of Industrial Physicians and Surgeons; past president of the Madison County Medical Society and the Eighth District Medical Society; for many years medical director of the Delco Remy Corporation; served during World War I; affiliated with St. John's Hickey Memorial Hospital; died in Ball Memorial Hospital, Muncie, September 23, aged 54, of coronary thrombosis.

Charles Augustus Woodard ⊕ Wilson, N. C.; born in Wilson County, May 11, 1876; University of Virginia Department of Medicine, Charlottesville, 1904; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; served in France during World War I; formerly practiced in Durham, where he was a member of the board of health and was affiliated with Watts Hospital; visiting surgeon, State Hospital, Raleigh; on the staff of Mercy Hospital; chief surgeon and president of the Woodard Herring Hospital, where he died October 5, aged 72, of coronary thrombosis.

Hiram Alonzo Alderman, Portal, Ga.; Atlanta School of Medicine, 1910; member of the American Medical Association; affiliated with the Bulloch County Hospital in Statesboro; died recently, aged 71, of injuries received in an automobile accident.

William Francis Asbury, Campbellsburg, Ky.; University of Louisville (Ky.) Medical Department, 1908; died September 11, aged 74.

Eugene M. Bewley, Tulsa, Okla.; Louisville (Ky.) Medical College, 1889; died September 1, aged 82.

Olav Bohmer, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1904; died October 5, aged 79, of burns received in an accidental fire in his home.

Herbert Drummond Boyd, Boston; Boston University School of Medicine, 1892; fellow of the American College of Surgeons; past president of the Massachusetts Surgical and Gynecological Society and of the alumni association of the Boston University School of Medicine; affiliated with Massachusetts Memorial Hospitals; died October 11, aged 79, of arteriosclerotic heart disease.

Norman E. Brundage, Rockford, Ohio; Fort Wayne (Ind.) College of Medicine, 1892; formerly health commissioner of Delphos; died in a convalescent home October 8, aged 85.

Joseph Harker Bryan, Asbury Park, N. J.; New York Homeopathic Medical College and Hospital, New York, 1890; member of the American Medical Association; past president of the State Board of Medical Examiners of New Jersey; fellow of the American College of Physicians; one of the original staff of Ann May Hospital, Spring Lake; affiliated with Fitkin Memorial Hospital in Neptune, where he died October 21, aged 82, of acute pancreatitis and bronchopneumonia.

William Dowd Burch, Hughes, Ark.; University of Tennessee College of Medicine, Memphis, 1917; member of the American Medical Association; died in Baptist Hospital, Memphis, Tenn., October 2, aged 67, of diabetes mellitus.

Harvey C. Burson, Denver; Baltimore University School of Medicine, 1896; veteran of the Spanish-American War; died in St. Anthony's Hospital October 22, aged 75, of cerebral hemorrhage.

Prentice E. Bushong, Gainesville, Mo.; National University of Arts and Sciences Medical Department, St. Louis, 1918; died September 4, aged 70, of cerebral hemorrhage.

Charles Henry Carroll, Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1906; member of the American Medical Association; affiliated with the Presbyterian Hospital and Allegheny General Hospital, where he died September 5, aged 71, of mesenteric thrombosis and chronic nephritis.

George Crook Clark, Fullerton, Calif.; the Hahnemann Medical College and Hospital, Chicago, 1884; died September 3, aged 85.

Halstead Archard Conner, New Richmond, Ohio; Eclectic Medical Institute, Cincinnati, 1906; died September 16, aged 75.

L. Berry Croley, Williamsburg, Ky.; Hospital College of Medicine, Louisville, 1902; member of the American Medical Association; member of the board of education and the board of directors of the First National Bank; died September 28, aged 72, of coronary occlusion.

Leon Festus Ferguson, Greenwood, Miss.; University of Louisville (Ky.) Medical Department, 1905; died in Greenwood Leflore Hospital October 7, aged 72, of chronic cardiovascular disease.

Jesse V. Ferrel, Louisburg, Kan.; Physio-Medical College of Indiana, Indianapolis, 1897; at one time on the staff of the Trinity Lutheran Hospital, Kansas City, Mo.; died October 5, aged 76.

Stella Compton Fisher, Camden, N. J.; Woman's Medical College of Pennsylvania, Philadelphia, 1916; member of the American Medical Association; on the staff of Cooper Hospital; died September 28, aged 62, of coronary thrombosis.

Sidney Jay Furst ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1908; affiliated with Morrisania City and St. Elizabeth's hospitals; died in Lutheran Hospital September 9, aged 66, of toxic myocarditis and pneumonia.

John Sterling Geatty ⊕ New Windsor, Md.; University of Maryland School of Medicine, Baltimore, 1906; past president of the Carroll County Medical Society; president of the New Windsor State Bank; died September 17, aged 66.

Joseph Herman Gettinger, New York; Cornell University Medical College, New York, 1903; member of the American Medical Association; past president of the Bronx County Medical Society; emeritus director of pediatrics at the Bronx Hospital; died October 23, aged 74, of arteriosclerotic heart disease.

James Thomas Green, Woodway, Va.; Chattanooga (Tenn.) Medical College, 1902; died recently, aged 69.

Arthur Charles Gronwold, Chicago; Bennett Medical College, Chicago, 1906; for many years on the staff of the Norwegian American Hospital; died October 10, aged 66.

Dale O. Groves, Simla, Colo.; Central Medical College of St. Joseph, Mo., 1903; member of the American Medical Association; died October 12, aged 67.

Alonzo H. Hall, Niantic, Ill.; College of Physicians and Surgeons of Chicago, 1885; died in the Decatur and Macon County Hospital, Decatur, October 6, aged 88, of pneumonia.

Harvey Wesley Hartman, Keyport, N. J.; College of Physicians and Surgeons, Baltimore, 1904; for many years county physician; served during World War I; died in the Riverview Hospital, Red Bank, October 8, aged 67, of coronary thrombosis.

Lawton Mervale Hartman, Jr., ⊕ York, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1902; an Affiliate Fellow of the American Medical Association; fellow of the American College of Physicians; served during World War I; past president of the York County Medical Society; for many years on the staff of York Hospital; died October 6, aged 69.

Albert Benjamin Herrick Jr., Santa Rosa, Calif.; Oakland College of Medicine and Surgery, 1913; member of the American Medical Association; died recently, aged 60, of heart disease.

Milton P. Hill, Baltimore; Baltimore Medical College, 1906; member of the American Psychiatric Association; served on the staff of Mount Hope Retreat; died October 9, aged 64, of cerebral hemorrhage.

William B. Holdship, Ubly, Mich.; Saginaw Valley Medical College, Saginaw, 1902; member of the American Medical Association; past president of the Huron County Medical Society; past president of the village and the board of education; affiliated with Hubbard Memorial Hospital in Bad Axe, where he died September 30, aged 72, of heart disease.

Zimri G. Houser, Eudora, Kan.; University Medical College of Kansas City, Mo., 1908; died in the Lawrence (Kan.) Memorial Hospital September 8, aged 74, of periarteritis nodosa and abscess of the kidney.

Charles Marion Hunter ⊕ Sedro Woolley, Wash.; Medico-Chirurgical College of Philadelphia, 1915; served with the regular army during and after World War I; affiliated with Memorial Hospital; died August 30, aged 57, of nephritis and hypertension.

Philip Williams Hunter ⊕ York, S. C.; Medical College of the State of South Carolina, Charleston, 1911; for service with the British Army during World War I was awarded the British Military Cross; died September 29, aged 63, of coronary thrombosis.

Samuel Haimes Jessurun ⊕ Newark, N. J.; College of Physicians and Surgeons, Baltimore, 1900; at one time on the staffs of Mount Sinai and Sydenham hospitals in New York; died in Beth Israel Hospital September 18, aged 70, of leukemia.

Philip Jerome Jordan, San Jose, Calif.; Stanford University School of Medicine, San Francisco, 1938; member of the American Medical Association and the American College of Allergists; specialist certified by the American Board of Otolaryngology; affiliated with the San Jose, Santa Clara County and O'Connor hospitals; died September 1, aged 37.

Thomas A. Key, Chattanooga, Tenn.; Meharry Medical College, Nashville, 1907; died August 26, aged 71.

George Alexander Kilpatrick, Los Angeles; Washington University School of Medicine, St. Louis, 1904; at one time practiced in McAlester, Okla., where he had been president of the Pittsburg County Medical Society and on the staffs of St. Mary's and Albert Pike hospitals; fellow of the American College of Surgeons; died recently, aged 66.

Roy Stanley Lanterman, Glendale, Calif.; Baltimore University School of Medicine, Baltimore, 1893; formerly county coroner; died September 8, aged 79.

Thurman Holmes Lautenschlager, Santa Barbara, Calif.; Ohio-Miami Medical College of the University of Cincinnati, 1912; served during World War I; member of the American Association of Industrial Physicians and Surgeons; died September 25, aged 60.

William Cooper Le Compte ⊕ Bristol, Pa.; Medico-Chirurgical College of Philadelphia, 1897; veteran of the Spanish-American War; served overseas during World War I; formerly member of the Bristol borough school board; for a time medical inspector of the public schools; died September 16, aged 73, of pernicious anemia and arteriosclerosis.

George Lenz ⊕ Gloversville, N. Y.; Albany (N. Y.) Medical College, 1900; fellow of the American College of Surgeons; served as a member of the board of health of Gloversville; affiliated with the Nathan Littauer Hospital, where he died October 18, aged 73, of cerebral hemorrhage.

Ludvig Reinhart Lima ⊕ Montevideo, Minn.; Minneapolis College of Physicians and Surgeons, 1903; affiliated with the Montevideo Hospital; died September 4, aged 71, of coronary occlusion.

William Little, Sherburne, N. Y.; New York Homeopathic Medical College and Hospital, New York, 1894; member of the American Medical Association; for many years health officer and president of the board of education; affiliated with the Utica (N. Y.) Memorial Hospital and Chenango Memorial Hospital, Norwich; died October 19, aged 82, of carcinoma of the liver and large intestine.

John Riley Loftis Sr., Pocahontas, Ark.; University of Nashville (Tenn.) Medical Department, 1900; member of the American Medical Association; died September 15, aged 73, of coronary thrombosis.

Joseph W. Love, Nevada, Mo.; American Medical College, St. Louis, 1896; member of the American Medical Association; affiliated with Nevada City Hospital; died in Fort Scott, Kan., October 7, aged 79, of cerebral hemorrhage.

Annie Galloway Lyle, San Francisco; Johns Hopkins University School of Medicine, Baltimore, 1902; died in Franklin Hospital October 7, aged 78.

Frank M. McHugh ⊕ Salt Lake City; Louisville (Ky.) and Hospital Medical College, 1908; past president of the Utah State Medical Association and Salt Lake County Medical Society; served in France during World War I; for many years member of the city board of health; died October 9, aged 61, of coronary thrombosis.

Harlen MacMullen, Manistee, Mich.; University of Michigan Homeopathic Medical School, Ann Arbor, 1905; member of the American Medical Association; fellow of the American College of Surgeons; formerly councilor of the ninth district of the Michigan State Medical Society; served during World War I; for many years affiliated with Mercy Hospital and Sanitarium; died October 6, aged 68, of cerebral hemorrhage and diabetes mellitus.

Lee H. Mann, Columbus, Ohio; Columbus Medical College, 1883; first mayor of Linden Heights; died in Jewish Hospital, Louisville, Ky., October 2, aged 87, of heart disease.

Oscar Francois Marcotte, Topeka, Kan.; College of Physicians and Surgeons, Medical Department Kansas City University, 1901; member of the American Medical Association; formerly county coroner; associated with Christ and St. Francis hospitals; died September 23, aged 74, of cerebral hemorrhage and paraplegia.

Albert Rankin Martin ⊕ Chicago; Rush Medical College, Chicago, 1892; an Associate Fellow of the American Medical Association; for many years affiliated with St. Mary of Nazareth Hospital; died in Wilmette, Ill., October 13, aged 86.

Hilmar George Martin ⊕ Milwaukee; Johns Hopkins University School of Medicine, Baltimore, 1919; member of the American Academy of Ophthalmology and Otolaryngology; specialist certified by the American Board of Ophthalmology; past president of the Milwaukee Oto-Ophthalmic Society; served during World War I; died October 5, aged 55, of chronic nephritis.

Elmer Lincoln Mather, Akron, Ohio; Starling Medical College, Columbus, 1892; member of the American Medical Association; also a lawyer; served on the staffs of the City and People's hospitals; died in St. Thomas Hospital October 8, aged 79, of carcinoma of the prostate with metastases.

Edward Meadow ⊕ Miami, Fla.; Loyola University School of Medicine, Chicago, 1935; affiliated with the Biscayne Hospital, where he was one of the founders and where he died October 10, aged 39, of coronary occlusion.

James Morgan Meehan, Buffalo; Tufts College Medical School, Boston, 1917; affiliated with the Lafayette General Hospital; died in the Buffalo General Hospital October 7, aged 54, of coronary thrombosis.

Warren Garfield Murray ⊕ Dixon, Ill.; Ohio Medical University, Columbus, 1906; member of the American Psychiatric Association; past president of the American Association on Mental Deficiency; superintendent of Dixon State Hospital; died in the Mayo Clinic, Rochester, Minn., October 13, aged 66, of chronic myocarditis.

Nathaniel Read Norton ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1894; formerly clinical professor of diseases of children at his alma mater; at one time on the faculty of Cornell University Medical College; served as consulting physician at the Northern Westchester Hospital in Mount Kisco and attending physician at Babies Hospital; died in St. Luke's Hospital October 1, aged 77, of carcinoma of the prostate and hypertensive cardiovascular disease.

Ellen Pembroke O'Flaherty ⊕ Hartford, Conn.; Cornell University Medical College, New York, 1901; formerly vice president of the board of health; affiliated with St. Francis and the J. J. McCook Memorial hospitals; died October 6, aged 71, of coronary thrombosis.

John Alfred O'Regan ⊕ New York; McGill University Faculty of Medicine, Montreal, Canada, 1916; assistant professor of clinical obstetrics and gynecology at the Cornell University Medical College; fellow of the American College of Surgeons; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; associated with the New York Hospital; died October 6, aged 55.

Frederick Marcellus Poindexter, Dillon, Mont.; Northwestern University Medical School, Chicago, 1902; member of the American Medical Association; for many years city and county health officer; served during World War I; on the staff of Barrett Hospital, where he died August 30, aged 73, of chronic myocarditis.

John Henning Porter, Andrews, S. C.; Jefferson Medical College of Philadelphia, 1922; member of the American Medical Association; formerly mayor of Andrews; for many years member of the state house of representatives from Georgetown County; died in the McLeod Infirmary, Florence, September 17, aged 54.

Carl Pototzky, New York; Schlesische-Friedrich-Wilhelms-Universität Medizinische Fakultät, Breslau, Prussia, Germany, 1903; member of the American Medical Association; served on the staffs of Sea View Hospital in Staten Island and Mount Sinai Hospital; died September 21, aged 68, of heart disease.

Herman L. Price, Taylorsville, N. C.; North Carolina Medical College, Charlotte, 1914; for many years chairman of the school board; served as county physician; died September 21, aged 58, of heart disease.

Fanny Radom, West Hartford, Conn.; Woman's Medical College of Pennsylvania, Philadelphia, 1912; one of the founders of Mount Sinai Hospital in Hartford; died September 12, aged 69, of acute coronary thrombosis.

James M. Powell, Wells, Texas (licensed in Arkansas in 1909); died August 1.

William Walter Reich ⊕ Berkeley, Calif.; Stanford University School of Medicine, San Francisco, 1929; served on the faculty of his alma mater; fellow of the International College of Surgeons; member of the council of Alameda County Medical Association; member of the Pan American Medical Association; chairman of the 1948 campaign in Berkeley of the American Cancer Society; affiliated with Herrick Memorial, Alta Bates and Children's hospitals; died September 19, aged 49, of coronary occlusion.

Chester Elwood Stephenson, Indianapolis; Medical College of Indiana, Indianapolis, 1903; died September 22, aged 71.

Orris Martin Thompson ⊕ Bloomington, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906; served during World War I; died September 2, aged 70, of coronary occlusion and hypertension.

Leonard Dober Thomas, Alamo, Tenn.; Meharry Medical College, Nashville, 1913; died in Carbondale, Ill., August 21, aged 58, of myocarditis and cardiovascular renal syndrome.

August Trapold, Wilkes-Barre, Pa.; Medico-Chirurgical College of Philadelphia, 1891; fellow of the American College of Surgeons; affiliated with the Mercy Hospital, where he died September 12, aged 81, of fracture of the ninth dorsal vertebra received in a fall.

Henry Brown Turner, Darien, Conn.; Johns Hopkins University School of Medicine, Baltimore, 1926; died October 5, aged 49.

Frank Rudolph Urban ⊕ Medical Director, Captain, U. S. Navy, Riverside, Ill.; University of Illinois College of Medicine, Chicago, 1933; entered the U. S. Navy on Aug. 9, 1932; served during World War II and received the Purple Heart and Bronze Star Medal; attached to the Naval Air Station, Norfolk, Va.; died in Norfolk September 14, aged 42, of coronary occlusion.

Luther Lee Vann, Mars Hill, N. C.; Jefferson Medical College of Philadelphia, 1890; died in Asheville, September 19, aged 83, of cerebral hemorrhage.

William McCoy Van Patten, Seattle; University of Pennsylvania Department of Medicine, Philadelphia, 1893; veteran of the Spanish-American War; served during World War I; formerly associated with the Veterans hospitals in Boise, Idaho, and Retsil, Wash.; died in the U. S. Marine Hospital September 21, aged 80, of cerebral thrombosis.

James Blaine Vedder ⊕ Marshfield, Wis.; Northwestern University Medical School, Chicago, 1905; past president and vice president of the Wisconsin Society of Obstetrics and Gynecology; served overseas during World War I; member of the school board; affiliated with St. Joseph's Hospital, where he died September 12, aged 65, of cerebral thrombosis.

Morton Josiah Vogt, White City, Fla.; Maryland Medical College, Baltimore, 1912; died in Grand Gorge, N. Y., August 11, aged 60, of heart disease.

Walter Charles Henry Weigner ⊕ Providence, R. I.; Tufts College Medical School, Boston, 1929; specialist certified by the American Board of Psychiatry and Neurology, Inc.; member of the American Psychiatric Association and the New England Society of Psychiatry; served on the staffs of the Butler and Providence Lying-In hospitals; died in Rumford, October 5, aged 42, of coronary occlusion.

P. J. Wieg, Strum, Wis.; Milwaukee Medical College, 1901; died in the Luther Hospital, Eau Claire, September 25, aged 74, of carcinoma of the liver and large intestine.

Robert M. Wood, Chaplin, Ky.; Hospital College of Medicine, Louisville, 1901; died in the SS. Mary and Elizabeth Hospital, Louisville, September 16, aged 69, of a fractured skull as the result of a fall.

Ambrose Miller Wylie ⊕ Chester, S. C.; Medical College of the State of South Carolina, Charleston, 1903; past president of the Chester County Medical Society; founder and president of the Chester Sanatorium, now known as Chester County Hospital; died September 22, aged 72, of carcinoma of the colon.

Frederick Hyder Yates, Decatur, Ill.; Barnes Medical College, St. Louis, 1907; member of the American Medical Association; served during World War I; died in St. Mary's Hospital August 19, aged 65, of hypertension and cerebral hemorrhage.

Russell Glenn Zimmerman, Berne, Ind.; Indiana University School of Medicine, Indianapolis, 1932; member of the American Medical Association; formerly surgeon for the Chrysler Corporation in Detroit; died in Lima, Ohio, September 24, aged 45, of cerebral hemorrhage.

DIED WHILE IN MILITARY SERVICE

Daniel Richard Skudowitz, New York; L.R.C.P., Edinburgh, L.R.C.S., Edinburgh, and L.R.F.P. & S., Glasgow, Scotland, 1939; interned at Lincoln Hospital; began active duty as a first lieutenant, medical corps, Army of the United States, in April 1942; promoted to captain in March 1943 and major in May 1945; died in Munster, Germany, July 24, 1945, of injuries received in an automobile accident.

Max Fackrell Day, Bountiful, Utah; Temple University School of Medicine, Philadelphia, 1943; interned at the Salt Lake County General Hospital in Salt Lake City; lieutenant (jg) medical corps, U. S. Naval Reserve; killed by lightning in Schofield, July 1, 1946, aged 27.

Arthur Miller Barrett ⊕ Passed Assistant Surgeon, Lieutenant, U. S. Navy, Winnetka, Ill.; Jefferson Medical College of Philadelphia, 1938; interned at the U. S. Naval Hospital in Mare Island, Calif.; appointed an assistant surgeon in the medical corps of the U. S. Navy with the rank of lieutenant (jg) on July 19, 1938; died Feb. 15, 1945, while a Japanese prisoner of war, aged 33, of malnutrition.

Howard Eugene Sellards ⊕ Lieutenant Colonel, M.C., U. S. Army, Topeka, Kan.; University of Kansas School of Medicine, Kansas City, 1938; interned at St. Luke's Hospital in Kansas City, Mo.; entered the U. S. Army on July 1, 1939; held a permanent rank of captain; on duty with the 91st Photo Reconnaissance Wing during World War II; killed in an airplane accident in Southwest Pacific June 3, 1945, aged 33.

The Longest Period of Gestation on Record

A longer period of gestation than previously recorded has been allowed in law courts. A member of the armed forces last cohabited with his wife before going abroad on Aug. 28, 1944. She bore a child on Aug. 12, 1945. He therefore petitioned for adultery, with the length of the gestation period as the chief ground. Suggestions of other evidence of adultery were rejected by the judge. Medical evidence was given that it was not impossible that the husband could be the father of the child, and the judge dismissed the petition. The case was taken to the Court of Appeal, which upheld the judge's decision on the ground that none of the unusual features of the pregnancy was sufficient to impel the court to reject the medical evidence and infer adultery.

This gestation period of 349 days is the longest ever held by an English court to be possible. It supersedes the record of 346 days set up in 1947 in a case which came into court, and is far in excess of the limit allowed in foreign legislation. Periods of gestation beyond 300 days are unusual and are regarded by authorities with suspicion. Cases have been recorded of 315, 323, 324 and 336 days; in the 3 last of these cases the children weighed 12.5, 14 and 16.5 pounds (5,670, 6,350 and 7,484 Gm.) respectively.

Gastroenteritis Flying Squad

The greatest children's hospital in Britain, the National Hospital for Sick Children, Great Ormond Street, London, has made an innovation which is believed to be the first of the kind in the hospitals of the world. It has organized a flying squad consisting of up to five fully trained nurses and one doctor, taken from the team which is working on infantile gastroenteritis, to go to the help of institutions or others who are in difficulties over an outbreak of the disease. The primary object is not to conduct research but to fill any gap in resources for investigation or treatment, and it is hoped that health officers will use the team. Equipment will be carried in a lorry containing drugs, sterilizers and everything needed for transfusions or infusions. Thus the squad is fully equipped to augment existing nursing arrangements or to set up a special unit. Normally the resources of the nearest laboratory will be used for bacteriologic studies, but the lorry contains power-driven centrifuge and other apparatus for simple work of this kind. Thus in isolated areas the unit can work independently of any hospital or institution, providing, if need be, for domiciliary service. The help of the squad, which is prepared to go anywhere, is to be sought through the local health officer or regional hospital board or, when the need is acute, by telephoning the house governor of the National Hospital for Sick Children, Great Ormond Street.

"The Filth We Breathe"

The pollution of the air of our large towns, particularly the manufacturing ones, by the smoke of the domestic grate and the factory chimney, is an unsolved problem. Under the caption "The Filth We Breathe" the *Manchester Guardian*, published in a city where the evil is rampant, writes; "If we realise the quantities of soot, grit, tar, sulphuric acid that go into our lungs with each breath, we are extraordinarily indifferent or fatalistic about it." The National Smoke Abatement Society has published an interim survey of atmospheric pollution. It sent a questionnaire to 1,496 local authorities and received replies from fewer than one half. One in five of those who replied reported their atmosphere as all clear—a statement regarded with some skepticism in view of the widespread dispersion of smoke and acid in the air over Britain. Some residental areas spouting smoke from thousands of domestic chimneys apparently think that this does not count, even though it is generally accepted that at least half our atmospheric pollution comes from this source. What is required is a government survey on a scientific basis. A few local authorities are establishing air-pollution stations with deposit gages and sulfur recorders.

As to prevention, smokeless fuel is expensive but steam-raising plants can be built to consume smokelessly any kind of coal. The domestic fireplace, so dear to the English heart, is a tougher problem. There are enough modern grates to supply every new house, but only one in three has been fitted with these since the war.

Increase of Mule Spinners' Cancer

The Manchester Committee on Cancer is sending to the 1,500 doctors practicing in cotton-spinning towns a booklet on "Mule Spinners' Cancer" by Dr. E. M. Brockbank, a well known teacher of the Manchester School. He states that cancer of the skin is *affecting men spinning cotton on mules in even* greater numbers than a few years ago. The incidence of the disease in 1926 was 1.83 per thousand, but in 1946 it had increased to 2.03 per thousand. He concludes that this increase is due to the greater proportion of spinners in the older age groups. It may be added that this in turn is an example of the increased longevity of our population, which, in combination with the shortage of labor following the war, has led to a prolongation of the working period of life.

TURKEY

(From Our Regular Correspondent)

ANKARA, Oct. 31, 1948.

Autotransfusion in Ectopic Pregnancies

At the recent tenth national medical congress held in Ankara, Dr. Halil Çiray, chief of the obstetric and gynecologic department of the Ankara Model Hospital, reported on his ten years of experience with autotransfusion. The report was based on 247 ectopic pregnancies. Autotransfusion was begun in 1938 and during ten years was applied in 134 cases. The patients were between the ages 17 to 44 years. Ectopic pregnancies occurred in the first, in the second to seventh and after the tenth pregnancy. Autotransfusion of 600 to 900 cc. was given to patients with moderate hemorrhages, 1,300 to 1,800 cc. when hemorrhages were serious, and in 2 grave cases 2,200 cc. were given. Of the 134 patients given autotransfusion 6 died, and of 65 patients not given autotransfusion 4 died. Of 247 ectopic pregnancies 188 were tubal abortions, 56 were ruptures and 3 were ovarian. In 131 cases the pregnancies occurred on the right side; 66 occurred in primiparas, 54 in biparas and 127 in multiparas. There were 101 stillbirths; of these 5 were abortions. On admission 137 patients were in a moderately alarming, and 62 in a grave condition. Six patients died before autotransfusion could be given and 4 patients whose condition on admission was critical died in spite of it. In 61 of the 247 cases there was no need for autotransfusion.

The autotransfusions were made by means of the Zank instrument. The abdomen always contained a great deal of blood in ectopic pregnancy ruptures. The peritoneum was opened and the blood was collected in cups with a special instrument and together with the squeezed coagulated blood strained through five layers of gauze into a warm basin containing 3 per cent citrate solution amounting to one tenth of the blood, and often with an additional 20 per cent solution of serum dextrose; it was then immediately injected slowly into the patient's vein. No untoward results were noted, except that in some sensitive patients temporary slight elevation of temperature and chills were observed. In most patients there was a rapid improvement in pulse, and soon after transfusion symptoms of shock disappeared completely.

Since no time is lost in determining the blood groups, searching for the Rh factor, making the Wassermann or Kahn tests, and because of the simplicity of procedure, autotransfusion can under relatively primitive conditions safely be applied in ectopic pregnancies to save the lives of mothers.

Juvenile Cataracts

Dr. Nuri Fehmi Ayberk, chief of the Istanbul-Haidar Pasha Model Hospital eye clinic, has published his seven years' observation on juvenile cataracts. From 1940 to 1947, 792 patients with cataract were admitted to the clinic. Of these, 698 had senile, 64 juvenile and 30 traumatic cataracts. His experiments with the Rotter method lead the author to the conclusion that faulty nutrition and insufficiency or absence of vitamin C are mainly responsible for the development of juvenile cataracts. After a 1 cc. subcutaneous injection of dichlorophenolindophenol in a 1/400 solution the developing blue color should disappear within ten to twelve minutes after the body has attained the normal vitamin C level; if hypovitaminosis exists it takes from thirty to sixty minutes. Among the 64 patients aged 15 to 38 it took 19 to 37 minutes for the Rotter test blue to disappear.

According to Dr. Ayberk faulty nutrition, intoxication, endocrine disturbances and radiations are contributing factors to the cataract pathologic changes. He concludes that juvenile cataracts occur more frequently in rural than in urban communities, that malaria as a contributing factor to the comparatively high ratio of juvenile cataracts should be taken into consideration and that, besides biochemical factors, physical factors also play a role. Dr. Ayberk emphasized the importance of a quick absorption of the degenerated lense tissue and recommends that to insure good vision after the operation iridectomy should be avoided but that if that is not possible the iridectomy should be peripheral only.

Death of Prof. Neshat Omer Irdelp

Senior cardiologist Prof. N. O. Irdelp, who for almost forty years taught at the Istanbul University Medical School, recently died of heart disease at the age of 67. Prof. Irdelp did postgraduate work under Prof. Vaquez of Paris and was the author of textbooks on internal medicine and heart diseases. His library of some ten thousand books he dedicated to the Istanbul University Medical School Library. Dr. Irdelp served two terms as deputy to the National Assembly and was private physician to Turkey's first president, the late Kemal Ataturk.

BUENOS AIRES

Nov. 2, 1948.

Congress of Surgery

The Nineteenth Argentine Congress of Surgery was held in October at the Faculty of Medicine in Buenos Aires under the presidency of Dr. Oscar J. Cames, professor of clinical surgery in Rosario, and with the participation of surgeons from Bolivia, Brasil and Paraguay and of Prof. Pierre Bertrand from Paris. The first main subject was "Surgical Treatment of Arterial Hypertension"; Dr. Ed. Braun Menéndez said that sympathectomy is founded on an empiric basis, and still lacks a theoretic basis. He proposed the creation of a permanent committee of physiologists, clinicians and surgeons to study the surgical treatment of arterial hypertension. Dr. A. S. Introzzi said that patients under 40 years of age with good renal function and with minimum lesions of the retina should be operated on. Essential hypertension is the form most indicated for surgical treatment. Technically he is in favor of the combined thoracoabdominal method of Smithwick when the operative condition of the patient is favorable. When these indications are followed strictly there is hope for the successful treatment of this difficult disease. Dr. Pedro Cossio said that the increase of arterial pressure is only a symptom, and not the most important one of the clinical picture. He was skeptical with reference to the future of surgical treatment. Dr. G. von Grolman, who discussed the ophthalmologic manifestations, said that the four classical grades of lesions of the retina must be revised and that surgeons and ophthalmologists must harmonize their opinions so that definite conclusions may be reached.

The subject of the second day was "Intravenous Anesthesia," and the speaker was Dr. Jose C. Delorme. He said that among the barbiturics thiopental sodium is preferred, and that in intraabdominal surgery it must be combined with curare. When it is used by experts its morbidity and mortality are comparable to those of most safe anesthetics. In the discussion the general opinion was that intravenous anesthesia is a notable advance only in experienced hands and when used prudently; otherwise it is a dangerous procedure.

The third main subject, "Treatment of the Congenital Luxation of the Hip," was considered by Drs. A. A. Salvatti (infancy), J. E. Rivarola (adolescents) and J. A. Piqué (adults). Dr. Salvatti insisted that for obtaining real benefit the surgical treatment should be carried out within the first five years of life. Dr. Piqué said that the surgical treatment of older patients gives only imperfect results; pain and claudication do not disappear. Dr. Bertrand, specialist of this disease, gave a special conference on the subject.

The next Congress will be presided over by Dr. Adolfo Landivar, professor of surgery, Medical Faculty of Buenos Aires, and the following subjects will be considered: operative wounds of the biliary tracts and their treatment; surgical splenopathies with the exception of hydatic cyst; coxa vara of the adolescent.

Propylthiouracil

Dr. A. Tachella Costa informed the Argentine Society of Endocrinology that he has treated 60 cases of hyperthyroidism with this substance. The initial dose should be limited to 200 mg. (4 times 50 mg.), the maintaining dose to 25 to 75 mg. per day. The greatest influence is exercised on the basal metabolism, weight, cardiovascular symptoms, asthenia and nervous excitation. The goiter and exophthalmos are not influenced by this medication. The number of leukocytes and neutrophils usually decreases slightly; however, 1 case of sharp reduction with menace of agranulocytosis has been observed; other reactions, such as pruritus or drug fever, have been seen in 5 per cent of the patients treated. Propylthiouracil is useful together with iodine as a preoperative measure. Remissions after treatment have been observed in 60 per cent of the cases. The "immediate reaction in one hour," viz., a diminished metabolic rate after giving the first 50 mg., is still not understood.

Leishmaniosis Cutaneamucosa Americana

Dr. Andrés Cornejo, director, department for skin and venereal diseases of the Hospital del Señor del Milagro in Salta (North Argentine) discussed leishmaniosis cutaneamucosa americana at the National Academy of Medicine of Buenos Aires. He, with the late Dr. Mazza, with whom he collaborated for sixteen years, has described five new forms of this disease: "papulosa gigante," lupus; "nodular cicatrizante no ulcerada"; "lymphangitica," and hypertrophic. The best treatment in the author's experience is with stibophen and chiniofon, adding vitamins, and liver; also with antimony potassium tartrate and potassium iodide (according to the method of Dr. Veintemillas, La Paz, Bolivia). Dr. Cornejo demonstrated forty-six moulages made perfectly, a unique collection of its kind.

Brief Items

Dr. P. O. Wolff addressed the Society of Legal Medicine and Toxicology in an extraordinary session on "Marihuana in Latin America: The Danger Which It Constitutes."

Correspondence

ADEQUATE MEDICAL EXAMINATION IN UNEXPECTED AND VIOLENT DEATHS

To the Editor:—In the concluding paragraph of the editorial entitled: "Medical Science and the Administration of Justice" (THE JOURNAL, November 6, pp. 751-752), the "medical examiner system" is offered as a panacea for all the weaknesses which exist under the coroner "system" in some localities. Throughout the entire article there is no recognition of the fact that competent medicolegal investigations are being made in many jurisdictions where there are coroners who are physicians with special interest and experience in legal medicine or who have such physicians as members of their staffs.

The editorial cites an opinion from the Report of the Committee of the American Medical Association to Study the Relationship of Medicine and Law (THE JOURNAL, June 24, 1944, page 577). However, the author seems to have failed to take cognizance of a comment in that same report (p. 578): "Obviously the name under which the medical investigator operates has little or no bearing on the effectiveness with which his public duties are discharged. If the law requires first that he be professionally competent and second that he have both the authority and the facilities for the conduct of such investigations as are required in the interest of public welfare, the name of his office is inconsequential." It is unfortunate that prejudice has so blinded the sponsors of the medical examiner system to this bit of wisdom that it has failed to influence their consideration of the problems confronting the coroner. The chief source of all the ineptitude lies in the antiquated laws which govern the office in many states.

When I presented the case for the coroner in the debate of the question "The Coroner System vs. the Medical Examiner System"[1] and ever since, I have been pleading for recognition that there are no essential differences between the two. In fact, there is no consistency of a "system" for either one. The ardent proponents of the medical examiner system are in many cases men of ability and position who command merited respect, but all too often they approach the problem with prejudices colored by an awesome respect for the medicolegal institutes of Europe. This fixation of attitude coupled with a lack of understanding of the intricacies of legislative procedures in a democratic country has led to a wanton waste of effort. The coroner system is a democratic institution with its roots deep in American philosophy of government, as contrasted with the medical examiner system, which sprang from bureaucratic and dictatorial governments. If the proponents of the medical examiner system had taken a broader perspective and sought the cooperation of the coroners who were interested in modernizing the office they might have accomplished much through recodification of the laws and in the recognition of forensic medicine as a specialty in its own right. The American Way has always favored improvement through evolution—not revolution.

The proponents of the medical examiner system propound the theory that the medical examination of the deceased person should be the only function of the office. This led to the erroneous conclusion that the coroner should be replaced by a pathologist. There are three fallacies underlying this premise. First is the belief that the medical examination alone and unsupported can furnish the law enforcement agencies with all the information they need. Second, is that the knowledge of pathology (a specialty) qualifies a man as a medicolegal expert (another specialty related to the first but requiring also clinical experience and additional familiarity with legal proceedings). Third is a general lack of understanding of the potential value of the coroner as an agent for legal justice not only in criminal cases but also in establishing civil rights and as a guardian of public health and safety. Few physicians realize that this specialty requires a knowledge of both law and medicine combined with the ability to integrate the involved facts and principles of each; therefore the general view has been obscured with this undue emphasis on one field alone, i. e., medicine.

In the accomplishment of justice it is equally important to determine the mode and manner of death and the cause of death. It has been argued that this is no concern of medicine. Those who are engaged in forensic medicine, whether they bear the title of coroner or medical examiner, know that in proper medicolegal examination there can be no complete separation of the medical and legal implications. The obvious question arises as to who is to take the responsibility for the proper interpretation of a cause of death. For example, in a case in which violence has been reported or is suspected and the death is found to be due to parenchymatous cerebral hemorrhage the proper interpretation is important and requires medical knowledge. On the other hand, consider a case in which the victim was smothered with a pillow and then strung up to appear as suicide by hanging. Had it not been for the thorough examination by an experienced medicolegal expert (Dr. LeMoyne Snyder), the cause of death would no doubt have been reported simply as "asphyxiation." The interpretation logically would have been that the mode was hanging and the manner suicide. However, because the autopsy included the examination of the cricoid cartilage, which showed no premortem injury, Dr. Snyder was able to direct the police to consider this a homicide. A corollary here is that it is necessary that information obtained concerning circumstances surrounding the death should be available to the official conducting the postmortem medical examination. A diagnostician depends on history elicited from the patient which he correlates with his physical findings. Diagnoses made after death require an equal amount of medical knowledge and keenest powers of observation, and certainly one is entitled to what history can be found on investigation. Volumes of examples could be cited to support the statement that there must be one central authority with a knowledge of medicine and an understanding of the legal details involved who can correlate all the facts and findings and so give direction to the law enforcement agents by establishing for them the cause, mode and manner of death. Ascertaining the cause of death is not the sole objective of a medicolegal postmortem examination. Fully as important is the recognition and recording of minute details which may become evidence or clues.

The medical profession as a whole has neglected its social responsibilities, as evidenced in the failure to meet and fulfil this need for the application of expert specialized knowledge of medicine and law.

The editorial calls attention to the possibility of nonrecognition of murder or direction of unwarranted suspicion toward innocent people when the investigation is incomplete or incompetent. Let us also consider the many instances in which a doctor, called in after death, certifies the death as due to natural causes when a thorough investigation by one trained in making diagnoses after death might reveal that death was actually due to violence, suicidal, homicidal or accidental. An erroneous cause of death in each instance carries a different social implication, and volumes could be written on each. I believe that there are many doctors who do not realize how far reaching is the significance of an an accurate determination of the cause in all cases of sudden death; else surely they would not take their responsibility so lightly. Sometimes it seems that the attitude which reigns is: "They are dead; so what does it matter?" I realize that many times a family physician is unduly influenced by the immediate grief of the surviving relatives and fails to consider what constitutes ultimately the greatest good for the greatest number of persons. All too often we hear much later that the deceased had been involved in an accident while at work and it is necessary to determine whether or not that death was due to such an injury in order to effect legal justice for the company and for the estate. Every doctor knows that a medicolegal autopsy performed after exhuming the body is often almost valueless. So, in the final analysis the favor granted by the physician unduly influenced by sentiment turns out to be a true injustice. If suicides were not properly investigated the opportunity would be provided to arrange homicides to appear as suicides. Therefore, when any doctor tries to cover up for the family by failing to report a suicide he is shouldering on himself a neglect of duty to society. Nonrecognition of murder cannot be blamed entirely on the lay coroner. Some of the blame belongs to the improper diagnoses both before and after death, made either intentionally or unintentionally by the otherwise competent physician.

---

[1] Gerber, S. R.: Advantage of the Coroner System over That of the Medical Examiner System, read at the Ninety-Third Annual Session of the American Medical Association, Atlantic City, June 12, 1942.

Before we have adequate medical examination of sudden and unexpected deaths throughout the nation we must have the interest and understanding of the entire medical profession aroused to accept their social responsibilities, both as organized groups and as individuals. One group alone with special interest influencing the point of view will never lead to a fair solution of the problems. There must be recognition of forensic medicine as a specialty in its own right and proper training programs instituted. With this background there should be support of proper legislation to grant the needed authority, facilities and compensation. This latter effort calls for close cooperation with the bar associations.

In conclusion I should like to restate that there is no consistency of a system either of the coroners or the medical examiners. The American Medical Association, the state and local medical societies and unaffiliated doctors all have an obligation to society to promote the recognition of the need for adequate medicolegal investigations in all deaths due to violence or which occur suddenly and unexpectedly, the education of competent specialists in this field and the encouragement and support of doctors who are serving society in this manner.

S. R. GERBER, M.D., Coroner,
Cuyahoga County, Cleveland.
Exec. Sec. Treas., National Association of Coroners.

Medical Motion Pictures

FILM REVIEWS

Speech Training for the Handicapped Child. 16 mm., color, sound, 990 feet (1 reel), showing time twenty-five minutes. Produced in 1945 by The University of Illinois, Division of Services for Crippled Children in Collaboration with the Speech Clinics of the University of Illinois, Rockford College and the Illinois State Normal University. Procurable on loan or purchase from The University of Illinois, Division of Services for Crippled Children, 1105 South Sixth Street, Springfield.

This motion picture shows a series of views of the activities connected with speech education in an institution sufficiently equipped with diagnostic and therapeutic devices as well as temporary housing so that a complete, well rounded attack on the patient's problems becomes possible. One sees children with cleft palate, and enough is shown to give the audience a lively appreciation of their problems. Children with brain injuries, especially birth paralysis, are also shown, and the technic for teaching them to relax is well illustrated. The problems of deaf children are outlined and the methods for dealing with their problems are pretty well indicated. While in many previous films of this sort the over-all effect has been that of needless fussing, the present film shows not only the technics but also the need for them. The background is a cheerful one, and the use of color contributes substantially to an appreciation of the thoroughness with which everything is planned. Almost all major types of speech defects are considered in this picture, so that the importance of thorough diagnosis and of training the patient as a whole becomes evident to the audience.

The manner in which the theme is handled, however, is not exactly technical, and the film would be of use mainly for introductory purposes. It could be used, for instance, at the beginning of a course in speech problems in a University. It is not suited to the needs of medical students because it shows so little of the underlying anatomic and neurologic disorders. It does not seem exactly suitable for audiences of physicians or specialists either. Its greatest value would probably be for showing to service organizations and charitable groups when it is desirable to impress such groups with the need of financial support for work of this sort. It might be suited for parent-teachers' associations and church organizations. On the whole, it is an instructive and inspiring film, and will be welcomed by audiences to whose needs it is adapted.

The photography is excellent.

Transthoracic Gastrectomy. 16 mm., color, silent, 935 feet (3 reels), showing time thirty-eight minutes. Prepared in 1948 and procurable on loan from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

The film shows a transthoracic subtotal gastrectomy for an ulcerating lesion in about the mid portion of the lesser curvature of the stomach. The history of the patient is given and a statement made that by roentgen examination, an ulcerating lesion was found high on the lesser curvature of the stomach and that it could not be determined definitely whether it was a benign or a malignant lesion. The roentgenograms are not shown, nor is any mention made of secretory studies or gastrostomy which may have helped in differentiating between a benign and a malignant lesion. From the position of the lesion as seen during the course of the operative procedure it appears to be in about the mid portion of the lesser curvature of the stomach.

If the ulcer were benign the procedure shown was too much for such a lesion and if it was an ulceration in a cancer the technic that was employed was not good cancer surgery. If there was any question about its being malignant one should have widely removed the portion of the pancreas into which the ulcer had perforated rather than cutting into it and leaving the base on the pancreas. A hemostat was passed several times into the opened ulcerated area, which, if there was a cancer present, would have permitted widespread seeding of the tumor cells. Since only the proximal three fourths of the stomach was removed in the operative procedure it would have been better to perform an esophagogastrostomy rather than an esophagojejunostomy. Preservation of a small amount of stomach makes a great deal of difference in the maintenance of an adequate nutritional state. From the location of the ulcer as seen in the specimen it is believed that it would have been adequately resected by an abdominal approach and the proximal portion of the stomach preserved; this would have been much better for the patient as far as future nutrition is concerned.

The operative technic is excellent. The film could be used to support a lecture or conference on transthoracic gastrectomy from a technical standpoint, but is not suitable for teaching residents, interns or medical students.

The titles are clear and the color photography is excellent. There is considerable "panning," and the use of a tripod would have improved the photographic technic.

SERVICE CHARGE FOR MOTION PICTURES

Beginning Jan. 1, 1949, there will be a service charge of approximately $1.00 per reel (400 feet) for the use of motion pictures procurable from the Film Library of the American Medical Association. This is in addition to the transportation charges.

Requests for a current list of films should be directed to the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10, Ill.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Degree of Skill and Care Required of General Practitioners.—This was an action to recover damages for the alleged negligent conduct of the defendant physician. From a judgment for the plaintiff, the defendant appealed to the district court of appeal, third district, California.

The plaintiff, who was then about 62 years of age, suffered a double comminuted fracture of the lower left leg and was taken to the Buchanan Hospital in Lodi, where the defendant was called to attend him. The leg was placed in a cast after roentgenograms showed the bones to be in alinement. After the application of the cast, additional roentgenograms indicated that, although the leg was in satisfactory position, there had been a slight change in the alinement. During the plaintiff's hospitalization periodic roentgenograms showed the alinement to be progressively changing, so that at the time of the trial the upper fracture had an angulation of approximately 30 degrees and the lower fracture of approximately 5 degrees in the opposite direction; the leg was 1¼ inches (3 cm.) shorter than the right one, and there was atrophy of the muscles and arthritis. The plaintiff testified that, because of the extreme pain caused by this condition, he cannot place his weight on the leg and therefore must use a cane, and, according to the plaintiff's expert witness, this condition has resulted in his total disability as a rancher. The defendant himself admitted that the plaintiff's deformity is permanent and that at the outset of the treatment he had anticipated permanent disability of the degree and in accordance with the results obtained. He further testified that he decided against the use of any traction on the leg because of possible complications and that none was ever used.

The defendant's first contention on appeal was that because the plaintiff's expert witness was not qualified there was prejudicial error in the admission of his testimony as to the standard of care. It was argued that the plaintiff's expert witness was not qualified to testify to the standard of care of a general medical practitioner in the city of Lodi in that he knew no doctors in that city and knew nothing of the facilities available there, his knowledge of professional standards being limited to neighboring communities. The qualifying examination of the witness, said the court, does show that with one exception he knew no doctors in Lodi, although he knew of the facilities of the hospital there, had practiced in nearby communities and at present maintains his office in Oakdale, about 40 miles distant from Lodi. This witness was permitted to testify that standard practice in treating fractures is uniform throughout the state, that the defendant did not follow standard practice when he failed to use any form of traction which was indicated by the progressive angulation of the leg as shown by the roentgenograms, and, furthermore, that he removed the cast prematurely.

In this day of rapid transportation and communication, said the court, there appears to be no reason why enlightened medicine with much of its improved practices and facilities should not be available to all. The defendant testified that he maintains an extensive medical library to which he constantly is adding technical books, that he takes and reads all of the medical journals which include articles on various special subjects, such as orthopedics, that he attends all of the county and state meetings of his profession, participating in all of the lectures that are there given and that on at least one occasion and possibly two he took a one week intensive course on orthopedics at the Univesrtity of California. In other words, nothing appears from his testimony or from the record as a whole which would or did hamper the defendant either by training or available facilities in his diagnosis and treatment of the plaintiff. The defendant's contention would require drawing an arbitrary geographic line separating Lodi from the neighboring towns which the evidence shows are almost identical in regard to the kind of medical services available. In its origin when, because of various and readily apparent reasons, uniform dissemination of professional knowledge was impossible, such a standard of care rule may well have been supported by valid and substantial reason. However, said the court, under present day conditions the reason for the rigid application of the rule as now advocated by defendant under the facts herein disclosed becomes a mere excuse. In fact, in a case similar to the present one our Supreme Court condemned a like contention, stating that to exclude expert testimony on such a ground "would be a misuse of the rules of evidence and an unjustifiable emphasis on empty technicalities." All of the medical witnesses testified as to the standard practices generally in fracture cases, although they disagreed on the application of the various methods to this particular injury. Furthermore, it was established by the defendant's *own witnesses* that the standard of care in Lodi was as good as elsewhere in the state and that the average physician in Lodi was as proficient as the average physician in neighboring towns. The court therefore held that the testimony of the plaintiff's expert was properly admitted.

The defendant next contended that one of the instructions given by the trial court was improper. A part of that instruction provided, "If he [defendant] undertakes such a service in a special branch of medical, surgical or other healing science, and if at that time and in the same locality there are members of his profession who specialize in, and limit their practice to, that particular branch of the healing profession, it is his duty to possess that degree of learning and skill ordinarily possessed by physicians and surgeons of good standing who engage in that special practice in the same locality." The defendant's attack on the instruction is directed primarily at the paragraph quoted, which he characterized as a "failure to differentiate between the recognized or unquestioned duty of a general practitioner to refer a case to a specialist when the ordinarily skilled practitioner would have done so and the duty imposed by the instruction, which requires every practitioner to be a specialist." He further argued that the record is barren of any evidence indicating that the ordinary physician in Lodi would not have treated the plaintiff but would have referred him to a specialist.

It appears from an examination of the attacked instruction, said the court, that it does not, as contended by defendant, impose on the general practitioner an affirmative duty of care equal to that of a specialist. The instruction merely states that if the general physician undertakes a specialized service and if in his locality there are those who specialize or whose practice is limited to that particular branch of the healing professions then it is his duty "to possess that degree of learning and skill ordinarily possessed by" those who specialize in such practice in that locality. The instruction does not attempt to cover all cases but limits the application thereof to those localities where there are specialists available in that particular branch of medicine. The record in this case, the court continued, conclusively shows that here a general practitioner confronted with a "very rare . . . situation," and in no emergency, undertook to treat a very "complicated," "difficult" and "unusual" compounded comminuted fracture. It is true that no orthopedic specialists were available in Lodi. But in Stockton, a distance of 12 to 14 miles, there were two available, one of whom testified for the defendant and who, the defendant said, had been called in by him for assistance in orthopedic cases on several occasions. This, said the court, is a day of specialists, a condition unquestionably brought about by the rapid and highly technical advancements in the entire field of medicine, advancements so complex and involved as to make it impossible for one to keep abreast of them all. Therefore, under conditions and circumstances such as are disclosed herein, it necessarily would seem to follow that the general rule must be that "as a part of the requirements which the law exacts of general practitioners of medicine and surgery, or other schools of healing, if, in the exercise of the care and skill demanded by those requirements, such a practitioner discovers, or should know or discover, that the patient's ailment is beyond his knowledge or technical skill, or ability or capacity to treat with a likelihood of reasonable success, he is under a duty to disclose the situation to his patient or advise him of the necessity of other or different treatment."

Finally, the defendant contended that he was materially prejudiced by the trial court in allowing the jury to examine the roentgenograms of the plaintiff's injuries, in that the effect of allowing such an examination without a qualifying instruction necessarily emphasized the angulation of the plaintiff's leg and caused the jury to pass over the real issue of the standard of care used by the defendant. Such a contention, said the court, is wholly without merit. The roentgenograms were identified, explained and interpreted at length by the defendant doctor and by the expert witnesses of both parties and therefore were properly admitted in evidence. Being properly admitted in evidence, the court concluded, we know of no rule in the circumstances whereby a jury may be prohibited from viewing such evidence.

The judgment in favor of the plaintiff was accordingly affirmed.—*Sinz v. Owens, 196 P. (2d) 52 (Calif., 1948).*

Washington: Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia Wotherspoon, Olympia.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Alabama State Medical Assn. Journal, Montgomery

18:1-32 (July) 1948

Further Observations on Ectopic Pregnancy. F. E. Whitacre and T. Bryan.—p. 1.
Status of Venereal Serology in Alabama. H. P. Sawyer.—p. 5.
Correlation of Liver Function Studies. S. W. Windham, J. T. Ellis and S. G. Latiolais.—p. 7.

Electrocardiographic Changes in Typhoid Fever and Their Reversibility Following Niacin Treatment. M. Rachmilewitz and K. Braun.—p. 284.

Anoxemia Test in Angina Pectoris and Atypical Chest Pain.—Stewart and his associates used the anoxemia test as described by Levy and his associates. Their experience is based on one hundred and thirty-eight tests performed on 119 patients, who were differentiated into four groups. The first group of 26 patients had no evidence of heart disease and served as controls. Of the second group of 5 patients, 2 had dextrocardia, 2 had hypertension and 1 had active primary syphilis. Group three was composed of 40 patients classified as having typical angina. Group four was designated as "atypical pain" group. None of the 26 normal subjects showed electrocardiographic changes following the anoxemia test. The anoxemia test gave electrocardiographic evidence of coronary insufficiency in 45 per cent of the group with typical angina, compared with 13 per cent of the group with atypical pain. When the pain was included, the test gave evidence of coronary insufficiency in 73 per cent of the group with angina and in 40 per cent of the group with atypical pain. This suggests the possibility that pain of an origin other than coronary disease may be aggravated by anoxemia. If there are clinical signs of angina pectoris, these should be accepted even if the result of the anoxemia test is negative. Hypertension had no effect in statistically increasing the incidence of coronary insufficiency in the group with typical pain, but in the group with atypical pain the reverse was true. The anoxemia test, when electrocardiographically positive in result, can be used as a means of substantiating the diagnosis of coronary insufficiency. When patients experience pain during the test but do not have an electrocardiographically positive reaction, the following factors should be considered: the similarity of the pain to the spontaneous pain, its prompt occurrence within a short time after beginning of the test and the nature of the pain as determined by observation of the patient. A positive electrocardiographic test is more significant than a negative one, and more significant than the occurrence of pain. In certain instances when the anoxemia reaction is negative, the reaction to the exercise test may be positive, but great care must be used in subjecting patients to exercise to the point of inducing pain. There were no serious reactions from the judicious use of the anoxemia test. Contraindications to the test are congenital heart disease, rheumatic heart disease with valvular damage, pregnancy, myxedema, epilepsy, emphysema or other pulmonary disease, severe anemia and recent coronary occlusion.

Circulatory Responses to Spinal and Caudal Anesthesia.—Taylor and his co-workers examined the relationship between the effect on arterial pressure of high spinal or caudal anesthesia and the effect of subsequent sympathectomy by the procedure of Smithwick. Preoperative and postoperative studies were made in 43 patients. Spinal anesthesia was induced in 25 of these and caudal anesthesia in 18. The effects of caudal and spinal anesthesia on arterial pressure in hypertension appeared similar despite the fact that in the former voluntary muscles were not paralyzed. Decreases in pressure were observed during anesthesia in 40 of the 43 patients. Blood pressure was persistently decreased by lumbodorsal sympathectomy and ganglionectomy in 12 of these patients. The 3 patients whose arterial pressures were not decreased by anesthesia were similarly unaffected by operation. It is concluded that the blood pressure response to spinal and caudal anesthesia has no more than negative value in the selection of patients for sympathectomy. The discrepancy between the effects on arterial pressure of spinal or caudal anesthesia and sympathectomy may be due to the great difference in time during which the effects are observed or to a difference in the denervation which each of them causes.

Circulatory Responses to Anesthesia: Effect on Renal Function.—Investigations by Corcoran and his associates are concerned with (1) the nature of the renal functional changes induced by high spinal and caudal anesthesia in patients with essential hypertension, and (2) the possibility of predicting in advance the results of sympathetic ganglionectomy from an analysis of these changes. The spinal anesthesia group included 1 patient with minimal hypertension and 17 patients with essential hypertension. The 18 patients in the caudal anesthesia group include 1 with mild essential hypertension, but the average severity of the disease in this group was greater than in that studied under spinal anesthesia. Most of these patients underwent bilateral lumbodorsal sympathectomy and ganglionectomy. The effects of high spinal and caudal anesthesia were found to be similar. Anesthesia which reduces average arterial pressure in hypertensive patients by 20 mm. of mercury to levels ranging from 85 to 125 mm. of mercury usually causes renal vasodilation, resulting in increased renal blood flow and a slight decrease in glomerular filtration rate. The observations are inconsistent with the view that essential hypertension is a compensation for increased renal vascular resistance. Qualitatively, the renal vascular responses of normotensive and hypertensive patients to these procedures are identical. Quantitatively, they may differ slightly in that, in hypertension, a fraction of afferent arteriolar resistance is not removed by anesthesia. The renal vasodilator response to anesthesia in hypertension indicates that a large proportion of increased renal vascular resistance in this disease is dependent on nervous influences which are affected by anesthesia extending to about the fifth thoracic vertebra, or that denervation by anesthesia has sensitized vasodilator influences. The major hemodynamic change induced by spinal or caudal anesthesia is seen to be due to decreased peripheral resistance. Exceptionally, a few hypertensive patients show deficient or slowed renal vasodilator responses to spinal or caudal anesthesia. Two such patients failed to benefit from lumbodorsal sympathetic ganglionectomy. But operation was equally ineffective in patients whose responses were vasodilator. The renal vascular response to anesthesia is not a positive guide in the selection of patients, although the absence of vasodilation during anesthesia may contraindicate operation.

Cellophane Treatment of Syphilitic Aneurysms.—Poppe presents observations on 6 patients whose thoracic aortic aneurysms have been successfully treated by cellophane wrapping. It is important to select the proper type of cellophane to produce fibrosis, since certain varieties incite little or no foreign body reaction. Polythene cellophane produces a dense fibrous tissue reaction which can be applied to aortic aneurysms to curb their pulsations, expansion and tendency to rupture. In the 6 patients under consideration relief of chest pain has been noted without deleterious effects from the cellophane during periods ranging from a few months to two years. The most favorable results have been obtained in fusiform aneurysms of the descending thoracic aorta, where it is almost possible to encircle the dilatation completely without encountering other vital structures or major arterial branches. Contraindications to surgical treatment appear to consist of bronchial obstruction or erosion from pressure, severe heart disease with aortic insufficiency and decompensation, or erosion of the anterior chest wall. Arteriosclerotic aneurysms appear less suitable for surgical treatment than syphilitic aneurysms in view of the generalized distribution of the disease, advanced age of the patients and frequent location of the dilatation in the abdominal aorta with involvement of vital visceral branches.

Atypical Pneumonia.—Morgan and Finland examined the serums of 89 patients admitted to the medical wards of the Boston City Hospital whose clinical course, physical examination and roentgenologic findings were characteristic of primary atypical pneumonia. In 74 patients cold hemagglutinins developed, and in 35 of 44 patients tested Streptococcus MG agglutinins were demonstrated. In 4 patients antibodies for a virus of the psittacosis group developed, indicating an infection with one of these agents. No instance of Q fever was observed in the 25 patients whose serums were tested for antibodies against this agent. In 5 additional patients who had atypical pneumonia associated with erythema multiforme exudativum, cold hemagglutinins were present, and 2 of these patients showed a rise in titer in complement fixation tests for psittacosis. A history of exposure to sick pigeons was a significant observation with respect to the development of psittacosis antibodies.

Malignant Melanoma of Skin.—Ackerman reports 75 patients, 44 men and 31 women between the ages of 19 and 90 years, with malignant melanoma of the skin. In 26 patients the lesions occurred on the lower extremities and in 24 in the region of the head and neck. Forty-six patients had a preexisting mole which preceded the occurrence of tumor most frequently in the lower extremities. In 15 of the 46 patients the mole had been present since birth. Malignant melanoma was easily diagnosed when the tumor was deeply pigmented and showed ulceration and bleeding. When the diagnosis was doubtful incisional biopsies were made, a thin wedge of tissue which included both normal and abnormal skin being removed. It never resulted in dissemination of the disease. The greatest difficulty in microscopic diagnosis is presented by the uncommon nonpigmented or scantily pigmented melanocarcinoma; here the dopa (dioxyphenylalanine) test may be diagnostically helpful. The age of the patient has bearing on the prognosis. If a malignant melanoma appears in a child in the prepubertal age group and is removed, the prognosis is excellent, even if the pathologic diagnosis is unequivocal. If melanuria due to malignant melanoma is present, the case is invariably advanced and the prognosis is hopeless. Thirteen of the author's patients had melanuria consistently present, and all are dead. In spite of the ominous character of the tumor, 8 of 21 patients (38 per cent) treated by radical excision and radical dissection survived five years. Three of the 8 had metastases to the regional lymph nodes at the time of operation. If 22 other cases of hopelessly far advanced disease which appeared during the same period are included, the percentage of survival for five years is 19 per cent. The treatment of this tumor is radical surgical excision followed by radical dissection of regional lymph node areas when predictable. All forms of compromise therapy including irradiation are contraindicated.

"Dicumarol" Therapy in Coronary Occlusion.—McCall reports observations on 71 patients with myocardial infarction following acute coronary occlusion. The diagnosis was substantiated by history, clinical signs and symptoms, laboratory data and the development of electrocardiographic patterns of acute anterior, posterior or lateral wall infarction, and/or a combination of these. Three who died within forty-eight hours of admission are omitted from the statistical data. Anticoagulant therapy consisted solely of "dicumarol." In addition, all patients received papaverine hydrochloride during the entire period of hospitalization. Oxygen was administered by catheter and morphine intravenously or subcutaneously routinely during the first three days and as necessary thereafter. Sodium restriction and leg exercises completed the regimen. Prothrombin times were determined daily. Although certain features were undesirable, it seems that this pharmacologic approach was sound. The appearance of hemorrhagic complications, especially hematuria, was unpleasant; but serious harm due to the drug did not occur. This sole hazard was controlled by menadione sodium bisulfite. The most useful purpose served by "dicumarol" therapy is prevention of thrombus formation in pelvic and leg vessels, as well as in the septal and mural areas. Because of the low incidence of thromboembolic phenomena a less stormy convalescent period was insured, justifying the continued use of this form of therapy.

"Capillary Fragility" in Hypertension.—Soloff and Bello say that since the hemorrhagic complications of hypertension are well known to physicians and unfortunately are both known and feared by patients with hypertension, a method of study which is capable of predicting such a development is worthy of becoming a routine procedure in the study of hypertensive patients. It has been suggested by Griffith and Lindauer that there is a close association between capillary hemorrhages and cerebral apoplexy. In view of contradictory results obtained by other investigators, the authors considered it necessary to reevaluate Göthlin's procedure as a test for capillary fragility in hypertension, but only after subclinical scurvy had been excluded. It was also thought desirable to compare the Göthlin reaction with the Rumpel-Leede reaction. They determined the capillary fragility by means of the Göthlin and the Rumpel-Leede tests in 50 patients with hypertension, who had been previously saturated with vitamin C. Only 2 patients had a positive reaction to the Göthlin test and 33 had a positive reaction to the Rumpel-Leede test. When the Göthlin test was performed on hypertensive patients previously placed on an adequate vitamin C intake, the authors were unable to verify the results obtained by Griffith and Lindauer. Rutin did not reverse to normal the Göthlin reaction of 2 patients who had been previously saturated with vitamin C. Rutin did not reverse to normal the reaction to the Rumpel-Leede test. There does not appear to be any correlation between retinal hemorrhages and a positive Rumpel-Leede reaction.

Pulmonary Paragonimiasis.—Tillman and Phillips report 12 Philippine Islands guerillas hospitalized because of tuberculosis and suspected paragonimiasis or oriental lung fluke disease. Coexistent tuberculosis and paragonimiasis were established in 4 of the 12 cases reported. In all but 1 instance a definite history of ingestion of fresh water shell fish was obtained. The onset of symptoms of paragonimiasis varied from one week to thirty-four months prior to observation, so that both early and late cases were seen. In spite of the history of prolonged cough and hemoptysis, the majority of the patients did not appear to be sick. Rales were present in 11 of the patients. These varied from fine to coarse in character and were heard in varying portions of the lungs. The laboratory diagnosis of this disease depends on the recognition of ova in the sputum, feces and pleural fluid. Transiently positive serologic reactions were noted in 4 patients both by the Kahn test and the Wassermann test. Seven patients showed an increase in serum globulin. Roentgenologic examination revealed massive and large areas of density in the lungs of one group, and diffuse changes with small, soft and generally multiple lesions in another group. Antimony potassium tartrate was tolerated poorly by 4 patients and did not appear effective in its brief trial. Emetine hydrochloride resulted in prompt and considerable subjective relief. Its repeated use was followed by the disappearance of ova in the sputum and pleural fluid in one instance. There was only a slight effect on the pulmonary parenchymal change within two months following its administration. The presence of tuberculosis is undeniable in the few cases in which tubercle bacilli were observed, but whether this disease was responsible solely for the roentgen appearance may be questioned. It is more likely that the association of tuberculosis and paragonimiasis contributed to the roentgenologic picture, but the subjective relief and decrease of pulmonary symptoms following emetine suggest that the part of the fluke was more important than that of the tubercle bacilli in causing the roentgen changes. Paragonimiasis may simulate tuberculosis closely, so that the former should be considered in the differential diagnosis of hemoptysis in personnel who have been in endemic regions.

Gastric Cancer.—Maimon and his co-workers report 377 patients, between the ages of 21 and over 70 years, with cancer of the stomach who were admitted to the Clinics of the University of Chicago and were operated on. One hundred and fifteen (30.8 per cent) survived resection; twenty-eight (7.4 per cent) survived five years or longer. In addition to these 28 survivors, 2 who lived four years and nine months have been incorporated in the authors' study, making a total of 30. Fifteen of the survivors (50 per cent) had had symptoms of over one year's duration as compared with 31 per cent of the initial group. The symptoms were essentially identical in type. Palpable tumor masses were present in 40 per cent of the original group as compared with 26.6 per cent of the survivor group. Nine of the survivors had type I (Borrmann) carcinoma, 17 had type II and 4 had type III; there were no five year survivors in the Borrmann type IV group. Metastases were present in 7 (23 per cent) of the five year survivors, 5 with involvement of lymph nodes, 1 with mesenteric involvement and 1 with spread to the transverse colon. Twenty-four (80 per cent) of the five year survivors were restored to useful life. Contrary to what might be expected in cancer of the stomach, patients with symptoms of long duration tend to show a higher percentage of five year survival than do those with symptoms of short duration. Presence of a palpable tumor mass is not a contraindication to operation or resection. The type of carcinoma is of the greatest prognostic significance, the long survivors consisting chiefly of those with type I and type II tumors.

Histiocytosis.—Straus reports 1 case of Gaucher's disease in a man aged 34. The patient illustrated well the clinical features of lipid histiocytosis by presenting pigmentation of the skin, a greatly enlarged spleen, leukopenia and a hemorrhagic tendency. The lower halves of both femurs showed widening of the shaft, thickening of the cortex and the characteristic Erlenmeyer flask appearance. Familial incidence of the disease was revealed by the patient's statement that his nephew had the same disease. This primary lipid metabolic disorder is to be clearly differentiated from eosinophilic granuloma of bone and its congeners, Hand-Schüller-Christian's disease and Letterer-Siwe's disease. They represent merging clinical variations of an essentially similar pathologic process, best described collectively by the term inflammatory histiocytosis. One case, predominantly of the Letterer-Siwe type, is reported in a man aged 21 with a bony defect involving the inner and outer table of the left parietal bone and with mottled infiltration and honeycombing of the lungs. Two additional cases, 1 of solitary eosinophilic granuloma of bone in the left temporoparietal region in a veteran aged 26, and 1 of multiple eosinophilic granuloma of bone and also pulmonary infiltration in a man aged 22, are presented. These syndromes or entities are believed to be due to some obscure infectious process which causes a secondary disorder of the lipid metabolism. Knowledge of these conditions will obviate confusion with malignant tumors involving bone and other granulomas such as tuberculosis and syphilis.

Ergotamine Compounds in Anxiety States.—Kelly reports observations on 59 patients with anxiety states who were treated with ergotamine tartrate, 37 treated with ergonovine maleate and 36 treated with placebos (calcium lactate). Dosage consisted of 2 mg. per dose, so that each patient received a total of 12 mg. in twenty-four hours. This dosage was continued for seven days. In addition to the ergot alkaloids or placebo, each patient was offered a high caloric diet, group psychotherapy, group physical therapy, medical and diagnostic procedures as indicated, and at night was given up to 1½ grains (0.1 Gm.) of sodium pentobarbital as a sedative if needed. It was found that patients receiving ergotamine tartrate or ergonovine maleate in massive doses do better than those who received placebos of milk sugar. Actually they do best from a subjective point of view, but tremors, sweating and irritability are also relieved. There was improvement in more cases with the alkaloids than with the lactose medication but the number of cases in which improvement occurred is not sufficiently high to merit the use of the drug except in specifically selected cases. The ergot alkaloids do act to combat the automatic stimulation resulting from acute anxiety. In selected cases these drugs may prove extremely useful.

Sewage Pollution of Oyster Beds.—Wise and his associates state that in February 1944 an outbreak of food poisoning occurred in Galveston as the apparent result of eating raw oysters. An investigation was started to learn some of the important facts concerning sewage pollution of oyster beds and the water over the beds, to follow the changes in pollution by frequent sampling over a period of time, to study the effect of external factors on sanitary conditions and to determine whether conclusions based on similar studies made along the North Atlantic Coast of the United States are applicable for conditions in the Gulf Coast area. The coliform content of oysters and water above the oyster reefs in Galveston Bay, Texas, was found to decrease in the spring, remain at low level from July to December and increase to high values during January. This is in contrast to reports made by investigators who have made similar studies along the North Atlantic Coast and report a decrease in coliform organisms as the temperature of the water falls. On the Gulf Coast the temperature of the water rarely decreases to a point necessary to cause hibernation of the oyster and cessation of water flow; thus the oysters do not show a decrease in coliform content when harvested from polluted waters during the usual winter temperatures, as has been reported for oysters of the North Atlantic Coast. The total volume of water entering the bay each month correlated with the degree of pollution. The percentage of Escherichia coli to total coliform flora in the water over the oyster beds increased from July to November as stream flow was minimal. The percentage decreased markedly in December and January as stream flow into Galveston Bay increased.

Delayed Pneumonitis Caused by Beryllium.—The 36 cases reviewed by Hardy included 12 men and 24 women engaged in the manufacture of fluorescent lamps. The material used to coat these tubes is a mixture of zinc, manganese and beryllium silicate. Interest became fixed on the beryllium component, because the illness did not correspond with the disorders associated with zinc, manganese or silica exposure. The disease was designated as a delayed chemical pneumonitis. It was necessary to exclude pulmonary tuberculosis, silicosis or sarcoidosis as a cause of the illness. The development was gradual in all cases. The patients sought medical advice because of weight loss and fatigue, followed by gradually increasing exertional dyspnea. Anorexia and nervousness were prominent at onset, especially among the women workers. It has been a problem to keep up the morale of these patients, in part because of the ceaseless dyspnea and in part because they knew of the death of their fellow workers and felt the air of mystery which surrounds this disease. Twenty-three of the 36 patients are still functionally disabled, 12 completely and 11 partially so after an average illness of two years. The 3 patients still convalescent but well enough to work had an average illness of eighteen months. Four patients, although free from symptoms, present roentgenologic changes. Three cases of delayed chemical pneumonitis in persons who were not workers deserve mention. In 2, the diagnosis was confirmed by necropsy. These so-called "neighbor cases" were discovered in 2 patients who lived close to the building where the fluorescent powders were being handled. The third case is that of the mother of one of the workers who died after nearly two years of a severe course of delayed chemical pneumonitis. The author stresses that, in view of the lack of a satisfactory quantitative test for beryllium in the air, the etiologic relationship between exposure to a beryllium compound and the pneumonitis is not definitely established. At present the incrimination of beryllium rests solely on its presence as the common denominator in the working environment of these patients who present various clinical types of pulmonary disability.

Aluminum Therapy in Silicosis.—Berry says that a review of the studies on the status of aluminum therapy suggests that most of the reported improvement has been subjective, although a fair number of patients have shown improvement in pulmonary function by objective measurement; there have been no satisfactorily controlled experiments, and the optimum dose of aluminum has not been determined. A study was made of the course of the symptoms of 26 silicotic patients who were treated with inhalations of aluminum dust and of 9 patients with comparable degrees of silicosis who received no aluminum. The members of the latter group were treated with inhalations of room air, but otherwise the management of the two groups was identical. All 35 patients were under the impression that they were receiving the same therapy. An impressive degree of subjective improvement was reported by the majority of the persons in both groups. No objective changes were observed in the aluminum-treated group which could be convincingly attributed to the metallic therapy.

Surgical Treatment of Infantile Coarctation of Aorta.—Johnson and Kirby point out that coarctation of the aorta may be divided into an infantile type in which there is an elongated narrowing of the aorta at the isthmus and an adult type in which there is an abrupt constriction at or near the ductus arteriosus. They have recently operated on 3 patients with coarctation of the aorta of the infantile type. The ages of these patients were 13, 17 and 20. In all instances the constricted area extended over a distance of several centimeters. It was impossible to perform the type of operation used by Crafoord or Gross in the adult type of coarctation. In 2 patients the end of the subclavian artery was anastomosed to the upper end of the descending aorta after the area of the defect had been excised. In the third patient the operation had to be abandoned because of the friability of the vessels due to atheromatous changes. This patient died from hemorrhage in the immediate postoperative period. The first patient obtained a good result, with the blood pressure in the upper extremities returning to normal. The second patient's systolic blood pressure did not fall, although the diastolic pressure returned to normal. The authors believe that the use of the subclavian artery to bridge the gap in the infantile type of coarctation of the aorta is worthy of further trial in selected cases.

Local Injection of Penicillin in Circumscribed Infections.—According to Kaplan and Rabin acute infections may be divided into two clinical types: (1) acute infections which do not cause death of tissue, such as septicemia and cellulitis, and (2) acute infections causing suppuration and death of tissue, as seen in boils and carbuncles. The results of treatment with penicillin in acute infections in which there is no death of tissue are dramatic, while in acute localized infections they are at times discouraging. It seemed to the authors that the most suitable method of administration of penicillin in acute localized infections should be direct injection into the infected area. By this means a high concentration of the drug at the point where it was needed could be assured. The authors inject 3 cc. of distilled water into a bottle containing 100,000 units of penicillin, making a dilution of approximately 33,000 units to the cubic centimeter. Small lesions require 0.5 to 1 cc. at each injection, while larger ones, such as a carbuncle, may require 4 cc. or even more. The authors used the local injection of penicillin in over 300 cases of acute circumscribed infections. Their experience has demonstrated that it is safe, effective and economical. There is almost immediate improvement following injection, and recovery is established in a few days. However, this therapy should be reserved for the more serious lesions and for lesions so located that surgical procedures may produce a bad cosmetic result. It is not recommended for the treatment of the cellulitides, for infections in the dangerous areas of face or for bone felons.

Tocopherols in Noduloulcerative Granuloma of Legs.—Burgess and Pritchard report the case of a woman aged 52, in whom diabetes was first discovered in 1941. She appeared in the clinic in 1942, with nodular lesions in both legs. Diagnosis of erythema induratum was made, and rest and supportive treatment resulted in partial cure. In 1943 ulceration occurred on the anterior aspect of the left shin. Exacerbations occurred from this time on. In September 1946 there were multiple ulcerative lesions on the lower third of both shins. In October she was admitted to the hospital for further studies. Following two biopsies a diagnosis of necrobiosis lipoidica diabeticorum was made. Since previous treatment had been of little value, she was given daily intramuscular injections of a preparation of vitamin E ("natopherol in oil"), 250 mg., from December 2 to December 11. In all, 2,500 mg. of tocopherols was given. Improvement was noted after one week. Since daily injections in the hips became too painful, they were discontinued and a vitamin E preparation ("natopherol"), 100 mg. daily, was given by mouth. One month later, healing had occurred. Treatment with tocopherols, 100 mg. daily by mouth, was continued, and on April 15 the area was represented by a residual atrophic scar, at which time a fourth, and final, biopsy was made. Histologic studies revealed that there was rehabilitation of the collagen fibers, which was coincident with the disappearance of the granulomatous reaction and the lipoidal depositions. The changes were apparently brought about by treatment with vitamin E preparations.

Chronic Lead Absorption and Intoxication.—According to Yeager an atmosphere containing less than 1.5 mg. of lead per 10 cubic meters of air is considered safe for workers in lead for the average work day. Discovery of lead fume exposures in Connecticut industry has led to a carefully coordinated control program by the Bureau of Industrial Hygiene. Excessive atmospheric concentrations have been found in lead and alloy casting, in soldering and subsequent grinding operations in bullet and storage battery manufacture, in several operations in the manufacture of silverware and in production using ceramics containing lead borosilicate frits. Stippling as a sign of lead poisoning may be misleading. This phenomenon occurs, although less consistently than in lead poisoning, in a variety of conditions, including pneumonia, anemia, leukemia, advanced cancer and following the administration of certain poisons, such as mercury, arsenic, aniline, nitrobenzene and carbon disulfide. McCord and Holden state that in the absence of other pathologic changes the finding in lead-exposed workers of, or in excess of, 1.5 per cent of basophilic stippling suggests the probability of lead absorption. Findings in excess of 2 per cent or 3 per cent are to be associated with an increased imminence of clinical lead poisoning. Other signs of lead poisoning include anemia (reduced erythrocyte and hemoglobin values), increase in the lead content of blood, urine and feces and the lead line of the gums.

Trauma in Initial Pneumothorax.—According to Tchertkoff and his co-workers every initial pneumothorax is of necessity first a traumatic pneumothorax. The needle inserted into the potential pleural space punctures the visceral pleura and air escapes into the pleural space from the lung. This is true irrespective of the type or character of the needle used. Initial manometer readings are those of this traumatically produced pneumothorax; it is into this space that air may be added from the pneumothorax apparatus. A study of 82 consecutive patients recommended for pneumothorax treatment at Sea View Hospital, Staten Island, N. Y., revealed that the condition of the lungs and the size of the needle used are the two principal factors determining the extent of the traumatic pneumothorax. The smaller needle, resulting in less trauma, gives a smaller collapse. In 67 initial pneumothoraces the collapse obtained with a large needle was approximately twice that noted with a small needle. With moderate pulmonary involvement the size of the needle is of minor importance, since excessive collapse and dyspnea are uncommon. In 16 cases of bilateral disease in which pneumothorax was induced with a small needle 3 patients became dyspneic, 1 requiring deflation. In 14 similar cases induced with a large needle 8 became dyspneic and 4 of them required deflation. In patients with extensive disease, the dangers of induction of the initial pneumothorax may be minimized by the use of a small gage needle. In cases of bilateral disease its use appears essential if a manageable collapse is to be obtained.

Pulmonary Resection for Tuberculosis.—In the surgical management of over 1,000 cases of pulmonary tuberculosis, Brewer and his co-workers performed lobectomy in 26 cases and pneumonectomy in 14 cases. After lobectomy 12 patients were apparently well with negative sputum; 8 patients were alive with positive sputum and 6 patients died, 3 soon after operation and 3 later. In the pneumonectomy series 6 patients were apparently well with negative sputum; 3 were alive with positive sputum and 5 died, 2 early after operation and 3 later. The total mortality in these 40 cases was 27.5 per cent (11 deaths). This represents a hopeless group of cases in which for the most part thoracoplasty had failed and no other treatment would cure. Primary pulmonary resection is preferred to thoracoplasty for lower and middle lobe cavities, tuberculomas and blocked cavities, persistent bronchostenosis and symptomatic bronchiectasis. With these exceptions the authors prefer thoracoplasty to lobectomy and pneumonectomy in the treatment of pulmonary tuberculosis. The mortality from thoracoplasty is considerably lower than from pulmonary resection and the late results of resection seem to offer no better chance of permanent cure. When thoracoplasty fails, revision thoracoplasty, creation of extrapleural space followed by packing, and cavity drainage should be considered before performing pulmonary resection; in some cases no further surgical treatment should be considered. In selecting any case for pulmonary resection the surgeon must be certain that the patient has sufficient pulmonary reserve. The type of disease most amenable to lobectomy and pneumonectomy is that characterized by fibroid and caseating lesions of the lung in which the mode of spread is principally by way of the bronchus. Primarily, hemotogenous or lymphogenous disseminated pulmonary tuberculosis is a contraindication to resection. Pulmonary resection has a definite place in the surgical treatment of pulmonary tuberculosis in salvaging otherwise hopeless cases.

Phenylpyruvic Oligophrenia.—Josephy points out that the mental deficiency referred to as phenylpyruvic oligophrenia was first described in 1934 by Foelling of Oslo. The author reviews observations on 16 cases observed at the Lincoln State School and Colony at Lincoln, Ill. These 16 patients included three pairs of siblings. The occurrence of several cases in one family has been noted by other observers and suggests the hereditary nature of the disorder. The patients excrete phenylpyruvic acid in the urine and are feebleminded. All 16 of the author's patients were fair haired, although some had dark parents and siblings. The skin of all these patients is poorly pigmented and is to some degree photosensitive. Fourteen of the 16 patients may be classified as low idiots. Only 2 are on the imbecile level. The phenylpyruvic idiots are restless and jerky; their gait is clumsy and gives the impression of some spasticity. Frequently the body is kept slightly bent and stooped, suggesting rigidity. The examination of the reflexes and of the tonus reveals no pathologic changes except somewhat vivid tendon reflexes. The author was able to perform necropsies on 2 of the patients, but nothing unusual was found. There is no satisfactory explanation as to why defective metabolism of phenylalanine is always combined with a low grade mental deficiency.

Bowel Healing as Influenced by Intestinal Antiseptics.—Experiments carried out by Poth and his co-workers on dogs to test the variation of the ability of the distal portion of ileum to survive and ultimately to heal after extensive damage to the blood supply of long segments of the bowel showed that after the administration of full therapeutic doses of succinylsulfathiazole or phthalylsulfathiazole for two weeks, 50 per cent of the animals lived after arterial ligation, 70 per cent lived after vein ligation, and 55 per cent survived after simultaneous ligation of both the arteries and the veins. It is suggested that the sulfonamide drugs protect the tissues of the ileum from massive necrosis by modifying the bacterial flora to such a degree as to prevent extensive infiltration of the bowel wall by bacteria which would then cause thrombosis of the capillaries. As a consequence the residual circulation was sufficient to protect the tissues against the necrotizing action of an attenuated bacterial flora. A similar mechanism probably explains the difference observed in healing at the line of bowel anastomosis in treated and untreated animals. Both open and closed technics of anastomosis of the colon were studied in a well controlled series of experiments on dogs. In the control experiments wound infection, peritonitis, stitch abscess and local soft tissue infections were the usual observations, while in those instances in which adequate treatment with succinylsulfathiazole or phthalylsulfathiazole was given, evidence of infection was seldom encountered. Grossly there was minimal edema of the mucosa in treated animals in contradistinction to extensive edema in the controls. Microscopically, the control specimens showed acute inflammation characterized by extensive edema, leukocytic infiltration and delayed revascularization and fibroplasia, while the specimens taken in the cases in which treatment was given exhibited slight inflammation which subsided rapidly and was characterized by moderate edema, limited leukocytic infiltration and rapid revascularization and orderly fibroplasia. The addition of streptomycin to the sulfonamide therapy did not alter the healing process materially.

Streptomycin in Miliary Tuberculosis.—Johnson and Sitkin report 1 case of miliary tuberculosis in a woman aged 26 who responded to treatment with 135 Gm. of streptomycin over a period of sixty-seven days. The patient presented in the right axilla a mass 3 cm. in diameter, freely movable, firm and nontender. Microscopic examination of aspirated material showed caseation necrosis, giant cell formation and leukocytic infiltration compatible with caseous tuberculosis. On the twenty-fourth day of treatment with streptomycin radical excision of the right axillary nodes was performed. The postoperative course was uneventful, with firm healing of the incision by primary union. Although excision of tuberculous lesions is generally contraindicated, it is conceivable that radical excision of accessible tuberculous foci may be feasible and rational while streptomycin is being given, as was demonstrated in this case. The patient was discharged from the hospital in July 1947, and was readmitted in May 1948 for reevaluation. She had remained well and asymptomatic and had gained 23 pounds (10.4 Kg.). There was no clinical or laboratory evidence of active tuberculosis.

Drugs for Blood Coagulation.—Experiments performed by Macht on rabbits, cats and dogs showed that all penicillin preparations on the market shorten the coagulation time of the whole blood as well as the prothrombin time. The same effect of penicillin injections on the blood clotting was obtained in several patients selected at random from the surgical clinic of the Sinai Hospital, Baltimore. Amorphous penicillin was more effective in this respect than the newer colorless crystalline preparations on the market, because of the four crystalline active principles of penicillin X and K are more thromboplastic than G and F. Such thromboplastic properties were observed not only after intravascular injections but also after intramuscular injections either of aqueous solutions of penicillin or of penicillin solutions in peanut oil. It was observed even after administration of buffered penicillin tablets by mouth. Experiments with streptomycin showed that this drug also definitely shortened the coagulation time in rabbits and in cats. Experiments revealed that the excessive thromboplastic effects arising from intensive penicillin therapy with massive doses predisposing to intravascular thrombotic accidents can be antagonized by suitable doses of "dicumarol." In animals receiving large doses of "dicumarol" and thus acquiring an extremely prolonged prothrombin and coagulation time and hemorrhagic tendencies, the danger of hemorrhage was effectively controlled by injections of penicillin, which is not toxic for animals. Thus penicillin and "dicumarol" are mutually complementary and corrective; each of them corrects and controls the undesirable and harmful effects of the other, thus enhancing the usefulness of both in clinical practice.

Colectomy in Ulcerative Colitis.—The Devines present observations on 11 advanced and desperate cases of ulcerative colitis, for which radical surgical treatment was planned. Two of the 11 patients died. One died of an adynamic ileus immediately following the first stage modified enterostomy, and 1 three months after the first stage from tissue deficiency and toxemia. None of the patients died after colectomy or excision of the rectum. Thus, of 11 desperately sick patients, 6 survived subtotal or near-colectomy, 1 a near-colectomy combined with excision of the rectum, 1 a partial colectomy involving two thirds of the colon, and 1 the first stage of colectomy. Six patients seem to be cured (the worst case of all for six years). They have no bowel discomfort and live normal lives. One patient has only two motions a day and none at night. Most of the patients have from four to five motions in twenty-four hours. The authors look forward to the use *of colectomy in* earlier cases and less debilitated patients.

"Phase Contrast" Microscope in Clinical Gynecology.—Culiner and Gluckman draw attention to the phase contrast microscope, which is a recent innovation in microscopy. The physical principles of this instrument were described by Richards in 1944. The *phase contrast microscope* has an immediate, direct use in the study and diagnosis of gynecologic tissues obtained by aspiration, curettage or smear. The material was obtained from patients in private practice and from the clinics and wards under the jurisdiction of the department of gynecology, University of the Witwatersrand. This tissue was removed by pipet, blunt spoon-shaped small curet, or by scraping the vagina or cervix with the gloved finger. Thereafter, a suspension of the tissue was made in Ringer's solution. This solution was found to be a satisfactory medium for the tissue cells, particularly if rapidly cooled pending examination. The examination of this tissue is best carried out within an hour of its removal. A single small drop of the agitated fluid is removed on to a clean slide and is covered with a glass cover slip. The edges of the cover slip are sealed with petrolatum to minimize fluid currents and desiccation. The tissue is then ready for examination. While photographic reproduction is unnecessary for observation and diagnosis it has been used extensively in these studies for purposes of record, and subsequent presentation. The authors lay down no specific features by which the identity of various cells may be established, but in the case of malignant lesions, or at least in the cells derived from tissues of proved malignancy, those stigmas by which they may be broadly differentiated from normal cells are indicated. Because tissues can be observed while the patient is being examined clinically, and because these tissues require no fixation or staining in order to show greater details of cell structure than by any other method in current use, it is considered that application of the instrument should constitute a significant advance in the early recognition of cancer.

Weil's Disease.—Broom and Alston reviewed 195 cases of leptospirosis which were diagnosed by serologic tests. The diagnostic criterion was the agglutination of a culture of Leptospira icterohemorrhagiae treated with formaldehyde solution which was observed by the microscopic technic described by Schüffner and Mochtar. Of 189 cases, 181 were in males. This probably reflects the greater risk of infection in certain predominantly male occupations and avocations and does not indicate a real difference in susceptibility. The proportion of females is much higher when chances of infection are equal for the two sexes. The prevalence of Weil's disease among coal miners, fish cleaners and workers in sewers and on the land has long been recognized; so has its occurrence after bathing in canals and stagnant rivers. The mortality rate was high in this group; of 114 patients 25 died, a rate of 22 per cent, compared to 9.4 per cent reported for Holland. The jaundice rate likewise was unusually high, the anicteric cases accounting for only about 10 per cent of the total. The authors believe that many cases of leptospirosis are missed, because they do not present the classical symptoms or the patient was not employed in one of the occupations recognized as carrying a risk of infection.

Poliomyelitis and Gastric Acidity.—Ashworth investigated the gastric acidity of persons over 10 years of age who contracted poliomyelitis in the 1945-1946 epidemic. Examinations were made approximately one year after the onset of disease, during the summer and autumn of 1946-1947. Of the 228 survivors over 10 years old, 91 were investigated. No evidence was found that gastric acidity of the population with poliomyelitis has a different distribution from that of a normal population.

Aspiration of Liver in Sarcoidosis.—According to Scadding and Sherlock no agreement has been reached about the causation of the syndrome known as sarcoidosis, Besnier-Boeck-Schaumann disease, lymphogranulomatosis benigna or noncaseating tuberculosis. In 1943 van Beek and Haex first drew attention to the possible value of aspiration of the liver in providing material for the histologic diagnosis of sarcoidosis. They reported that in 2 out of 4 cases presenting features of this syndrome they had been able to find characteristic changes in the material obtained by aspiration of the liver, although in neither of them had there been clinical evidence of hepatic involvement. Subsequently van Buchem in 1946 published a series of 14 cases in which aspiration of the liver was performed, with positive results in all. In view of the controversy about the relation between sarcoidosis and tuberculosis van Buchem also carried out biopsy of the liver in 9 cases of active pulmonary tuberculosis. In none were specific changes found. The authors report 3 cases with clinical manifestations of sarcoidosis, in which characteristic changes were found in liver tissue obtained by aspiration, and a fourth in which similar changes were an incidental finding in a biopsy specimen from the liver of a patient showing no other evidence of this syndrome. The first 3 cases were the only ones the authors saw in two years in which the clinical aspects suggested sarcoidosis, and in all of them lesions were found in the liver by aspiration biopsy. In 2 of them the diagnosis was also confirmed by biopsy of lymph nodes, but in the third the biopsy specimens from the liver alone gave histologic proof of the diagnosis. Taking into consideration these cases as well as those reported by van Beek, Haex and van Buchem, one can see that of 21 cases diagnosed clinically as sarcoidosis, 16 showed typical lesions in the liver. The fourth case was detected in 450 biopsies of the liver in patients with a variety of diseases. This lesion might be a single miliary tubercle, but the good general condition of the patient and the absence of other evidence of active tuberculosis are more in keeping with the view that it was of sarcoid type.

Abduction Contracture in Shoulder Joint. T. Cellarius.—p. 221.

Resection of Femoral Artery.—According to Bernhard, disturbance in the blood perfusion of the legs is often caused by thrombosis of the femoral artery. Observations, particularly in the course of operations on aneurysms, convinced him that not every thrombosis of the femoral artery will lead to a disturbance in the blood perfusion. The disturbance in the blood perfusion may take place in both legs, although only in one leg is the artery obliterated. Treatment consists in excision of the diseased artery. After this excision, pains and disturbances in the blood perfusion cease first on the contralateral side, and only after several hours have elapsed does the same process take place on the side that has been operated on. Thrombosis of the femoral artery is usually detected on both sides, since this concurrence has been watched for. The obliteration of the femoral artery is not the only cause of the disturbance in blood perfusion; an irritation existing in the wall of the obliterated vessel is the chief cause. This irritation can lead at the same time to vasoconstriction and involvement of the other side as well as to disturbances in the entire sympathetic nervous system. It has been proved by histologic studies that ordinary arteriosclerosis may lead to thrombosis of the femoral artery. Resection of the artery produces the best results in arteriosclerosis. Results are less favorable in cases of arteritis of various origins and are poorest in endangiitis obliterans. For this reason, simultaneous resection of the lumbar sympathetic is advocated in the latter cases. Arterial resection can be attempted also in case of ulceration and of threatening gangrene. The collateral vessels must be preserved as much as possible, whereas the diseased femoral artery must be removed as extensively as possible. The throttling of the collaterals is abolished by this operation and active vasodilatation is induced in the peripheral regions, because the thrombosed artery which acted as a vasoconstrictor has been removed. The author presents several illustrating case histories.

*Mitral Rheumatic Disease and Multiple Cerebral Embolism. M. Manguel. —p. 1501.

Mitral Rheumatic Disease with Multiple Cerebral Embolism.—A man 50 years of age suffered repeated attacks of rheumatic fever from childhood. Cardiac symptoms appeared at the age of 38. The clinical symptoms and electrocardiographic changes demonstrated mitral stenosis. Since the age of 40 the patient presented neurologic symptoms which seemed to be due to multiple cerebral embolism. Early in course of the disease the neurologic symptoms, which followed appearance of precordial pain, consisted of acute pain in the left temple and in the left shoulder, followed by spasms of the left arm and of the head and transient facial paralysis. Later arrhythmia and auricular fibrillation occurred. The neurologic symptoms consisted of left spastic hemiplegia, aphasia and Cheyne-Stokes respiration. In both instances the neurologic symptoms improved on administration of antispasmodic and vasodilating drugs. The patient is kept on the Schemm diet. Treatment consists of digitalis, oxygen inhalations and injections of papaverine in doses of 0.10 Gm. given every six hours. Massage therapy and progressive slow reeducation will be indicated if aphasia regresses.

Penicillin in Treatment of Congenital Syphilis. S. J. de Jong.—p. 161.

Hypervitaminosis D.—Hooft and Haesebrouck observed in some infants and children who came to their clinic typical signs of D hypervitaminosis. Massive single doses of 15 mg. of vitamin D are justified for the treatment of active rickets or tetany or for the prevention of rickets, but it was found that this large dose had been given, without justification, repeatedly, every month or even every week, to children with tuberculosis, chronic bronchitis, anemia or anorexia or to children who appeared weak. Although disturbances caused by this medication usually disappear after administration is stopped, there are cases in which serious complications and even death have resulted. The authors report 2 cases, one of which terminated in death. Both infants had slight anemia, hypercalcemia, hypercholesteremia and increased urea in the blood. Hyperphosphatemia was observed in the first case only. Protein levels proved to be high in both cases. In the first case roentgenologic examination revealed calcification of the epiphysial zone, thickening of the cortex of the long bones and renal opacity. In both cases the T wave was slanted in the electrocardiogram. Necropsy in the fatal case showed severe lesions of the heart, the kidneys, the blood vessels, the stomach and the meninges. Microscopic examination suggested hypofunction of the thyroid. The authors direct particular attention to the hypercholesterolemia. On the basis of their observations and of experimental work by Goormaghtigh the authors conclude that thyroid preparations may be helpful in the treatment of hypervitaminosis D.

Anti-M Antibodies and Latent N Receptors in Human Subjects.—When the usual cross matching test between the patient's serum and the donor's erythrocytes was carried out on a woman in preparation for a blood transfusion, van der Spek and de Kromme detected an incompatibility of blood groups outside of the ABO system of blood groups. The incompatibility seemed to be due to the presence of anti-M antibodies in the serum of the patient, whose blood type was N. The anti-M antibodies were probably congenital and without pathologic significance. This case again demonstrates the great importance of the cross matching test before a transfusion is given. In newborn infants N antigen may not be developed or may be developed to such a slight degree that a wrong blood type may be registered. In excluding paternity by means of the M or N blood type this possibility has to be reckoned with, and also the occurrence of certain M and N receptors which react with only a limited number of anti-M and anti-N serums.

Synthetic Antithyroid Agents. L. Lefebvre.—p. 370.
Changes of Blood Formula in Course of Treatment with Antithyroid Agents: Some Clinical Cases. A. Nizet.—p. 387.

Antithyroid Agents in Thyrotoxicosis.—Brull and Lefebvre treated 113 patients between the ages of 18 and 72 who had thyrotoxicosis, with various antithyroid agents; 7 patients were given thiourea with an average daily dose of 0.80 Gm., 26 thiouracil with an average daily dose of 0.60 Gm., 7 methylthiouracil with an average daily dose of 0.40 Gm., 26 propylthiouracil with an average daily dose of 0.30 Gm., 26 aminothiazole with an average daily dose of 0.30 Gm., and 21 were given treatment with several of these drugs. In 6 patients (5 per cent) treatment failed. Three patients (3 per cent) showed intolerance. Excellent results were obtained in 58 patients (51 per cent). Less satisfactory results were obtained in 46 patients (41 per cent) who presented recurrences, partial persistence of symptoms, mild thyroid hypertrophy (6 cases), and transitory myxedema. An occasional granulocytosis should be guarded against, although it was not observed by the authors. Except for this limitation, the administration of antithyroid agents may be considered as a method of treatment which gives highly satisfactory results, although it is a more tentative method of treatment than surgical intervention or roentgen therapy. It has the advantage that it does not cause irreversible changes of the anatomy or physiology of the thyroid.

*Study of 10 Cases of Late Hypochromic Anemia Observed in 1947, 6 of Which Secondary to Diaphragmatic Hernia. J. Mallarmé and R. Tilquin.—p. 282.

Hypochromic Anemia.—Mallarmé and Tilquin report 10 patients, 3 men and 7 women between the ages of 32 and 72, with hypochromic anemia. In all cases the hemoglobin level was low, but in some cases the number of the red blood corpuscles was nearly normal, varying frm 3,950,000 to 4,500,000, while they were low in others (varying from 1,450,000 to 1,700,000). Nucleated red blood corpuscles were not observed. Examination of the bone marrow revealed an association of large proerythroblasts (macroblasts) with small erythroblasts presenting a pale protoplasm; this association may be considered as responsible for giving rise to hypochromic anemia. In 9 patients the chlorosis was secondary, due to cancer, to hemorrhoids and to metrorrhagia respectively in 3 cases and to diaphragmatic hernia in 6 cases. These 6 latter cases were characterized by anisocytosis and poikilocytosis associated with a low hemoglobin level but with little alteration in the number of the erythrocytes. Normal chemical composition of gastric contents was demonstrated in 3 of these cases in which gastric aspiration was done. Recovery of all patients with secondary hypochromic anemia due to diaphragmatic hernia resulted from treatment with iron. Surgical treatment was omitted in all of them because of the advanced age of the patients. Only 1 patient had primary hypochromic anemia; there were Hunter's tongue, anachlorhydria, severe dyspeptic disturbances and anemia with a low hemoglobin level and low number of erythrocytes. Recovery resulted from treatment with iron, but with higher doses and of longer duration than that in the cases of secondary anemia. Primary achylous hypochromic anemia should be considered separately from secondary hypochromic anemias, as Biermer's disease should be distinguished from secondary hyperchromic anemias.

Book Notices

Viral and Rickettsial Infections of Man. Edited by Thomas M. Rivers, M.D., Director of the Hospital, The Rockefeller Institute for Medical Research, New York. Aided by a Grant from the National Foundation for Infantile Paralysis, Inc. Cloth. Price, $5. Pp. 587, with 77 illustrations. J. B. Lippincott Co., 227-231 S. Sixth St., Philadelphia 5, 1948.

Dr. Rivers points out in the preface that knowledge of virus and rickettsial infections of man has developed so rapidly in the past two decades that any book written during that time would have been out of date before publication. Within the past few years ideas have crystallized, and the purpose of this book is to bring this knowledge together so that interested persons not actively engaged in the study of virus and rickettsial infections may be properly informed.

The twenty-seven contributors are all experts in their fields. With so many contributors it is remarkable that the various contributions fit together so well. Under the virus and rickettsial infections a definite pattern is followed with the headings introduction, history, clinical picture, pathogenic picture, experimental infection (host range), etiology, diagnosis, treatment, epidemiology and control measures. The illustrations are excellent and up to date. The small price for this volume is made possible by financial aid provided for the preparation and publication of the volume by the National Foundation for Infantile Paralysis. This authentic book is a must for the libraries of both medical students and physicians.

Lectures on the Liver and Its Diseases Comprising the Lowell Lectures Delivered at Boston, Massachusetts, in March 1947. By H. P. Himsworth, M.D., Professor of Medicine in the University of London, London. Cloth. Price, $5. Pp. 204, with 58 illustrations. Harvard University Press, Cambridge, 38, Massachusetts, 1947.

This monograph is based on a series of lectures delivered at the Lowell Institute of Boston. The author deplores the retention of the word "cirrhosis," preferring to use the term "fibrosis of the liver." This, he feels, will aid in ridding medical thought of the view that the disease is a unity rather than the end result of many types of hepatic injury.

There is a good discussion of the vascular, nutritional, toxic, infectious and infiltrative factors which produce hepatic parenchymal damage. The author believes that the result of damage to the liver depends not so much on the type of agent, but whether the injury is of sufficient severity to destroy the entire lobule rather than the central or midzonal cells alone. If a thin rim of parenchymal cells survives around each portal area, these cells regenerate and restore the lobule within a fortnight. If, however, massive hepatic necrosis occurs, the reticulin framework collapses, fibrosis follows and those few remaining liver cells in the area necessarily undergo concentric hyperplasia with the formation of discrete nodules.

The role of methionine deficiency in liver disease is discussed rather briefly. Deficiency of cystine, perhaps conditioned by tocopherol deficiency, is considered an essential factor in the production of experimental hepatic necrosis. No mention is made of these substances in relation to the human disease.

This monograph should arouse the interest of all students, especially those concerned with the study of hepatic disease.

Medical Writing: The Technic and the Art. By Morris Fishbein, M.D., Editor, Journal of the American Medical Association, Chicago, with the Assistance of Jewel F. Whelan, Assistant to the Editor. Second edition. Cloth. Price, $4. Pp. 292, with 36 illustrations. The Blakiston Co., 1012 Walnut St., Philadelphia 5, 1948.

This book has evolved from a small pamphlet first published in 1910. The present volume is a book of almost 300 pages with much material not available anywhere else. It advises the physician on the preparation of a scientific manuscript, particularly one designed for submission to The Journal of the American Medical Association or any of the special periodicals published by the Association. The various chapters discuss the style of writing, the construction of the manuscript, such simple matters as spelling, capitalization and abbreviations, the preparation of the bibliography and—most important of all—the revision of the manuscript. Special sections deal with illustrations, charts and diagrams, tables and proofreading. The book includes also a list of the periodicals in the *Quarterly Cumulative Index Medicus* and a competent index.

Cirugía estética. *Por el Dr. Ramón Palacio Posse.* Boards. Price, 20 pesos. Pp. 299, with 397 illustrations. Libreria y editorial "El Ateneo," Florida 340—Códoba 2099, Buenos Aires, 1946.

This is an excellent survey of plastic surgery of the esthetic type. It is thorough, comprehensive and well written. After the preliminary introduction and general considerations, the first chapter is devoted to plastic surgery of the nose.

The second chapter concerns itself mainly with surgical technic—the preparation of the surgeon's hands, the patient, anesthesia and postoperative care. A special chapter is devoted to surgical armamentaria.

Chapters 4 through 10 contain a comprehensive analysis of the various types of nasal deformities and the methods used in their correction. Chapter 11 concerns itself with the abnormalities of the ear. Chapter 12 is devoted to a consideration of relaxation of soft structures of the face and the various operations on the lips. This chapter is written in a lucid style and includes consideration of the etiologic factors that produce wrinkles, with special emphasis on the hypertrophic form and evaluation following operations. This is followed by an excellent description of conditions on various parts of the face, such as the eyelids, the surgical treatment of facial paralysis by plastic procedures, defects of the lips, chin, etc.

Chapter 15 is a thorough and informative contribution to the book, dealing primarily with hypertrophies and ptosis of the breasts. The various transposition operations are described. The Thorek technic of transplantation of the nipples is thoroughly elucidated; the author's observations and conclusions complete the chapter.

Chapter 16 deals with esthetic corrections of localized hyperadiposities in the extremities, as well as in the abdominal wall. The work concludes with a discussion of the causation and the treatment of cicatrices, their mode of prevention, the suitable material used in their repair, the formation of keloids, the treatment of atrophic scars and the method of removing tattooing.

This all-embracing work contains a wealth of information; the text is notably free from padding. The illustrations are good.

Respiration et machine humaine. Par le Docteur Nicolas Taptas. Préface du Professor F. Lemaitre. Contribution à la physio-pathologie nasale avec applications cliniques dans les affections nasales et auriculaires et cardio-pulmonaires. Paper. Pp. 221, with 56 illustrations. Librairie Le François, 91, Boulevard Saint-Germain, Paris, 6^e, 1947.

This volume presents in its first half a general survey of the anatomy, histology and functions of the nasal and paranasal structures. The second half, clinical in nature, considers the effects which abnormalities of the upper respiratory passages may exert on the development of the thorax and on respiratory and circulatory function. References to the general literature are few.

Manual of Physical Diagnosis with Special Consideration of the Heart and Lungs. By Ellis B. Freilich, M.D., F.A.C.P., Professor of Medicine, University of Illinois College of Medicine, Chicago, and George C. Coe, M.D., Associate of Medicine, University of Illinois College of Medicine. Revised in collaboration with Joseph K. Freilich, M.D., Adjunct, Mount Sinai Hospital, Chicago. Third edition. Cloth. Price, $5. Pp. 351, with 75 illustrations. The Year Book Publishers, Inc., 304 S. Dearborn St., Chicago 4, 1947.

This is a concise and practical manual of physical diagnosis for the use of the student and practitioner especially in daily bedside practice. Special emphasis has been placed on a description of the technic of examination of the heart and lungs. A section has been added to previous editions on examination of the nervous system which should prove of value.

Selected Papers from the Royal Cancer Hospital (Free) and the Chester Beatty Research Institute. Published by Order of the Governors of the Royal Cancer Hospital (Free) London. Vol. IV. [Reprints.] Cloth. Price, 16s. Pp. 381, with illustrations. The Royal Cancer Hospital (Free), Fulham Road, London, S. W. 3, 1943-1944.

These papers provide a striking indication of Britain's ability to maintain medical science through the war period. The subjects range from radiation dosage to fundamental considerations of the biology of differentiating tissue and the correlation of the chemical structure of compounds with their biologic effects. The material is so diverse as to give an excellent cross section of the type of work under way in a cancer institute of the highest type.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

CORONARY DISEASE AND EXERCISE

To the Editor:—Is coronary heart disease less likely to occur in persons who engage in strenuous physical exercise, such as calisthenics, running, swimming and hiking than in those who lead a more sedentary life?

Albert Rubin, M.D., Hartford, Conn.

Answer.—No adequate information exists as yet with reference to the relation of athletic activity and of sedentary life to coronary heart disease. It will be important to gather such statistics in the future. At present, the young persons with coronary heart disease tend to be men of muscular build who are somewhat overweight. This seems to be true whether they are physically active or not. Whether overweight and sedentary life added to a husky build are deleterious or not in this respect has not yet been proved, although such is the opinion of some observers.

INSULIN ATROPHY

To the Editor:—A diabetic patient receives 20 units of protamine zinc insulin daily in her thighs. At the sites of injection fatty tissue atrophy has developed to such an extent that there are huge crater-like tissue defects. Is there anything that can be done to correct this and to avoid its progression from future injections?

M.D., California.

Answer.—Localized atrophy of subcutaneous fat at the site of insulin injections has been reported in 5 to 18 per cent of all patients using insulin. Any type of insulin may cause it. It occurs almost exclusively in females and children. Men almost never exhibit the lesion. The reason is unknown. It is more common in allergic persons but is presumed to be due to the presence of a lipase in the insulin or to abnormal activation by the insulin of a normal lipolytic enzyme in the tissues. Pathologically and chemically it is characterized only by the disappearance of neutral fat. In nondiabetic persons and animals development of insulin atrophies has been reported.

The only harmful effect of the lesions is cosmetic. They may gradually fill in with fat if reinjection of the affected areas is carefully avoided. There is no other effective treatment. Atrophy is less likely to occur if systematic rotation of injection sites is practiced faithfully. Susceptible persons can avoid the undesirable cosmetic results by the use of the abdomen for injections.

The subject is reviewed thoroughly by Alexander Marble in the *Proceedings of the American Diabetes Association,* **2**:171-186, 1942 ("Atrophy of Subcutaneous Fat Following Injections of Insulin").

"ZYLCAINE"

To the Editor:—I saw a patient who had fractures of several ribs. Rather than use the conventional method of treatment with adhesive tape, I did an intercostal block, using "zylcaine," and the patient obtained immediate relief. What are the possibilities of complications arising from the use of "zylcaine"? I refer particularly to later neuritis or abscess formation.

M.D., Illinois.

Answer.—"Zylcaine" is stated to contain in each cubic centimeter procaine base, 0.075 Gm.; butyl aminobenzoate, 0.3 Gm., and benzyl alcohol, 0.25 Gm., dissolved in peanut oil. Anesthesia lasting for from one to four weeks has been reported from its use. It is usually used as rectal anesthesia and seldom for infiltration or nerve block. This combination may be irritating principally because of its content of butyl aminobenzoate, which is a water-insoluble anesthetic not suitable for injection. It is possible, therefore, that prolonged contact of this mixture with nerve trunks could produce chemical neuritis.

Although peanut oil is widely used as a vehicle for oil-soluble medicaments, a number of instances of oil-retention cysts have been reported following the injection of this and other oily vehicles. Probably the exact site of injection and the volume of solution are important determining factors in the production of such cysts.

The recent literature does not contain reports on untoward effects due to this proprietary mixture, but in view of its composition it would not seem unlikely that it might produce occasional instances of neuritis and cyst formation.

FETAL POISONING

To the Editor:—Please describe symptoms and course of strychnine, phosphorus and nitrobenzene poisoning. If a pregnant woman (eight months) were poisoned with one of these, what would happen to the fetus? During what interval before delivery of the baby would one expect no symptoms in the baby—i. e., interval after ingestion of one of these poisons?

M.D., Louisiana.

Answer.—The symptoms of strychnine poisoning are referable to increased reflex excitability of the spinal cord. They consist of repeated attacks of convulsions which involve all the voluntary muscles of the body, including the diaphragm. The tetanic condition of the abdominal muscles and diaphragm arrests respiration, and the asphyxia may be fatal. Strychnine also causes spasms of the gastrointestinal tract and the uterus. These tetanic convulsions recur at intervals, followed by periods of exhaustion. Death may be due to asphyxia or depression. The chief characteristic symptom of strychnine poisoning is the tetanic convulsions.

Phosphorus poisoning occurs in two phases. At first there is local gastrointestinal irritation, with nausea and vomiting. After two or three days the symptoms are due to the poisonous effects of the phosphous on the liver. These consist of hepatic enlargement, intense icterus and metabolic changes.

The onset of symptoms in nitrobenzene poisoning is usually delayed, sometimes for several hours. The symptoms consist of nausea, vomiting, headache, prostration and extreme cyanosis, due to the formation of methemoglobin. Death is due to respiratory failure.

Phosphorus passes to the fetus in sufficient amounts to produce fatty hepatic degeneration. Nitrobenzene has been used frequently to produce abortion, but even large doses are ineffective. Nitrobenzene evidently does not pass the placental barrier. Strychnine would probably cause the death of the fetus because of the violent tetanic convulsions of the uterus.

Because nitrobenzene poisoning is delayed sometimes for hours after ingestion, the interval before the fetus would be affected would probably be considerable. With phosphorus the interval would probably be somewhat prolonged. With strychnine the effects on the fetus would be only a matter of minutes.

INTERMITTENT INFUSIONS

To the Editor:—In some institutions a cannula is inserted into a child's vein for intermittent infusions; that is, a stilette is inserted into the cannula, and when it is time to start the infusion, fluid is forced into the vein under pressure to open the vein. What is the possibility of thrombus and embolus formation with this procedure?

Robert C. Tavlin, M.D., Mooreland, Okla.

Answer.—The procedure described is a common practice in hospital pediatric services. It is often difficult to find a vein in the child that will easily receive an instrument through which fluids may be given. When such a vein is discovered a cannula is inserted and left in place sometimes for days. After a variable period of time, thrombophlebitis occurs in the superficial vein being used and the infusions must be stopped or their site changed because the lumen of the vein becomes obliterated. Embolic phenomena in children have been extremely rare, so that their possibility need not influence the use of this method.

The cannula for intravenous infusion in adults has been found practical in cases requiring continuous infusions over a long period of time. Mason has pointed out that thrombosis and lymphangitis often necessitate changing the site. The newer plastic and nylon catheters are less irritating but still may cause local reaction however small the catheter may be. Intermittent use of the cannula in adults has not been successful except for the intravenous administration of heparin, in which the intraluminal reservoir of heparin tends to keep the catheter open and to prevent clotting. Positive pressure to start the flow is risky in all cases.

PROTEIN-BOUND IODINE

To the Editor:—Is there a simplified method for determining blood protein-bound iodines? Methods which we have been able to find involve special equipment, expense and much time. What is the range of normal values?

August F. Fath, M.D., Kalamazoo, Mich.

Answer.—Perhaps the most satisfactory method for the determination of serum protein-bound iodine is that described by Barker (*J. Biol. Chem.* **173**:715, 1948). This method requires some special equipment, but is not unduly difficult or time consuming.

The extreme range of normal values is given as 3 to 9 micrograms per hundred cubic centimeters of serum (Riggs and others, *J. Clin. Investigation,* **24**:722, 1945), although most euthyroid persons will yield serum containing from 4 to 8 micrograms per hundred cubic centimeters. Man and others (*J. Clin. Investigation,* **21**:773, 1942) found a group of 15 hyperthyroid patients to exhibit values between 9.4 and 33.7 micrograms per hundred cubic centimeters, while Riggs and others (*J. Clin. Investigation,* **24**:722, 1945) found the serum in 26 cases of hypothyroidism to contain 0.2 to 2.5 micrograms per hundred cubic centimeters.

LOSS OF SENSE OF SMELL

To the Editor:—Immediately after an operation for removal of a cancer of the esophagus, opposite the seventh cervical vertebra, a man aged 60 lost the sense of smell and experienced a perversion of the sense of taste. The operation occurred a year ago. The larynx was removed at the same time, so that nasopharyngeal respiration was terminated. There were no operative procedures involving tissues above the neck. The patient was under the anesthetic for five hours. Convalescence was uncomplicated. Examination of the nasal cavities showed a moderate grade of edema and a persistent discharge of clear mucus. The accessory nasal sinuses were normal. The central nervous system was unaffected. The patient, a year after the operation, cannot detect the odor of tobacco smoke, ether, essential oils, carbon tetrachloride and other volatile substances which are allowed to pass through his nasal cavity. What is the cause of the impairment of the olfactory and gustatory senses? What is the prognosis? Would topical therapy be of avail?

M.D., New York.

ANSWER.—Since the sense of smell provides, beyond the recognition of sweet, salt, bitter and sour, most of what is called "taste," it is probably a fair assumption that this patient's perversion of taste is related to his loss of smell.

Loss of smell is unusual after an operation of the kind described. Assuming that the sense of smell was lost at the time of operation, one would suppose the site of the disturbance to be in the olfactory nerves of the nasal mucosa. Two possibilities are suggested. One is that the long exposure to the anesthetic may have injured the nerves. The other is related to removal of the larynx, a procedure which eliminates the nose as an airway and necessitates intubation. The nasal mucosa no longer functions and as a result becomes edematous. This edema usually subsides after a few days. Ordinarily, the olfactory nerve endings are not damaged by it.

There is little likelihood that the condition will improve. Topical therapy would be of no avail.

LUPUS VULGARIS

To the Editor:—A married woman of 25 with two children has suffered from lupus vulgaris for fifteen years; the cheeks alone are involved. Can you suggest appropriate treatment?

M.D., Canada.

ANSWER.—Charpy (*Ann. de dermat et syph.* **6**:310-346 [May-June] 1946) introduced a revolutionary treatment for lupus vulgaris with calciferol (chemically pure vitamin D_2). Synthetic oleovitamin D, 150,000 international units, and 1 quart of milk daily (the latter to insure an adequate supply of calcium) have been used in this country. Such treatment may have to be given for a year or longer. Anorexia, loss of weight and polydypsia may occur. Stop vitamin D_2 if the subjective symptoms indicate it. The blood sedimentation rate is the most reliable indicator of reactions, showing a rise of 60 to 98 mm.

Local treatment is also necessary—cover the areas of lupus vulgaris with Lassar's paste; change it daily, using warm liquid petrolatum to cleanse it. Resistant areas of lupus vulgaris should be excised if at all possible.

HYDRATED SILICIC ACID

To the Editor:—A buffered solution containing the equivalent of 5 mg. of hydrated silicic acid has been advocated as effective in the treatment of various arthritic processes. Are there any published reports confirming this? Is this toxic or injurious if given frequently? Which is the best route of administration? How often should it be given?

M.D., Rhode Island.

ANSWER.—Such a preparation is exploited by a pharmaceutical company but neither substantiation of their claims nor critical evaluation of this substance can be found in the medical literature.

ACNE

To the Editor:—Can testosterone be successfully and safely used for acne in adolescence? What is the customary dosage and method of administration?

Paul A. Ferrier, M.D., Pasadena, Calif.

ANSWER.—The use of testosterone for the treatment of acne is not an established method of treatment. Estrogenic substances are used, but on an experimental basis only—the indications and dosages have not yet been established.

PULMONARY FIBROSIS

To the Editor:—A patient, aged 42, is thin, having slowly lost weight over a period of five years. She has one degree of fever daily. Roentgenograms of the chest show nonspecific fibrosis. Repeated tests for tuberculosis were negative in result. All the findings were negative. The disturbing symptom is an irritating, almost nonproductive cough. Many clinics and means of therapy have been of no avail. Would the inhalation of aluminum dust as is used in the symptomatic treatment of silicosis have anything to offer?

L. L. Sherman, M.D., Picayune, Miss.

ANSWER.—The available evidence does not permit of exact diagnosis in the case described, but one is inclined to suspect that the primary condition is pulmonary emphysema with associated fibrosis. If this is correct, treatment is likely to be most unsatisfactory. The use of iodides to augment bronchial secretion, physical therapy to increase the movements of the thoracic cage and the inhalation of penicillin aerosols to combat intrabronchial infection may be tried in the hope of obtaining some symptomatic improvement. If bronchial spasm complicates the picture, ephedrine or some of the recently discovered sympathomimetic amines may be tried. The inhalation of aluminum dust has a limited field of usefulness in relatively acute silicosis. It acts by "plating" the particles of silicon and rendering them less irritating to the pulmonary tissues. In cases of silicosis with marked fibrosis, little can be accomplished, and in the case of nonspecific fibrosis under consideration there would not appear to be any indication for such treatment.

PRESSURE URTICARIA

To the Editor:—A garage mechanic aged 36 complains of itching of the skin in various parts. For six or seven years he has noticed that any undue pressure on his skin will produce intense itching, e. g., as he bends over the motor of a car that part of his body touching the fender begins, after a few minutes, to itch; the hand holding a wrench itches; if he plays baseball the gloved hand itches from the trauma of the ball. The condition has been described by other physicians as giant urticaria. There is no family history of allergy, and the condition does not seem to be related to his occupation. He has been partially relieved by diphenhydramine hydrochloride ("benadryl"). Please discuss the diagnosis and treatment.

D. E. Schlosser, M.D., Mt. Joy, Pa.

ANSWER.—This patient apparently has urticaria sine urticis. Chronic cases such as this are sometimes caused by sensitization to drugs, to unusual foods or to a focus of infection. A detailed history and clinical tests made by the trial and elimination method might help to identify any causative drug or food. The patient should also be examined carefully for the presence of infection or parasites in his system. Those cases in which symptoms are produced by physical agents, such as in this case, sometimes respond well to treatment with so-called antihistaminic or antiurticarial drugs. Some patients respond better to one than to another of these drugs. Only clinical trial will determine which is the better, and the proper dosage for each case.

BEDBUG BITES

To the Editor:—Can bedbug bites cause bullous erythema?

David L. Cooper, M.D., Erie, Pa.

ANSWER.—The lesions produced by bedbugs occur usually on the ankles and legs in groups of three, or three lesions in a line, which medical students often refer to as "breakfast, lunch and dinner"—to form a striking and unforgetable clinical picture. Ordinarily the lesions consist of either small edematous papules, wheals or purpuric macules, rather than bullae, but bullae may occur in highly sensitive skins which react violently to noxae of any sort.

DUPUYTREN'S CONTRACTURE

To the Editor:—In the July 24 issue of The Journal, page 1177, an inquiry was published regarding the cause of and treatment for Dupuytren's contracture. The reply implicated trauma more explicitly than is justified by the facts. The cause of this condition remains unknown in spite of the many suggestions which have been advanced. Clinical observation points to the fact that it is frequently hereditary and is often associated with such diseases as gout, arthritis and diabetes. It is also sometimes associated with plastic induration of the penis and with a similar condition of the plantar fascia.

Contrary to the belief expressed in the reply, it seems clear that this condition is unrelated to trauma. It occurs less frequently in the hands of laborers than in those whose hands are less subject to injury. All hands are subject to what was described as "multiple minimal trauma." But the fact of the relative infrequency of the Dupuytren contracture points to the unimportance of such trauma.

I believe that the reply given may be misleading if accepted seriously by industrial courts and that many unjustifiable awards might be made.

SURGERY OF THE HEART AND ALLIED GREAT VESSELS

Chairman's Address

B. NOLAND CARTER, M.D.
Cincinnati

The purpose of this paper is to present in concise form the status of surgery of the heart and associated great vessels. I do not plan to go into actual details of surgical technic, but rather to give an idea of what can be accomplished by operation in various cardiac conditions. Some of the surgical approaches to problems of heart disease are not new but advances of note have been made in them. A new chapter in surgery is being written in the management of certain congenital diseases of the heart, and is of such importance that it should be forcibly brought to the attention of the profession. Only by surgical means can patients with certain conditions formerly considered hopeless be offered a good chance for cure, and this opportunity should not be denied them. The subjects for discussion will be taken up as outlined.

- I. Heart
  - A. Disease
    - 1. Acute suppurative pericarditis
    - 2. Chronic constrictive pericarditis
    - 3. Coronary sclerosis
  - B. Injuries
    - 1. Nonpenetrating
    - 2. Penetrating
    - 3. Retained foreign bodies
  - C. Tumors
- II. Allied great vessels
  - A. Congenital anomalies
    - 1. Patent ductus arteriosus
    - 2. Coarctation of the aorta
    - 3. Tetralogy of Fallot
    - 4. Aortic ring

ACUTE SUPPURATIVE PERICARDITIS

Prior to the general use of penicillin about 1944 the sole chance of recovery in cases of suppurative pericarditis lay in surgical drainage, and then as now the best prognosis was afforded by early operation—an end rarely achieved since this disease is usually not recognized until late. Behrend and Boles reported that of 146 cases of acute purulent pericarditis coming to autopsy at the Philadelphia General Hospital the disease had been diagnosed in only 4, and 3 had come to operation.[1]

Surgical drainage has been effected by various approaches, the most frequently used being an anterior one in which portions of one or more costal cartilages and a portion of the sternum are resected. Every effort must be made to evacuate the pus which is so prone to collect in the sulcus behind the heart and to prevent its reaccumulation either by the introduction of tubes with gentle irrigation or by the daily exploration of this area with the lubricated gloved finger; whereas the mortality rate in cases of suppurative pericarditis not treated surgically is 100 per cent, roughly 50 per cent of patients treated by surgical drainage have recovered.[2]

What is the role of chemotherapy in the management of suppurative pericarditis? From a prophylactic point of view, a decided decrease in incidence should be effected, since the disease is never primary but always secondary to infections elsewhere, such as empyema, infected wounds, pneumonia and septicemia from various causes, especially osteomyelitis, all of which are so favorably influenced by chemotherapy. The systemic use of chemotherapeutic agents alone in established cases of suppurative pericarditis has been extremely disappointing. A careful analysis of the few reports available dealing with pericardial paracentesis followed by the introduction of penicillin would indicate that this method of treatment is open to serious question, and in my own mind is not to be recommended.[3] The two chief objections to it are (1) the inherent danger of injuring the heart with the needle, a fact particularly to be reckoned with in this disease in which the heart is so commonly "floated" against the anterior pericardium and may even be adherent there, and (2) the impossibility of removing by aspiration performed anteriorly the pus which uniformly collects behind the heart. The proper place for chemotherapy would appear to be as an adjunct to surgical drainage, when it should be employed systemically in large doses and locally in the pericardial sac after the latter has been surgically exposed and when the drug may be placed in all portions of the pericardial cavity under direct

---

vision. Today in the established disease the most effective treatment is early surgical drainage supplemented by intensive systemic and local penicillin therapy.

CHRONIC CONSTRICTIVE PERICARDITIS

Although the medical treatment of chronic constrictive pericarditis is often palliative it is never curative, and with such therapy alone this disease always kills. The surgical attack on the condition is relatively recent. Churchill's patient, operated on July 18, 1928, was the first successfully treated patient in the United States.[4] Since that time the operation has been performed by many surgeons, with decreasing mortality rates and more gratifying results.

As experience with this disease has widened, certain facts have become increasingly evident. Tuberculosis has assumed a more prominent role in the causation.[5] It has been found unwise to operate while the inflammatory condition is active unless it is obvious that death will otherwise ensue. The most reliable signs now recognized are: high venous pressure, low arterial pressure, a quiet fixed heart, paradoxic pulse, an enlarged liver, with ascites followed by edema of the lower extremities, and fluid in the pleural cavity.[6] The diagnosis has many times been confused with cirrhosis of the liver, principally on account of the ascites. From a technical point of view there have been few changes in the operation itself, which consists of the removal of a portion of the thickened adherent pericardium. A recent modification in technic has been effected by utilizing a direct intrapleural approach after resection of the fifth rib and division of two or more costal cartilages. This procedure is easier and less mutilating than the formerly preferred method of an extrapleural approach with resection of the second to sixth costal cartilages together with short segments of the ribs and occasionally a portion of the sternum. Much emphasis is placed by Heuer [7] on adequate preoperative preparation, consisting of bed rest, restoration of protein balance and removal of fluid by diuretics and aspiration, even though this takes many weeks.

Owing to atrophy from disuse and also to myocardial degeneration, in long-standing cases the heart does not recover for many months or may always show impaired function. For this reason, as well as on account of permanent hepatic damage that may result in neglected cases, early diagnosis and prompt operation are essential for full recovery.

In general it may be stated that results of operation in the disease are as follows: 61.5 per cent of the patients are cured or decidedly improved and 9.5 per cent unimproved; the mortality rate, which varies from 29 per cent to 0 per cent, has declined strikingly in the last decade. The most recent comprehensive report is by Heuer, who in 1946 cited 18 personal cases with no deaths and 83 per cent of the patients cured or considerably improved.[7]

CORONARY SCLEROSIS

The vast majority of deaths due to "heart disease" result from diminished blood flow through the coronary arteries. It follows, therefore, that any method of supplementing and increasing coronary circulation would be of great value in the management of this disease. Studies have indicated that in coronary artery sclerosis the larger branches are involved first, often to the exclusion of the smaller ones. This should provide an ideal arrangement for the efficacy of anastomoses between an outside source and the smaller coronary branches which nourish the myocardium.

The essential factors involved in the production of an adequate collateral circulation are to provide an adequate source of blood and to produce an anastomosis between this source and the myocardial vessels. The actual anastomosis has been attempted by the production of vascular granulation tissue between the heart muscle and the intended new blood supply. It has been postulated that newly formed vessels in this tissue would join with existing vessels in the donor and recipient sites and thus provide new channels by which blood could reach the myocardium. Considerable reliance has been placed on the fact that when an organ is in need of blood, it avails itself of any possible source of supply. Experimental and clinical attempts to produce vascular granulation tissue through which a collateral blood supply can reach the myocardium have been by scarification of opposing surfaces and by the use of irritating substances, such as talc, powdered asbestos and acriflavine. Potential sources of new blood supply which have been utilized are the thoracic wall, including the pectoral muscles and the internal mammary and intercostal arteries, the pericardium together with its fat, the omentum and the lung. It has been definitely demonstrated experimentally that new vascular channels can be established between the heart and an outside source, but the direction of blood flow has not been proved, nor the volume of blood which can be supplied, nor the duration of the newly formed channels. Evaluation of any method is notoriously difficult in view of the remarkable improvement which nature alone sometimes effects in coronary disease.

In 1935 Claude Beck published his first paper dealing with the production of collateral blood supply to the heart, and his painstaking and fundamental work since that time has been of outstanding importance. He first sutured flaps of pectoral muscle to the abraded heart surfaces, but in subsequent operations abandoned this procedure in favor of the introduction of powdered asbestos, leaving windows in the anterior pericardium through which vascular connections could be established between the cardiac muscle and the thoracic wall.[8] From 1935 to his last published report in 1943 he had operated on 37 patients, with an operative mortality rate of 37.8 per cent.[8g] Of the survivors 14 were cured or greatly improved, 5 were moderately improved and 4 were unimproved. In May 1948 he reported the results of studies on anastomosing the aorta to the coronary sinus by way of a transplanted vessel, first ligating the coronary sinus.[9] After a considerable number of animal experiments the procedure was carried out on a patient, a portion of the branchial artery being used for the graft.

In 1938 O'Shaughnessy of England, utilizing omentum brought up through the diaphragm as a source of blood supply, operated on 20 patients, with 6 deaths. Nine of the survivors were asymptomatic. Since his tragic death in the battle of Dunkirk his work has not been continued.[10]

Thompson and Raisbeck in 1942 utilized talc to produce vascular adhesions between the heart and pericardium.[11] Thompson's latest report comprised 38 patients with good results in 70 per cent and a 15.8 per cent mortality rate.[12]

Fauteux has attempted to relieve anginal pain by pericoronary neurectomy combined with ligation of the coronary sinus to increase the amount of blood available to the myocardium. His clinical cases at his last report (1946) numbered 16, with 3 operative deaths.[13] Eleven patients were alive with objective improvement three months to six and a half years after operation. More recently he published studies on anastomosis of the internal mammary artery with the coronary sinus and anastomosis of the right auricle with the pulmonary artery above the pulmonary valves, but no clinical data were given.[14]

Vineberg (1946, 1948) has reported experimental studies on the production of vascular anastomoses through implantation of the internal mammary artery directly into the myocardial wall of the left ventricle. There has been no clinical application of these studies.[15]

Lezius in 1939 utilized the lung experimentally as a source of blood to the heart.[16] O'Shaughnessy used this procedure in 1 patient with decided improvement. I have modified Lezius' operation and, after considerable experimental work in which undoubted numerous new vascular channels were demonstrated, have operated on 2 human beings. One of these patients, operated on one year ago, is decidedly improved, and the other died of a massive infection thirty-six hours after operation.

In attempting to evaluate the results of the clinical efforts at producing a collateral blood supply to the heart, I find it striking that, in spite of apparent improvement in the majority of surviving patients, reporting surgeons have not published further experiences with the operation and that their lead has not been followed by others. The solution of the problems involved is of so great potential therapeutic value that it justifies the continuation of the combined efforts of cardiologists and surgeons. In my opinion careful clinical application of the principles worked out in the laboratory is not only justifiable but is indicated if progress is to be made in this field.

NONPENETRATING WOUNDS OF THE HEART

There is no question that the heart may be damaged by nonpenetrating injuries, such as direct blows over the precordium, compression of the thorax and sudden compression of the abdomen and lower extremities. Beck has emphasized the importance of "steering wheel accidents" in this regard and other authors have reported cardiac damage caused by blows from baseballs and fists and by compression by trailer bars, tail gates of trucks and the like.[17] The damage produced in the heart varies from actual rupture to mild contusion. The signs and symptoms of injury to the heart are frequently unrecognized, since they are masked by the evident injury to the bony thorax. They are precordial pain, tachycardia, arrhythmia, dyspnea and roentgenologic and electrocardiographic changes. The heart is capable of withstanding considerable trauma, and the vast majority of patients sustaining moderately severe cardiac injury recover, provided that the injury is recognized and the medical treatment employed is similar to that in myocardial infarction. There is, however, a group of cases in which surgical intervention is indicated and is life saving. These cases include those (1) in which a small rupture of the heart muscle occurs, accompanied with hemorrhage into the pericardial sac with a resulting acute compression of the heart, (2) in which acute cardiac compression occurs from the accumulation of large amounts of bloody fluid without actual rupture of the myocardium and (3) in which softening and fibrosis of a contused area results in the formation of an aneurysm. If signs and symptoms of acute cardiac compression are evident immediately or within a short time after injury, rupture of the heart should be suspected and immediate operation performed with evacuation of blood and clot and suture of the laceration. If such signs and symptoms develop more gradually over a period of hours or days, it is logical to assume that no actual rupture has occurred but that bloody fluid has accumulated from a contusion. In such circumstances aspiration is preferable, since there is little likelihood of an actively bleeding point. In instances in which aneurysm of the heart is developing, the involved area may be reinforced with a patch of fascia lata or pericardium. A more definitive surgical approach would be excision of the aneurysm, and this may well be feasible in view of Murray's successful resection of acutely infarcted areas in dogs' hearts and of my own experience of successful removal of considerable areas of both normal and infarcted heart muscle in animals.[18]

PENETRATING WOUNDS OF THE HEART

Prior to 1933 the vast majority of cases with penetrating wounds of the heart were either unrecognized or treated conservatively, with a mortality rate of 90 per cent or more. With a better understanding of the problems involved has come a more precise method of surgical management and a mortality rate ranging from 22 to 49 per cent in those clinics in which a considerable number of cases are encountered. At the Cincinnati General Hospital there has been a 21 per cent mortality rate in 29 patients. There is evidence that mortality figures are being lowered even more; Griswold reports only 3 deaths in the last 36 cases from his clinic.[19]

The diagnosis is as a rule easy, provided that the possibility of heart injury is ever kept in mind. Such diagnosis is based primarily on the signs and symptoms of acute compression of the heart resulting from bleeding into the pericardial sac. Beck has emphasized a triad of signs of fundamental importance: elevated venous pressure (normal being 6 to 12 cm. of water), a lowered arterial pressure and a quiet heart. In addition there is shock out of proportion to the apparent injury and fluoroscopic evidence of diminished or absent cardiac pulsation.

As experience with this condition has accumulated there has come a recognition that not all patients sustaining penerating heart wounds need be subjected to operation. The selection of cases for conservative treatment requires delicate judgment combined with critical and continued observation. Several important factors enter into this crucial and hazardous decision. If the causative agent is one apt to produce a small wound in the heart which therefore does not tend to bleed furiously or continuously, aspiration should be curative. Such agents are ice picks, small-bladed knives and long pins. On the other hand, bullets and large-bladed knives are prone to produce large lacerations of the heart which require operation and suture. A slow onset of the signs and symptoms of acute cardiac compression after injury indicates a small heart laceration with little tendency to rapid or continuous bleeding. Patients with bleeding from a heart wound into the pleural cavity can be saved only by operation. Singleton,[20] Strieder,[21] Griswold,[22] Warren and his co-workers [23] and Blalock and Ravitch [24] have reported successful treatment in carefully selected cases by aspiration, but all emphasize the necessity of performing aspiration with the operating room in readiness if aspiration is not successful because of clot, in the presence of clearcut signs of cardiac compression, or if there is evidence of recurrence of compression. Aspiration is of unquestionable benefit as a life-saving measure in patients who might well succumb to pronounced cardiac compression before operation can be performed.

Beck in 1942 [25] and Cooper, Stead and Warren [26] in 1944 have demonstrated the real value of intravenous infusions of isotonic sodium chloride solutions and blood as a preliminary to either conservative or operative treatment where there is cleancut evidence of acute cardiac compression.

RETAINED FOREIGN BODIES

One of the most thrilling and spectacular advances in cardiac surgery resulting from experiences in World War II is that of removal of foreign bodies from the chambers of the heart and from the lumen of the nearby great vessels. Prior to the war there was some difference of opinion as to the advisability of the removal of such foreign bodies, but a majority of observers favored treatment without operation. Factors which have served to reverse this attitude have been the relatively large number of such cases occurring in military surgery and surgical confidence stemming from improved operative technics combined with perfected methods of anesthesia. Harken and his associates have been the leaders in this field, and their phenomenal success is directly responsible for the present attitude that foreign bodies measuring 1 cm. or more in two dimensions should be removed surgically.[27] The proved reasons for such removal are: (1) to prevent embolism, (2) to diminish the danger of bacterial endocarditis and (3) to decrease the incidence of myocardial or vessel wall damage leading to possible rupture with hemorrhage. In addition, the distressing symptoms of precordial pain, dyspnea, asthenia and cardiac neurosis can be relieved by operation.

Harken's results are as follows: 134 patients with foreign bodies in and in relation to the thoracic blood vessels and heart were operated on without a death. In 13 of these patients, foreign bodies were removed from cardiac chambers.[27a]

PRIMARY TUMORS OF THE HEART

Primary tumors of the heart are infrequently encountered, the estimated ration of primary to metastatic lesions being 1 : 16. Woll and Vickery cite Maheim as having collected 320 cases of primary tumors of the heart to 1945, the disease in only 3 of which had been diagnosed ante mortem.[28] These lesions are usually clinically silent. Roentgenologic examination may reveal a fixed right border, or the size and shape of the heart may be abnormal. Unexplained and sometimes inconstant changes in cardiac rhythm and the development of hemorrhagic pericardial effusion are suggestive of a tumor of the heart.

The chambers of the heart are usually extensively involved in primary tumor, over 50 per cent occurring on the left side.[29] Rarely are these lesions so situated as to be amenable to surgical removal even when properly diagnosed. The only recorded case with successful operative removal is that of Beck, who in 1942 reported a patient with an unidentified type of calcified lesion on the left ventricular wall.[30]

PATENT DUCTUS ARTERIOSUS

Although some patients with patent ductus arteriosus live out their life span in comparatively good health, the vast majority succumb to complications of the disease within the first three decades. These complications are cardiac decompensation, as a result of the increased load thrown on the heart; bacterial endarteritis, usually due to Streptococcus viridans infection occurring on the plaques produced in the pulmonary artery by the swirl of the blood and increased arterial pressure in the artery; rupture of the thinned duct or pulmonary artery, and thrombosis with embolism. Shapiro and Keys after careful study concluded that 80 per cent of the patients with patent ductus arteriosus eventually succumbed to their lesion; of these, 40 per cent died of subacute bacterial endarteritis while the remainder, except for a few deaths due to rupture of the ductus or pulmonary artery, died of congestive cardiac failure.[31] In view of these observations they reversed their previous conservative attitude and made a statement representative of the best present day opinion: "Surgery is advisable in the great majority of patients with patent ductus arteriosus with or without subacute bacterial endarteritis. In the latter case surgery affords more than a forlorn hope. The uninfected patient cannot expect a normal life span without surgery and is liable to develop subacute bacterial endarteritis at any time in spite of apparent well being." Signs and symptoms of patent ductus include "machinery" murmur accented during systole, thrill over the pulmonic area, hilar dance and prominent left pulmonary artery.

Great credit is due Gross for his performance in August 1938 of the first successful ligation of a patent ductus arteriosus and for his fundamental contributions to this subject.[32] An increasing number of surgeons have performed the operation until it is now widely practiced with excellent results. Touroff has emphasized the curative value of the operation for patent ductus arteriosus complicated by subacute bacterial endarteritis, a condition at one time considered a contraindication to operation.[33] Prior to the advent of penicillin the operation alone proved curative in about one half of such cases. The use of penicillin has greatly widened the field for operation in cases with infection, has materially reduced mortality rates and has increased the chance for cure. It is of particular value in preparing these desperately ill patients for operation as well as in their subsequent treatment.

Gross first advocated simple ligation of the duct. Owing to 20 per cent incidence of recanalization following ligation in continuity, he now divides the duct between clamps and sutures the cut ends. It seems fair to state that ligation is satisfactory in about 80 per cent of the cases, whereas division completely precludes recanalization and is the more surgical procedure.

The following figures indicate what can be expected of the operation: Gross reported ligation of the ductus in 43 patients with 3 deaths and complete division in 90 patients with 2 deaths.[32d] In Jones' series of fifty-three ligations and eight divisions there were 2 deaths.[34]

COARCTATION OF THE AORTA

Coarctation of the aorta has been known for two hundred years and is commoner than is usually recognized. For example, Abbott found 142 cases among 1,000 instances of congenital cardiovascular defects and stated that the average age at death was 36 years.[35] The fibrosed constriction in the aorta is located just beyond the site of origin of the left subclavian artery and produces from slight to complete obstruction. The most important diagnostic sign is hypertension in the upper portion of the body with hypotension in the lower, as evidenced by diminished or absent femoral pulses. It is imperative that this condition be ruled out in all cases of hypertension, especially in children. Additional evidences of the disease are cardiac hypertrophy, absence of the aortic knob, scalloping of the ribs from pressure of the dilated intercostal arteries and palpation of pulsating arteries on the thoracic wall, particularly in the interscapular region when the patient bends forward. The chief dangers of the condition are those of hypertension, others result from aneurysm of the aorta, with or without dissection and rupture, and S. viridans endarteritis.

In October 1944 Crafoord of Stockholm performed the first successful operation for relief of this condition.[36] He resected the coarcted portion of the aorta between clamps and performed end to end suture. In this country Gross performed this operation on 2 patients in 1945, and in May 1948 he reported a total of 41 patients with 6 deaths and good results in 32.[37] Blalock operated on 21 patients with 3 deaths, in 16 of whom end to end suture was accomplished and in 4 a subclavian-aortic anastomosis was done.[37e] Stephens of California reported 6 cases in 1948, with the 3 survivors well.[38] Jones reported 13 cases, in 9 of which end to end suture was utilized, and 4 with subclavian-aortic anastomosis. There were 2 deaths in his series.[39]

TETRALOGY OF FALLOT

The tetralogy of Fallot is present in the majority of cases of congenital cardiovascular defects which are accompanied with cyanosis. Prior to the brilliant contribution of Blalock and Taussig in 1943, patients suffering from this condition were faced with a hopeless outlook, only a few surviving beyond the first decade.[40] The components of the tetralogy are pulmonic stenosis, interventricular septal defects, dextroposition of the aorta and hypertrophy of the right ventricle. The chief disabling factor is pulmonic stenosis or atresia which prevents an adequate flow of blood to the lungs with resulting deficiency in oxygenation. It is in large part this factor which the Blalock operation attempts to overcome by anastomosis of one of the systemic arteries arising from the aortic arch to the right or left pulmonary artery.

The important diagnostic features in this condition are cyanosis, roentgenologic evidence of decreased size of the pulmonary artery and absent or diminished pulsations together with absence of congestion in the lung fields. The most suitable age for operation is from 2 to 10 years; it is not advised in infants 18 months or younger.

Although each of the vessels arising from the aortic arch have been utilized for anastomosis Blalock prefers the innominate subclavian, because of the better angle it makes when swung down to the pulmonary. The end of the systemic artery is best anastomosed to the side of the pulmonary artery, since in this way the new blood flow can reach both lungs, a condition which would not obtain in an end to end suture.

In Blalock's last published report 243 patients had been operated on, with a 21 per cent mortality rate and only a 15 per cent mortality rate in the last 100 patients.[40b] In a paper read before the Royal Society of Surgeons in London in September 1947, he cited 474 cases with an over-all mortality rate of 18 per cent.[40c] Stephens reported twenty-two anastomoses, with a 4.5 per cent mortality rate.[41] Dodrill reported 12 cases, with 3 deaths and 5 cases with excellent results.[42] Murray in Canada has operated on 94 patients.[43] In my clinic only 5 patients have been operated on.

In general the results in the patients surviving operation have been phenomenal, and it has been remarkable how well the pathetic, weak and cyanosed children have tolerated the operation. There has been little or no difficulty with the arm after sacrifice of the subclavian artery. It may be said that the operation represents an outstanding contribution to surgery, has proved thus far to be effective and has given hope to hundreds of patients formerly doomed to death or early invalidism.

About a year and a half after Blalock and Taussig's first publication Potts, Smith and Gibson reported an ingenious operation for this condition, consisting of a side to side anastomosis between the aorta and the right or left pulmonary artery.[44] This anastomosis was made possible by a specially devised clamp, which pinches off and occludes a portion of the aorta for suture but leaves a channel through which blood can continue to flow. The advantages of this operation are that the size of the artificially created communication can be varied to suit the needs of the patient and that it is well suited for use in patients in whom, because of the anatomy of the vessels, there is difficulty in making the systemic artery reach the pulmonary. No reports of the operation other than those by its originators have appeared. In a second paper they reported forty-five completed operations with 4 deaths (8.8 per cent) and seven explorations with 3 deaths.

AORTIC RING

The majority of anomalies of the aortic arch, exclusive of patent ductus arteriosus, give rise to few symptoms and have received little attention from a surgical point of view. Recently several of these abnormalities have been recognized as factors capable of producing troublesome and sometimes fatal compression of the trachea or esophagus. In 1945 Gross emphasized the importance of such anomalies and was the first to treat them successfully by surgical means.[46] The conditions to which he has directed particular attention are: (1) right aortic arch in which the aorta passes behind the esophagus, with variable arrangements of the vessels arising from the arch which, often in conjunction with a patent ductus arteriosus or a ligamentum arteriosum, cause compression of the encircled trachea or esophagus, and (2) double aortic arch in which the ascending aorta splits in two limbs encompassing the trachea and esophagus and joining beyond to form the descending aorta. The posterior limb passes behind the esophagus and the anterior one in front of the trachea.

Whether symptoms develop as a result of such anomalies depends on the size of the space between the encircling vessels in relation to the size of the encircled trachea or esophagus. The symptoms appear soon after birth, are referable to the compressed viscera and consist of dysphagia, wheezing respiration, stridor, retraction of the chest and cough, all of which are increased during the act of swallowing. Frequent bouts of bronchitis or pneumonia result from aspiration into the bronchial tree of material spilled over during attempts to swallow. The diagnosis is readily made by roentgenologic means, whereby indentations can be seen in the esophagus after ingestion of barium sulfate, and narrowing of the trachea is visualized after instillation of iodized oil.

The operation consists in relieving the constricting ring by dividing it at appropriate points. This may entail (1) division of the anterior limb of a double aorta at a safe site; (2) division of a patent ductus or ligamentum arteriosum or (3) a combination of the two procedures. Gross obtained cures in 2 patients using these methods. These are the first and only surgically treated patients that have been reported. With the recent emphasis placed on it, this condition should be more frequently recognized and more adequately treated.

CONCLUSION

In conclusion I should like to emphasize the following points:

1. Surgery of the heart and associated great vessels has made remarkable strides in the past few years.

2. The rapidly growing interest in this type of surgery is sure to result in further advances. The recent attempts at surgical attack on certain types of valvular disease by Smithy[47] and by Gibbon[48] and the efforts at closure of interauricular septal defects reported by Gordon Murray[49] are evidence of this statement.

3. It behooves the medical profession in their efforts to reduce the present ravages of heart disease to be aware of what can be accomplished by surgical treatment.

AUREOMYCIN THERAPY OF ROCKY MOUNTAIN SPOTTED FEVER

SIDNEY ROSS, M.D.
EMANUEL B. SCHOENBACH, M.D.
FREDERIC G. BURKE, M.D.
MORTON S. BRYER, M.D.
E. CLARENCE RICE M.D.
and
JOHN A. WASHINGTON, M.D.
Washington, D. C., and Baltimore

Aureomycin is an antibiotic derived from a strain of Streptomyces aureofaciens).[1] It has been found to protect mice and guinea pigs infected with the rickettsia of Q fever, Rocky Mountain spotted fever, murine typhus and rickettsial pox.[2] The drug is readily absorbed after oral administration. Although quantitative assay in the body fluids has not been satisfactory, low levels (0.3 to 2.5 micrograms per millimeter) have been detected in the blood serum and levels up to 320 micrograms per milliliter [3] in the urine. Pharmacologic studies in animals have shown that the toxicity of the drug is low except after intravenous administration where hemoglobinuria and anemia have been noted.[4] In human beings, therapeutic doses up to 60.0 milligrams per kilogram of body weight per day given orally have not been associated with any toxic manifestations except for occasional nausea and vomiting.[5] The latter has been transient and does not contraindicate or prevent continuation of therapy. In the present series the antibiotic was found to be free of any untoward reactions.

In view of the experimental evidence that aureomycin possessed antirickettsial activity, and the absence of toxicity of the drug when given orally, it was decided to treat patients suffering from Rocky Mountain spotted fever, Eastern type, with this antibiotic. Thirteen patients with Rocky Mountain spotted fever, diagnosed clinically and confirmed serologically, have been treated since June 1948.

The response of these patients has been impressive, and it is apparent that aureomycin is an effective therapeutic agent. Seven patients were treated at the Children's Hospital, Washington, D. C. One patient was treated at each of the following hospitals: Georgetown Hospital, Washington, D. C.; Providence Hospital, Washington, D. C.; Arlington General Hospital, Arlington, Va.; Prince George General Hospital, Cheverly, Md.; Sydenham Hospital, Baltimore, and Union Memorial Hospital, Baltimore. Several patients whose disease was diagnosed clinically but as yet unconfirmed serologically are not included in this series. The course of these patients, after treatment with aureomycin, paralleled that noted in the cases presented.

The significant observations in this series of patients are tabulated in table 1 and summarized in table 2. In the latter, data obtained from observation of untreated patients and those treated with para-aminobenzoic acid are included for comparison.

The two case histories presented serve to illustrate the general course of the disease as observed in this series of patients treated with aureomycin.

REPORT OF CASES

CASE 1.—J. K., an 8 year old white boy, was admitted to Children's Hospital on June 25, 1948, with the complaint of fever of two days' duration and a rash of one day's duration. Ten days prior to entry, an embedded tick was removed from the boy's scalp. The child was well until two days before admission, at which time a temperature elevation to 103 F. was observed. On the following day, the temperature fluctuated between 103 and 104 F., and during the afternoon a rash appeared on the arms, legs and chest. Past history and family history were noncontributory.

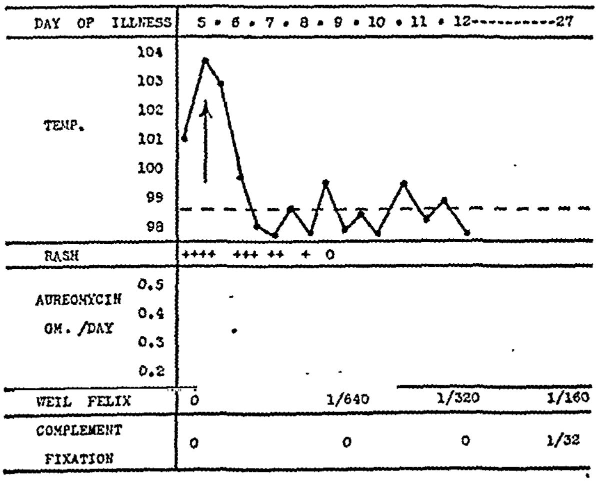

Chart of treatment with aureomycin and observations in a case of Rocky Mountain spotted fever (case 9, W. K., age 3, weight 30 pounds [13.6 Kg.]).

The child was obese and moderately apprehensive, but not critically ill. His temperature was 104 F. A red maculopapular rash which blanched on pressure was observed on his entire body, including the palms and soles. Otherwise the results of his physical examination were negative.

The laboratory examinations showed a hemoglobin level of 13 Gm., 3,900,000 red cells and a white cell count of 6,900, with 63 per cent neutrophils, 34 per cent lymphocytes and 3 per cent monocytes. The results of urinalysis were negative. Subsequent daily blood cell counts and urinalyses during therapy showed no essential variation from the normal. Results of other tests of the chemical content of the blood were normal. Results of cephalin flocculation tests, both on entry and three days later, were negative. On admission, results of a Weil-Felix agglutination test with Proteus OX_{19} and a complement fixation test for Rocky Mountain spotted fever were negative. Seven days later, the Weil-Felix reaction was positive in a titer of 1:160 and the reaction to the complement fixation test performed at the National Institute of Health was positive in a titer of 1:64.

Aureomycin therapy was started within two hours after admission. Initially the patient received 50 mg. every hour

for three doses and then 100 mg. every four hours. The drug was well tolerated, and no nausea or vomiting was encountered. Within three days after initiation of therapy with aureomycin, the temperature had returned to normal and remained so during the rest of the boy's hospital stay. The rash became petechial and then gradually faded. It had disappeared entirely by the seventh day of his disease and the fourth day of treatment. Aureomycin therapy was discontinued on July 1, after an uneventful convalescence.

Case 9 (table 1).—W. B., a 3 year old white boy, was admitted to the Union Memorial Hospital, Baltimore, on July 19, 1948, on the service of Dr. T. E. Daniels and Dr. Young, with the complaint of fever for five days and a rash of four days' duration. Nine days prior to entry, an embedded tick was removed from the boy's scalp. The child was well until five days before admission, at which time fever was observed. On the following day, the fever continued and a rash appeared on the arms and legs. It spread rapidly to involve the face and trunk. Past history and family history were noncontributory.

The child was well developed and well nourished. He appeared acutely ill and slightly lethargic. His temperature was 103 F. An erythematous maculopapular petechial rash was present on his head, trunk and extremities, including his palms and soles. There was moderate generalized adenopathy. His spleen tip was palpable 2 fingerbreadths below the left costal margin. Slight nuchal rigidity, with positive Kernig and Brudzinski signs, was present. Otherwise the results of the physical examination were negative.

The laboratory examination of the blood showed a hemoglobin of 11.0 Gm.; the white cell count was 12,250, with 73 per cent neutrophils, 24 per cent lymphocytes and 3 per cent monocytes. Repeated urinalyses were normal. The nonprotein nitrogen in the blood was 24 mg. per hundred cubic centimeters, and the total protein was 6.4 Gm. per hundred cubic centimeters. The reaction to the cephalin flocculation test was negative. On admission, a Weil-Felix agglutination test with Proteus OX_2 and OX_{19} and a complement fixation test for Rocky Mountain spotted fever performed by Dr. Herald Cox showed negative reactions. Four days later, the result of the Weil-Felix (OX_{19}) test was positive in a dilution of 1:640. The reaction to the complement fixation test was still negative. Three weeks later, the agglutination for Proteus OX_{19} was positive in a dilution of 1:160, and the complement fixation titer was 1:32.

Aureomycin was administered on the day of admission. The patient was given 50 mg. every hour for three doses. Thereafter 50 mg. of the antibiotic was given every three hours. The drug was well tolerated, and no nausea or vomiting occurred. Within two days after intiation of treatment, the temperature had returned to normal and the patient was alert and eating well. The rash disappeared by the fourth day of treatment. Aureomycin therapy was discontinued after five days, and the patient was discharged from the hospital as cured on the seventh day after treatment was begun. When seen three weeks later, the patient was well. The clinical course of this patient is illustrated in the chart.

COMMENT

It was considered advisable to give three initial "loading" doses of 2 to 5 mg. of aureomycin per kilogram of body weight at hourly intervals and then the same dose every two hours thereafter as maintenance therapy. The dosage schedule was usually changed to four hour intervals after the temperature had been normal for approximately forty-eight hours. In this series aureomycin was administered for a mean period of six days; the shortest period of therapy was four and one-half days, while the longest was nine days. No exacerbations of fever were noted in any case after cessation of treatment with the drug. There seemed to be no definite correlation between the total amount of the drug given and the duration of fever after initiation of therapy. Thus in cases 1 and 8 (table 1) 2 mg. of aureomycin per kilogram of body weight per dose was administered, and the temperature became normal within approximately the same period of time (i. e., two days) as in cases 2 and 3 in which 11 and 12 mg. per kilogram of body weight per dose were given. The total amount of aureomycin administered in our series ranged from 2.3 to 16.3 Gm., with an average of 9.5 Gm. per patient.

The optimal dose of aureomycin in spotted fever has not been determined in this study, and further investigation will be required to define the dosage range within which salutary results may be expected. However, it would appear that an excellent clinical response may be expected when daily doses of 30 to 60 mg. of aureomycin per kilogram of body weight are given orally in this disease. The intramuscular or intravenous routes of administration of aureomycin were not used in these patients.

Definite toxic manifestations were not noted. Some nausea and vomiting was encountered in 4 cases during the first two days of treatment. In 2 of the patients, the simultaneous administration of aluminum hydroxide tablets seemed to mitigate these symptoms. It was difficult to dissociate the nausea and vomiting often encountered in spotted fever from that which might have been attributed to aureomycin. The older children in the group were able to swallow the capsules of aureomycin (50 or 100 mg. per capsule) without too much attendant difficulty. In the younger children it was given as a solution in tap water or incorporated in a syrup. No vomiting of the drug was encountered after the second day of treatment.

Incidence of complications (including pneumonia, myocarditis and parotitis), percentage	26.6	17.6	0
Deaths, percentage	10	0	0

* It is to be noted that the duration of the rash in both the patients treated with para-aminobenzoic acid and those treated with aureomycin represents the post-treatment interval.

The rash usually disappeared within three to five days after the initiation of drug therapy in the patients who were treated early (i. e., within two to four days after onset of the disease), and in these patients the rash did not become petechial. However, in cases 2 and 5, in which the drug was started on the eighth day of the disease, the rash was slow to fade and the petechial manifestations of the rash were still present after one week.

The rapid defervescence observed in all patients treated with aureomycin was matched by the striking clinical improvement. The majority of patients on admission to the hospital were toxic, irritable, anorexic and lethargic. However, within twenty-four to forty-eight hours after starting aureomycin therapy, the children were much more active and alert and showed a return of appetite and interest in their surroundings.

Adjuvant therapy, such as isotonic sodium chloride solutions, plasma and blood, which had been found to be important in the management of spotted fever in past years, was used in only 2 cases (cases 2 and 5); in both instances the disease was in its eighth day before treatment with the drug was started, and both children were in need of supportive therapy. In the other 11 cases, however, the response to aureomycin was so rapid and the course of the disease so promptly altered that no supportive treatment was required, since the children took adequate food and drink within twenty-four to forty-eight hours after the antibiotic therapy was started.

COMPARISON WITH PREVIOUS METHODS OF MANAGEMENT OF SPOTTED FEVER

In view of the endemic concentration of Dermacentor variabilis in the Maryland and Virginia areas, we have had a good opportunity to study spotted fever since its identification in the East in 1931 by Badger, Dyer and Rumreich.[6] In the seventeen years up to and including 1947, there have been 47 patients admitted to Children's Hospital. These patients have been described in previous reports.[7]

From 1932 to 1945, prior to the advent of para-aminobenzoic acid (PABA), 30 cases were observed. The patients were treated only with supportive and symptomatic therapy. Complications were frequent, and the mortality rate in this group was 10 per cent. The average duration of fever in these cases was eighteen days, while the rash persisted for twelve days, usually becoming petechial after the first week. The average hospital stay was twenty days, while the incidence of complications (including pneumonia, myocarditis and parotitis) was 26.6 per cent.

During the summers of 1946 and 1947, there were 17 patients with spotted fever, all of whom were treated with para-aminobenzoic acid. There were no deaths in this group. The average duration of temperature following treatment with para-aminobenzoic acid was six days, and the rash generally persisted for an equal period of time (i. e., six days). The usual duration of hospital stay was twelve days, while complications were observed in 17.6 per cent of the patients. This represented a distinct improvement over that previously encountered in the group who received no specific therapy.

In the present series of patients treated with aureomycin during the summer of 1948 there were 13 patients. Aureomycin was found to be superior to para-aminobenzoic acid for several reasons. First, the temperature response was much more dramatic. In all 13 cases a rapid defervescence to normal by crisis was noted; the average duration of fever after initiation of treatment with the drug was two and one-third days. It was significant that even in the 2 patients with spotted fever who were not treated with aureomycin until the eighth day of their illness (cases 2 and 5) there was an equally dramatic drop in temperature within thirty-six and seventy-two hours, respectively, and a concomitant improvement clinically. This is to be contrasted with previous experience with para-aminobenzoic acid, where, in 7 patients treated after the seventh day of illness, the average duration of fever following institution of therapy was ten days. Of the 3 patients who were severely ill and in whom complicating pneumonitis developed in the series in which para-aminobenzoic acid was used, 2 were started on para-aminobenzoic acid therapy on the eighth day, while the third received the first dose on the sixteenth day. There appears to be little doubt, both from the reports of others[8] and from our own observations,[7c] that favorable therapeutic results were not obtained with para-aminobenzoic acid unless treatment was started before the seventh day of the disease. In the treatment of advanced disease, it would appear, from these preliminary studies, that aureomycin is preferable to para-aminobenzoic acid because of the rapidity of the therapeutic response to this antibiotic. The duration of the rash in the group treated with aureomycin was shorter than in the series treated with para-aminobenzoic acid, averaging four days. Therapy with aureomycin cured the patients and permitted them to be discharged from the hospital more expeditiously, the average stay in the hospital being eight days. Some of the patients were retained in the hospital for a longer period of time than was considered necessary from the point of view of treatment in order to obtain serologic confirmation of the diagnosis. There were no complications in the patients treated with aureomycin.

J.: Para-Amino Benzoic Acid in the Treatment of Rocky Mountain Spotted Fever: A Report of Its Use in Seventeen Cases, J. Pediat., to be published.

A comparison between the toxicity of para-aminobenzoic acid and aureomycin should be of interest because any drug destined for widespread usefulness must not be too toxic. In previous reports on the use of para-aminobenzoic acid in spotted fever[7b,c] it was noted that this drug would produce leukopenia in a certain number of cases, and when this occurred the drug had to be discontinued. In addition, many of the patients receiving para-aminobenzoic acid showed a 3 plus and 4 plus cephalin flocculation reaction and a significant drop in the prothrombin level. These observations indicate that there is the possibility that para-aminobenzoic acid exerts an untoward effect on hepatic function. Damage of the liver and kidneys has been observed in postmortem examination of several children treated with para-aminobenzoic acid in diseases other than spotted fever.[9] In addition to daily white cell counts and frequent tests of hepatic function, it was necessary, in following a patient treated with para-aminobenzoic acid, to perform daily tests of para-aminobenzoic acid levels, as well as levels of blood nonprotein nitrogen and carbon dioxide at frequent intervals.

Aureomycin to date appears to be relatively nontoxic when administered orally. No evidence of toxic manifestations other than slight nausea and vomiting was encountered either in the patients with spotted fever or in a control group of normal children. In this latter group, which will be reported more fully elsewhere, a series of laboratory studies (including blood studies, urinalyses, blood nonprotein nitrogen determinations, carbon dioxide–combining power, cephalin flocculation, prothrombin levels, total proteins, Van den Bergh, blood sugar, platelet and reticulocyte counts, bleeding and clotting times and fragility tests) were performed at regular intervals while the subjects were receiving aureomycin in therapeutic doses. No significant changes were encountered in any of these children during the seven days that the drug was given. It is possible, however, that toxic manifestations might yet be noted after a much larger series of patients treated with this drug has been observed. Although no allergic reactions have been encountered so far in our experience, this does not rule out the possibility that such reactions may occur.

CONCLUSIONS

Aureomycin, a new antibiotic, was used in the treatment in 13 cases of Rocky Mountain spotted fever during the summer of 1948. The temperature subsided rapidly, within an average period of two and one-third days, and striking clinical improvement was observed in all of the patients. No toxic effects from the drug were noted. Comparison with para-aminobenzoic acid would indicate that aureomycin is a more effective agent in the treatment of spotted fever.

THE USE AND ABUSE OF ESTROGEN

ROBERT A. KIMBROUGH, M.D.
and
S. LEON ISRAEL, M.D.
Philadelphia

Our knowledge of the physiology of the ovary has passed beyond the original concept of a simple endocrine gland which might possibly produce symptoms by means of quantitative variations of its secretions. The advances of the last two decades have made available clinically useful preparations of the two hormones of the ovary, estrogen and progestogen. This paper deals with estrogen—the hormone of growth and preparation—the more widely employed of the two.

When estrogen first became available for clinical use, there was an understandable overenthusiasm for its application. The rational indications, however, of estrogen usage have contracted measurably following earlier empiric trials. Nevertheless, there is still much confusion concerning estrogenic dosage and the avoidance of undesirable side actions. If one depends on the beautifully embossed brochures which exhort the practitioner with every mail, one falls, unhappily, into the security of the illusion that there are neither contraindications nor side effects in the use of estrogen. Such pamphlets, while providing succinct clinical reviews and emphasizing the multiple commercial forms of estrogen, are often full of omissions.

PREREQUISITES OF ESTROGEN THERAPY

It seems expedient to reemphasize four basic maxims, the observance of which is prerequisite to the administration of estrogen.

1. *Preliminary Physical Examination.*—Prior to prescribing estrogen, a complete survey of the patient must be made to exclude the presence of any organic gynecologic or constitutional disorder which would preclude its use. The ordinary diagnostic procedures, including complete physical examination, blood count, urinalysis, serologic study, biologic tests for pregnancy and determination of the basal metabolic rate, should be employed as indicated.

2. *Consideration of Menstrual Physiology.*—Inasmuch as estrogen is a potent force in the regulation of menstruation, knowledge of the patient's menstrual cycle is of paramount importance. Despite the fact that most physicians have some understanding of the current concept of menstrual physiology, and at the

---

From the Department of Gynecology and Obstetrics, Graduate School of Medicine, University of Pennsylvania.

risk of being somewhat pedantic, a brief review of its cardinal features is presented.

The cyclic ovarian changes are governed by the follicle-stimulating, luteinizing and luteotrophic hormones of the anterior lobe of the hypophysis. These are responsible for maturation of the follicle, ovulation, luteinization and maintenance of the corpus luteum. The recurring changes in the endometrium are, in turn, dependent on the hormones estrogen and progestin, secreted respectively by the ovarian follicles and the corpus luteum.

At the conclusion of the menstrual flow, resulting from the presence of estrogen, the endometrium changes from a thin layer of cells practically devoid of glands to a tall, richly glandular tissue. Throughout this phase, the cells of the endometrial glands are filled with the growth-associated enzyme, alkaline phosphatase.[1] After the ripening of one follicle, ovulation occurs during the midportion of the cycle. The empty follicle collapses and is transformed within a few days into a corpus luteum. The luteotrophic gonadotrophin supports the continued function of the corpus luteum, stimulating the production of both estrogen and progestin for a limited time.

During the second half of the cycle, progestin causes the estrogen-primed endometrium to become a hyperemic, highly functional tissue. The cells of the endometrial glands are, at this time, richly endowed with the nutritive substances which are necessary for the embedment and support of a fertilized ovum. If fertilization does not occur, the corpus luteum disintegrates because of failure to receive the support of trophoblastic luteotrophin. Almost immediately thereafter, the endometrium, so earnestly constructed to house a pregnancy, suffers from the withdrawal of the corpus luteum hormones and is dismantled by the process of menstruation.

3. *Evaluation of Pharmacologic Principles.*—The ovarian hormones, estrogen and progestin, belong to the steroid family of hormones, a group which also includes androgens and the adrenocortical hormones. The ovarian steroids have been chemically identified, their structural formulas are known, they are available in pure crystalline forms and have been made synthetically. They are stable and will remain potent indefinitely without refrigeration. Inasmuch as they contain no protein, neither of them per se gives rise to allergic manifestations, but they are frequently dispensed in vegetable oils which have been known to evoke sensitization. They may be administered intramuscularly, orally and by absorption through skin or mucous membrane. They have the significant dual ability of acting both on the genital end organs and on the anterior lobe of the hypophysis. The latter propensity, especially true of estrogen, has bearing in its use in the regularly menstruating woman because it may disturb the rhythm of her cycle by depressing the production of hypophysial gonadotrophins.

4. *Selection of Patients.*—Of equal importance with the previously stated maxims is the realization that no 2 patients ever present the same endocrinologic problem. The value of such individualization is clearly emphasized by the varied treatment accorded the same endocrinopathy at different ages. Moreover, not only must treatment be directed to the disorder in question, but it must also be so administered that associated derangements are aided. Whenever necessary, advice relevant to better living habits and to the solution of unsolved social problems should be proffered. Finally, adjuvant medication, such as iron, and dietotherapy should not be overlooked.

USES OF ESTROGEN

The physiologic effects of estrogen make it clinically useful in three broad categories—to achieve growth of all or part of the genital tract, to depress temporarily the function of the anterior lobe of the hypophysis and to effect an antiandrogenic action. In the first instance are included the treatment of atrophic vaginitis and the adjunctive therapy of amenorrhea; in the second, the suppression of lactation and the alleviation of the menopausal syndrome, and, in the third group, the temporary resolution of the metastatic lesions of prostatic carcinoma and the restraint of postoperative erections following penile plastic operations.[2]

Atrophic Vaginitis.—Postmenopausal vaginitis occurs because of the extreme vulnerability of the atrophic vaginal mucosa to trauma and infection. The cessation of ovarian function, depriving the vagina of the trophic effect of estrogen, results in diminution of the layers of the epithelium, disappearance of the glycogen content of the cells and loss of the protective vaginal flora. Deprived of these natural barriers to infection, the vagina becomes fertile soil for bacterial growth. The atrophy and subsequent infection give rise to the symptoms of irritating leukorrhea, introital paresthesia and dyspareunia. Trichomonas vaginalis is often a secondary invader under such circumstances.

Since the absence of estrogen is the basic cause of this disorder, it is logical to administer estrogen to restore the vaginal epithelium to its former height and state of resistance. The dosage of estrogen employed for this purpose should be small, inasmuch as the vagina responds to very small quantities. It may be given effectively orally as either 0.5 mg. of diethylstilbestrol or 0.625 mg. of estrone sulfate daily for several weeks. Given intravaginally, smaller quantities of estrogen may be employed. The nightly introduction of a vaginal suppository containing 0.2 mg. of estrone is satisfactory, but many patients object to it because of nocturnal soiling. However prescribed, the estrogen should be discontinued within a month and repeated only if required for a recrudescence of symptoms.

Secondary Amenorrhea.—The causes of secondary amenorrhea are so protean that intelligent therapy cannot be applied without a complete investigation of the constitutional background of each amenorrheal woman. The treatment of amenorrhea with estrogen alone is notoriously unsatisfactory. Estrogen evokes only the proliferative phase of endometrial growth. Although uterine bleeding may result from such growth, it is not menstruation.

The objective of estrogen therapy in amenorrhea is the cure of uterine hypoplasia. If such atrophy—perhaps the sequel of a previously existing pituitary-ovarian deficiency—is the sole cause of the amenorrhea, fair results may be obtained from treatment with estrogen. In such women, the endometrium is rebuilt to a point of normal responsiveness, and, in effect, the estrogen acts merely as the "starter" which sets the abeyant cycle in motion. Unfortunately, this applies to few amenorrheal women.

---

[2] Vermooten, V.: Value of Estrogens in Penile Plastic Operations, J. Urol. **58**: 391 (Nov.) 1947.

An effective technic of employing estrogen in the treatment of amenorrhea is its administration with the corpus luteum hormone, progestin. They may be given either together, as a combined injection, or separately in consecutive manner. In the former method, the amenorrheal patient may be given a combined intramuscular injection of 2.5 mg. of estradiol benzoate and 12.5 mg. of progesterone on two successive days. Using the consecutive style, one may administer 1.5 mg. of estradiol benzoate intramuscularly every third day for five doses and follow immediately with five daily injections of 10 mg. of progesterone. Such dual therapy, combined or cyclic, is generally repeated for three consecutive months.

When parenteral medication is to be avoided, estrogen and progestin may be administered orally. A suitable schedule, for example, is the use of 2 mg. of diethylstilbestrol daily for fifteen days, followed by 60 mg. of pregneninolone, the "oral progestin," daily for five days.

It must be remembered that *neither estrogen alone nor estrogen with progestin gives permanent results in amenorrhea unless other measures are taken simultaneously to restore the general health of the patient.*

Puerperal Engorgement of the Breasts.—One of the most satisfactory uses of estrogen is the prevention of breast engorgement when postpartum inhibition of lactation is desired. If the administration of estrogen is started immediately after delivery, there is generally entire freedom from pain and engorgement, as well as distinct depression of lactation. In fact, when suckling is not permitted, lactation, in the clinical sense, rarely occurs. If the administration of estrogen is started after lactation has been established, relief from engorgement and subsidence of lactation are hastened.

The dosage of estrogen required to prevent puerperal breast engorgement is relatively small. Intramuscular administration for this purpose is not required. As little as 1 mg. of diethylstilbestrol, or its equivalent in natural estrogen (such as 1.25 mg. of estrone sulfate), given orally three times daily for a week is adequate. The estrogen is then best withdrawn gradually by a reduction of one dose daily for several days.

The danger of administering estrogen during the puerperium is its propensity to create hyperplasia of the regenerating endometrium, which may result in abnormal bleeding. This unwanted effect may be avoided by employing only small doses of estrogen for a limited period and by discontinuing its use gradually.

Menopausal Syndrome.—Most women do not require treatment for the menopausal syndrome. In this majority group, the flushes, nocturnal sweats and nervous instability are mild and may be completely mitigated by consultation alone. An explanation of the temporary nature of the symptoms and of their tendency to disappear spontaneously after a variable time, coupled with the sympathetic prescription of a mild sedative, may be all that the patient requires. However, when the symptoms are troublesome, there is no more specific therapy than estrogen.

The orally administered estrogens are ideal for menopausal therapy; there is virtually no need for parenteral administration. The smallest oral dose required to assuage the vasomotor symptoms should be prescribed. Whether one employs a daily dose of 0.5 mg. of diethylstilbestrol, 0.625 mg. of estrone sulfate or 0.02 mg. of ethinyl estradiol is immaterial. The important rules are to prescribe the estrogen for a limited period and to withdraw it in a gradual manner. The most prevalent abuse in the usage of estrogen is the prescription of a routine daily dose to be taken more or less indefinitely. This often results, even in women in whom menstruation has long since ceased, in the occurrence of uterine bleeding. Such bleeding also frequently follows sudden withdrawal of the estrogen. It must be emphasized that the objective of estrogen therapy of the menopausal syndrome is to aid the patient's adjustment to the diminution and cessation of ovarian function. This logical aim is lost if the estrogen is not prescribed for measured periods, with repeated attempts to withdraw the hormone entirely. When the latter is accomplished gradually, withdrawal bleeding is generally avoided.

Postmenopausal uterine bleeding evoked by estrogen is most often caused by faulty dosage and incorrect method of withdrawal. It does, however, also occur in some of the properly controlled patients, in whom the *endometrium is peculiarly sensitive to estrogen.*

The unfortunate faculty of estrogen of inducing uterine bleeding in the postmenopausal woman is indirectly responsible for many instances of neglected carcinoma of the uterus. Prior to the almost universal use of estrogen for the relief of the menopausal syndrome, postmenopausal metrorrhagia was most frequently the result of uterine carcinoma. However, the current prevalence of estrogen usage has altered the incidence. The physician, faced with postmenopausal bleeding, may unfortunately lapse into a false state of security, tending—without proper examination of the patient—to attribute the bleeding to previously administered estrogen. The natural and proper suspicion in all cases of postmenopausal uterine bleeding should be carcinoma of the uterus, and the attending physician should be impelled to inspect the cervix (executing a biopsy if indicated) and to perform diagnostic curettage. That these admonitions are not universally borne in mind is well illustrated by the recorded experience of many cancer clinics. In support of this, we are privileged to cite statistics from the files of the Philadelphia Committee for the Study of Pelvic Cancer, a commission devoted to study of the histories of patients with pelvic cancer in order to analyze the factors which delay diagnosis. From December 1945 to December 1946, this committee uncovered 116 instances of unwarranted delay in the diagnosis of pelvic cancer. Of these 116 instances, 78 were classified as "physician delay" and the remaining 38 as "physician and patient delay." More significant, perhaps, is the disturbing fact that 31 of the 116 patients were given medication, oral or hypodermic, in the presence of symptoms suggestive of uterine cancer, without examination. Such a practice, particularly if the patient presents abnormal uterine bleeding, is reprehensible and criminally negligent. That such neglect may stem directly from indiscriminate prescription of estrogen is illustrated by the following 2 case histories selected at random from the 116 mentioned:

Case 1.—G. N., a white woman aged 41, had prolonged, scanty menstrual flow and menopausal vasomotor symptoms in January 1946. During February she bled intermittently for two weeks. She was advised by a physician in March—without benefit of pelvic examination—that she was "changing" and that she required "needles." The latter were given twice weekly for two months with relief of the vasomotor symptoms but not of the metrorrhagia. At that time, May 1946, the patient visited another physician who removed "a small growth from the mouth of the womb" and advised additional "injections." These were administered weekly until the end of June, when the patient experienced a sudden vaginal hemorrhage. The final diagnosis was squamous cell carcinoma of the cervix, stage III.

Case 2.—A. W., a Negro woman aged 50, had a sudden episode of menorrhagia and summoned a physician who did not examine her but prescribed tablets "for the change of life." Menorrhagia was repeated the next month and was followed by intermittent metrorrhagia. Noting no relief after taking the medication for two months, the patient saw a second physician who examined her and recommended admission to a hospital. The diagnosis was squamous cell carcinoma of the cervix, stage III.

These histories are shocking examples of the glaring omission of pelvic examination and of the too facile prescription of estrogen. No further comment seems necessary to emphasize the importance of pelvic examination before prescribing estrogen. Frequently, however, mere pelvic examination is not sufficient. When a postmenopausal woman who has taken estrogen begins to bleed, one does not know whether the bleeding is estrogen evoked or caused by cancer. In this dilemma, the physician may either wait expectantly, observing the effect of the complete withdrawal of estrogen, or he may perform an immediate diagnostic curettement. If he decides to wait, it is his duty to keep the patient under close observation in order that the curettage be done promptly should the bleeding continue. If estrogen evokes bleeding in a menopausal woman, she should avoid such therapy in the future. If the patient's persisting, severe, menopausal symptoms demand treatment, one may resort to testosterone propionate at a parenteral dosage of less than 300 mg. monthly—a quantity which ordinarily does not induce virilization.

Estrogen should never be administered in anticipation of menopausal symptoms. Its allegedly prophylactic use, advocated for the prevention of symptoms which may follow surgical castration, seems to be highly illogical and unnecessary. As stated previously, many women who suffer a loss of ovarian function experience no symptoms and require no therapy. In others who do, temporary estrogen therapy should be governed solely by the severity of complaints.

Prostatic Carcinoma.—The endocrine theories of Huggins[3] regarding advanced prostatic cancer have led to the recent use of estrogen in its management. Carcinoma of the prostate is often stimulated to growth by androgen. Conversely, in many patients, the inactivation or diminution of circulating androgen results in temporary regression of the cancer. This is true of malignant cells in the prostate gland and in the metastatic lesions. A decrease of circulating androgen may be accomplished by either castration or the administration of estrogen. Although castration does terminate the production of androgen of testicular origin, it does not affect the adrenal secretion of the hormone. In fact, castration may, by stimulating the functional activity of the anterior hypophysis, result in an increased supplemental secretion of androgen by the adrenal glands. It is, therefore, contended by some that the administration of estrogen, through its pituitary-depressing action, may be more effective than castration in curtailing the production of androgen.[4] The urologists have resolved this controversy by the simple expedient of employing both castration and estrogen in the treatment of prostatic cancer. Moreover, estrogen is especially valuable in men who, despite previous castration, are suffering from metastases of prostatic cancer. In such patients, estrogen not only alleviates the symptoms of the metastases, particularly the pain of osseous lesions, but also lowers the serum acid phosphatase. The latter is a definite reflection of the regression and lessened activity of the metastatic cancer cells. It must be emphasized, however, that such treatment is not curative. The estrogen-evoked diminution of the primary growth and the recession of metastases are temporary improvements, maintained for variable periods of time.

Both the synthetic and the natural estrogens may be employed in this form of therapy. The dose is entirely empiric, but should be sufficient to obtain a clinical effect. The use of diethylstilbestrol permits the best oral dosage, an adequate quantity being 1 or 2 mg. three times daily. Estradiol benzoate or estradiol dipropionate may be administered intramuscularly, especially in initiating therapy, at a dose of 5 mg. twice weekly. The duration of the estrogen therapy must be determined by the disappearance of clinical evidence of the prostatic cancer or of its metastases and by the degree of gynecomastia, an untoward side effect of the treatment. There is, of course, no objection to repeated courses of estrogen—as long as the patient properly responds to its use.

ABUSES OF ESTROGEN

There are several prevalent abuses in the clinical application of estrogen, some of which are potentially dangerous. In addition to the thoughtlessness of failing to limit the duration of treatment with estrogen, as discussed previously, physicians often overlook certain contraindications to its use. Estrogen therapy, we believe, should be avoided in the following circumstances.

Premenopausal Menstrual Irregularity.—The current tendency to prescribe estrogen for women during the fifth decade because of indefinite "middle-age complaints," manifestations rarely of menopausal origin, should be condemned. Estrogen therapy of the menopausal syndrome is intended to alleviate the vasomotor, nervous and arthritic symptoms in a woman who has ceased to menstruate. Estrogens are ill advised in the woman approaching the menopause who has vasomotor symptoms but who also exhibits irregular menstruation. Under such circumstances, estrogen may result in even more irregular bleeding and may also prolong the climacteric adjustment. The danger of confusing estrogen-evoked bleeding with metrorrhagia of more serious origin has already been discussed.

Residual Endometriosis.—Estrogen is contraindicated in women who have castration symptoms after the removal of both ovaries because of endometriosis. It must be assumed that any patient who has undergone bilateral oophorectomy because of advanced and disseminated endometriosis still harbors foci of ectopic endometrium in the remaining pelvic tissue. Such foci are but asymptomatic, microscopic lesions following the regression of castration. It should, however, be no surprise that these receded endometrial lesions are reactivated by the administration of estrogen. The resultant symptoms depend entirely on the site of the resurgent tissue. If, for example, the residual endometrium lies in the rectal wall, estrogen-evoked functional reactivation may result in serious intestinal hemorrhage.[5] It is best, then, to avoid estrogen entirely in any woman castrated because of endometriosis. If her castration syndrome cannot be controlled by means of sympathetic reassurances and mild sedatives, androgen therapy should be tried.

Carcinoma Background.—The impression has been created that estrogen is carcinogenic, particularly in regard to carcinoma of the breasts and uterus. This implication arose from the induction of cancer in experimental animals. In such experimentation, either cancer-susceptible strains or huge dosages of estrogen were employed. The results of such laboratory investigations are not directly applicable to man. For instance, it is impossible to administer quantities of estrogen in a human being comparable to those given to experimental animals.[6] Moreover, the clinical evidence of the alleged carcinogenic tendencies of estrogen in the human female is purely clinical and, therefore, rather indirect.[7] Nevertheless, there are so-called "cancer families," in whom a susceptibility to cancer appears to be dominant. The suspicion must be entertained that women of such families have a potentially malignant substratum. Even though it is generally agreed that estrogen per se is not carcinogenic, it cannot be denied that it is a stimulant to growth of the breasts and uterus, which are frequent sites of carcinoma in the female. There is also no doubt that estrogen will accelerate the rate of growth of an existing carcinoma of either the uterus or the breast, as well as of any metastasis derived therefrom. This is best evidenced by the salutary effect of castration following radical mastectomy for carcinoma. If there is, then, a clearcut history of multiple instances of either mammary or uterine cancer in a patient's family, it is safer not to administer estrogen to that patient. It is an obvious corollary that estrogen is also contraindicated if the patient herself is a salvaged survival type of malignant neoplasia.

Palpable Benign Tumors.—The mammary ducts and the connective tissue around them are stimulated to growth by estrogen. It should not, therefore, be administered—for any reason—to a patient who has, or who has recently had excised, a fibroadenoma of the breast.

The presence of a palpable uterine fibromyoma constitutes a contraindication to the use of estrogen. Although the quantity of estrogen required to induce growth and increased vascularity of an existing myometrial tumor is not known, it is conceivable that even minimal dosage could exert an adverse effect.

Hepatic Insufficiency.—It is well established that the integrity of the liver is important to the normal metabolic fate of the steroid hormones, including estrogen.[8] The liver, for instance, through its inactivation of circulating estrogen, plays a dominant role in determining how much biologically free, circulating estrogen is available to effect changes in estrogen-stimulated end organs, such as the mammary glands. This is well illustrated by the recently reported syndrome of gynecomastia and testicular atrophy in association with cirrhosis of the liver.[9] The gynecomastia and testicular atrophy result from the failure of the cirrhotic liver to metabolize estrogen properly, permitting the circulation of a too potent form. Although it cannot be shown that these untoward effects of improper estrogen metabolism occur in any but the most advanced instances of hepatic disease, it is conceivable that severe hepatitis may temporarily result in hepatic decompensation sufficient to cause failure of estrogen inactivation. In fact, it is asserted, on the basis of animal experimentation and some clinical data, that the steroid inactivation function of the liver is controlled by certain nutritional factors.[10] Prominent among the latter is vitamin B complex, although certain amino acids and the total protein intake are also important.[11] Although the nutritional concept has not met with universal acceptance,[12] the possibility of deficient hepatic inactivation of estrogen—albeit one requiring severe hepatic disturbance[13]—is recognized. Therefore, it seems wiser, at least until further investigation clarifies the problem, to avoid the use of estrogen in patients giving a recent history of hepatitis.

SUMMARY

Four prerequisites of the clinical use of estrogen are defined.

The currently accepted usages of estrogen in the treatment of atrophic vaginitis, amenorrhea, puerperal engorgement of the breasts, the menopausal syndrome and metastases of prostatic cancer are critically reviewed. It is observed that oral administration of estrogen is entirely satisfactory, except in certain instances of amenorrhea and in the alleviation of the pain of prostatic cancer, which respond best to parenteral therapy.

It is emphasized that estrogen should never be prescribed without a specific limitation of time. This is especially important in the menopausal patient in whom estrogen is apt to evoke diagnostic disturbing uterine bleeding, impelling uterine curettage. The importance of the latter is illustrated by the citing of 2 instances of neglected uterine carcinoma.

The specific contraindications to estrogen therapy are reaffirmed. The reasons for avoiding estrogen in women exhibiting menstrual irregularities, giving a history of endometriosis, having a family background of cancer, presenting palpable mammary or uterine tumors or suffering hepatic insufficiency are restated. The regrettable use of estrogen as an "all purpose female tonic" is condemned.

PHYSICAL MEDICINE AND PSYCHIATRY, SOME INTERRELATIONSHIPS

WINFRED OVERHOLSER, M.D.
Washington, D. C.

Psychiatrists have probably been interested in physical medicine longer than the practitioners of any other specialty. Even in the time of Hippocrates prolonged warm baths were recognized as of value in certain mental conditions, and as long as there have been institutions for the care of the mentally ill, which made any pretense whatever of treatment, various physical methods have been employed. Hydrotherapy is, of course, the oldest, but there was a time when the static spark and the faradic current were used as well in treatment, the modus operandi being largely psychologic. Within the last ten years the almost undue attention paid to the electroconvulsive type of psychiatric therapy has diverted a good deal of attention from the better established methods of treatment, but it certainly has emphasized the usefulness of physical medicine in the field of psychiatry.

Psychiatry and physiatry have certain things in common: both are new specialties, and both arose under conditions which occasionally savored of charlatanry, with the result that certain suspicions still linger in the minds of some segments of the public. Research in the methods of causation, prevention and treatment has been only very recently developed in either field. Today, however, both have achieved standing and general acceptance as important specialties, built on a sound foundation of investigation and scientific study. There is still need of much further knowledge, however, and need of trained personnel.

It is gratifying to the psychiatrist to see the interest displayed by the practitioners of physical medicine in the psychiatric aspects of their work. So much attention has been devoted to the effects of the various modalities on the tissues and their functions that there has been at times a tendency to overlook the psychologic effect of the methods employed. The more recent work in the field of what has come to be rather cumbersomely termed "psychosomatic medicine" has done much to bring together the thinking of the psychiatrist and the physiatrist. Psychosomatic medicine is, strangely enough, not a new term. It was used in psychiatric literature in Germany over one hundred years ago, but has recently been resuscitated and refurbished so as to give the impression that it is a new discovery. This rediscovery was greatly facilitated by the contributions of William Alanson White and Adolf Meyer, and their interpretations of the "organism-as-a-whole," the concept, that is, that what we refer to as "mind" is merely one aspect of biologic functioning, that this "mental" functioning represents the adjustment at the social level to environmental influences, past and present, internal and external. More recent physiologic researches, stimulated by Cannon and followed up by Wolff and others, have demonstrated effectively the influence which the emotions exert on physical functioning. So much attention has been paid to this aspect of psychosomatic medicine that the obverse of the picture has sometimes been overlooked, namely, the fact that the malfunctioning of the physical organism has much to do with the emotional response of the patient. In other words, the person who is physically ill is not the same person emotionally as he was when he was enjoying good physical health. The hyphen (if "psycho-somatic" were written with one) should be thought of as a two way sign rather than as having one direction only.

More recently another type of treatment long used in psychiatry has been officially taken under the aegis of physical medicine, namely, occupational therapy. Occupational therapy, that is, the application of various types of occupation to the treatment of neurologic and psychiatric disorder, is a valuable adjunct to the application of physical means, such as heat, electricity and massage. Occupational therapy gives vent to the patient for his aggressions; it redirects his interest in topics outside himself and can be useful in developing skills and talents and in determining emotional and physical limitations and handicap levels. It is of value not only in the mental hospital but in the rehabilitation clinic and in dealing with many types of patients who have both physical and psychologic problems. After all, every patient who has one is likely to have the other; the interaction of the two should never be overlooked.

One hears much nowadays of psychotherapy, one of the oldest forms of treatment, but one which is only recently becoming more or less formalized. Presumably every successful physician in every era has utilized psychotherapy as a part of his armamentarium, whether he knew it or not. Psychotherapy is defined by Whitehorn as "the art of modifying a patient's attitudes in a more healthy direction by the personal influence of the therapist." Certainly the physiatrist is in an extraordinarily good position to exert this particular form of influence. In the first place, he has the authority of the physician. The patient comes to him with his complaint expecting that the physician will help him toward greater comfort and efficiency. He finds in the physician's office certain apparatuses which in this day of science make a profound impression. These apparatuses, to be sure, have known physical effects, effects concerning which more is learned daily, but effects which are nevertheless clearly demonstrable.

The fact that in addition there is a symbolic value to these impressive instruments does not in the least detract from their value, their efficiency or usefulness. The patient may, for example, be suffering from some joint, muscle or nerve disability which causes substantial physical handicap. This is a field in which the physiatrist can be of great assistance from the strictly physical point of view. He can do much for his patient as well, however, if he bears in mind that the patient is suffering at the same time from anxieties and concern over the ultimate outcome of the disability and its effect on his economic status or his physical appearance. The importance of the motivation of self recognition, of facing the facts and of encouragement in the case of physical handicaps is coming to be widely recognized. Reassurance and encouragement may, of course, be overdone, but when they are properly administered they can be extremely useful for the patient's peace of mind and happiness. The confidence of the operator, his readiness to deal with situations as they come up and his general behavior are more important than words in giving a feeling of assurance and confidence to the patient. It should be borne in mind that some patients, particularly the more dependent type, are particularly searching for assurance. This is one reason that the quack is so successful, for his chief stock in trade is

Read before the Section on Miscellaneous Topics at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

Superintendent, Saint Elizabeths Hospital, Professor of Psychiatry, George Washington University School of Medicine, and Chairman, Consultants in Occupational Therapy, Council on Physical Medicine, American Medical Association.

assurance and the more ignorant he is the more positive his assurances. It is important for the well trained physiatrist not to misrepresent, not to overpraise and not to make promises which he cannot keep, but he can at the same time make it clear to the patient that he is aware of the latter's needs and that he proposes to do everything possible to meet those needs and restore the patient to a useful and happy life.

Sometimes difficulty is experienced in breaking the dependency of a patient on the physician. This is particularly true of the physiatrist because of the personal contact. Some patients derive a certain amount of erotic satisfaction from the manipulations which they undergo; others are encouraged by these manipulations to fancy themselves in an earlier state, to regress to a level of childhood in which they are fondled by the parent. These situations can develop into rather awkward complications, and they call for a good deal of psychologic understanding on the part of the physiatrist and the utmost of tact and discretion. In certain types of cases it is obvious that massage and other physical manipulations should be avoided on account of their erotic effect. This is especially true in patients with a pronounced homosexual component, for example.

The possibility that the symptoms complained of may be essentially psychogenic should never be overlooked. In an interesting study published recently by Watkins, Cobb, and others [1] it was found in a series of 45 patients who complained primarily of fatigue that about 80 per cent of them were suffering from anxiety neurosis. There is a danger in such cases that overattention to the physical complaint may serve, so to speak, to fix it by directing attention to it and make it more difficult to deal with by psychotherapy. I do not mean by this that the physiatrist should try to make a psychiatrist of himself any more than the reverse should be the case. The two specialties are complementary; indeed, psychiatry is to some extent complementary to all the other specialties in the sense that no specialist can afford in justice to his patient or to himself to overlook the psychologic factors in disease. This does not mean that the psychologic factors may be dealt with only by the psychiatrist. Even if the patient could be induced to consult a psychiatrist, as often he cannot, there are not enough psychiatrists to take care even of the urgent cases. If progress is to be made in the field of psychologic medicine, it must be made by means of the recognition by other specialists of the psychologic factors and their readiness to deal with at least the simpler and more obvious, though sometimes overlooked, factors. The recognition of the unity of the patient, the fact that the patient who comes to the physician is a whole person made up of various organ systems, all of them functioning in a body which in turn is impinged on by external influences of the physical environment and in the form of social and interpersonal forces, influences to which that person is reacting as a unit, is essential, whatever the physician's specialty. The patient's fears, his anxieties, his frustrations, his aggressions, his conflicts and his feelings of guilt must all be taken into account if we mean what we say about the unity of the organism. There is no doubt that this recognition is becoming widespread in the specialty which deals with some of the tangible and demonstrable physical means of healing; namely, physiatry. Much progress has been made, but much room still remains for research, research which can well be carried on jointly by the psychiatrist and the physiatrist.

ISOTOPES FOR MEDICINE

PAUL C. AEBERSOLD, Ph.D.
Oak Ridge, Tenn.

This year marks two important anniversaries for radioactivity in the fields of biology and medicine: (1) the golden anniversary of the discovery of radium for use in radiation treatment and (2) the silver anniversary of the use of radioactive atoms for tracing stable atoms—that is, of the tracer atom technic.

Fifty years ago radium was discovered by Pierre and Marie Curie in France. This led to the wide and valuable use of radioactivity for radiation treatment of certain diseases, particularly cancer. Twenty-five years ago Hevesy in Denmark first used radioactivity to trace the course and behavior of a stable element in a biologic system. This was the inception of the technic of tracing the atoms of stable elements by means of their radioactive counterparts—the radioactive isotopes of that element. The first tracer experiments were done with the naturally occurring radioactive isotopes and were limited to the tracing of the heavy elements lead and bismuth.

As long as radioactivity was a phenomenon found only in the heaviest elements—elements which have little or no presence in biologic material, the use of radioactivity for purposes of treatment or tracer studies was limited in scope. Then came the miraculous discovery by Curie and Joliot in 1934 that ordinary elements, which in nature are found in the stable state, can be induced to become radioactive. It was soon observed that radioactive isotopes could be formed of nearly all the elements. This includes most of the elements that occur in biologic material. The door was thus opened to a wide variety of new possibilities for research and application in biology and medicine.

This was like the fulfilment of a cherished dream. Now investigators had at their disposal radioactive atoms of a wide variety of elements which could be applied in unique ways to biologic and medical problems. The man-made radioisotopes offered new ways of delivering radiation treatment directly to various tissues of the body, as well as a means of following atoms in the thousands of complicated reactions which go on in the human body, either healthy or diseased.

This door to new medical knowledge and application, opened by the advent of artificially produced radioisotopes, did not, however, open wide at first. The man-made radioisotopes could be made in significant quantities only by the use of very high energy nuclear bombardment devices or "atom smashers" such as the cyclotron. Not only were these devices limited in number but the amounts of radioactive materials produced were not sufficient for wide scale application and were rather expensive.

A vastly wider opening of the door into the new world of opportunity in medical research and application became a possibility with the operation of the first successful chain reaction in uranium—the operation of a "nuclear reactor" or "atomic pile"—a development of the wartime atomic energy project. This possibility, however, was not immediately capable of realization because of the secrecy and special purpose which surrounded the wartime program. Actually the new door was really opened wide for the first time just two

---

Chief, Isotopes Division, Atomic Energy Commission, Oak Ridge, Tenn.

Read in a symposium on Atomic Energy in the General Scientific Meetings at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 22, 1948.

years ago, in June 1946, when it was announced that pile-produced radioisotopes would be made available outside the atomic energy project.

Thus, although we have come to the golden and silver anniversaries of the start of two important uses of radioactivity, we are now just coming to the second, or "cotton," anniversary of the wide scale opportunity to realize all the possibilities that radioactive atoms offer in biology and medicine.

I do not wish to generalize further on the subject in this paper. Rather I will give some specific data on the distribution of isotopes for medical and biologic purposes accomplished during the two years of the project's isotope program. Also I will note briefly some examples of the uses actually being made of isotopes in medical research, diagnosis and treatment.

For the first twenty-two months of the distribution of pile-produced isotopes, i. e., from Aug. 2, 1946, to May 30, 1948, I have the following data for the number of shipments, number of using institutions and number of individual projects in which the isotopes are being employed.

Total Number Shipments
  1. For studies in animal and human physiology and medical therapy—2,103
  2. For all fields of study—2,901
  3. For all fields now over 200 per month
Number of Institutions Using
  1. Phosphorus 32 in medical therapy—43
  2. Iodine 131 in medical therapy—38
  3. Radioisotopes in medicine and biologic studies—119
  4. Radioisotopes in all fields of study—229
Number of Individual Projects
  1. In medicine and biologic studies—over 700
  2. In all fields of study—over 1,400

It is evident that the major share of the shipments of isotopes are for investigations in medical therapy and in studies in animal and human physiology. The combination of these two accounts for over 70 per cent of all the shipments. Other biologic uses (studies in plant physiology and bacteriology) account for about 6 per cent of the shipments. The remaining fields of use —chemistry, physics, industrial research and metallurgy —account for about 20 per cent of the shipments.

One reason for the large number of shipments in medical therapy is that the radioisotopes being used, largely P^{32} and I^{131}, are of short half-life, approximately fourteen and eight days respectively. The same situation exists to a large extent in the case of studies of animal physiology. If the data are analyzed in terms of number of individual projects rather than shipments the greatest use is still in the fields of medical therapy and studies of animal and human physiology, but these two fields then account for about 50 per cent of the total.

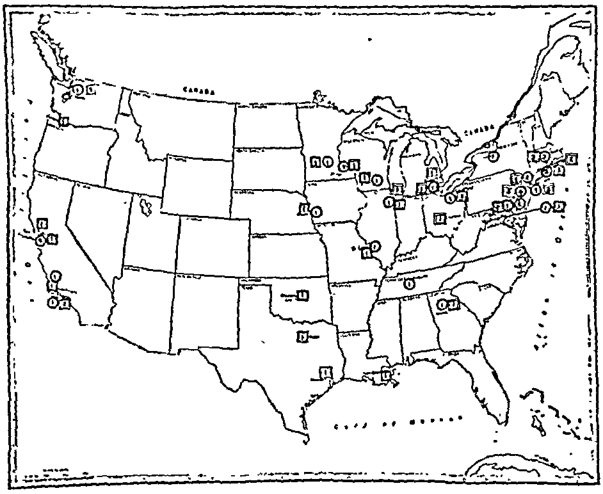
Of the radioisotopes used in medical therapy, I^{131} and P^{32} account by far for most of the shipments. The number of *shipments* of I^{131} slightly exceed those of P^{32} largely because the half-life of I^{131} (eight days) is shorter than that of P^{32} (fourteen days). Because of the greater rapidity of decay of I^{131}, shipments are required more frequently. In the first twenty-two month period, a total of over 30,000 millicuries each of I^{131} and P^{32} have been distributed. Only a very limited use of other isotopes has been made for experimental therapy, namely, of gold 198, calcium 45, strontium 89 and cobalt 60.

In studies of animal and human physiology, most use is made of three radioisotopes, iodine 131, phosphorus 32 and carbon 14. The number of shipments is in the order I^{131}, P^{32} and C^{14} largely because the length of half-life increases in this order. The actual number of using projects, however, is about the same for all these three isotopes, with P^{32} somewhat in the lead. In addition, sulfur 35, sodium 24, potassium 42, iron 55 and 59 and calcium 45 have been used extensively.

Shipments of pile-produced radioisotopes for therapy and medical research are being made to about thirty states. Most of these states are east of the Mississippi River. The largest number of shipments for therapy is to New York state, and Massachusetts, Minnesota, Pennsylvania, Ohio, California and Texas follow along closely with somewhat decreasing number.

With respect to the number of shipments for medical research, Massachusetts leads, with New York, California, Ohio, Illinois and Michigan following closely. The number of shipments for bacteriologic research are much smaller than for the other two fields, with California in the lead and Maryland, Illinois and Connecticut following, in that order.

The greatest number of shipments have been received in the Northeast area, largely because there are a greater number of academic and research institutions and a higher population in that section of the country. Another important reason, however, is that before the war there were a considerable number of cyclotron laboratories distributed throughout the Northeast, and these helped to institute the use of radioisotopes in the immediately surrounding regions. Accordingly, after the war, when pile-produced isotopes became available, the institutions and persons that had previously had experience with cyclotron-produced isotopes were most readily able to take advantage of the new opportunities. California, which was the birthplace of the cyclotron, is one of the states leading in the number of shipments received.



Geographic location of institutions using radioiodine and radiophosphorus for medical therapy. The location of phosphorus users (total 43) is indicated by a square and iodine users (total 38) by a circle. The figure in the square or circle indicates the number of institutions at that location which are using the materials for medical therapy.

In the figure is shown the geographic location of institutions using radioiodine and radiophosphorus for medical therapy. The figure does not attempt to show the locations of all the hundred and nineteen institutions spread throughout thirty states, which are using radioisotopes in medicine and biologic studies.

It is to be noted that the using institutions cluster around the largest centers of population. New York city leads, with the largest number of using institutions, with Philadelphia and Boston next. It is evident here again that the institutions which were previously in the vicinity of operating cyclotrons before the war have been those most immediately able to engage in the use of pile-produced radioisotopes.

It is difficult to give a complete picture of the varied ways in which radioisotopes are being used in approximately seven hundred projects concerned with medicine and biology. I will try, however, to give a partial indication of the scope and importance of all the uses by a few selected illustrations of actual uses. These are outlined briefly for the isotopes iodine 131, phosphorus, 32, carbon 14, sulfur 35 and calcium 45.

Illustrations of Uses of I^{131} in Physiology and Medicine
  Diagnosis
    1. Disorders of the thyroid gland
    2. Thyroid carcinoma and metastases
    3. Localization of brain tumors with diiodo-fluorescein
  Treatment
    1. Hyperthyroidism
    2. Thyroid carcinoma and metastases
  Research
    1. Physiology of liver and gallbladder with labeled tetraiodo-phenolphthalein sodium salt
    2. Renal function in terms of labeled iodopyracet "clearance"
    3. Rate of entrance and exit of labeled iodopyracet in the eyes

Illustrations of Uses of P^{32} in Physiology and Medicine
  Treatment and study of blood dyscrasias—leukemia, lymphosarcoma, polycythemia, multiple myeloma
  Metabolic studies
    1. Labeled nucleoprotein in the metabolism of bacteria and host tissues
    2. Phospholipid synthesis
    3. Exchange of radio phosphorus by bones and teeth as a function of nutrition
    4. Labeled malaria plasmodium—host relationship
  Physiologic studies
    1. Vascular capacity in heart and kidney
    2. Effect of digitalis on phosphorus transfer from medium into beating heart
    3. Fate of labeled antigens and rate of antibody production
    4. Permeability of skin and placental tissue to labeled phosphatides
    5. Effect of anterior pituitary growth hormone on phosphate balance

Illustration of Uses of C^{14} in Studies of Physiology
  Metabolic studies
    1. Protein metabolism with labeled amino acids—leucine, glycine, lysine, (α)-amino adipic acid, alanine
    2. Carbohydrate metabolism with labeled intermediates—lactic, pyruvic, oxalacetic and proprionic acid
    3. Fate of labeled fats
    4. Role of steroids and estrogens with labeled cholesterol, progesterone and diethylstilbestrol
    5. Fate of labeled urethane as a possible therapeutic agent for leukemia
    6. Fate of carcinogens with labeled methyl cholanthrene and 1, 2, 5, 6-dibenzanthracene
  Pharmacologic studies
    1. Action of labeled "benadryl hydrochloride" (diphenhydramine hydrochloride), "dilatin sodium" (diphenylhydantoin sodium), digitoxin, morphine, codeine, nicotine, colchicum and atropine
    2. Fate and localization in nervous system of labeled barbiturates

Illustrations of Uses of S^{35} in Physiology
  Metabolic studies
    1. Protein metabolism with labeled amino acids—cystine, cysteine, methionine, glutathione
  Pharmacology
    1. Levels of labeled penicillin in blood and urine
    2. Rate of uptake of sulfur by cartilage, bone matrix and bone marrow
    3. To determine absorbability of thioglycolic acid and its salts through skin
    4. To determine factors influencing tissue distribution of labeled organic compounds containing sulfonamide linkages
    5. To determine mode of action of sulfonamide drugs with labeled sulfanilamide

Illustrations of Uses of Ca^{45} in Physiology
  Metabolic studies
    1. Calcium metabolism relative to hypoparathyroidism and hyperparathyroidism
    2. Calcium metabolism in eclampsia and preeclampsia
  Physiologic studies
    1. Calcium absorption in tissue, nerve, muscle, epidermis and intestine
    2. Effect of vitamin D and thyroidectomy on calcium exchange and uptake
    3. Calcium secretion in crop gland as a quantitative assay for prolactin

There are, of course, many more uses for these isotopes than shown in the outline. In addition, a wide variety of uses are being made of sodium 24, potassium 42, iron 59, cobalt 60, copper 64, zinc 65, silver 110 and gold 198.

I have had to omit an almost equally interesting story on the distribution and valuable uses of concentrated stable isotopes. Stable isotopes cannot, of course, be utilized, as radioisotopes are, for radiation treatment or for diagnosis which depends on detection at a distance, but they are useful for many tracer studies. As the result of wartime activities in the concentration of isotopes, there are now available through our facilities over one hundred concentrated stable isotopes of thirty-three elements. Of these, only heavy hydrogen (deuterium) and oxygen 18 are being used in biologic and medical investigations. Two other isotopes, carbon 13 and nitrogen 15, available from commercial sources, are also used extensively for such investigations. There remains, however, a wide selection of concentrated stable isotopes which may be useful in these investigations but for which some development is needed in technic.

I should mention also that investigators in foreign countries can obtain through the Commission twenty-nine radioisotopes of twenty elements, which are of particular value in biologic and medical studies. Although international distribution has been in effect for only nine months, shipments have been made to fourteen countries and already impressive results are being obtained in over a hundred individual projects.

Isotopes will come to be used by more and more groups as isotopic technics and applications take their destined place in laboratories and medical research centers everywhere along with other important but now routinely used tools of investigation. In the future, reports in which isotopic methods have been used as part of the investigational procedure will no doubt so completely permeate the literature and scientific meetings that such papers will no longer be set apart by special symposiums or by special reference in the title, any more than this is now done for papers in which a microscope is used. Just as microscopy and spectroscopy have become highly developed technologies for investigation, we are now nurturing and maturing an "isotopology." And, just as it is now routine to speak of spectroscopists, we will have technicians known as "isotopologists."

In this connection one should remark that research using isotopic technics is not a goal in itself. Also, the use of isotopes is no substitute for thinking and effort. First, the investigator must have a problem involving the transfer of atoms, or transport and transformation of molecules, which would be difficult or impossible to solve by already available technics. Second, he should examine the usefulness of isotopes as a tool in solving the problem in conjunction with employment of his existing methods. Complicated problems nearly always involve a carefully combined attack with all the applicable technics. Isotopic technics will give new and trustworthy results only as an added power of perception used with other complementary technics.

The Atomic Energy Commission, is, of course, eager to promote progress in the proper and effective use of the isotopes which are available from its facilities. Much has been accomplished in making desired isotopes available in suitable form and quantity. No longer need a research problem or a technical application which is dependent on a producible isotope suffer from lack of availability of the isotope. Moreover, well developed technics and very satisfactory instrumentation for the various uses of isotopes have become generally available.

The main remaining deterrent to advances in knowledge which can be obtained by employing these powerful investigational tools is the unpreparedness of most research groups to take full advantage of all the available isotopes. The greatest need now is for dissemination of detailed information on the laboratory procedures of isotope applications and for making training in these applications readily available to interested scientists.

Progress is now being made in the information and training aspects of isotope applications. Several good books have appeared or will soon appear on isotopic technics. Journals are carrying an increasing number of articles on the procedures as well as the results of work with isotopes. A new journal devoted to "nucleonics" has even appeared, and it includes numerous technical articles on the use of isotopes. Several universities have given training courses in isotope applications and have sponsored rather complete symposiums in this field. More of such courses and symposiums are expected.

The Atomic Energy Commission will be giving increasing assistance to the dissemination of information and provision of training in the peacetime developments of atomic energy. Our office is providing circulars on many aspects of the use of isotopes, and the Commission now has an Office of Technical Information for effective dissemination of unclassified information in general. The Commission has initiated a system of fellowships for training in atomic energy developments and is assisting in the establishment of training centers.

In addition, our office has an Advisory Field Service the personnel of which visit isotope users and interested groups and give direct advice to them in their own laboratories on proper procedures for the safe and efficient use of radioisotopes. Although our personnel is limited, we will be pleased to offer whatever assistance we can. I urge physicians to write to us at the Isotopes Division, Atomic Energy Commission, Oak Ridge, Tenn., concerning available information and assistance on whatever problems you think may be best approached through the use of isotopes.

It should be pointed out that although atomic energy and radioactivity can be fraught with hazard, there is really a large body of knowledge and experience on how to control them. There is no need for unreasonable or unhealthy fear of radioactivity. Knowledge and a healthy respect are sufficient. Radioactivity can be detected with extremely high sensitivity and with comparative ease; consequently, safe conditions of work or application are easy to establish.

Over fifty years' use of radium and roentgen rays have demonstrated that both of these can be applied and handled safely. Radium and roentgen rays have revolutionized the field of medicine and are absolutely essential to its modern practice. Likewise radioisotopes can be applied and handled safely. They too will help to bring about revolutionary advances in medicine, and they also will become essential components of this art and science.

The infant field of isotope applications and the newborn program of isotope distribution are already doing a man-sized job and are on the way to herculean achievements.

THE MEDICAL PROFESSION AND ATOMIC ENERGY

REAR ADMIRAL LEWIS L. STRAUSS, U.S.N.R.
Washington, D. C.

As a layman, I approach this symposium with considerable humility—aware of the easy opportunity for disaster, such as accompanied the lecture of a friend who had traveled in the South Seas and, on his return, spoke to an audience of engineers. He mentioned that when he was in the Trobriand Islands, he had been impressed by the clarity and translucence of the atmosphere. It was so clear, he said, that he could frequently see the natives standing in their dugout canoes at a distance of 10 miles. At the end of the lecture, one of the audience of engineers thanked him and commented that many present, competent to calculate for the curvature of the earth, had noted his remarkable discovery, that the natives of the Trobriands were 69 feet tall. Taking this lesson to heart, I will avoid any reference to technical matters, leaving them to be dealt with by my competent and distinguished colleagues, Dr. Shields Warren, Dr. Paul Aebersold and Dr. Stafford Warren, who take part in this program.

I would begin these brief remarks by observing that medicine has assisted at the birth of more than one of the physical sciences. The study of gases and the measurement of heat were once the exclusive province of physicians. Current electricity had its inception in medical research on nerves. It is in keeping with good precedent, therefore, that nuclear physics, the youngest of the physical sciences, should also benefit by the attention of the medical profession as life begins for it.

On the other hand, advancement in the physical sciences has regularly placed at the disposal of the medical profession new instruments, new problems and new means of solving those problems. Atomic energy has already begun to do so. And just as the progress of modern medicine may be said to date from Harvey's discovery of the circulation of the blood, so with the

---

Member of the United States Atomic Energy Commission.

Read in a symposium on Atomic Energy in the General Scientific Meetings at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 22, 1948.

physical sciences, their real development began with the circulation of ideas and the free exchange of information.

The heart which provides the circulation of ideas and information in your profession, the American Medical Association, is the largest most representative body of persons charged by their choice of profession with responsibility for the health of the public. By virtue of the whole tradition of your membership, it has achieved and has accepted a position of great public trust. This position imposes a solemn and unusual obligation. A physician accepts, as his established duty, giving a part of his time, often at substantial loss, to teaching others, improving his own ability to serve and aiding in solving the health problems of his community. Medicine was probably the first science to be recognized as such, obviously because it had a vital and practical importance to every citizen. For centuries it has enjoyed special prestige and, in consequence, has had special duties.

The development of atomic energy as a military weapon through our unique engineering and scientific competence poses to medicine new and rather fearful questions. The existence of radiation hazard on a large scale is a threat to life, health and reproduction. How to handle it is a medical problem, both in theory and in practice. It is timely and proper that the American Medical Association should consider certain aspects of atomic energy control which confront the nation and which specifically face the Atomic Energy Commission, the nation's deputy in this field.

These problems concern medicine as a science and men of medicine as individuals, not only because of questions of health in time of war but also because of certain social and administrative matters which surround the use of atomic energy in peace. These latter difficulties were originally faced by medicine as a discipline and have been solved by medicine in a peculiarly gratifying and exemplary way. I refer to the solution of such problems as useful cooperation between public and private agencies, the subordination of private interests for public good, the voluntary collaboration of scientific men to forward common and predominantly lay interests. Finally, and most important as an example, is the ability of men of medicine to unite for the attainment of practical ends through the scientific method and to be able to do this without loss of scientific freedom to continue undirected individual search for new concepts.

The first question to be answered concerning the future of atomic energy was one of its ownership. Was it exclusively military property because it was first employed in a major way by the military? Was it the property of the scientists who brought it into being? Certainly neither could be considered as having title any more than that healing science should be the sole chattel of the medical profession. The moment when knowledge becomes practical technical competence affecting the well-being of everyone, then at that moment title to this competence must pass to the public domain. The rights of the citizens as a whole should, and do, wholly transcend the rights of the individual in every major instance in which they may conflict. I believe that this is a fundamental and generally accepted principle in the democratic state.

Once the title to atomic energy is established in the public domain, the delegates of the public must decide how to handle this force in the public interest. Three factors seem to bear on this decision: First, what is needed? Second, what is practicable? Third, what is expedient? To answer these questions in detail obviously involves considerations which are outside the scope of a short discussion. A general statement may suffice. It could be worded somewhat as follows: We need to make atomic energy as useful as we can for peace and, at the moment, for possible war. Usefulness in both is certainly practicable. Moreover, within certain limits, usefulness is wholly expedient. Recall that these basic decisions are made in the public interest, after due consultation with special interests which I shall later mention.

When we have concluded that atomic energy can be made useful, we have simultaneously decided that our problem is an applied one and that our planning must be set up to convert an advance in pure science to practical ends. This conversion presents serious problems, since certain hurdles exist that must first be cleared. These are three in number and old and familiar; namely, prejudice, tradition and special interests.

Up to now, prejudice against work on atomic energy, based on lack of detailed information, has been a reasonably serious handicap. Atomic energy, long on our doorstep, burst on public consciousness with an appalling detonation. Many persons still assume that explosions and devastations are uniformly its concomitants. This is, of course, no more true than that because this great city was once destroyed by fire, milking by lamplight must always produce a holocaust. Atomic energy had two generations of quiet usefulness and life-saving behind it before atom bombs were ever dreamed of. It should have centuries of orderly and unsensational application in the future.

More serious perhaps than the thought of structural ruin from the atom is the widespread impression that atomic energy is a health hazard of monumental and enduring proportions. True enough, we know it can kill in a protracted and unpleasant manner. Certainly, persons can be injured by loose and restless atomic particles, and chromosomes can be damaged, with resultant mutations. But we should remember that these changes can be produced also by any number of agents from sunlight down to the garden crocus. In other words, they are neither very new, nor very startling. It is simply that our attention is focused on them at the moment. Happily, the facts are coming to be more widely understood and fear is being replaced, though slowly, by confidence. In future, we must equally guard against overconfidence.

Tradition is the next barrier. It is serious because it is deeply impressed on the minds of many of the men and women of science on whom we must depend to carry the task forward. The fundamental tenet of this particular tradition is that science is for the scientist. This was more nearly true at a time when the acquisition of knowledge, in fields other than medicine, was completely an end in itself. It is, of course, no longer true now that the lives and rights of free men everywhere are dependent on science. A scientific subject need not be completely abstruse in order to qualify for research.

The third hurdle in the development of a useful position for atomic energy is the existence of special interests in the scientific fields. These interests are long established and strongly held. It is likewise of great importance that they be maintained. But they *should be maintained in* such a way that the early and intelligent development of the benign uses of atomic energy shall be pressed. These interests are, of course, the government departments, the industrial laboratories and the universities.

For instance, it is always simple to conceive of the creation of vast governmental laboratories, supposedly capable of solving the most refractory problems, by sheer weight of funds. But this procedure is not really an effective move, or even a desirable one, on the basis of peacetime experience. Federal departments are removed from the free enterprise system. Work in them is generally conducted on a high plane, with excellent facilities and talented personnel and often with distinguished results. They must, however, from their very bulk and permanence, be inflexible and should be. Their concern is to be right and to avoid errors. They are invaluable as reference and control activities. But science, being always unconventional, demands flexibility and unorthodoxy. These are the concomitants of competition, incentive and daring. Usually they are not found, and do not belong, in government enterprise.

On the other hand, the industrial laboratories know the value of ingenuity. They have highly developed the incentive motives and thereby have acquired staffs of great competence, admirable equipment and smooth flexible organization. These groups are ideally constituted for the conversion of fundamental knowledge to direct application. That is their business. They have, however, a serious handicap which makes their exclusive use in an activity as extensive and vital as atomic energy unworkable. This handicap is not, as is sometimes supposed, the fact that they must earn profits for stockholders. A proper profit always must be found in private operation for public ends. The real handicap for an exclusively industrial approach is the impossibility of adequately rewarding key personnel. In short, the use of the patent system to reward the inventor for brilliant strikes, profoundly implicit in the operation of commercial laboratories, is out of the question where atomic energy is concerned, at least as far as one can see ahead.

The third interest is the university. The university, as the traditional trustee of learning and the vigorous defender of free unprejudiced thought, must have a predominant consultative role in any important scientific public enterprise. This was recognized as early as when President Lincoln created the National Academy of Science to advise the federal government in learned matters. The principle has expanded in the use by federal agencies of advisory bodies, largely drawn from university circles. But advisers with this background may be expected to have a tendency to resist the lay demand for quick practical return, in terms of things, for the very practical outlay of large sums of money taxed from the lay public.

SUMMARY

I have tried in this necessarily brief paper to sketch an outline of some of the problems of atomic energy development in the United States. They bear, it seems to me, some similarity to the problems and responsibilities which have been faced by medicine for many years. They have been solved by medicine by a professional acceptance by its members of an obligation to public service. The recognition of this sort of obligation establishes an important and timely precedent. It is one which was invoked successfully for science as a whole during the war, and it must become the touchstone of obligation for citizenship on the part of gifted persons in the era of atomic peace.

MEDICAL PROGRAM OF THE ATOMIC ENERGY COMMISSION

SHIELDS WARREN, M.D.
Boston

In this symposium, you have heard varying aspects of the relations of atomic energy to the field of medical science. The advent of atomic energy, as you can well see from the foregoing presentations, has had its impact not only on the political structure of the world but on its scientific and medical makeup as well.

You and your fellow citizens have given the Atomic Energy Commission the responsibility of insuring that the best possible use of this new source of energy will be made, consistent with the national security.

The last six years have seen more profound changes in scientific medicine than any period since the discovery of bacteria or the invention of the microscope. The changes have been brought about by many factors: the wholesale uprooting incident to the war, the development of antibiotics, the impact of social legislation and, above all, the advent of atomic energy. When we consider that before the war scattered persons received localized radiation in the hospitals and in physicians' offices, whereas hundreds of thousands were killed or exposed to ionizing radiations at Hiroshima and Nagasaki; when we think that six years ago the average man had no more concern with ionizing radiation than as a means of checking on an aching tooth or determining the cause of chronic cough, whereas today millions of persons live within the shadow of possible wartime exposure to ionizing radiation from the atomic bomb, and when we realize that six years ago it would be a skilled chemist who could detect after hours of work a millionth of a gram of phosphorus and now a technician with a Geiger counter can detect a fraction of a millionth of a gram of radioisotopic phosphorus in a few minutes, we realize how long a road we have come in this short span.

As a result of the atomic bomb in Japan, the Bikini test and the lowering clouds of war, it is natural that we think of atomic energy in terms of mass destruction, mass destruction cheaper and more efficient than any other then envisaged. However, like the old coin with the eagle and clutched arrows on one side and the head of Liberty on the other, this picture of atomic energy has a fair and forward-looking obverse. What atomic energy may bring about in the way of development of power and of heat, what it may do in the propulsion of ships or aircraft remains all but hidden in the mists of the future. What it means as a provider of research tools is at present as overwhelming as a streamliner rushing down on a grade crossing.

EXTERNAL RADIATION AND INTERNAL RADIATION

In any consideration of radiation, it is important to remember that ionizing radiation may affect the body in two ways: first, as external radiation, as from the

---

Read in a symposium on Atomic Energy in the General Scientific Meetings at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 22, 1948.

conventional x-ray tube, and, second, as internal radiation, as from the administration of radioactive phosphorus.

The various ionizing radiations affect cells qualitatively in similar fashion. There is no way that one can tell by examination of a cell or tissue whether the radiation effect seen has been produced by neutrons, by 200 kilovolt roentgen rays or by the gamma rays of radium. The predominating effect is assumed to be through interference with the nucleic acid metabolism of the cell. External radiation, in passing through the body, has an almost equal chance of being absorbed by the various cells with which it comes in contact. The quantitative variation that these cells show in response hinges chiefly on their inherent sensitivity to irradiation. In internal radiation, on the other hand, because of the specific affinity of certain tissues for specific elements, as, for example, bone and phosphorus, or thyroids and iodine, and because of the relatively short range of many of the types of radiation emitted by the various isotopes, there can be some degree of selective localized radiation.

RADIOACTIVE ISOTOPE THERAPY

In radioactive isotope therapy there is an attempt to take advantage of these selective localizations. In determining the therapeutic value of any radioactive isotope, there are several factors to be taken into consideration: first, the inherent toxicity of the substance itself—thus, strontium, which might be useful because of its high toxicity to bone marrow. Second, the half-life of the material: material which has a long half-life is much more dangerous from the standpoint of possible excessive radiation than one with a short half-life. On the other hand, problems of shipment and preparation of the material for administration demand a certain amount of time, and material with too short half-life would not be satisfactory. Third, the degree of localization; for example, radioactive sodium is relatively limited in use because of the high degree of diffusibility of the sodium ion. Fourth, range and type of radiation which tend to limit the region effectively irradiated to the vicinity of localization. Fifth, the element must be such that its specific activity can be reasonably high, preferably in the order of 1 millicurie per milligram of element. Thus, radioactive calcium with a half-life of forty-five days might be a fairly suitable material from the therapeutic standpoint; however, the specific activity of calcium is relatively low and, consequently, it is difficult to get an effective concentration of the isotope at a desired point. There are relatively few substances that fulfil all these desirable criteria.

There is also an important set of variables from the standpoint of the lesion to be treated. First, the lesion must be one that may be satisfactorily treated by ionizing radiation, that is, its cells must be responsive to radiation; second, there must be a fair differential between the sensitivity of the abnormal and the normal cell of the part.

In the light of these limitations, it is not surprising that only a few isotopes among those thus far tried have been useful from the standpoint of treatment. These are radioactive phosphorus in the case of polycythemia vera, and some leukemias; iodine^{131} in rare carcinomas of the thyroid and gold^{189} in some malignant processes in which either direct injection into the tumor is utilized or the selective uptake of colloidal substance by the reticuloendothelium system is of value.

MEDICAL PROGRAM

The medical program of the Atomic Energy Commission may be divided into four parts: First, the maintenance of health of the workers of the commission and its contractors. Thus far, the health and safety record is an enviable one, and speaks highly for the foresight of those who set the initial standards of safety and permissible dose levels for exposure to ionizing radiation. Second, the protection of environmental health. This involves such problems as waste disposal, possible contamination of surrounding areas and the like. Third, the development of basic research in those problems peculiarly related to atomic energy, of which the effect of ionizing radiation on the plant, animal and human cell, both isolated and aggregated into organisms, must be determined. Such problems as permissible dose levels of ionizing radiation, metabolism of new or rare elements, the mechanism of radiation injury, the development of treatment for such injury and the character and mode of development of hereditary changes due to ionizing radiation are among those of basic importance. Fourth, the exploration of what, if any, values the new sources of energy available at the installations of the Atomic Energy Commission themselves and the value that very short-lived radioactive isotopes may have in cancer research and cancer therapy.

An important aspect of the cancer research program is the free provision of the isotopes thus far established as most definitely of value, namely, phosphorus^{32}, iodine^{131} and soduim^{24}, for cancer research and cancer therapy. It is hoped that this list may later be enlarged to cover other important materials. Cobalt^{60} is receiving careful consideration at the present time. It is of special interest, owing to the fact that the gamma radiations from cobalt are essentially the same as those from radium, since cobalt has a moderately long half-life of five and three-tenths years, and, since it is nontoxic as an element, its use offers certain definite advantages. Of particular importance is the fact that it is not an alpha particle emitter and is not stored indefinitely in bone, as in the case of radium and radon.

Finally, since no program can hope to be better than the personnel by which it is being implemented, training plays a very important part. To this end and to compensate partly for the dirth of scientific personnel due to the war, a fellowship training program is being developed in the medical and allied sciences. This training program, administered by the National Research Council for the Atomic Energy Commission, provides up to one hundred predoctoral fellowships annually and seventy-five postdoctoral fellowships annually in the life sciences.

The predoctoral fellowships are one year in duration and are renewable. The postdoctoral fellowships have a term of two years and are not renewable. The greatest latitude compatible with sound training will be offered the fellow in obtaining his training, whether in the installations of the Atomic Energy Commission or whether in a university or a hospital. One feature of the predoctoral fellowships is their availability to medical students who may desire to interrupt their training, particularly at the end of the second year, for a year of fundamental research in this new field.

Council on Physical Medicine

REPORTS OF THE COUNCIL

The Council on Physical Medicine has authorized publication of the following reports. HOWARD A. CARTER, *Secretary.*

PRESS-AIRE PRESSURE AND VACUUM PUMP ACCEPTABLE

Manufacturer: Press-Aire Products, 909 E. Willetta, Phoenix, Ariz.

Press-Aire Pressure and Vacuum Pump.

The Press-Aire Pressure and Vacuum Pump is a device designed to furnish relatively small positive or negative pressures such as might be used clinically for aerosol therapy. It takes up space amounting to 16.5 by 11 by 17 cm. (6½ by 4¼ by 6¾ inches) and weighs 3.9 Kg. (8½ pounds). The shipping weight is 4.1 Kg. (9 pounds). It draws 132 watts (1.2 amperes) on a 110 volt 60 cycle alternating current.

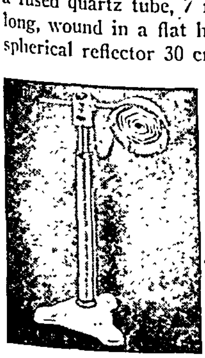
The descriptive folder states that the pump can furnish a maximum air pressure of 15 pounds (per square inch, equal to 775 mm. of mercury). This claim was verified in a laboratory acceptable to the Council, where the pump gave more than 789 mm. The folder similarly claims a maximum vacuum of 16 inches (presumably inches of mercury, equal to —406 mm.). This claim was also verified by the laboratory, where the pump gave —439 mm. of mercury.

The Council on Physical Medicine voted to include the Press-Aire Pressure and Vacuum Pump in its list of accepted devices.

LIFE LITE COLD QUARTZ ULTRAVIOLET LAMP, MODEL R-6, ACCEPTABLE

Manufacturer: Ultra Violet Products, Inc., 5205 Santa Monica Blvd., Los Angeles 27.

This ultraviolet generator is of the high potential, low vapor pressure, "cold quartz," mercury arc type. The burner, which is a fused quartz tube, 7 mm. in diameter, about 180 cm. (6 feet) long, wound in a flat hexagonal spiral, is supported in a hemispherical reflector 30 cm. (12 inches) in diameter.



Life Lite Cold Quartz Ultraviolet Lamp, Model R-6.

The reflector is supported on the end of an arm that is free to travel horizontally and rotate about the axis of the arm. This arm is mounted on a vertical telescoping column that is adjustable in height from 75 cm. to 132.5 cm. (30 to 53 inches). The vertical column is attached to a substantial base that houses the high voltage transformer.

The lamp operates on 110 to 130 volts, with an average power consumption of about 35 watts. The exposures are timed by an automatic clock-controlled switch.

Mechanical, electrical, radiometric and physiologic tests on this lamp indicated that about 90 per cent of the biologically effective ultraviolet radiation of wavelengths 3,132 angstroms, and shorter was in the wave band centering about 2,537 angstroms, and that at the standard distance of 61 cm. (24 inches) from the plane of the rim of the reflector on 120 volts (38 watts) the intensity was close to 750 microwatts per square centimeter. This is about twenty times the minimum intensity specified in the published statement of requirements for Council acceptance of such lamps, which stipulates an exposure of 45 seconds for a minimum perceptible erythema.

The Council on Physical Medicine voted to include the Life Lite Cold Quartz Ultraviolet Lamp, Model R-6, in its list of accepted devices.

MICROTONE AUDIOMATIC T-3 HEARING AID ACCEPTABLE

Manufacturer: The Microtone Company, 4602 Nicollet Avenue, Minneapolis 9.

The Microtone Audiomatic T-3 is a battery-contained hearing aid. The white plastic case contains the microphone, amplifier and batteries. The outside dimensions are 122 by 62 by 24 mm. ($4\frac{13}{16}$ by $2\frac{7}{16}$ by $\frac{15}{16}$ inch) exclusive of the clip and the attachment of the cord to the receiver. The A battery and the 30 volt B battery are both of the zinc-carbon type. The A battery drain is 60 milliamperes and the B battery drain is approximately 0.55 milliampere.

Microtone Audiomatic T-3 Hearing Aid.

The instrument is of sturdy construction. The following results were obtained in a performance test:

Subject	Acoustic Gain	Articulation Scores Microtone	 Reference
A	Not Observed	80%	80%
B	Not Observed	75%	77%
C	46 db.	Not Observed	
D	49 db.	Not Observed	

The Council on Physical Medicine voted to include the Microtone Audiomatic T-3 Hearing Aid in its list of accepted devices.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., *Secretary.*

PENICILLIN (See New and Nonofficial Remedies 1947, p. 144).

The following additional dosage forms have been accepted:

PREMO PHARMACEUTICAL LABS., INC., SOUTH HACKENSACK, N. J.

Tablets Crystalline Penicillin G Potassium (Buffered): 50,000 and 100,000 units. Buffered with calcium carbonate 0.25 Gm.

Troches Crystalline Penicillin G Potassium: 5,000 units.

PROPYLTHIOURACIL (See THE JOURNAL, Oct. 9, 1948, p. 429).

The following dosage form has been accepted:

ELI LILLY & CO., INDIANAPOLIS

Tablets Propylthiouracil: 50 mg.

DIGITOXIN-U.S.P. (See New and Nonofficial Remedies 1947, p. 249).

The following dosage form has been accepted:

THE WM. S. MERRELL CO., CINCINNATI 15

Tablets Unidigen: 0.1 Gm.

STREPTOMYCIN (See New and Nonofficial Remedies 1947, p. 150).

The following additional dosage form has been accepted:

PREMO PHARMACEUTICAL LABS., INC., SOUTH HACKENSACK, N. J.

Streptomycin Sulfate: Vials containing streptomycin sulfate equivalent in activity to 1 Gm. of streptomycin base.

SATURDAY, DECEMBER 25, 1948

THE ASSESSMENT AND PUBLIC OPINION

Chief among the subjects discussed by doctors since the interim session of the House of Delegates in St. Louis has been the assessment of twenty-five dollars per member voted at that session. Few indeed are adverse comments from members of the medical profession. Most physicians who have expressed their views feel that they want to participate fully in the campaign of education that will be financed by these funds. Some few physicians have said that they do not favor the assessment.

Opposition to the point of view of the medical profession of long standing, such as that from the Committee on the Nation's Health, Senator Murray, Congressman Dingell and the so-called Committee of Physicians for the Improvement of Medical Care, Inc., might have been anticipated; they are merely running true to form; their strength is but little either in numbers or in medical support. From many of the state medical societies has come enthusiastic official endorsement of the action taken by the House of Delegates; this has been most heartening to those who will have the burden of determining the actions to be taken.

One state has circularized the official bodies of the Association, including many of the delegates, with its concept of the form that the program should take. In addition, literally hundreds of advertising agencies, purveyors of radio time, public relations counsels, experts in propaganda, motion picture producers, publishers and similar groups have besieged the headquarters of the Association with proposals which might utilize a considerable share of the funds when they become available. It would be inconsistent with the status, the prestige and the tradition of the American Medical Association to approach this problem in a confused or disorderly manner. The procedure since the House of Delegates passed the resolution endorsing the assessment has been strictly according to proper organizational action. The Board of Trustees announced to the House of Delegates the establishment of a special committee to be known as the Coordinating Committee for the Protection of the People's Health, composed of members of the Board of Trustees and of the House of Delegates; on this committee will rest the responsibility for ultimate decisions. The executive committee of that group employed the firm of Whitaker and Baxter of California as special public relations counsel. This firm had previously acted as counsel for the California Medical Association in its presentation of the point of view of the medical profession in relation to compulsory sickness insurance in California. At present Whitaker and Baxter are developing a comprehensive program of education, which will be submitted to the entire Coordinating Committee at its second meeting on January 8.

The American people have not as yet heard specifically of the purpose for which the funds will be used. Again, as might have been anticipated, some newspapers referred to the assessment as "war chest," others as a "slush fund," even more as the basis for a vast lobby. None of these appellations is justified. As was directed by the House of Delegates, the special fund will be employed to educate the American people as to the nature of medical practice in the United States, as to the services rendered by the medical profession and as to the program of the American Medical Association for extending medical research and medical care. No doubt all the usual mediums of public education will be utilized. Emphasis will be placed on the ideals of the American medical profession. Certainly the American people should know that compulsory sickness insurance is not a technic for providing free medical care to all of the people but instead a system whereby the workers of the nation are taxed to support a vast bureaucracy which itself will distribute medical care and which will be the intervening agency between the sick and the medical, hospital, pharmaceutical, nursing and allied professions. An educational campaign of the scope contemplated will reach to the very grass roots of the nation. Every physician and every medical organization can aid in this educational project by further interpretation and education of patients and public groups.

As might also have been expected, because the campaign against compulsory sickness insurance has been going on since 1916, many a medium of public information, many an official of county, state and national government, many a leader of industry, finance, transportation and banking has rallied to the cause of the medical profession. Innumerable offers have come to the headquarters of the Association of space in periodicals and in the press, time on the radio and similar facilities for the campaign of extension of knowledge to the people. Many organizations allied to medicine have indicated their firm support of the program of the medical profession and have offered to participate with funds, with speakers and with their other facilities. In view of this situation leaders of the medical profession in the individual states need not be overcome by apprehension or fear. They need only to recognize the necessity for such leadership as the Coordinating Committee must provide. They should recognize the desirability of a well coordinated program under such leadership rather than a state of confusion with innumerable leaders widely scattered throughout the country and out of intimate contact with the central organization.

In the time that has elapsed since the House of Delegates met, certain members of the established opposition have been, as usual, expressing their points of view wherever they could gain an audience. The Committee on the Nation's Health, under the presidency of Channing Frothingham, has issued several bulletins. The Committee of Physicians for the Improvement of Medical Care, Inc., has sent out its Statement No. 25. These thirty-five physicians do not choose to agree with many of the actions of the representative body of American medicine.

Mr. Ewing, Federal Security Administrator, has, for reasons known only to himself, taken to the hustings; he has appeared on several radio programs, forums and platforms in promotion of compulsory sickness insurance. Some physicians have thought that the American Medical Association, through its president and secretary, ought to be answering every one of the statements that have been issued by the people already mentioned and also by Senator Murray, Congressman Dingell and others.

The St. Louis *Globe-Democrat* has directed a pointed inquiry at these activities on the part of Mr. Ewing. A few paragraphs are worthy of quotation:

> Ewing, who presumably is hired solely to administer the Social Security set-up as dictated by present laws, has gone all-out on a lobbying expedition against the lobbying plans of the A. M. A. against socialized medicine. Though ethics would seem to decree that he stick to his legal chores, he is feverishly denouncing A. M. A.'s "frantic taxation of members to finance the greatest lobbying effort in history." Curiously, he is condemning others for the kind of congressional pressure for which his and federal social reform departments have long been noted. It is all very confusing. Bureaus, it now seems, are supposed to tell Congress what to do; not be content merely to carry out the laws it passed.
>
> As an individual he has, of course, the right of free speech, but when he says categorically that President Truman's election gave socialized medicine the green light, he ought to state it merely as an opinion and not as a fact to excuse his wild haymakers.
>
> This appears to be the beginning of a gigantic compulsory health insurance campaign which Ewing is reported "coordinating." Rumors say the attacks will accuse doctors of charging outrageous fees the average citizen cannot afford, of shuttling him expensively back and forth between specialists, of supervising medical education in such a way as to insure a continued shortage of physicians, and of failing to attempt to remedy the poor distribution of medical talent over the nation.
>
> But won't such a campaign be expensive? If so, whose slush fund is Ewing co-ordinating? Or will the work be done by regular FSA and Public Health Service employes whose salaries are paid by taxpayers who oppose as well as favor socialized medicine.

In the same editorial the *Globe-Democrat* recognizes the right of the American Medical Association to assemble any sum it may wish to assemble to battle the Ewing program, but it also points out that perhaps a goodly portion of funds might be used to "hunt ways to remedy the conditions Ewing and others properly decry." The *Globe-Democrat* may be assured that a definite portion of the effort of the American Medical Association at this time is designed to develop exactly such remedies.

This then is the present status of the assessment and of public opinion concerning it. The medical profession of the nation should recognize that there is no panic, no fear, no doubt in the minds of the leadership of the American Medical Association. The Coordinating Committee is proceeding in an orderly, scientific manner to do the task assigned to it by the House of Delegates.

GLUTAMIC ACID AND INTELLIGENCE

Experimental studies during the past twelve years have suggested that glutamic acid may bear some unique relation to the normal functioning of the brain. In 1936, the English worker Weil-Malherbe[1] demonstrated that slices of the gray matter of rat and guinea pig brain will oxidize *l*-glutamic acid, the naturally occurring form, but would not oxidize the *d*-form, or any of twelve other amino acids studied. This investigation suggested that glutamic acid played some important part in brain metabolism, perhaps in the utilization of carbohydrate for energy. More recently it has been observed[2] that *l*-glutamic acid increases formation of acetylcholine in extracts of rat brain, and still others have found that *l*-glutamic acid administered to rats enhances their ability to learn a simple maze[3] and a somewhat more complicated problem box.[4]

Studies on the possible effect of glutamic acid in human subjects with various types of dysfunction of the brain have logically followed the foregoing suggestive experimental observations. That glutamic acid exerts a favorable effect in decreasing the frequency of petit mal seizures in epileptic patients now appears to be fairly well established,[5] and the effect is claimed to be due to some other factor than an alteration of acid-base balance.[6] Another unexpected observation in the epileptic patients was an increased mental alertness,[5] a result which is in general accord with those obtained in experimental animals as mentioned.[7] A further logical extension of the problem was, therefore, to study the effect of glutamic acid on the intelligence of mentally retarded human subjects. Two such recent studies[8] have indicated some favorable response; using standard psychologic tests as criteria, these investigators have observed a rise in "mental age" and intelligence quo-

tient in the patients and a general improvement in mental functioning. The improvement was not restricted to any one segment of intelligence and personality; it was greatest within six months of beginning therapy and diminished after that. The "ceiling effect" appeared after one year of treatment.

Although current work[9] challenges the earlier claim that glutamic acid improves learning in the rat, further careful studies of this question are clearly warranted. Any therapeutic measure which offers even a glimmer of promise in conditions heretofore as apparently hopeless as these mental deviations merits full and objective consideration.

Current Comment

NEW HEALTH REGULATIONS FOR IMMIGRANTS

The workings of the legal mind are frequently difficult for the scientific mind to understand. According to a recent report, an alien arriving in the United States who wishes to become a permanent resident must provide evidence of freedom from venereal disease in the form of a certificate signed by a physician and a roentgenogram of the chest to indicate freedom from tuberculosis. The new rules do not apply to aliens who come for visits or for business reasons and who may stay as long as six months. In the case of war brides, they must be admitted even if they have venereal disease and/or tuberculosis, and local health officers in the areas to which they go are notified of their condition. Everyone arriving in the United States, including United States citizens returning from abroad, must have a certificate showing a recent vaccination against smallpox. Apparently casual visitors may spread their diseases at random. This should be a big help to the cause of good health.

PSYCHIATRIC REHABILITATION OF SELECTEES

The New York City Committee on Mental Hygiene[1] recently studied the extent and nature of psychiatric problems among men in New York city excluded from military service for neuropsychiatric disabilities. They proposed to determine the severity of handicapping, the numbers needing psychiatric help, the kinds of psychiatric help needed and the possibilities of reducing the gap between present needs and present resources for psychiatric aid. The study was made by interviewing 314 men rejected and 309 men discharged for neuropsychiatric disabilities. These were selected from ten selective service boards. Ten categories of disturbance were studied. However, the large majority of cases fell within the first two groups, viz., psychoneuroses and inadequate psychopathic personality. Among other interesting facts developed in the study, it was discovered that many of the men demonstrated to need psychiatric aid refused treatment because of the fear and scorn popularly associated with psychiatric disorders. The mention of psychiatry still suggests to most persons the "frightening implications of insanity and lunatic asylums." Interview responses from patients needing treatment contained rubber stamp phrases such as "nut doctor" for psychiatrists, and "Don't tell me I'm loco," and "I'm not wacky." Many patients during the course of the interview expressed great relief at the assurance that they were not "crazy" or "slaphappy" and subsequently agreed to undertake extended treatment. Many who were unwilling to admit the psychiatric nature of their complaints were willing to take medical treatment but not psychiatric treatment. The gap revealed between numbers of dischargees needing psychiatric help and those who would accept it was painfully large. However, the gap between those who needed help and those receiving it was much greater. Of those who needed help, only 26 per cent were willing to accept it and only 5 per cent were actually receiving psychiatric aid. Furthermore, 61 per cent of the men who need and want psychotherapy require free service and the remaining 39 per cent, with but few exceptions, could pay for only low cost care. The authors concluded that greatly increased budgets and staffs will be imperative for supplying even partially adequate service. However, given the necessary insight, training, determination and recognition of what is required, much can be done even under present limitations.

STANDARD NOMENCLATURE OF DISEASE

Many recent inquiries from hospitals and persons interested in disease classification have indicated that confusion has arisen in relation to the purposes of the new "Manual of International Classification of Diseases, Injuries, and the Causes of Death" and the "Standard Nomenclature of Disease." These books serve two distinct purposes, which do not overlap or conflict. The International statistical classification is published under the auspices of the World Health Organization. The main purpose of this classification is to establish international standards for coding diseases and carrying out large scale statistical studies. The diagnostic breakdown is much less specific than that of the "Standard Nomenclature of Disease." "The Standard Nomenclature of Disease and Standard Nomenclature of Operations" is published for the American Medical Association. This book standardizes and codes individual specific diagnoses designed for hospital filing and reference work. The diagnostic breakdown in the "Standard Nomenclature" is much greater than that of the International classification. At present the "Standard Nomenclature of Disease and Standard Nomenclature of Operations" is undergoing revision, and it is expected that the new volume will be published early in 1950. The new volume will also contain code numbers of the "International Classification" (parenthetically) for cross reference use in statistical studies.

ORGANIZATION SECTION

Proceedings of the St. Louis Interim Session

MINUTES OF THE INTERIM SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN ST. LOUIS, NOVEMBER 30-DECEMBER 1, 1948

HOUSE OF DELEGATES

Second Meeting—Wednesday Afternoon December 1

The House of Delegates was called to order at 1:30 p. m. by the Speaker, Dr. F. F. Borzell.

Report of Reference Committee on Credentials

Dr. H. B. Everett, Chairman, stated that 173 delegates had been seated and that a quorum was present, and the Speaker announced that the House would proceed with its business.

Presentation of Minutes

It was moved by Dr. John W. Cline, California, seconded by several and carried, that the adoption of the minutes be deferred.

Executive Session—Wednesday Afternoon

On motion of Dr. Mather Pfeiffenberger, Illinois, regularly seconded and carried, the House went into Executive Session at 1:35 p. m.

Report of Reference Committee on Executive Session

Dr. J. Stanley Kenney, Chairman, presented the following report, which was adopted:

Your reference committee has given careful consideration to the following Resolution on Voluntary Participation in Government Plans introduced by Dr. Samuel J. McClendon, California:

WHEREAS, compulsory governmental medical insurance would (1) lower the quality of medical care, (2) substantially increase its cost, (3) create an administrative political bureaucracy, (4) weaken personal responsibility, (5) weaken local public responsibility, (6) fail to satisfy the demands for better medical care at lower cost, (7) waste and demoralize professional personnel, (8) fail to improve the quality or increase the number of professional personnel, (9) destroy voluntary plans for the provision of medical care, (10) most certainly ruin the most efficient, effective, progressive and sound system of medical practice—the American private practice of medicine—yet devised in the history of mankind; and

WHEREAS, The enactment of compulsory governmental medical insurance legislation is favored by the political party currently in power in the executive and legislative branches of the federal government of the United States of America; and

WHEREAS, Enactment of compulsory governmental medical insurance legislation by the 81st Congress of the United States of America may be imminent; and

WHEREAS, The Constitution of the United States of America guarantees the right of any physician to eschew personal participation in any scheme of compulsory governmental medical insurance; and

WHEREAS, All physicians are morally and professionally bound to hold the welfare of the patient paramount to all other consideration; and

WHEREAS, Compulsory governmental medical insurance is not consistent with the best interests of the patient; and

WHEREAS, Compulsory governmental medical insurance is the keystone of the arch of state socialism; be it then solemnly

Resolved, (1) That voluntary participation in any form of compulsory governmental medical insurance by any member of the American Medical Association shall be deemed an act unworthy of the noble heritage of our profession, an act against the concepts of individual freedom, personal responsibility and free enterprise, an act against the best interest of the patient and an act deserving of the strongest condemnation and censure by the American Medical Association and its membership;

(2) That personal honor, integrity and moral considerations render it impossible for any physician to participate voluntarily in compulsory governmental medical insurance; and

(3) That this House of Delegates make a statement of policy to all members of the American Medical Association with a request that written endorsement of this policy be obtained for all individual members of the medical profession.

No one appeared to discuss this resolution and it is the unanimous opinion of your reference committee that this resolution be disapproved.

Respectfully submitted,

J. STANLEY KENNEY, Chairman.
JESSE D. HAMER.
CLAUDE R. KEYPORT.
ERLING W. HANSEN.
WALTER G. PHIPPEN.

On motion of Dr. Kenney, seconded by several and carried, the report of the reference committee was adopted as a whole.

Wednesday Afternoon—Continued

On motion of Dr. H. P. Ramsey, District of Columbia, seconded by several and carried, the House rose from Executive Session at 1:40 p. m., to meet immediately in general session, Dr. F. F. Borzell, Speaker, presiding.

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr. Floyd S. Winslow, Chairman, presented the following report, which was adopted on motion of Dr. Winslow, duly seconded and carried after the Speaker declared that its adoption constituted an amendment to the By-Laws:

Your committee has carefully considered the three resolutions presented regarding changes in the Constitution and By-Laws concerning the Executive Session.

After hearing all sides of the question, your committee recommends the adoption of the report presented by the delegation from Pennsylvania, amended so that Division Three, Chapter IX, Sec. 3 (4) shall read: "The House of Delegates, in any session, by a two-thirds vote, may extend an invitation to address the House of Delegates to any individual who, in its judgment, might assist in its deliberation."

Respectfully submitted,

FLOYD S. WINSLOW, Chairman.
JAMES P. WALL.
VAL H. FUCHS.
DONALD CASS.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Creighton Barker, Chairman, presented the following report, which was adopted section by section and as a whole, on motions of Dr. Barker, duly seconded and carried:

REPORT OF THE SECRETARY

The reference committee views with satisfaction the statement in the Report of the Secretary concerning the increase in membership in the Association. During the past nine months this increase has been substantial—2,053 Fellows and 4,258 members.

The reference committee also notes, and wishes to emphasize to the House of Delegates, the increased field activity of the Secretary, and, although it realizes the time and effort that these field trips take, it is confident that these visits bring the membership of the constituent associations much closer to Association headquarters.

All matters placed before the House of Delegates at its annual session in June have been referred to the proper agencies as directed by the House.

The committee wishes to compliment Dr. Lull on the active and vigorous conduct of the Office of Secretary and General Manager.

REPORT OF THE BOARD OF TRUSTEES

1. Finances: The reference committee wishes to direct the attention of the House to the financial statement of the Association and increased cost of the Association's operations. It is certain that these costs will increase, and your reference committee hopes that the House in this session will take appropriate action to provide generous financial support for the projects in which the Association is now engaged and for additional activities.

2. The Journal and Other Publications: All of the publications of the Association have prospered and extended their usefulness. The Journal continues to be the outstanding medical periodical in the world and Hygeia the most important agency of lay information in matters of health. The circulation of Hygeia is now 225,000 copies a month, nearly double that of three years ago.

The reference committee is in full agreement with that section of the report on The Journal which suggests a special publication to be devoted largely to the social, economic and industrial aspects of medicine, and your committee hopes that this may be established without delay.

3. World Medical Association: American medicine has a grave responsibility in the continued development of the World Medical Association; our participation in it is imperative to its success.

There is confusion in the minds of many concerning the World Medical Association and the World Health Organization. The World Health Organization is an official assembly of governmental agencies and is the health section of the United Nations. The World Medical Association is a voluntary association of representatives of medical organizations throughout the world. It has a great potential in bringing physicians from everywhere together and affords opportunity for discussion of mutual problems and development of mutual strength.

The reference committee wishes to encourage the Board of Trustees in this project.

4. The Mission to Japan: The reference committee wishes to call particular attention to the important mission to Japan carried out by five members of the Board of Trustees at the request of General MacArthur. It is a significant evidence of the esteem in which American medicine is held.

5. National Health Assembly: The reference committee wishes to commend the Board of Trustees for the action taken in relation to the National Health Assembly held in May, providing the opportunity for many informed spokesmen for American Medicine to present our views to the Assembly even though they were finally distorted and/or disregarded in the official reports.

6. Actions of House at June Session; The House of Delegates during its session in June took action on the service of physicians in connection with the draft and on several phases of the operation of the Veterans Administration. These matters are discussed in the report of the Board of Trustees, but no comment will be made on them by your reference committee, since resolutions relating to them are now pending before this House.

7. Reports of Councils and Bureaus of Board: The committee has reviewed the reports of all the bureaus and councils and the laboratory, and it is pleased to state that in its opinion, they are operating efficiently and being of great service.

8. Bureau of Legal Medicine and Legislation and Bureau of Medical Economic Research: Particularly does the committee mention the broad usefulness of the Bureau of Legal Medicine and Legislation and the Bureau of Medical Economic Research. The former has long been an active agency of the Association, and your committee is pleased to see that it continues as such and extends its services. The Bureau of Medical Economic Research is a new enterprise of the Association and has already taken its place as a valuable and unique stimulation to the better understanding of medical economic problems. It is hoped that its publications may have wider distribution among the profession and the public.

9. Board of Trustees: Your committee wishes to express appreciation to the Board of Trustees for its painstaking and time-consuming service to medicine in America, not only for the things embodied in the report presented to this House but also the myriad details which constantly confront it.

SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES

1. Committee on Hospitals and the Practice of Medicine: The Board of Trustees also submitted a supplementary report which was a progress report of the Committee on Hospitals and the Practice of Medicine, under the chairmanship of Dr. Elmer Hess. That committee is charged with the analysis of a delicate question, and your reference committee will not comment at length on its preliminary report. It does, however, wish to urge on the committee the realization that although many of the problems involved must be settled at the local level, the American Medical Association, although it has no actual police power, must establish policies for the guidance of the component societies in all matters related to the practice of medicine.

2. The Future of Medicine in the United States: The reference committee took no action on a supplementary report from the Board of Trustees entitled, "The Future of Medicine in the United States." This report had to do with levying an assessment on constituent associations to finance additional activities of the American Medical Association. The report was referred to the Reference Committee on Legislation and Public Relations, which had received a number of other resolutions dealing with the same subject.

APPRECIATION

And now, Mr. Speaker, I wish to thank my colleagues on the committee for their assistance and those who appeared before the committee for the aid and guidance that we received from them.

Respectfully submitted,

Creighton Barker, Chairman.
Samuel J. McClendon.
Hans H. F. Reese.
Fred H. Muller.
Coursen B. Conklin.

Report of Reference Committee on Sections and Section Work

Dr. Henry S. Ruth, Chairman, presented the following report, which, on motions of Dr. Ruth, duly seconded and carried, was adopted section by section and as a whole:

1. The Reference Committee on Sections and Section Work considered the two items referred to it, namely, the initial and supplementary reports of the Council on Scientific Assembly.

2. The Reference Committee commends and compliments the Council on the unique and well planned scientific program for the present Interim Session.

3. The appointment of officers for the forthcoming first meeting of the Section on Diseases of the Chest and a ruling for the election of their delegate and his alternate were approved, and these officers are welcomed to their new duties.

4. Identical action was voted in respect to the allotment of a session and the appointment of officers for allergy and two sessions for physical medicine in the Section on Miscellaneous Topics at the 1949 Scientific Assembly at Atlantic City, and your committee concurs in the encouragement for the possibility that a session be held once every second or third year on the history of medicine, as coinciding with previous indi-

cations that these portions of the report are consistent with the wishes of the House of Delegates.

5. The Reference Committee approves of the Council's correlation of the assignment of units of sessions for sections with past attendance at the recent section meetings. It took cognizance with praise of the accompanying table in the report showing attendance at recent section meetings. It is in accord with the Council's decision to accede to the wishes of the section secretaries in numbers of sessions granted as far as possible within the limitations of available physical space and other considerations, as well as the Council's objective toward stimulating by this recommendation the formation of continued vital and valuable programs. The committee was impressed with and expressed confidence in the Council's decision in adopting a fluid policy in respect to the number of sessions for each section.

6. The advisability of granting an increase in the membership of the Council from five to seven in number was clearly apparent for reasons adequately expressed; therefore, the Committee approves of such an enlargement and recommends that the indicated change in the By-Laws be presented at the next meeting of this House of Delegates for consideration at that time.

All the above recommendations were unanimously approved by your reference committee.

Respectfully submitted,

Henry S. Ruth, Chairman.
Thomas A. Foster.
Benjamin H. Minchew.
Homer L. Pearson.
Jean P. Pratt.

Report of Reference Committee on Hygiene and Public Health

Dr. Stanley H. Osborn, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. Osborn, duly seconded and carried:

Your Reference Committee on Hygiene and Public Health had three matters referred to it for consideration on the following subjects: (1) Health Units for the Nation, (2) Diabetes Week and (3) The Proposed Definition of "Public Health."

1. Resolutions on Health Units for the Nation: These resolutions were introduced by Dr. Herbert P. Ramsey, District of Columbia, and, with minor changes, have the approval of your committee, to read as follows:

Whereas, No amount of medical care of persons already sick will substantially reduce the incidence of illness; and

Whereas, The traditional position of the American Medical Association has been one of firm support of public health services; in fact, this constitutes a major element of the Ten Point National Health Program of the American Medical Association; and

Whereas, Large numbers of local areas and counties in the United States are not now and never have been covered by adequate sanitary and other public health services; and

Whereas, The Surgeon General of the United States Public Health Service has announced that one of his first major objectives is assistance in development of local health units throughout the nation to meet this fundamental need; and

Whereas, The medical profession has now an opportunity to exert constructive leadership in this matter through the national, constituent state and component county medical societies; therefore be it

Resolved, That the House of Delegates reaffirm its abiding interest in the necessity for the provision of full time modern public health services at the local and community level, including sanitation and all the services usually considered essential for the preservation of the public health; and be it further

Resolved, That the United States Public Health Service be commended for, and encouraged in, its efforts for the further development of local health units for these purposes; and be it finally

Resolved, That the Board of Trustees be commended for its efforts in furthering full time local health units and urged to continue actively all proper procedures to the end that local public health service shall become adequate throughout the nation.

2. Resolutions on Support of Diabetes Week and Resolutions on Diabetes Week and Efforts in Behalf of the Undiscovered and Untreated Diabetic Patient: These resolutions on the subject of "Diabetes Week" have been referred to this committee, which approves these resolutions, with slight modifications, as follows:

Whereas, The medical profession has always recognized its obligations for the discovery, treatment and prevention of diabetes mellitus; and

Whereas, The number of persons with latent and undiscovered diabetes in the United States, according to surveys, is much larger than had been supposed and is estimated to be about 1,000,000 persons; and

Whereas, There exists also a large number of patients whose diabetes is neglected and who are therefore under ineffective or no treatment; and

Whereas, The American Diabetes Association, Inc., whose membership consists of more than a thousand doctors interested in diabetes, has appointed a committee to formulate plans for a national "Diabetes Week," December 6 to 12, 1948; and

Whereas, The purpose of this effort is to assist doctors and local committees in effectively carrying out continuing plans for discovering the unknown diabetic persons and guiding them to their physicians and for spreading widely to the public information about diabetes; and

Whereas, This is to be a doctor's project, of the profession, by the profession and for the public; and

Whereas, To achieve the aims of "Diabetes Week," the American Diabetes Association seeks to enlist the formal support and active cooperation of the medical profession through the American Medical Association and its constituent and component societies; therefore be it

Resolved, That the House of Delegates of the American Medical Association heartily endorse the efforts of the American Diabetes Association in behalf of the undiscovered and untreated diabetic person and approve of the plans for a "Diabetes Week" from December 6-12, 1948.

3. Proposed Definition of "Public Health" from the Report of the Council on Medical Service on Pages 125-126 of the Handbook: Your committee recommends that this definition be amended so that it will be in agreement with the Ten Point National Health Program of the American Medical Association. The following definition has the approval of your committee:

"Public Health" is the art and science of maintaining, protecting and improving the health of the people through organized community efforts. It includes those arrangements whereby the community provides medical services for special groups of persons and is concerned with prevention or control of disease, with persons requiring hospitalization to protect the community and with the medically indigent.

Respectfully submitted,

Stanley H. Osborn, Chairman.
W. Palmer Dearing.
Gerald V. Caughlan.
Karl S. J. Hohlen.
Albert F. R. Andresen.

Report of Reference Committee in Medical Education

Dr. James R. Reuling, Vice Speaker, assumed the Chair.

Dr. George W. Kosmak, Chairman, presented the following report:

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

The report of the Council on Medical Education and Hospitals as published in the Handbook constitutes further evidence of the valuable work done by Dr. Herman G. Weiskotten and his associates in this important activity of the American Medical Association. Your reference committee, which has given diligent consideration to this report, desires to make the following comments, considering in their turn the various headings.

1. Financial Support of Medical Educations: This constitutes a topic of great importance to the medical profession. Decreasing income from former sources, increased costs of upkeep and administration, inflation and other factors constitute problems which have stimulated a search for funds from other sources, among them subsidies from the federal government. Naturally, the Council believes that this should be only a last resort and that further attempts should be made to secure the needed support from voluntary agencies. The Council believes that this can be developed through the medium of a national foundation for medical education and meetings have been held with interested lay groups to further the project. The Council believes that such support from voluntary sources in commerce, banking and industry is possible. Your reference committee feels that such activities should be continued and looks forward to the time when definite plans can be presented in future Council reports for action by the Association. It has no comments to offer.

2. Part Time Hospital Inspectors: Your committee commends the procedure adopted by the Council to make more adequate inspection of hospitals designated for intern and resi-

dent training in securing the assistance of part time inspectors for this purpose in various sections of the country. The more frequent appraisal of institutions appears essential to maintain adequate standards.

3. Resident Training and Development of Specialty Boards: In this connection attention might be drawn to the extension of the plan for resident training and the development of the "specialty boards." It is stated that at least one year of an approved rotating internship should be required before a physician can start his specialty training. Practically, this means that young physicians aspire to become residents in limited fields so that they may become eligible for examination by the various specialty boards and do not get enough training in general medicine to make good doctors of medicine. The tendency to specialize appears rather unfortunate in view of the universal desire for more general practitioners. How can this be obtained if we do not provide for the training of the latter and if we stimulate the development of more specialties by the methods now in vogue? In support of the activities of the House of Delegates of the American Medical Association in its attempt to redignify the general practitioner, your reference committee recommends that a reevaluation of basic teaching programs in undergraduate medical schools and of the overemphasis of specialty board certification be made by the Council on Medical Education and Hospitals.

4. Collaboration and Liaison with Other Agencies: The desirability of maintaining relations with other bodies interested in developing standards in teaching and other activities is acknowledged, and it is a satisfaction to note that cooperation is apparently universal. It is recommended, however, that the action of 1934 in refusing representation of two members of the Council on Medical Education and Hospitals as members of the Advisory Board for Medical Specialties be rescinded and that the American Medical Association request that two members of the Council on Medical Education and Hospitals be appointed on that Advisory Board instead of maintaining only the present liaison between the Council on Medical Education and Hospitals and the Advisory Board for Medical Specialties.

5. Summary of Hospitals and Technical Schools: It is of interest to be informed of the large number of institutions which have been under consideration by the Council. Such registration and approval should prove of enormous educational value, together with the regular publications of the Council in The Journal and elsewhere. Attention may be called to the statement that the hospitals approved for intern training call for 9,200 approved internships, whereas it has been stated in the report of a previous committee of this House that only 6,700 persons are available to fill these positions. Therefore, your reference committee believes that if a two year rotating internship could be arranged, the number would be definitely reduced.

6. Association of Interns and Medical Students and the Association of International Medical Students: Among other matters referred to the Council by the House of Delegates, your reference committee noted that the Council was requested to investigate the Association of Interns and Medical Students and the Association of International Medical Students as to facts, tendencies, affiliations and objectives. The Council has this under study, and your reference committee recommends that the matter be subjected to further investigation and that, if feasible, a report be submitted as soon as practicable.

7. Council Activities: To the Council have been assigned many problems in the field for which it was designated, and it has met these with understanding and knowledge. Its activities are therefore of paramount importance and value not only to the medical profession but to the community at large. Your reference committee is pleased to commend the Council highly for its outstanding accomplishments and desires to express gratitude and appreciation for its cooperation in the deliberations of this committee.

Your committee recommends the adoption of the report of the Council on Medical Education and Hospitals and in addition the adoption of the recommendations of the reference committee concerning several of the items in the report of the Council as mentioned.

SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

Your reference committee further recommends for approval the revised rules and regulations submitted by the Council on Medical Education and Hospitals in its supplementary report. This supplementary report included a revision of the Council's "Essentials of a Registered Hospital," "Essentials of an Approved Internship" and "Essentials for Approved Residencies and Fellowships." Your committee has suggested three minor alterations in these essentials; namely, in the "Essentials of an Approved Internship" on page 7 the wording "not less than twenty recognized medical journals" be changed to "an adequate number of recognized medical journals." In the Essentials of Approved Residencies and Fellowships" your reference committee recommends the omission of the paragraph on page 7 which reads: "Most residency programs are designed to meet the needs of physicians seeking certification by an American board. Therefore in fields represented by the American boards, the Council seeks to approve only such residencies or fellowships as will be acceptable in whole or in part for admission to the certification examinations." Your reference committee further recommends the deletion of the last paragraph on page 14 referring to the essentials for an approved residency in general practice which reads: "Since residencies of this type are planned to prepare the resident for general practice, they ordinarily do not carry credit towards certification by the specialty boards."

The suggested changes in these reports of the Council on Medical Education and Hospitals are offered for the sake of clarity and should not be interpreted in any way as detracting from the admiration that your reference committee has for the efficiency and excellence of the reports of the Council on Medical Education and Hospitals.

Your reference committee recommends the adoption of the essentials referred to with the modifications cited.

RESOLUTIONS

Resolution on Supplying Doctors for the Armed Forces: This resolution deals primarily with the deferment of medical students until completion of an internship not to exceed two years. Your committee believes that this matter should be given consideration by the Council on National Emergency Medical Service and respectfully suggests that it be referred to that Council.

Resolution on Increase in Number of Students Graduated at Medical Schools in Michigan: Your reference committee believes that the following resolution submitted by Dr. Wyman D. Barrett, Michigan, is based on false premises and is not inclined to give it consideration:

> Whereas, There is general agreement as to the need for a larger number of physicians; and
>
> Whereas, The facilities for teaching are not sufficiently increased to provide hope in the near future of answering the need for a larger number of physicians; and
>
> Whereas, The number of individuals other than Doctors of Medicine licensed to practice the healing art in the State of Michigan has increased materially; therefore be it
>
> *Resolved*, That the Michigan State Medical Society, through its officers, support any reasonable means to increase the number of students graduated from medical schools in this state, and that the delegates to the American Medical Association take similar action at the next meeting of the House of Delegates of the American Medical Association.

Resolutions on Interns: Your reference committee wishes to report that the matter contained in the following Resolutions on Interns submitted by Dr. Joseph F. Londrigan, New Jersey, is now under consideration by the Council on Medical Education and Hospitals and no further report is necessary:

> Whereas, It is increasingly difficult for American Medical Association-approved hospitals to secure interns; and
>
> Whereas, the Association of American Medical Colleges recommends reorganizing the plan of internship to give a two year service with the rotation so arranged as to make possible intensive training in the major divisions of medicine; therefore be it

Resolved, That the period or term of internship be extended to two years, one year rotating and the second year rotating or straight internship; and be it further

Resolved; That the specialty boards give credit for the second year of internship as the equivalent of a junior residency.

Resolution on Federal Subsidization of Medicine: The following Resolution on Federal Subsidization of Medicine has been referred to this reference committee, which believes that the resolution, including the original statement referred to in it, should be referred to the committee on legislation and public relations:

Whereas, the policy of the American Medical Association on federal subsidization of medicine has been clearly defined by its Council on Medical Education and Hospitals; and

Whereas, It is apparent from the recent action taken by an affiliated specialty academy that this policy is not being observed; be it

Resolved, that the American Medical Association, through its Council on Medical Education and Hospitals, reaffirm its statement on this matter and disseminate this statement to the responsible officials of all affiliated organizations and specialty groups.

Respectfully submitted,

George W. Kosmak, Chairman.
Mather Pfeiffenberger.
William Bates.
Louis A. Buie.
Warde B. Allan.

The seven sections of the report of the reference committee dealing with the report of the Council on Medical Education and Hospitals were adopted section by section on motions of Dr. Kosmak, duly seconded and carried.

The report of the reference committee dealing with the Supplementary Report of the Council on Medical Education and Hospitals was adopted on motion of Dr. Kosmak, seconded and carried.

Dr. Kosmak moved adoption of the report of the reference committee referring to the Resolution on Supplying Doctors for the Armed Forces. The motion was seconded by Dr. Walter E. Vest, West Virginia, and discussed by Dr. Vest and by Dr. E. Vincent Askey, California, who moved an amendment that premedical students be considered in this problem as well as medical students, and the motion to amend was seconded by Dr. Vest, and carried. The motion to adopt this section of the report of the reference committee as amended was then carried.

It was moved by Dr. Kosmak, seconded and carried, that the report of the reference committee referring to the Resolution on Increase in Number of Students Graduated at Medical Schools in Michigan be adopted.

Dr. Kosmak moved adoption of the report of the reference committee dealing with the Resolutions on Federal Subsidization of Medical Education. The motion was severally seconded and discussed by Dr. Kosmak, who stated that he did not think the resolutions came within the province of this reference committee. Dr. Samuel J. McClendon, California, moved that the resolutions be acted on immediately, and this motion was duly seconded and carried after the resolutions had been reread.

Dr. T. K. Gruber, Michigan, moved that the resolutions be adopted, and the motion was seconded by Dr. Samuel J. McClendon, California. Dr. C. B. Conklin, District of Columbia, moved an amendment to the motion to strike out that part of the resolutions that refers to a certain academy, and the motion to amend was duly seconded and lost after discussion by Drs. C. B. Conklin, District of Columbia; Samuel J. McClendon and Robertson Ward, California; William D. Stovall, Wisconsin; H. P. Ramsey, District of Columbia; Louis A. Buie, Section on Gastro-Enterology and Proctology; Donald G. Anderson, Secretary of the Council on Medical Education and Hospitals; E. Vincent Askey, California; Morris Fishbein, Editor of The Journal of The American Medical Association, and James R. Reuling, Vice Speaker, and Dr. Kosmak.

The House then carried the motion to adopt the resolutions, which had been duly seconded, after discussion by Drs. E. Vincent Askey, California; Allen H. Bunce, Georgia; Samuel J. McClendon, California; E. H. Cary, Texas, and James R. Reuling, Vice Speaker, and Dr. Kosmak.

On motion of Dr. Kosmak, duly seconded and carried, the report of the reference committee as amended was adopted as a whole.

Report of Reference Committee on Reports of Officers

The Vice Speaker presided.

Dr. James Z. Appel, Chairman, presented the following report:

1. Address of the Speaker: (*a*) Your reference committee wishes to congratulate the Speaker in his efforts to expedite the business of the House of Delegates.

(*b*) Your committee believes, in observing this session, that a few changes might be made which would further facilitate this desire on the part of the Speaker. It would like to suggest that the roll call be so modified that all late comers quietly and while the House is conducting its business report their presence to the Secretary.

(*c*) Further, it believes that it is unnecessary and time consuming to count publicly the ballots of the vote for the General Practitioner's Award and the Distinguished Service Award.

(*d*) In this latter regard it recommends that the qualifications of the three nominees of the Board of Trustees for these two awards be mimeographed and those mimeographed copies be distributed to the Delegates at the time of the nomination. It does not believe that any other sketches of possible nominees should be permitted to be distributed.

(*e*) Your reference committee agrees with the Speaker that there should be some clarification in the By-Laws concerning the Executive Session. It understands that the implementation of this suggestion has been presented and is under consideration of another reference committee. It heartily endorses the idea.

2. Judicial Council: The report of the Judicial Council which appeared in the Handbook, pages 98 to 101 inclusively, met with the approval of your reference committee. It wishes to congratulate the Judicial Council on its expounding the principle that anesthesia is a medical service in contrast to its being a hospital service. It believes that this principle applies to the other specialties generally associated with hospital care as well. It regrets that the Judicial Council must again delay the formulation of a new Principles of Medical Ethics until the report of the Committee on Rebates has been acted on by the House. It can see the wisdom in doing so and can only hope that at the next session the Council will introduce a definite statement on this matter one way or the other. It is the opinion of your reference committee that effort should be made to instil in the members of the American Medical Association the knowledge and the practice of the Principles of Medical Ethics. It believes that the publication of a collection of questions and answers by the Judicial Council will be helpful in this matter. It urges the Judicial Council to take further steps to educate the young doctor and reeducate the older doctor of medicine in these medical ethics. As a suggestion it offers the idea of urging the county medical societies to institute indoctrination courses for all new members, which course would include a thorough understanding of the Principles of Medical Ethics.

Respectfully submitted,

James Z. Appel, Chairman.
J. B. Lukins.
Willis I. Lewis.
Deering G. Smith.
E. Vincent Askey.

Dr. Appel moved adoption of the first paragraph of the report of the reference committee dealing with the Speaker's address, and the motion was seconded. There was discussion by Dr. F. F. Borzell, Speaker; Dr. Appel; Dr. James R. Reuling, Vice Speaker; Dr. G. Henry Mundt, Illinois; Dr. E. Vincent Askey, California, and Dr. E. L. Henderson, Chairman, Board of Trustees, after which Dr. Appel requested deletion of the part of the report referring to having mimeographed copies of qualifications of three nominees for Distinguished Service Award and General Practitioner's Award distributed to members of the House at the time that action is to be taken.

Dr. Appel then moved adoption of the report of the reference committee dealing with the first two paragraphs of the Speaker's Address. The motion was seconded and carried.

Dr. Appel moved adoption of the report of the reference committee contained in the third paragraph dealing with the Report of the Speaker excluding the part deleted. The motion was duly seconded and discussed by Dr. R. W. Fouts, Vice President; the Speaker; the Vice Speaker; Dr. Appel; Dr. G. Henry Mundt, Illinois, and Dr. Thomas M. D'Angelo, New York, who moved that the matter be tabled. The motion was regularly seconded and carried.

It was moved by Dr. Appel, duly seconded and carried, that the portion of the report of the reference committee referring to supplying mimeographed copies of qualifications of nominees for the awards be withdawn.

Dr. Appel moved, and the motion was seconded and carried, that the report of the reference committee dealing with the Report of the Judicial Council be adopted.

On motion of Dr. Appel, regularly seconded and carried, the report of the reference committee with the exception of that part that was deleted and tabled was adopted as a whole.

Report of Reference Committee on Emergency Medical Service

The Speaker resumed the chair.

Dr. Thomas F. Thornton, Chairman, presented the following report, which, on motions of Dr. Thornton, duly seconded and carried was adopted section by section and as a whole:

The deliberations of your reference committee were carried on with the aid and advice of the delegates from the Army, the Navy and the Public Health Service and of members of the *Council on National Emergency Medical Service.* The reports of this Council show a vigorous and continuing activity since the last meeting of the House of Delegates. Your committee feels that this Council should be commended on its fine work in dealing with this urgent problem relating to the use of physicians in our armed forces.

1. Report of Council on National Emergency Medical Service: The Report of the Council on National Emergency Medical Service, printed on pages 70 and 71 in the Handbook, was considered carefully. The committee particularly commends the Council for its emphasis on the need for economy in the use of physicians in the armed forces and for its concern in trying to keep civilian medical personnel adequate for civilian and industrial needs.

2. Statement of Council on National Emergency Medical Service: A statement of the Council on National Emergency Medical Service as printed in The Journal of the American Medical Association on Nov. 20, 1948, page 893, was next considered. The following resolution that was recommended by the council in that statement is recommended by this committee for adoption by the House of Delegates:

Be it Resolved, That in the light of current medical personnel shortages, and in line with the accepted policy for coordination by the armed forces, every effort should be made to consolidate the facilities for the hospital care of the several armed forces; and

Resolved, That the patient load in military hospitals, particularly of nonmilitary patients, be reduced to the minimum consistent with the primary mission of the armed forces as defined by Congressional Acts.

3. Resolutions on Position of Surgeons General: The committee next considered resolutions introduced by Dr. James C. Sargent, Wisconsin, in regard to the position of the Surgeon General of the Army, the Surgeon General of the Navy and the Air Surgeon. After discussion of the resolutions and the problems involved by the committee and others in attendance the committee recommends to the House of Delegates for its adoption the following substitute resolution:

Whereas, The chief medical officers of the Army, Navy and Air Force have a great responsibility in connection with the prevention as well as the treatment of diseases and injuries in members of the armed forces, and the modern unconventional weapons of war have serious medical and health implications both in defense and offense; and

Whereas, The effective execution of the medical mission in peace as well as in war demands that the chief medical officer in the three respective services have a voice in the planning and other activities affecting the health and the treatment of the sick and injured; and

Whereas, The Surgeon General of the Army and the Air Surgeon do not have comparable organizational relationship with their respective Secretaries and Chiefs of Staff as is enjoyed by the Surgeon General of the Navy with the Secretary of the Navy and Chief of Naval Operations; therefore be it

Resolved, That in peace as well as in time of war the Surgeon General of the Army and the Air Surgeon be so placed in the respective organizational set-up of the Army and the Air Force that he is directly under the Chief of Staff of the Army or the Chief of Staff of the Air Force, as the case may be; and be it further

Resolved, That the Surgeon General of the Army and the Air Surgeon have the responsibility directly under the Chief of Staff of the Army and the Chief of Staff of the Air Force respectively in all matters pertaining to health, hospitalization, evacuation, sanitation and research in their respective services; and be it further

Resolved, That a copy of these resolutions be sent to the President of the United States, the Secretaries of National Defense—Army, Navy and Air—and the members of the Committee on Armed Services of both the Senate and the House of Representatives.

4. Recommendation of Appointment of Civilian Medical Advisory Board: The Council on National Emergency Medical Service had recommended to the Secretary of Defense, Hon. James Forrestal, the appointment of a Civilian Medical Advisory Board to act in an advisory capacity with the Secretary of Defense on problems of the armed forces in the field of medicine. Dr. Sargent has received a telegram from the Secretary of Defense dated Nov. 29, 1948, reading as follows:

"Reference your telegrams of twenty four November Nineteen Forty-Eight concerning Medical Advisory Committee, on 9 November I approved a Charter for such committee, copies of which are in the hands of Admiral Boone. In addition, invitations for civilian membership have been issued to a number of eminent medical and allied professional individuals. Announcement of the formation and membership of this committee is being held up pending receipt of all acceptances to membership invitation. Greatly appreciate continued interest and support of you and the members of your Committee."

5. Armed Forces Medical Advisory Committee: Your reference committee also received a copy of the Charter issued by the Secretary of Defense, Hon. James Forrestal, establishing the "Armed Forces Medical Advisory Committee" and outlining the organization and functions of this committee. A copy of this charter is attached to this report.

6. Supplementary Report of Council on National Emergency Medical Service: The committee next considered the supplementary report of the Council on National Emergency Medical Service dated Nov. 29, 1948, introduced by Dr. E. L. Henderson, Chairman, Board of Trustees. This report includes four recommendations on policy. Your committee recommends adoption of the recommendations, to read as follows:

(*a*) It is recommended by the Council on National Emergency Medical Service to the House of Delegates that the American Medical Association favors the call-up and commissioning of the number of physicians in this age group already registered under the Selective Service Act of 1948 that are required by the armed forces to accomplish their primary mission of the defense of our country.

(*b*) The Council further recommends to the House of Delegates that it reaffirm its support of the democratic principles of our country and in so doing object to any special legislation which directly or indirectly singles out the medical profession for registration or draft in categories other than those established for their fellow citizens.

(*c*) It is further recommended that the House of Delegates of the American Medical Association authorize and urge the Council on National Emergency Medical Service, the officers and Trustees of the Association, as well as its constituent organizations operating through their committees on emergency medical service, to initiate and support a program for the recruitment of a sufficient number of qualified physicians for the armed forces.

(*d*) The Council on National Emergency Medical Service recommends to the House of Delegates that the resolution passed by it in June 1948 relative to the development of a resident training program in the Department of Army and the Department of Navy be clarified. Such a program represents the highest type of medical education but cannot be supported as a program of officer procurement beyond the peacetime needs of the agency to support its primary mission. Full utilization of civilian teachers and civilian clinical and hospital facilities for such a graduate training program of the armed forces or any other government agency is paramount to our national economy and the maintenance of the established high level of medical educational standards and training. Such a graduate training program for the armed forces or for any other government agency must be limited by the actual needs of its peacetime establishment and the support of its primary mission as established by Congress. In our democratic form of government an adequate number of medical specialists always has been and always will be available to serve in the defense of our country.

Respectfully submitted,

Thomas F. Thornton, Chairman.
Howard B. Goodrich, Acting Secretary.
F. S. Crockett.
W. A. Coventry.
James Beebe.

ADDENDA

The Secretary of Defense
Washington

Directive

Armed Forces Medical Advisory Committee: Pursuant to the authority vested in me by the National Security Act of 1947 (Public Law 253, 80th Congress), and in order to insure the highest possible standards of medical and allied professional care for personnel of the Armed Services and civilian employees thereof, there is hereby established, within the Office of the Secretary of Defense, an Armed Forces Medical Advisory Committee hereinafter called the Committee), with the composition and functions hereinafter described:

I. Composition of the Committee: The committee shall be composed of a civilian chairman designated by the Secretary of Defense, the Surgeon General of the Army, the Surgeon General of the Navy, the Air Surgeon, and not less than three other individuals who shall be appointed by the Secretary of Defense from among members of the civilian medical and allied professions.

II. Functions of the Committee: 1. The Committee shall serve in an advisory capacity to the Secretary of Defense on questions which affect the Armed Services as a whole in the fields of medicine and its allied professions. In these several fields, the committee shall, on request, or on its own initiative, submit recommendations to the Secretary of Defense with respect to (*a*) the establishment of general policies and programs for the National Military Establishment as a whole; (*b*) the development of medical and allied services capable of efficiently and effectively supporting the missions and needs of the Armed Services; (*c*) the elimination of unnecessary duplication or overlapping, and (*d*) the development of the maximum degree of continuing cooperation and mutual understanding between members of the civilian medical and allied professions and the Armed Services. The Committee shall concern itself with these matters not only as they relate to the Armed Forces in peacetime but also as they concern plans for mobilization in the event of any future national emergency.

2. The Committee shall, on request, render advice or assistance to the Secretary of the Army, the Secretary of the Navy, the Secretary of the Air Force, the Chairman of the Munitions Board, the Chairman of the Research and Development Board, or the head of any other board or agency in the National Military Establishment, with respect to any problems in the fields of medicine and allied professions which fall within the jurisdiction of his individual department or agency.

III. Administration: 1. The Committee, subject to the approval of the Secretary of Defense and the provisions of this directive, shall provide for its internal organization and shall establish its own rules and procedures.

2. The Committee is authorized to consult with such persons within the National Military Establishment as it may wish, to call upon any agency of the National Military Establishment for information and assistance which it may require, and to solicit the help of any other individuals or agencies, both governmental and non-governmental, whenever it deems this to be appropriate.

3. The Committee is authorized to establish such continuing or temporary subcommittees as may be necessary to conduct studies, assemble information, or otherwise carry out functions of the Committee. In doing so, full use should be made of any existing committee within the National Military Establishment.

4. The Secretary of Defense shall provide the Committee with such personnel, facilities and other administrative services as he from time to time determines are required for the performance of its functions.

Approved: 9 November 1948.

James Forrestal.

Report of Reference Committee on Industrial Health

Dr. Thomas K. Gruber, Chairman, presented the following report, which on motions of Dr. Gruber, duly seconded and carried, was adopted section by section and as a whole:

1. Resolution on Accident Prevention: Your committee believes that this is a most noteworthy suggestion, and that the American Medical Association should be a leader in this most worth while effort, since accidents causing the death of 40,000 persons annually are in all probability preventable. Your committee approves this resolution.

2. Report of Council on Industrial Health: The report of the Council on Industrial Health, pages 67, 68 and 69 of the Handbook, is worthy of commendation, and evidences most worth while activity on the part of the Council.

(*a*) Annual Congress on Industrial Health: Your committee notes with interest that the next Annual Congress on Industrial Health, which will be held Jan. 18 and 19, 1949, will be a joint meeting with the Division of Industrial Hygiene of the United States Public Health Service and interested departments of the American Medical Association. It will include panels devoted to public relations, medical administration and environmental hygiene, medical hospital service, health education and preventive medicine.

Your committee believes that this House of Delegates should reaffirm past actions of this House of Delegates of the American Medical Association which expressed approval of industrial health planning by management, labor and medicine.

(*b*) Workmen's Compensation: Your committee approves the appointment of consultants to the Council on Industrial Health representing the administrative, legal, insurance and technical aspects of workmen's compensation.

(*c*) Civil Defense and Industry: Your committee is in accord with the action taken by the Council on Industrial Health recognizing the important part played by industrial workers in national defense, and approves the appointment of a committee to assist in the formulation of a proper program.

3. Supplementary Report to the Board of Trustees from the Council on Industrial Health on Medical Advisory Board of Welfare and Retirement Fund, United Mine Workers of America: Your committee compliments this supplementary report which deals with the pattern of procedure in the handling of hospital and medical care developed by the United Mine Workers Health and Welfare Retirement Fund. This report is noted with great interest.

Your committee particularly approves of the proposal made by the Medical Advisory Board of the United Mine Workers Health and Welfare Retirement Fund which calls for the creation of an advisory committee from each state medical society in each state in which the fund operates. These committees should be of great assistance to the regional officers in the development of policy and the promotion of proper administrative relationship.

Your committee approves the report of the Council on Industrial Health as well as the supplementary report and commends the Council for the work accomplished.

Respectfully submitted,

T. K. Gruber, Chairman.
Homer G. Hamer.
William L. Benedict.
H. B. Mulholland.

The House recessed at 3:15 p. m. and reconvened at 3:40 p. m., with the Speaker, Dr. F. F. Borzell, presiding.

Report of Reference Committee on Miscellaneous Business

Dr. Walter E. Vest, Chairman, presented the following report, which on motions of Dr. Vest, duly seconded and carried, was adopted section by section and as a whole, after an amendment to include a telegram was tabled:

1. Resolutions on Proposed Veterans Hospital Near Ann Arbor, Mich.: Your committee would reiterate the stand heretofore taken by the American Medical Association in which it explicitly expressed its objection to the utilization of veterans hospitals for non-service-connected disability cases, except for those patients who are medically indigent. It is the opinion of your committee that the present plans of the Veterans Administration will result in overbuilding, and it urges that before constructing other hospitals the medical society of the state in which the proposed hospital is to be constructed be consulted as to the actual need for the proposed hospital, pointing out that government funds are now available under the Hill-Burton Act to increase hospital facilities in local communities where such facilities are needed.

2. Report of Liaison Committee to Consider Red Cross Blood Bank Program: Your committee recommends acceptance of the report of the Special Liaison Committee to Consider Red Cross Blood Bank Program presented by Dr. L. W. Larson as a progress report. Your committee further recommends that this special committee be continued, with as little change in personnel as possible, and that it be instructed not only to act as a liaison committee with the American Red Cross Blood Program, but also to evaluate the private blood bank situation throughout the country and explore the possibilities of the development of further local blood banks in areas not now supplied with blood banks. It also recommends that this committee report the status of its studies and endeavors to each session of the House of Delegates.

3. Resolutions on Reorganization of Council on Medical Service: It is the opinion of your committee that the recommendations coming from the Chairman of the Council on Medical Service should be approved in toto. It recommends, therefore, the approval of the resolutions as presented.

4. Resolutions on Selective Service: Your committee believes that the premises on which the resolutions adopted by the House of Delegates in June 1948 were based were erroneous, and that the resolutions then adopted place the medical profession definitely in an unfavorable light. Your committee recommends, therefore, reconsideration of the action taken in June 1948 and approval of the resolutions.

5. Resolutions on Compulsory Hospital Staff Attendance: Your committee calls attention to the fact that the American Medical Association has not at any time advocated compulsory attendance at stated staff meetings. This committee is in sympathy with the philosophy prompting the resolutions.

6. Report of Committee on Rebates: Your committee has given prolonged consideration to this matter and approves that portion of the report which states that the House of Delegates reiterates condemnation of the practice of any member's accepting rebates, and that the House of Delegates condemns also the practice of giving rebates by a member. It urges that the different state societies in those states in which such practices are not now illegal give serious consideration to the introduction of legislation making the practice of rebating to or by physicians illegal.

Your committee recommends further to the component county societies that on the receipt of a bona fide complaint the disciplinary committee of that society hold a hearing and endeavor to make an investigation of the doctor's records and accounts at society expense, and that a record of such hearing and examination be kept for the information of the state society and, if necessary, for the Judicial Council of the American Medical Association.

Respectfully submitted,

Walter E. Vest, Chairman.
Herbert H. Bauckus.
Britton E. Pickett Sr.
James P. Kerby.

Report of Reference Committee on Legislation and Public Relations

Dr. Thomas K. Lewis, Chairman, presented a report stating that he requested that one section of the report of his committee be considered in Executive Session. The sections of the report submitted in open session were adopted on motions of Dr. Lewis, duly seconded and carried after amendment. This report, as amended, reads:

1. Report of the Executive Assistant: Your committee commends the excellent work of the Executive Assistant and feels that his accomplishments have more than justified the creation of this new office.

The committee wishes to call the attention of the House to the interest of other organizations in the Public Relations Conference held at this session. The committee is of the opinion that the American Medical Association should gratefully accept and commend the assistance of all organizations which have in the past, or may in the future, aid in efforts toward preservation and improvement of a high standard of medical care for the American people. The PR Doctor, the Secretary's Letter and other publications emanating from headquarters have been of inestimable value and will be enhanced and enlarged in the future under the new plan proposed by the Board of Trustees. The basic and most effective form of public relations is that which emanates from the doctor's office; therefore a wider dissemination of these publications is recommended. Your committee recommends the approval of that portion of the report of the Executive Assistant referred to it.

2. Report of the Council on Medical Service: (*a*) Your committee approves that portion of the report allocated to it on pages 115 to 118 of the Handbook. Your committee would comment on the tremendous public relations value of the Council's activities in fostering and stimulating community leadership. The regional conferences have been of exceptional value. Your committee would suggest that a larger attendance at these meetings should be encouraged.

(*b*) The Washington Office: Pages 126 to 128 of the Handbook. The Washington Office has become an increasingly important and effective agency. This Office should be expanded as rapidly as practicable.

Your committee approves those portions of the report of the Council on Medical Service.

3. Resolutions on Medical Service Plans: Your committee approves of these resolutions amended to read as follows:

Resolved, That the American Medical Association reiterate to the public its approval of these medical service plans and stress the desirability of their rapid expansion; and be it further

Resolved, That the American Medical Association urge, with moral support, every constituent state society to undertake the organization and operation of medical service plans, covering the services mentioned above, as expeditiously as possible; and be it further

Resolved, That the American Medical Association urge the rank and file of the profession to participate in and give whole-hearted support to the operation of these duly authorized and approved medical service plans; and be it further

Resolved, That the American Medical Association announce to the public the availability of such plans and give the widest possible publicity as to the purpose of and the benefits to be derived from nonprofit voluntary prepayment medical service plans.

4. Report of Committee on Veterans Affairs: Your committee recommends that the House of Delegates commend the efforts of the Committee on Veterans Affairs and recommends that the committee continue its negotiations with reference to this complex problem, holding as it has done in the past to the principles established by the House of Delegates with regard to the care of veterans who have established the fact of their inability to pay for needed medical services and hospitalization. It is suggested that this committee be directed to report to the House of Delegates in June of 1949 and that, in the meantime, it report periodically to the Board of Trustees concerning the progress of its efforts at negotiations in this matter.

5. Resolutions on Gathering and Dissemination of Information Relative to Health Legislation and Resolution on Presentation of Facts Concerning Health Care to Members of Congress: Resolutions from Kentucky and Oklahoma were introduced regarding activities along the line of contact with legislators. Your committee feels that the mechanism for the implementa-

tion of these recommendations is already in existence and, therefore, that no action need be taken on these resolutions. However, it feels obligated to call to the attention of the members of this House of Delegates the importance of taking home with them the obligation to see to it that their state and component county medical societies participate in the activation of a legislative program which, to be effective, must be on a local level.

Respectfully submitted,

THOMAS K. LEWIS, Chairman.
JOHN W. CLINE.
CHARLES H. PHIFER.
EDWARD H. CARY.
CLIFFORD C. SHERBURNE.

Closed Session

On motion of Dr. Clifford C. Sherburne, Ohio, regularly seconded and carried, the House resolved itself into Closed Session to hear the balance of the Report of the Reference Committee on Legislation and Public Relations, after a proposed amendment of Dr. H. P. Ramsey, District of Columbia, to have the Closed Session at the conclusion of all business, which was duly seconded, was lost.

The House entered into Closed Session at 4:20 p. m.

Report of Reference Committee on Legislation and Public Relations

Dr. Thomas K. Lewis, Chairman, presented the following report, which was adopted as amended, on motion of Dr. Lewis, duly seconded and carried after discussion:

Report of Board of Trustees on the Future of Medicine in the United States; Resolution on National Publicity; Resolutions on a Public Relations Program, and Resolutions on Compulsory Health Insurance: Four resolutions were presented to the committee for consideration coming from (1) the Board of Trustees, (2) Colorado, (3) California and (4) Michigan.

With regard to the Colorado resolution, your committee recommends that it be turned over to the newly appointed Planning Committee as a suggestion for guidance in outlining its activities. The other three resolutions on this subject were rather similar in content and, therefore, have been combined into one resolution, the framework of which is based on the resolutions introduced by the California Medical Association.

The resolutions as finally recommended and adopted by the House read:

Resolved, That this House of Delegates instruct the Board of Trustees to implement a "Statement of Policy" as adopted by the House at this session;

Resolved, That the House of Delegates declare that the Board of Trustees of the American Medical Association has its complete confidence in its intention and ability to carry out the objectives and execute the mandates of the House of Delegates;

Resolved, That the House of Delegates authorize the Board of Trustees to levy an assessment of $25 on the members of the American Medical Association;

Resolved, That this House of Delegates hereby directs the immediate expansion of the Washington Office and its placement directly under the supervision, direction and control of the Board of Trustees;

Resolved, That the immediate employment of suitable public relations counsel to assist in the execution of this program be recommended;

Resolved, That in order to coordinate the activities of the public relations phase of this program at all levels the public relations counsel shall disseminate information to (*a*) the general public, (*b*) the Congress of the United States and (*c*) state and county medical societies and individual physicians;

Resolved, That it be the unanimous expression of the medical profession, as represented by the House of Delegates, that we are firmly united behind the positive and constructive program as outlined by the House of Delegates; that we are confident in the ability of our leadership; that we are determined to protect and foster the high standards of medical care for the public; that we are steadfastly opposed to the regimentation and socialization of American medicine, and that we are confident that an intelligent and informed public will join us in our crusade to ever improve the health and welfare of the American people.

On motion of Dr. Philip W. Morgan, Chairman, Reference Committee on Rules and Order of Business, seconded and carried, the House rose from Closed Session at 4:55 p. m.

Wednesday Afternoon—Continued

The House reconvened in regular session at 4:55 p. m. with the Speaker, Dr. F. F. Borzell, presiding.

Dr. Philip W. Morgan, Chairman, Reference Committee on Rules and Order of Business, moved that the report of the Reference Committee on Medical Service and Prepayment Insurance Plans be heard and action taken without debate, since all interested parties appeared before the reference committee earlier in the day. The motion was regularly seconded and lost after discussion by Dr. John W. Cline, California.

Report of Reference Committee on Medical Service and Prepayment Insurance Plans

Dr. Raymond L. Zech, Chairman, presented the following report, which on motions of Dr. Zech, duly seconded and carried, was adopted section by section and as a whole:

1. Report of Council on Medical Service: That portion of the Report of the Council on Medical Service in the Handbook on pages 118 to 126 has been reviewed and approved with certain changes.

These changes occur on page 119, in which the last sentence has been deleted and the sentence before that in the third paragraph under "Compulsory Sickness Insurance" has been changed to read: "The Council believes that these should be placed in every college, medical school and hospital library and public libraries and in high school libraries on request."

2. Statement of Policy of American Medical Association: This statement submitted by Dr. E. Vincent Askey, representing the California Medical Association, relative to a statement of policy is approved wtih the following change in paragraph 1, line 4. This now reads, "Coverage is now provided throughout the country and protection is being extended rapidly to an ever increasing portion of our population." Your reference committee believes that this could be somewhat strengthened by changing that sentence to read: "Constantly increasing coverage is being provided throughout the country and protection extended to an ever increasing proportion of our population."

The second paragraph, beginning with the words, "compulsory sickness insurance," your committee believes could be improved by placing a period after the word "scheme," so that the second sentence from the bottom of that paragraph would then read: "The American Medical Association rejects any such scheme." deleting the semicolon and making a new sentence to read: "We are equally certain that when the people understand the facts they also will reject it with the same finality."

3. Resolution on Blue Cross–Blue Shield Proposals and Resolutions on National Health Insurance: The resolutions of the Michigan State Medical Society and the following resolutions, presented by Dr. C. C. Sherburne, Ohio, relative to the formation of a Blue Cross–Blue Shield Association and a Blue Cross–Blue Shield Health Service, Inc., were considered:

WHEREAS, The House of Delegates of the American Medical Association has already endorsed, at one of its previous sessions, the establishment of voluntary plans for the prepayment of medical care costs; and

WHEREAS, It has been the purpose of the medical profession, in establishing such plans, to extend their protection as rapidly as possible to all segments of the American public; and

WHEREAS, It has been difficult, if not impossible, to enrol certain large segments of the population because of a lack of correlated enrolment facilities on the part of the plans; and

WHEREAS, The need for establishing adequate facilities for the enrolment of national accounts has been recognized; and

WHEREAS, Specific proposals for establishing such facilities have been prepared and approved by the Blue Shield Commission of Associated Medical Care Plans, and at the request of its member plans; therefore be it

Resolved, That the House of Delegates of the American Medical Association approve the establishment of a Blue Cross–Blue Shield Association and a Blue Cross–Blue Shield Health Service, Incorporated, as contained within the published proposals referred to above.

In an open session lasting three hours, the committee heard arguments for and against the resolutions from Ohio and Michigan. The committee is in entire accord with the necessity and advisability of extending medical care and coverage to all classes of our population. Your committee does not believe that sufficient factual data have been supplied to enable it to make an intelligent decision on this most important subject. Therefore, these resolutions from Ohio and Michigan are not approved.

4. Resolution on Associated Medical Care Plans Incorporated: Your committee recommends disapproval of the Resolution on Associated Medical Care Plans Incorporated.

5. Supplementary Report of Council on Medical Service: The Supplementary Report of the Council on Medical Service relative to the A. M. C. P. proposal to form a national insurance company was carefully reviewed. Your reference committee recommends the adoption of the supplementary report with the following addition to paragraph 1, "further development of coordination of and reciprocity among the local plans."

Respectfully submitted,

Raymond L. Zech, Chairman.
W. H. Halley.
J. F. Londrigan.
H. E. Griffin.
W. L. Estes Jr.
F. J. Pinkerton.
F. J. L. Blasingame.

Report of Board of Trustees

Dr. E. L. Henderson, Chairman, presented the following report:

1. Planning Committee: Mr. Speaker and Members of the House of Delegates: Yesterday, when I announced to you that the Board of Trustees had formed the Planning Committee, I told you that we would submit the name of that committee to you today. We have decided on the name "Coordinating Committee for the Protection of the People's Health." I wish to announce that that committee will have its first meeting tomorrow morning at ten o'clock in Room C, where the Board of Trustees has been meeting.

If any member of the House knows of any organization interested in this great principle of protecting the American Way of Life that will join with the profession, will he please submit the name of that organization to this committee?

2. Interim Session in 1949: At the June meeting of the House of Delegates, I announced that the next Interim Session would be in Tampa, Fla. I wish to tell you at this time that the Board of Trustees has rescinded that and will announce a little later where that session will be held. It was thought by the Board of Trustees that that session should be more centrally located than Tampa.

Resolution on Expression of Appreciation

Dr. James C. Sargent, Wisconsin, asked the unanimous consent of the House to present for adoption without reference to a committee a Resolution on Expression of Appreciation.

Receiving unanimous consent, Dr. Sargent presented the following resolution, which was adopted on motion of Dr. Sargent, duly seconded and carried:

Whereas, The physicians of America have a deep concern over the medical and health care prevailing within the military establishment and in the civilian population of the country in time of national emergency; and

Whereas, The medical profession of America represented by the American Medical Association feels a deep sense of appreciation for the consideration and understanding with which its recommendations concerning the general structure of the National Defense Establishment have been received; therefore be it

Resolved, By the House of Delegates of the American Medical Association that a proper expression of its appreciation be extended to the President of the United States, the Secretary of Defense and the Chairman of the National Security Resources Board by the President of the American Medical Association.

Remarks of Speaker

The Vice Speaker took the Chair.

Dr. F. F. Borzell, Speaker, thanked the members of the House for their cooperation and suggested that hereafter the delegates refrain from stating that resolutions were approved by this, that and the other state, permitting each state to present its own resolution.

He also expressed regret that Dr. Walter F. Donaldson, Pennsylvania, who had served as delegate for more than twenty-five years, was leaving the House at this session, after which the House rose in honor of Dr. Donaldson.

On motion of Dr. John W. Cline, California, duly seconded and carried, the House adjourned sine die at 5:10 p. m.

Washington Letter

(From a Special Correspondent)

Dec. 13, 1948.

Scottish Under-Secretary of Health Visiting United States

T. D. Haddow, Under-Secretary of Health for Scotland, who is visiting the United States as a Commonwealth Fund fellow, will spend the greater part of January in California, he asserted shortly before leaving Washington to inspect the Federal Communicable Disease Center in Atlanta, Ga. On the West Coast he will study state and local public health activities and facilities. Mr. Haddow left Scotland in September, which, he said, was too soon after launching of the British health service program to enable him to draw any conclusions on efficiency of its operation. He volunteered, however, that fears of the Scottish Department of Health that there would be a large volume of complaints by patients in the first few weeks did not materialize. Mr. Haddow added that dissatisfaction was expressed by some participating physicians because payments for services rendered were not as large as they had been given to believe.

Veterans Administration Reports on "Home Town" Medical Care in 1948

An annual report just released by Veterans Administration reveals that during the fiscal year ended June 30, 1948, private physicians treated 761,165 veterans under arrangements with the Veterans Administration. For their services they received $11,437,739 for a total of 2,735,429 treatments. Thus, the average cost per treatment was $4.18 and the cost per veteran, for the twelve month period, was $15.03. In the same period, Veterans Administration staff doctors at outpatient clinics administered 1,680,183 treatments to 865,004 veterans. For the first quarter of the present fiscal year (July, August and September 1948), the number of cases handled—both by private physicians and Veterans Administration staff men—ran about 30 per cent behind the figure for the corresponding period in 1947.

Navy's Second Course for Medical Reservists

Gratified by the success of its special five day course in "Medical Aspects of Special Weapons and Radioactive Isotopes," which ended December 10, the Bureau of Medicine and Surgery has announced that a second course will be conducted in mid-February. It will be five and one-half days in length—a half-day longer than the December seminar—and will offer some curricular changes. It is due to open February 14, with two hundred and ten vacancies for members of the Navy Medical Corps Reserve. The December session had approximately one hundred and fifty in attendance. Applications should be directed to commandants of the respective naval districts before Jan. 17, 1949. The February course, like its predecessor, will be held at the Naval Medical School, Bethesda, Md.

Coming Medical Meetings

Annual Congress on Industrial Health, Chicago, Drake Hotel, Jan. 18-19. Dr. Carl M. Peterson, 535 N. Dearborn St., Chicago 10, Secretary.

Annual Congress on Medical Education and Licensure, Chicago, Palmer House, Feb. 7-8. Dr. Donald G. Anderson, 535 N. Dearborn St., Chicago 10, Secretary.

National Conference on Rural Health, Chicago, Palmer House, Feb. 4-5. Dr. F. S. Crockett, 535 N. Dearborn St., Chicago 10, Chairman.

American Society for Surgery of the Hand, Chicago, Jan. 21-22. Dr. Joseph H. Boyes, 1401 S. Hope St., Los Angeles 15, Secretary.

International Post-Graduate Medical Assembly of Southwest Texas, San Antonio, Jan. 25-27. Dr. John J. Hinchey, P. O. Box 2445, San Antonio, Secretary.

Southeastern Allergy Association, Durham, N. C., Washington-Duke Hotel, Jan. 22-23. Dr. Katharine B. MacInnis, 1515 Bull St., Columbia, S. C., Secretary.

Southeastern Surgical Congress, Biloxi, Miss., Jan. 24-27. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.

Western Section American Urological Association, Coronado, Calif., Hotel del Coronado, Jan. 17-19. Dr. Adolph A. Kutzmann, 1930 Wilshire Blvd., Los Angeles 5, Secretary.

GOVERNMENT SERVICES

ARMY

CONSULTANTS TO THE PACIFIC AREA IN 1948

The Surgeon General's Office has been carrying out a program designed to bring to the Army Medical Department in the Pacific Area the latest advances in the field of medicine and in so doing assigned during 1948 the following civilian consultants to aid in this work:

MARCH

Name	Residence	Specialty

Moore, John R.	Mobile, Ala.	Orthopedics

MILITARY RESIDENT TRAINING

Regular Army commissions, in the grades of first lieutenant and captain, have been awarded to eighteen physicians preparatory to their entering the first year of military residency training in their various professional specialties next January.

Major General Raymond W. Bliss, the Surgeon General of the Army, announced that five Army teaching hospitals—Letterman General Hospital, San Francisco; Brooke General Hospital, Fort Sam Houston, Texas; Oliver General Hospital, Augusta, Ga.; Fitzsimons General Hospital, Denver, and Walter Reed General Hospital, Washington, D. C.—are providing instruction at the levels of assistant resident, resident and senior resident in ophthalmology, internal medicine, general surgery, pathology, orthopedics, psychiatry, otolaryngology, radiology, urology and other specialties.

This training as part of the recently evolved Graduate Professional Training Program is designed to offer all qualified applicants the opportunity to meet their requirements for certification by an American specialty board in the fields of their choice, contingent on the needs of the Army.

Applications for the next phase of the training program, to begin next July 1, are being received by the Office of The Surgeon General. No action will be taken on these until physicians applying have accepted commissions in the Regular Army.

The eighteen newly commissioned officers who will enter the program in January are: Herbert M. Alston, Columbus, Texas; John H. Bickerton Jr., Los Angeles; Ernest M. Bralley Jr., New York; James N. Brien Jr., Memphis, Tenn.; Samuel J. Camarata, Pittsburgh; Layne E. Carson, Wynne, Ark.; Francis E. Foley, New York; Harry M. Henderson, Fort Sam Houston, Texas; Augustus B. Jones Jr., San Francisco; Oliver Mays, Austin, Texas; Clarence S. Miller, San Francisco; William Moore, Fort Sam Houston, Texas; Marvin E. Perkins, Fort Eustis, Va.; Thomas F. Puckett Jr., 7th Infantry Division; Herbert P. Sube, Madigan General; Leo S. Szakalun, Wilmington, Del.; Donald R. Taylor, 1106th A.S.U. Medical Detachment, and George S. White, Ridgely, Md.

RESEARCH ON JAPANESE ENCEPHALITIS

The Surgeon General announces that plans have been made for a new study of the carriers of Japanese encephalitis and host reservoirs of this disease in Okinawa and Japan. This study will be made on a large scale, particularly in view of the recent epidemic of encephalitis among the natives, which carried a high mortality rate. Basic material for the study is provided in a recent publication entitled "Mosquito Fauna of Japan and Korea," by Major Walter J. La Casse, an entomologist of the Army Medical Service Corps. This report represents a study of the countless breeding places for mosquitoes in rice paddies, decorative pools in sacred gardens, moats, water-filled depressions in bombed areas, and other places. For years the Army Medical Research and Graduate School has been engaged in research to find a successful treatment of this disease, chiefly by means of a vaccine. Colonel Thomas E. Patton Jr., Deputy Chief, Preventive Medicine Division, the Surgeon General's Office, is hopeful that by close cooperation with allied scientists and civilian consultants a method of controlling Japanese encephalitis will be found.

BIOLOGISTS, ENTOMOLOGISTS AND MYCOLOGISTS WANTED

The Board of U. S. Civil Service Examiners, Army Chemical Center, Md., announces that opportunities are available for the employment at that location under civil service of biologists (medical), entomologists (research) and mycologists (research) for probational appointment. For details write to the Board of U. S. Civil Service Examiners, Army Chemical Center, Md.

MONTHLY MEDICAL MEETING

At the regular monthly medical meeting conducted by The Surgeon General at the Walter Reed Hospital, Washington, D. C., on December 16, Dr. Howard B. Lewis will speak on "Protein Metabolism in Disease" and Dr. J. W. Conn on "Endocrinology and Metabolic Diseases." Both speakers are from the University of Michigan Medical School, Ann Arbor.

ARMY MEDICAL LIBRARY

The increase in Japanese publications received by the Army Medical Library has necessitated organizing an extra team of catalogers in the Index-Catalogue Division to handle Japanese publications published without romanized abstracts.

The Army Medical Library now holds 85 per cent of the important German medical books published during the war years, practically all of which were obtained through the Library of Congress Cooperative Acquisitions Project. The library will attempt to acquire the other 15 per cent.

The library has received films of 252 manuscript theses submitted to the University of Paris for the year 1939; films of several thousand theses submitted in manuscript form from 1943 to 1948 will be received, and thus complete the library's collection of Paris theses. Copies of these films can be supplied to other libraries from the negatives in the Army Medical Library.

RESEARCH ON MELANOMA

The Surgeon General announces that the Army will make an intensive study of some 400 autopsy and surgical specimens of melanoma at the Army Institute of Pathology. Thousands of slides for an exhaustive study of this subject will be prepared, in order, if possible, to bring about a complete histologic understanding of this disease, its manner of growth and criteria for recognition. To cover the Army's broad field of dermatology, twenty-seven additional specialists are needed in the Army Medical Department—*seven dermatologists* who are certified specialists and twenty who have completed dermatology residencies. Information regarding these openings may be obtained by writing The Surgeon General of the Army, Washington 25, D. C.

PERSONAL

Colonel Charles H. Beasley, Retired, has received the military award of the Order of Leopold from Belgium for outstanding services during the time that he served as Surgeon of the Advanced Section of the Communications Zone with headquarters at Namur from Oct. 25, 1944 to April 7, 1945. During this period Colonel Beasley established and directed twenty-five hospitals in Belgium which handled more than 1,000,000 casualties.

NAVY

FIRST ACTIVE DUTY AS INTERNS

The following lieutenants (jg) with the medical corps reserve have received orders for their first active duty as interns in the institutions indicated: John S. Anderson, Salina, Kan., to City Hospital of Akron, Ohio; Markham J. Anderson, St. Paul, Minn., to a fellowship in surgery at the Mayo Foundation, Rochester, Minn.; Sidney J. Blair, Chicago, to Cook County Hospital, Chicago; Keith M. Coverdale, Fort Wayne, Ind., to a residency in pediatrics at the Naval Hospital, Philadelphia; Joseph A. Fleetwood Jr., Conway, N. C., to Medical College of Virginia Hospital, Richmond, Va.; Harry R. Freeman, Oak Park, Ill., to Cook County Hospital, Chicago; Edward M. Goldberg, Chicago, to Cook County Hospital; Charlie R. Jernigan, Tyler, Texas, to Parkland City-County Hospital, Dallas, Texas; Gene B. Kaufman, Chicago, to Cook County Hospital; Sheldon H. Kluger, Wyoming, Pa., to Philadelphia General Hospital; George P. Kochis, Whiting, Ind., to Saint Francis Hospital, Evanston, Ill.; Ralph B. Martin, Barstow, Calif., to Huntington Memorial Hospital, Pasadena, Calif.; Kenneth W. Meinert, Milwaukee, to St. Mary's Hospital, Milwaukee; Berry B. Monroe, Laurinburg, N. C., to Cincinnati General Hospital; Marshall C. Morgan, Summit, Ohio, to City Hospital of Akron; Robert F. Jejedly, Chicago, to Saint Francis Hospital, Evanston, Ill.; Lester C. Paterson, Rosedale, N. Y., to Philadelphia General Hospital; William A. Shaver, Bradford, Pa., to Graduate Hospital of the University of Pennsylvania, Philadelphia; William E. Sheely, Elizabeth City, N. C., to Philadelphia General Hospital; Jesse B. Shelmire Jr., Dallas, Texas, to the Roosevelt Hospital, New York; Vernon L. Summers, Portland, Ore., to Minneapolis General Hospital; Robert L. Swezey, Los Angeles, to Los Angeles County General Hospital; Sidney A. Tyroler, Bexley, Ohio, to Indianapolis General Hospital; David H. Walworth, Wilmette, Ill., to Evanston Hospital, Evanston, Ill.; James A. White Jr., Memphis, Tenn., to John Gaston Hospital, Memphis; Guy T. Williams, Little Rock, Ark., to St. Louis City Hospital; Robert T. Brown, Bloomdale, Ohio, to the Naval Hospital, Philadelphia; William W. Bryant, Senecaville, Ohio, to the Naval Hospital, San Diego, Calif., and Donald L. Gantt, Delaware, Ohio, to the Naval Hospital, Long Beach, Calif.

SPECIAL COURSES FOR RESERVE OFFICERS

The first of a series of five day special courses in the medical aspects of special weapons and radioactive isotopes began December 6 at the Naval Medical School, Bethesda, Md., and two hundred reserve medical officers were in attendance. The staff for these courses includes civilian consultants, representatives from the Atomic Energy Commission and Oak Ridge, Tenn., and Naval officers who specialize in the use of radioactive isotopes. Part of the courses will comprise visits to the cyclotron at the Carnegie Institute at Chevy Chase, Md., the National Cancer Institute and the National Institutes of Health. The Surgeon General, Rear Admiral C. A. Swanson, has announced that the second course in this series will begin February 14, with only 210 vacancies open. Reserve medical officers who desire to take the course should make application to the commandant of their local Naval district prior to Jan. 17, 1949.

POSTGRADUATE INSTRUCTION

The following medical officers have been nominated for the course of postgraduate instruction indicated: Comdr. Thomas M. Foley, Washington, D. C., to a fellowship in children's orthopedics at the Shriner's Hospital for Crippled Children, Honolulu, T. H.; Lieut. James A. Kaufman, Blue Island, Ill., to a residency in surgery at the Naval Hospital, Great Lakes, Ill., and Lieut. (jg) August P. Ciell, Roxborough, Pa., to a residency in otolaryngology at the Naval Hospital, Philadelphia.

MEETING OF RESERVE MEDICAL DIVISIONS

A staff meeting of Naval Reserve Volunteer Medical Divisions 4-1 was held in Pittsburgh November 8. Those present comprised medical, dental and medical service corps officers, nurses and hospital corpsmen. Captain J. R. Thomas, Fourth Naval District medical officer, talked on the retirement plan for reserve officers which was discussed by Captain Paul Titus, M.C., U.S.N.R., and others. Naval medical motion pictures were exhibited.

RECALLED TO ACTIVE DUTY

The following medical reserve officers have been voluntarily recalled to active duty: Comdr. Lillian Hadsell, Bergen County, N. J., to the Naval Hospital, St. Albans, Long Island, N. Y.; Lieutenants (jg) Cyril J. Honsik, Oak Park, Ill., to a residency in general surgery at the Naval Hospital, National Naval Medical Center, Bethesda, Md., and Henry Santina, Chicago, to the Naval Air Station, Pensacola, Fla.

SYMPOSIUM ON DIABETES MELLITUS

The Naval Hospital, Bethesda, Md., and the District of Columbia Diabetes Association sponsored a symposium on diabetes mellitus at the Naval Medical Center, December 10, when problems in diabetes in relation to surgery, obstetrics and pediatrics were discussed. In addition to Naval officers, the speakers included Drs. Samuel Benjamin and Louis K. Alpert of Washington, D. C., and Dr. Thomas N. Carey of Baltimore.

PERSONAL

Lieut. Comdr. Margaret M. Kiehm (bacteriologist), Lieut. Frederick J. Lewis Jr. (physicist) and Lieut. Robert S. Herrmann (psychologist) have been appointed to the Medical Service Corps of the Regular Navy.

PUBLIC HEALTH SERVICE

REGULAR CORPS EXAMINATION FOR MEDICAL OFFICERS

A competitive examination for appointment of medical officers in the regular corps of the U. S. Public Health Service will be held on Jan. 17, 1949, at various points throughout the United States. Appointments are permanent in nature and provide opportunities for a lifetime career in clinical medicine, research and public health at Marine hospitals and other Public Health Service facilities. Appointments will be made in the grades of assistant surgeon and senior assistant surgeon, for which entrance pay is, with allowance for dependents, $5,011 and $5,551. Provisions are made for promotions at regular intervals up to and including the grade of senior surgeon and for selection for promotion to the grade of medical director, at $9,751 per annum. All applicants must be United States citizens, at least 21 years of age and graduates of a recognized school of medicine. Additional information may be obtained from the Surgeon General, United States Public Health Service, Attention: Division of Commissioned Officers, Washington 25, D. C.

SURVEY OF CASES OF MULTIPLE SCLEROSIS

The Public Health Service and the National Multiple Sclerosis Society are sponsoring a survey of multiple sclerosis cases in four different parts of the country to determine incidence, prevalence and local distribution of the disease and to attempt to find out whether geographic, climatic or racial factors influence case distribution. Dr. L. T. Kurland is the Public Health Service representative on the cooperative project. The dean of a school of public health or a school of medicine will supervise each survey; the data will be gathered by public health nurses or medical students. Expenses of local teaching institutions in connection with the survey will be met by grants from the National Multiple Sclerosis Society. The physicians, hospitals and nursing homes in each area will be questioned in an attempt to record all cases in the survey areas. The first survey began in New Orleans on November 15. Subsequent surveys will be conducted in San Francisco, Boston and rural and urban areas covered by medical facilities in Minneapolis, St. Paul and Rochester, Minn.

CANCER RESEARCH

Surgeon General Scheele has approved the following nine National Cancer Institute grants totaling $82,688 to support laboratory and clinical research in cancer. The grants were recommended by the National Advisory Cancer Council at its meeting in September but were contingent on adjustment of certain items in the original request.

Research Grants

Institution	Amount Granted	Subject
Univ. of San Francisco, San Francisco	$ 3,272	Synthesis and microbiologic evaluation of amino acid analogues
Michael Reese Hospital, Chicago	12,000	Nutritional factors in the origin and growth of tumors
University of Illinois, Chicago	11,448	Study of formation of jaw tumors in a known strain of rats
Indiana University, Bloomington	7,506	Factors influencing abnormal development in mammals, with particular reference to neoplasms of thyroid and thymus tissue in man
Tulane University, New Orleans	18,576	Relationship of hormones to neoplasia
Smith College, Northampton, Mass.	4,752	Studies of tumors in plant embryos
University of Missouri, Columbia	10,000	Development of skin cancer in mice and men
University of Virginia, Charlottesville	11,880	Studies of blood in cancer patients
University of Wyoming, Laramie	3,200	The effect of deuteron bombardment on the chemical composition and carcinogenicity of organic compounds

INTERNATIONAL CONGRESS ON RHEUMATIC DISEASES

Surgeon General Scheele has announced that, on recommendation of the National Advisory Health Council, a grant of $15,000 has been approved to help finance the International Congress on Rheumatic Diseases in New York May 30-June 3, 1949. The American Rheumatism Association, which is serving as host for the Congress, will provide most of the financing. The Congress, sponsored by the International League against Rheumatism, will bring together leading authorities throughout the world on rheumatic diseases including arthritis.

DIVISIONS OF SANITATION AND WATER POLLUTION CONTROL

The Surgeon General announces a reorganization of the engineering activities of the Public Health Service, the former sanitary division being replaced by a Division of Sanitation and a Division of Water Pollution, both under the supervision of Assistant Surgeon General Mark D. Hollis. The expansion of the water pollution section into a new division is a result of the Water Pollution Act passed by Congress in 1948, which requires The Surgeon General to provide financial and technical assistance to the various states in their water pollution control programs. The chief sanitary engineering officer (Assistant Surgeon General Hollis) is responsbile to The Surgeon General for the general administration of programs under the Divisions of Sanitation and Water Pollution and the Environmental Health Center, Cincinnati, which is engaged in basic research in the field of water and sewage treatment and milk and food sanitation. Sanitary Engineer Director Carl E. Schwob will be head of the new Division of Water Pollution Control, and Sanitary Engineer Director Callis H. Atkins will be head of the new Division of Sanitation.

RESEARCH ON MENTAL HEALTH

The last session of Congress authorized the Surgeon General of the Public Health Service to make grants for research in the mental health field for periods beyond the fiscal year 1948-1949. These grants, if approved during the fiscal year 1948-1949, will constitute a contractual obligation of the federal government to forward finance the research projects over and beyond the present fiscal year. Forward financing of grants to medical schools for undergraduate training in mental hygiene was also authorized. The contractual obligations for both research and training grants must not exceed $2,300,000. Initial decisions as to which institutions and individuals are to benefit from this form of forward financing will be made by the National Advisory Mental Health Council at its meeting in December. The contract authorization ceiling will not permit forward financing of all mental health grants. Consequently, some will continue to be paid under the old system, which does not obligate federal support beyond the current fiscal year.

APPOINT MENTAL HOSPITAL CONSULTANT

Dr. Riley H. Guthrie has been appointed special mental hospital consultant to the Mental Hygiene Division of the Public Health Service. He will be available after November 1 to conduct surveys of mental hospitals and provide consultive services regarding hospital administration, care of patients and other problems of mental hospitals. Requests for his services may be made by state governors, superintendents of state mental hospitals, or other qualified persons concerned with the administration of mental hospitals. Dr. Guthrie, who has been associated with state mental hospitals for twenty years, has been superintendent of the state hospital at Norwich, Conn., for two years. Previously, he served on the staffs of St. Elizabeth's Hospital, Washington, D. C.; Boston Psychopathic Hospital; Massachusetts Department of Mental Diseases; Monson State Hospital, Palmer, Mass.; Massilon State Hospital, Massilon, Ohio, and Arkansas State Hospital, Little Rock.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

COLORADO

Dr. Ruck to Head Department of Biophysics.—The University of Colorado announces the establishment of a department of biophysics at the University Medical Center in Denver. A graduate program leading to a Ph.D. degree in biophysics will be offered. Courses of instruction include training in the use of radioactive isotopes in biology, the interactions of ionizing radiations with living systems, study of the behavior of biologically important macromolecules and biostatistics. The department will also take part in the Atomic Energy Commission's program for postdoctoral training in biophysics. A research program centering about cellular growth processes and study of the radiation chemistry of artificially induced mutations is now being set up. Theodore Puck, Ph.D., formerly of the departments of medicine and biochemistry of the University of Chicago, has been named head of the department.

CONNECTICUT

Personal.—Dr. Hilda H. Kroeger, director of Maternal and Child Health in the state department of health, Phoenix, Ariz., has been appointed assistant director of Grace-New Haven Community Hospital and professor of hospital administration at Yale University. Dr. Kroeger received her M.D. degree from Rush Medical College in 1932.

State Association Medical Service Plan.—The Connecticut State Medical Society at the semiannual meeting of the society's house of delegates December 9 adopted a prepayment plan through which state residents may meet costs of maternity and surgery. It offers full payment of doctor's fees for childbirth or surgery to subscribers whose annual incomes do not exceed the following amounts: $3,500 for subscriber and family; $3,000 for subscriber and one dependent, and $2,500 for individual subscriber. Subject to further study by actuaries, tentative monthly subscription rates are 75 cents for subscriber only; $1.50 for subscriber and one dependent, and $2.25 for subscriber and family. The plan will be operated on nonprofit principles, in cooperation with the Connecticut Blue Cross organization. Control will be exercised through the Connecticut Medical Service, a new corporation whose board of directors will comprise six licensed physicians appointed by the state medical society and six members named by the Connecticut Blue Cross. A Professional Policy Committee of nine physicians will determine and recommend action in all matters involving medical ethics and professional practice. Enrolment of physicians in the plan will be purely voluntary. Those enrolling will agree to accept the amounts listed in the plan's schedule of fees as full payment for subscribers whose incomes do not exceed the stated levels. For subscribers whose incomes are above the stated limits any additional charge will be subject to patient-physician agreement. Membership in the plan will be open without physical examination or age limit to all persons holding Blue Cross Hospital Service contracts.

ILLINOIS

Increase in Diabetes in Illinois.—According to the Illinois State Department of Public Health the incidence of diabetes has shown a steady upward trend in the state during the past twenty-five years. With 1,367 deaths reported in 1922, mortality from diabetes was at a rate of 19.6 per 100,000 population. By 1932 the toll had climbed to 2,079, or a death rate of 25.8, and in 1947 the number of deaths due to diabetes totaled 2,735, with a rate of 33.3 per 100,000 population.

Chicago

Hospital News.—Work began November 30 on a four story 75 bed addition to the South Shore Hospital costing $850,000. The new structure, for general medical, surgical and obstetric cases, will have four new operating rooms, two delivery rooms, four labor rooms, six nurseries and additional laboratory and utility space. A blood bank will also be set up as a new service by the hospital.

Course in Electrocardiographic Interpretation.—A course in electrocardiographic interpretation for graduate physicians will be given at the Michael Reese Hospital Postgraduate School each Wednesday from 7 p.m. to 9 p.m. for twelve weeks beginning Feb. 9, 1949. Information may be obtained from Dr. Samuel Soskin, Dean, Michael Reese Hospital Postgraduate School, 29th Street and Ellis Avenue, Chicago 16.

Personals.—Dr. Stanley Gibson will retire January 1 as chief of staff of Children's Memorial Hospital, having attained the retirement age. He will continue on the medical staff of the hospital as consulting cardiologist. Dr. Gibson has been on the staff since 1932 and chief of staff since 1944. Dr. John A. Bigler, a member of the medical staff since 1931 and medical director since 1944, has been appointed chief of staff.

Organize Diabetes Association.—A group of Chicago physicians, nurses, dietitians and laymen have organized the Chicago Diabetes Association, which eventually will be incorporated and will apply for affiliate status to the American Diabetes Association, on whose invitation the Chicago association was formed. Officers are Dr. Arthur R. Colwell, president; Dr. Samuel Soskin, vice president; Dr. Henry T. Ricketts, secretary, and Mr. Paul Dice, treasurer. After the organizing procedures are completed, membership will be expanded to include other physicians, nurses and dietitians, as well as social workers and technicians.

IOWA

Society News.—Private practitioners and representatives of each of the state's mental institutions have organized the Iowa Neuro-Psychiatric Society with Dr. Paul E. Huston, Iowa City, as president and Dr. Grace M. Sawyer of Woodward, secretary.——The Linn County Medical Society on January 13 will hear Dr. Robert L. Sanders, Memphis, Tenn., speak on "The Peptic Ulcer Problem with Special Reference to Bilateral Vagal Resection."

KENTUCKY

State Medical Election.—The Kentucky Medical Association installed Dr. Charles A. Vance, Lexington, as president and chose Dr. Hugh L. Houston, Murray, as president elect at its annual meeting in September. Dr. Bruce Underwood, Louisville, was elected secretary. Dr. Houston, at the age of 40, is reported to be the youngest president in the history of the organization. He received his M.D. degree from Vanderbilt University School of Medicine, Nashville, 1933.

Portrait of Irvin Abell.—A portrait of Dr. Irvin Abell Sr., an alumnus and member of the Board of Trustees of the University of Louisville, was recently presented to the School of Medicine. Dr. Fred W. Rankin, Lexington, in the presentation speech cited Dr. Abell as "the most distinguished alumnus of this university, [who] has shed lustre on his Alma Mater by his professional accomplishments, his Christian example, and his devoted service to the organized medical profession." Dr. Abell is a former president of the American Medical Association.

LOUISIANA

Personal.—Dr. E. W. Alton Ochsner, William Henderson professor of surgery at Tulane University of Louisiana School of Medicine, New Orleans, has been reappointed consultant to the headquarters, U. S. Air Force.

Cancer Research.—Tulane University of Louisiana School of Medicine, New Orleans, has received a grant of $47,452 from the American Cancer Society to expand the specialized care and study of selected patients regardless of their ability to pay.

Founder's Day Forum.—The Rapides Parish Medical Society and the Eighth District Medical Society are sponsoring the Annual Founder's Day Forum Jan. 15, 1949 at the Hotel Bentley in Alexandria. This meeting will be attended by members of the medical profession from Central Louisiana and will be conducted by members of the teaching staff of Tulane University and Louisiana State University of New Orleans. Subjects to be discussed include "The Use of Blood and Blood Substitutes," "Early and Late Treatment of Traumatic Injuries with Special Reference to those of the Face," "Carcinoma of the Colon" and "Mycotic Infections of the Skin."

MARYLAND

Society News.—The Montgomery County Medical Society, which meets on the third Tuesday of each month at 8:15 p. m. at the Manor Country Club, Norbeck, has arranged the following meetings for 1949:

Jan. 18, T. Wiley Hodges, Richmond, Va., The Bone Graft in Reconstructive Surgery.
Feb. 15, Norman H. Topping, Bethesda, Md., Research Program of the National Institutes of Health.
March 15, Robert J. Reeves, Durham, N. C., Diagnostic Problems in Radiology.
April 19, Wallace E. Herrell, Rochester, Minn., Anti-Biotics and Clinical Medicine.

MICHIGAN

State Medical Election.—The Michigan State Medical Society at its meeting in September elected the following officers for 1948 and 1949: Dr. Edward F. Sladek, Traverse City, president; Dr. William E. Barstow, St. Louis, president elect, and Dr. L. Fernald Foster, Bay City, secretary.

Report of Mediation Committee.—Eighteen months ago the Wayne County Medical Society appointed a mediation committee to analyze and adjust all complaints having to do with the economics of the practice of medicine against members of the society in Detroit and environs. Only thirty-seven complaints from a population of 2,500,000 have been received in one and one-half years.

Postgraduate Clinical Conference.—The third annual Michigan Postgraduate Clinical Institute, sponsored by the Michigan State Medical Society, Wayne County Medical Society, University of Michigan Medical School and Department of Postgraduate Medicine, Wayne University College of Medicine, Ann Arbor, and the Michigan Foundation for Medical and Health Education, Inc., will be held at the Book-Cadillac Hotel, Detroit, March 23-25, 1949. The complete program will be announced in January. A "Heart and Rheumatic Fever Day" on March 26 will follow the institute. Members of American and Canadian medical associations are invited to the institute, as well as to the heart conference. There is no registration fee.

NEVADA

State Medical Election.—The Nevada State Medical Association chose Dr. Rodney E. Wyman, Reno, president; Dr. David E. Hemington, Las Vegas, president-elect, and Dr. Roland W. Stahr, Reno, secretary-treasurer, for the coming year.

NEW JERSEY

Organize Speakers' Bureau.—The Camden County Medical Society has organized a Speakers' Bureau with an initial complement of twenty-six speakers. Letters have been sent to more than 1,000 organized lay groups in the county indicating that requests for medical speakers will receive consideration.

Martland Lecture.—The thirteenth annual Harrison S. Martland Lecture under the auspices of the Essex County Pathological and Anatomical Society was given in Newark December 7 by Dr. Shields Warren, Boston, on the "Pathology of Diseases of the Thyroid with the Present Status of Radioactive Treatment."

Blood Banks.—A growing number of communities in New Jersey are reported to have organized "walking blood banks." Prospective blood donors are recruited by the American Red Cross and typed for donation of blood if, as and when needed. Union Township is the latest to set up such a blood bank with the cooperation of the Union Township Medical Society and the Elizabethtown Red Cross Chapter. A similar program is contemplated for Mercer County and has the endorsement of the county medical society.

Medical School Proposal Approved.—Governor Alfred E. Driscoll has approved a proposal of the Medical Society of New Jersey for a committee to study the "need for the development and operation of an approved medical school" for New Jersey. The society's proposal is that a representative committee be appointed to be composed of sixteen members, four of whom would be designated by the medical society, four by Rutgers University in New Brunswick, and eight public members appointed by the governor. On completion of its study the committee will be requested to make its recommendations to the governor and the legislature. This is viewed as the first formal step toward the eventual accomplishment of the objective long sought by the Medical Society of New Jersey.

NEW YORK

Regional Health Offices.—New York's six regional health offices are now in operation. Dr. Robert L. Vought is director of the lately opened New York City Suburban Regional Office in White Plains. Dr. Ralph M. Vincent assumed duties as head of the Albany regional office on October 28. The first three regional offices were opened in Buffalo, Rochester and Syracuse early in August, with Drs. Archibald S. Dean, Buffalo, Joseph P. Garen, Rochester, N. Y., and Ray D. Champlin, Oneonta, N. Y., as regional directors. The sixth regional office was opened in November and will operate under the direction of Dr. Philip J. Rafle, former district state health officer for the state health district in New York City. The regional offices were established early this year (The Journal, February 28, p. 635).

New York City

Residencies Available.—Residencies in neurology are now available under the Veterans Administration program, beginning Jan. 1, 1949 at the Bellevue Psychiatric Hospital, New York. Applications may be secured by writing Professor S. Bernard Wortis, New York University College of Medicine, Department of Neurology, 400 East Thirtieth Street, New York 16.

Dr. Bernecker to Retire.—Dr. Edward M. Bernecker, commissioner of hospitals since March 1942, will retire December 31. Dr. Bernecker entered city service in 1915 as an intern in Metropolitan Hospital on Welfare Island, where he became resident physician and in 1927 deputy medical superintendent. He was medical superintendent and later general superintendent in Kings County Hospital in Brooklyn.

The James Ewing Cancer Hospital.—Cornerstone ceremonies for the ten story 300 bed James Ewing Hospital for cancer, to be affiliated with the Memorial Cancer Center, were held November 26. Construction costs of the hospital, expected to be completed late next year, will total $5,632,250. The hospital was named by the city, which will operate it for the care and treatment of long term cancer patients and research, in honor of the late Dr. James Ewing because of his long association with Memorial Hospital. Construction of the hospital began on Jan. 24, 1947 (The Journal, Feb. 8, 1947).

Appoint Head of Public Health Education Division.—Dr. Llewellyn E. Kling, formerly of the U. S. Public Health Service, has been appointed associate professor of public health education and head of the Public Health Education Division in Columbia University School of Public Health. He is a graduate of Louisiana State University School of Medicine, New Orleans, and studied public health at Columbia. He has been county health officer in Nebraska and served for six years as a commissioned officer in the public health service active in tuberculosis and cancer educational and control work. He has served more recently as medical director of the Planned Parenthood Federation.

Personals.—Dr. Arthur Sayer was recently appointed associate clinical professor of dermatology at the New York Medical College, Flower and Fifth Avenue Hospitals. Dr. Sayer, a graduate of the Columbia University College of Physicians and Surgeons, has been an attending dermatologist at the Morrisania City Hospital.——Dr. George G. Deaver, professor of clinical rehabilitation and physical medicine at New York University College of Medicine, has been awarded the Medal of Merit for pioneer work in the field of rehabilitation.——Dr. Carl R. Wise, instructor in medicine at the Columbia University College of Physicians and Surgeons, has succeeded Dr. William H. McCastline as university medical officer. Dr. McCastline retired last June. Dr. Wise, a graduate of Harvard Medical School, Boston, served in the medical corps in World War II.——Dr. Edward H. Mandel was recently made correspondent member of the Japanese Dermatological Association in the United States.

Immunize Dogs Against Rabies.—The health department's experimental campaign in Staten Island for the elimination of rabies is reported as being received apathetically by dog owners in the second year of its operation. Vaccination of all licensed dogs was made compulsory after an outbreak of rabies in Staten Island last year. Vaccination centers were set up in various parts of boroughs in June 1947, after which 11,000 of the island's 14,000 licensed dogs were immunized. During the second year of the experiment, however, only 3,800 dogs have been inoculated thus far, and only a few of the animals vaccinated last year have been brought back for a second injection. The health department is sending letters to all dog owners warning them to have their pets inoculated again; new dog owners are being informed concerning the ruling. Seven rabid dogs have been found on Staten Island, compared with 18 last year. The last death reported in the city from the disease was in 1944.

NORTH CAROLINA

State Cancer Centers.—Since March 1, 1948, when the Division of Cancer Control of the North Carolina State Board of Health was activated, cancer centers have been set up at Wilmington, Asheville and Winston-Salem. Specialists make a diagnosis, which with the recommendations is sent by letter to the patient's personal physician. Only men and women 40 years of age or older are admitted to these clinics. A survey of work done by the clinics operating an average of three and a half months reveals that of 1,277 persons examined, 76 were found to have cancer; that represents more than 6 per cent of the total number examined, and twelve times the average found in detection clinics throughout the nation, according to Dr. John W. R. Norton, acting state health officer. The State Board of Health by authority of the Cancer Act in 1945 set up the North

Carolina Cancer Control Program. Affiliated agencies are the Medical Society of the State of North Carolina and the American Cancer Society, North Carolina Division. Funds are derived from appropriations by the U. S. Public Health Service and the State Legislature; and the Cancer Division donated $25,000 in 1946 to administering the program.

OKLAHOMA

Personal.—Dr. John F. Hackler, professor of preventive medicine and public health since 1943 at the University of Oklahoma School of Medicine, Oklahoma City, resigned October 1, to accept a position as director of the City-County Health Department, Muskogee.

Narcotic Violation.—According to the Bureau of Narcotics, Dr. Edward C. Keyes, Pawhuska, pleaded guilty to violation of the Federal Narcotic Law in the U. S. District Court at Tulsa September 29. A sentence of two years was suspended and he was placed on probation for a like period.

Fifty Years in Practice.—More than one hundred Tulsa County physicians met last month to pay tribute to Dr. W. Albert Cook, who has served in the medical profession for more than fifty years, and Dr. Pleasant P. Nesbitt. Dr. Nesbitt received the plaque in recognition of his service as past president of the Oklahoma Medical Association in 1925. Dr. Patrick H. Mayginnes, who was unable to attend, was awarded a gold medal for fifty-one years of active practice in Tulsa. Dr. Cook was the first president of the Tulsa County Medical Society, in 1907.

PENNSYLVANIA

Society News.—At a recent meeting of the Reading Eye, Ear, Nose and Throat Society, Dr. Philip R. Wiest, Reading, discussed "The Sphenopalatine Ganglion."

State Society Desires Names of Centenarians.—The Medical Society of the State of Pennsylvania, which has just celebrated its centennial, desires to share birthday honors with all residents of the state who will be 100 years old during 1949. A framed testimonial will be presented to each centenarian on his or her birthday. Those who will be 100 years old next year may write to The Medical Society of the State of Pennsylvania, 230 State Street, Harrisburg.

Philadelphia

Cancer Detection Clinic and Tumor Registry.—A cancer detection clinic was opened in Frankford Hospital November 9, the first of a network to be set in operation by the Philadelphia Division of the American Cancer Society. The purpose is to examine persons for presymptomatic cancer. Appointments may be made for examinations on Tuesday afternoons. A Tumor Diagnostic Service and Registry for Children has been established at St. Christopher's Hospital for Children in conjunction with the pediatric department of Temple University Hospital. The service is available to any hospital in the state and is made possible by assistance from the New York State Department of Health through its Cancer Fund. Gross specimens should be sent through the pathology department of the hospital. No fee will be charged by St. Christopher's Hospital, and whatever charge is made to a patient will be by the pathologist or hospital sending the specimen.

SOUTH CAROLINA

Speakers' Bureau.—The South Carolina Medical Association's Committee on Maternal Welfare is organizing a speakers' bureau, the members of which will be available not only to the committee but also to interested groups of women and to medical societies as speakers on subjects pertaining to child bearing. Inquiries should be addressed to Dr. Manley E. Hutchinson, chairman, 1412 Bull Street, Columbia. The bureau was set up to aid the association's committee which had been in operation a number of years but was discontinued during the war. Its purpose is to conduct studies in the circumstances of all deaths of South Carolina mothers and to determine what changes in treatment should be made. The South Carolina Obstetrical and Gynecological Society will cooperate in the educational program. Committee chairman is Dr. J. Decherd Guess, Greenville.

WISCONSIN

Appoint Assistant Dean.—Dr. Otto A. Mortensen, professor of anatomy at the University of Wisconsin, has been appointed assistant dean of the University of Wisconsin Medical School, Madison. He is a graduate of the University of Wisconsin Medical School, Madison, 1929, and has been on the staff of the medical school since 1930.

Course in Gastroenterology.—The University of Wisconsin Medical School, Madison, through its division of graduate medical education is presenting a five day course in gastroenterology February 14-18 at the Wisconsin Medical School, under the supervision of Dr. Karver L. Puestow and Dr. Frank L. Weston. The course will include proctoscopic and gastroscopic demonstrations, discussion of technics, parasitic diseases of the intestinal tract, food poisoning, toxemias, malignant disease, roentgen ray and surgical aspects of therapy, jaundice and its causes, along with other disorders of function and physiology. Enrolment will be limited to twelve physicians. Applications may be made to Dr. Llewellyn R. Cole, the Medical School, 418 North Randall, Madison 6.

GENERAL

Executive Director of Heart Association.—Mr. Rome A. Betts, general secretary of the American Bible Study since 1942, will become the first executive director of the American Heart Association January 1. He will be responsible to the Board of Directors for the functions of the three main administrative divisions: medical, public health and fund raising. The association and its affiliates in the major areas of the United States will conduct a nationwide campaign February 7-28, 1949, to raise $5,000,000 to combat diseases of the heart and circulation.

Multiple Sclerosis Fund.—At a luncheon of the Association for Research in Nervous and Mental Disease December 10, the National Multiple Sclerosis Society announced plans to raise a Research and Educational Fund of $225,000 for 1949. The National Multiple Sclerosis Society was founded in October 1946. Richard I. Straus, New York, is president and Dr. Tracy J. Putnam, Beverly Hills, Calif., is chairman of its medical advisory board. Offices are in the New York Academy of Medicine Building, Fifth Avenue and 103rd Street, New York 29.

Section Meetings.—The section meetings of the American Laryngological, Rhinological and Otological Society, Inc., will be held in January. The Eastern Section will meet at the Hotel Puritan, Boston, January 7. Those invited to deliver papers are Drs. Laurence L. Robbins, W. Lloyd Aycock, Conrad Wesselhoeft and John F. Enders, Ph.D., all of Boston. The Southern Section meeting will be held at the Hotel Raleigh, Washington, D. C., January 10. Invited speakers are Drs. Russell C. Grove, New York, and Edwin N. Broyles, Baltimore. University Hospital, Iowa City, is the headquarters for the Middle Section meeting January 17. Those speaking by invitation are Drs. John B. Erich, Rochester, Minn., Jerome A. Hilger, St. Paul, Minn., and Adolph L. Sahs, Iowa City. The Western Section meeting will be held in the Los Angeles County Medical Building, Los Angeles, January 29-30.

Scholarship Fund.—The Delta Gamma Fraternity has a $1,500 annual fund and a $2,000 annual loan fund from which smaller scholarship awards are available for preparation of those intending to become (1) orthoptic technicians, (2) teachers of partially seeing children or (3) specialists for blind preschool children. Any person wishing to specialize in one of these fields is eligible for assistance, the amount in each case to be determined by the particular need and costs involved. Applications may be made to Mrs. Thomas Johnson, 1235 Longfellow, Detroit 2. Applications for scholarships should be filed by March 15 for training starting in June; for training starting in the fall by July 15. Candidates are selected with the advice of a professional committee under the chairmanship of Dr. LeGrand H. Hardy, New York, of the American Orthoptic Council.

Society Elections.—The American Society of Anesthesiologists has installed Dr. H. Boyd Stewart, Tulsa, Okla., as president, and elected Dr. Rolland J. Whitacre, East Cleveland, Ohio, as president elect; Dr. Curtiss B. Hickcox, Philadelphia, and Dr. Moses H. Krakow, New York, continue as secretary and treasurer respectively.——At the recent meeting of the National Society for Crippled Children and Adults, Dr. John J. Lee, dean of the Graduate School, Wayne University, Detroit, was elected president, succeeding Colonel Elbridge W. Palmer, Kingsport, Tenn.——The American Cancer Society has elected Dr. Clifford C. Nesselrode, professor of surgery, University of Kansas School of Medicine, Kansas City, as national president; Charles D. Hilles, New York, secretary, and J. Ernest Allen, treasurer. Dr. Nesselrode has served on the society's board since the beginning of the organization.——The Mississippi Valley Conference on Tuberculosis recently chose as its president Dr. Oscar Lotz, executive secretary of the Wisconsin Anti-Tuberculosis Association.——The Mississippi Valley Trudeau Society selected Dr. Christopher J. Stringer, Lansing, Mich., president, Dr. John D. Steele, Milwaukee, Wis., president elect and Dr. Gustaf A. Hedberg, Nopeming, Minn., secretary-treasurer.

Cancer Monographs.—The American Cancer Society is planning to distribute a series of monographs written by distinguished physicians and designed to emphasize some of the more important measures that can be used by the doctor in detecting early cancer. To provide visual concepts of early diagnostic signs these 20 to 30 page brochures will be illustrated in color, and they will be uniform in format and size so that they may be conveniently incorporated into a binder. It is desired to place them in the hands of as many practicing physicians throughout the country as possible. The first, The Cancer Problem, by Dr. Shields Warren, Boston, will be ready for distribution by Jan. 1, 1949; the others will be released periodically. Titles and their authors are as follows: Head and Neck, by Hayes E. Martin, New York; Skin, by Dr. S. William Becker; Esophagus and Stomach, by Owen H. Wangensteen; Large Intestine and Rectum, by Thomas E. Jones; Larynx-Pharynx, by Chevalier L. Jackson Jr.; Thyroid, by John Pemberton; Lung, by Richard J. Overholt; Breast, by Cushman D. Haagensen; Female Pelvic Organs, by Herbert F. Traut; Genitourinary, by Victor Marshall; Soft Part Tumors, by John J. Morton, and Lymphomatous Diseases, by Lloyd F. Craver.

Board for Certification of Orthopedic Appliances.—To improve the professional standards of manufacturers of artificial limbs and braces and the fitters employed by such firms, an American Board for Certification of the Prosthetic and Orthopedic Appliance Industry, Inc., has been established in Washington, D. C. with headquarters at 336 Washington Building. Three orthopedic surgeons and four leaders in the orthopedic appliance industry constitute the national board which will grant certification. The orthopedic surgeons are Dr. Rufus H. Alldredge, New Orleans; Dr. Henry H. Kessler, Newark, N. J., and Dr. Atha Thomas, Denver. Lay members of the board are Chester C. Haddan, Denver; Lee J. Fawver, Kansas City, Mo.; J. B. Korrady, Chicago, and David E. Stolpe, New York. Mr. Haddan is president, and Glenn E. Jackson is executive director. To be qualified for certification an applicant must prove that he has had at least four years of actual experience under proper supervision or two years of special training and one year of experience. In addition, the applicant must present the signature of two physicians who state that he meets various other requirements. More than one hundred firms and two hundred fitters have already applied for certification. The medical profession has been of invaluable assistance during the two years of intensive work which resulted in the incorporation of the board.

Fellowships in Exfoliative Cytology.—The American Cancer Society has made available twenty-three fellowships in exfoliative cytology at nine of its laboratories in order to provide training in diagnostic technics for qualified pathologists. These four month fellowships will be awarded by institutions or laboratories designated by the society on the basis of past training and the intention to teach diagnostic technics to interested pathologists, clinicians and technicians. Applicants must be graduates of class A medical schools, citizens not over 50 years of age and must have completed two years of postgraduate training in pathology. Stipends will be paid in two sums: the first to the laboratory; the second to the trainee partially to cover his expenses in the amount of $140 per month in advance. Applications should be made to one of the following laboratories. The number in parentheses indicates the number of fellowships available at that laboratory. Cornell University Medical College, New York (6), George N. Papanicolaou; Jefferson Hospital, Philadelphia (6), Lewis C. Scheffey; University of Oregon Medical School, Portland (2), Warren C. Hunter; University of California Hospital, San Francisco (2), Herbert F. Traut; Michael Reese Hospital, Chicago (2), Otto Saphir; Hartford Hospital, Hartford, Conn. (2), Ralph E. Kendall; New York Post-Graduate Hospital, New York (1), Locke L. Mackenzie; Free Hospital for Women, Brookline, Mass. (1), Arthur T. Hertig; Mayo Clinic, Rochester, Minn. (1), John R. McDonald.

United Mine Workers' Welfare and Retirement Fund.—The United Mine Workers of America Welfare and Retirement Fund is concerned in the main with pensions, disability benefits, death benefits and medical, health and hospital services for members of the organization. In the last mentioned, it is the purpose of the fund to provide a prepaid form of hospital service and medical attention in all of the districts and in all local unions. Arrangements are being made to utilize present medical and hospital services under conditions which guarantee high standards of medical and hospital care and are satisfactory to the physicians, the hospitals and the fund alike. When these arrangements are completed in a given district, it will mean that the expense of medical and hospital services will be borne by the United Mine Workers' Welfare and Retirement Fund and that the members will be freed from paying a monthly amount deducted from their wages—so much a month to the hospital fund and so much a month to the doctor, as now exists in many places. It is possible that experience may demonstrate the necessity of providing additional and more specialized facilities for meeting the needs, but this will come from knowledge gained through present procedure and through the availability of funds.

The administration of the medical and hospital work is under the general direction of Dr. Warren F. Draper, former Deputy Surgeon General of the United States Public Health Service and Major General in charge of the Public Health Branch at Supreme Headquarters Allied Expeditionary Forces during World War II. He served also as State Health Commissioner of Virginia and as a member of the House of Delegates of the American Medical Association from 1925 to 1946. Medical administrative offices, each in charge of a full time physician employed by the fund and working under the direction of the Executive Medical Officer, are being established at ten locations in or near the soft coal mining areas as follows:

Denver, serving Districts 10, 15, 22, 27, Dr. William Dorsey.
Johnstown, Pa., serving District 2, Dr. Leslie A. Falk.
Pittsburgh, serving Districts 3, 5, 6, Dr. Richard F. Boyd.
Morgantown, W. Va., serving Districts 31, 16, 4, Dr. Lorin E. Kerr.
Charleston, W. Va., serving District 17, Dr. John T. Morrison.
Beckley, W. Va., serving District 29, Dr. Deane F. Brooke.
Knoxville, Tenn., serving Districts 19, 28, Dr. John D. Winebrenner.
Birmingham, Ala., serving District 20, Dr. I. Herbert Scheffer.
St. Louis, serving Districts, 12, 13, 14, 21, Dr. Cecil A. Z. Sharp.
Louisville, Ky., serving Districts 8, 11, 23, 30, Dr. Asa Barnes.

The area medical administrators, in collaboration with the physicians and hospitals in the Districts, will work out simple and satisfactory agreements for providing medical and hospital care to eligible members and their dependents. The detailed arrangements may vary to some extent according to conditions within the Districts. In the beginning the activities will be directed to the hospitalization of those who are receiving disability benefits and pensions and therefore cannot obtain services through a check-off on their wages. Included also will be United Mine Workers of America members with serious conditions for which adequate treatment facilities are not available in the localities where they live. Through this approach the area medical administrators will be able to establish procedures and train their personnel before assuming a larger work load. The program will be extended gradually as the necessary arrangements can be made.

Medical societies and leading members of the medical profession have given assurance of their desire to demonstrate the practicability of the program and make it a success. With an enterprise of such far reaching significance, it is the hope of the fund that the physicians and hospitals of this country, with the aid of their organizations, will join in an undertaking to render high standards of medical and hospital care at as reasonable cost as such quality of care could be furnished under any system that could be devised.

Marriages

Herbert Lee Wormhoudt, Cincinnati, to Miss Hazel Rebecca Durden of Fernandina, Fla., in Washington, D. C., September 4.

Frank Warren Howard, Benton Harbor, Mich., to Miss Sarah Jane Yonkman of Grand Rapids, October 2.

Edward Craig Hamilton, Mobile, Ala., to Miss Elizabeth Courtenay of Greenville, S. C., October 16.

Joseph Justin McCarthy Jr., to Miss Mary Lourdes Riley, both of Washington, D. C., October 16.

William J. Cathey, Portland, Ore., to Miss Patricia Gene Person of Veradale, Wash., October 2.

Malcolm E. Ruben, Washington, Pa., to Miss Ruth Elva Wilson in Chicago, September 4.

Lawrence J. Essember Jr., Peabody, Mass., to Miss Gertrude T. Bugler of Salem, October 2.

Charles Allen Ashley to Miss Audrey Waite, both of Bronxville, N. Y., October 9.

Lester A. Steinberg, Bridgeton, N. J., to Miss Esther Saxe of Newton, Mass., recently.

Harry Alden Wall to Mrs. Bessie Nye Mattox, both of Norfolk, Va., October 9.

Robert A. Hoffman to Miss Phyllis Strause, both of Richmond, Va., October 16.

Deaths

Charles R. Robins, Richmond, Va.; born in Richmond, Dec. 31, 1868; Medical College of Virginia, Richmond, 1894; professor of gynecology at his alma mater from 1907 to 1938, when he became emeritus professor; member of the founders group of the American Board of Surgery; member of the Southern Surgical Association, of which he had been vice president, Tri-State Medical Association of the Carolinas and Virginia, American Medical Association and the South Atlantic Association of Obstetricians and Gynecologists; past president of the Richmond Academy of Medicine; fellow of the American College of Surgeons; served during World War I; member of the school board; formerly director of the State Planters Bank and Trust Company; a founder and for many years president of the board of directors of the Stuart Circle Hospital; affiliated with the Retreat for the Sick and the Sheltering Arms Hospital; past president of the Rotary Club; died October 16, aged 79, of coronary sclerosis.

Horace Gilbert Smithy Jr., Charleston, S. C.; born in Norfolk, Va., July 19, 1914; University of Virginia Department of Medicine, Charlottesville, 1938; assistant professor of surgery at the Medical College of the State of South Carolina; specialist certified by the American Board of Surgery; served an internship and residency at the Roper Hospital, where he was a fellow in surgery; member of the American Medical Association; fellow of the American College of Surgeons; is said to have performed the first successful heart valve operation; surgeon at Roper Hospital, where he died October 28, aged 34, of aortic stenosis.

Bernard Philip Conway, Chicago; Chicago College of Medicine and Surgery, 1914; member of the American Medical Association; received the Croix de Guerre and the Purple Heart for bravery in action during World War I; formerly chief surgeon for the Hartford Accident and Indemnity Company of Hartford, Conn., whose examiner he has been for over thirty years; since 1942 supreme medical examiner and a member of the managing committee of the Royal League; died in the Presbyterian Hospital November 4, aged 61, of bronchopneumonia following an operation.

Francis Marion Bair, Cuba City, Wis.; Baltimore University School of Medicine, 1899; member of the American Medical Association; died September 25, aged 74, of endocarditis.

Samuel Edward Ballard, Long Beach, Calif.; Baltimore Medical College, 1899; member of the American Medical Association; on the staff of the Community Hospital; died September 20, aged 74, of coronary occlusion.

Louis C. Bauman ⊕ St. Joseph, Mo.; Central Medical College, St. Joseph, 1904; an Associate Fellow of the American Medical Association; past president of the Buchanan County Medical Society; died in Rochester, Minn., September 15, aged 73, of hypertrophy of the prostate and parkinsonism.

George Lewis Cable, Denver; Starling Medical College, Columbus, 1897; died recently, aged 75.

George William Carson, St. Louis; Barnes Medical College, St. Louis, 1901; died October 22, aged 70, of pneumonia.

Edwin James Cauffield, Akron, Ohio; Cleveland University of Medicine and Surgery, 1895; for many years on the staff of City Hospital, where he died October 8, aged 76, of toxemia.

Edgar Boykin Clark ⊕ Philadelphia; Meharry Medical College, Nashville, Tenn., 1928; died recently, aged 46.

Leonard Easton Claydon ⊕ Red Wing, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1895; died August 15, aged 79, of chronic bronchiectasis.

Samuel Walter Cottle ⊕ Morgantown, W. Va.; University of Louisville (Ky.) School of Medicine, 1925; died October 31, aged 49, of a head injury sustained in a fall.

Joseph Francis Cusick, Binghamton, N. Y.; Georgetown University School of Medicine, Washington, D. C., 1931; member of the American Medical Association; an officer during World War II; served on the staffs of Our Lady of Lourdes Memorial Hospital and Binghamton City Hospital, where he died October 13, aged 41, of peptic ulcer with massive gastric hemorrhage.

Frank E. Dawson, Detroit; Meharry Medical College, Nashville, Tenn., 1917; member of the American Medical Association; died October 12, aged 70, of carcinoma of the stomach.

Persis F. Elfeld ⊕ Wilmington, Del.; University of Illinois College of Medicine, Chicago, 1923; member of the American Psychiatric Association; for many years associated with the Delaware State Hospital in Farnhurst; died recently, aged 50, of heart disease.

Ray Eugene Persons ⊕ Cairo, N. Y.; Albany (N. Y.) Medical College, 1916; past president of the Greene County Medical Society; president of board of education; director of the First National Bank; chief of staff, Memorial Hospital of Greene County, Catskill; died September 29, aged 57, of carcinoma.

James Hardy Pittman, West Palm Beach, Fla.; Vanderbilt University School of Medicine, Nashville, Tenn., 1899; member of the American Medical Association; formerly associated with the U. S. Public Health Service; affiliated with Good Samaritan and St. Mary's hospitals; died September 23, aged 75, of uremia.

Wayne S. Regar, Ephrata, Pa.; Medico-Chirurgical College of Philadelphia, 1907; member of the American Medical Association; died October 3, aged 76, of injuries received in an automobile accident.

William Reid, Deerwood, Minn.; Trinity Medical College, Toronto, Canada, 1892; died in Grand Rapids, September 9, aged 82, of carcinoma of the colon.

Ella N. Ritter, Williamsport, Pa.; Woman's Medical College of Pennsylvania, Philadelphia, 1893; member of the American Medical Association; died in Darlington Sanitarium, West Chester, September 30, aged 82.

Howard Royer, Grand Island, Neb.; University of Nebraska College of Medicine, Omaha, 1930; member of the American Medical Association; served overseas in the medical corps of the U. S. Naval Reserve during World War II; affiliated with St. Francis and Lutheran hospitals; died October 15, aged 43, of chronic nephritis and uremia.

Charles Bradley Russell ⊕ Paterson, N. J.; Harvard Medical School, Boston, 1904; served during World War I; affiliated with the New Jersey Orthopedic Hospital, Orange, Nathan and Miriam Barnet Memorial Hospital and St. Joseph Hospital, where he died October 26, aged 72, of coronary thrombosis and carcinoma of the bladder.

Morris Samsky, Brooklyn; Long Island College Hospital, Brooklyn, 1912; died in October, aged 59.

John Theodore Schlesselman, Mankato, Minn.; Cleveland University of Medicine and Surgery, 1897; member of the American Medical Association; fellow of the American College of Surgeons; affiliated with St. Joseph's and Immanuel hospitals; died September 6, aged 71, of coronary thrombosis.

Cyril Evan Sheppard ⊕ Larned, Kan.; University of Kansas School of Medicine, Kansas City, 1914; during World War I served in the medical corps of the U. S. Army; for two terms mayor of Larned; affiliated with St. Rose Hospital in Great Bend; died September 14, aged 63, of myocardial infarction.

Korah Ellis Sherrill, Fulton, Mo.; Barnes Medical College, St. Louis, 1911; member of the American Medical Association; died September 4, aged 75.

William Smith Shimer, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1886; served during World War I; affiliated with St. Mary's and Stetson hospitals; died September 19, aged 82, of cardiovascular renal disease.

Jay Dow Shively, Clinton, Mo.; American Medical Missionary College, Battle Creek, Mich., and Chicago, 1900; died September 9, aged 77, of intestinal obstruction.

Robert Armstrong Smith, Ghent, Ohio; McGill University Faculty of Medicine, Montreal, Canada, 1897; veteran of the Spanish-American War; died in the People's Hospital, Akron, September 30, aged 78, of bronchopneumonia and cholelithiasis.

Wesley Munger Thomas ⊕ Westville, Ind.; Chicago Homeopathic Medical College, 1895; formerly on the staffs of Ravenswood and St. Luke's hospitals in Chicago; died October 21, aged 80, of cerebral hemorrhage.

Albert Lycurgus Victor ⊕ Washtucna, Wash.; Marion-Sims College of Medicine, St. Louis, 1899; member of the Oregon State Medical Association; died in a hospital at Pendleton, Ore., September 17, aged 79, of cerebral hemorrhage.

R. W. Waldrop ⊕ Bessemer, Ala.; Louisville (Ky.) Medical College, 1896; fellow of the American College of Surgeons; owner and chief surgeon at the Bessemer General Hospital; died in Rochester, Minn., October 11, aged 74, of coronary occlusion.

Fernando A. Ward, Suffolk, Va.; Medical College of Virginia, Richmond, 1899; member of the American Medical Association; died October 9, aged 73, of Hodgkin's disease.

Frederick Stockton Watson ⊕ Trenton, N. J.; Medico-Chirurgical College of Philadelphia, 1907; for many years on the staff of the Mercer Hospital, where he died September 15, aged 65, of coronary thrombosis.

Treatment of Obstinate Eczema by Duodenal Intubation

P. Delore has presented to the Medical Society of the Lyons Hospital 21 cases of eczema treated by daily duodenal intubation. The patients had suffered for a long time from generalized eczema resisting all other treatment. The authors did not find any common stigma, but noted diabetes in 6 cases, obesity in 6 cases, slight hepatobiliary disorders in 3 cases and hypercholesterolemia in 1 and in 1 case hyperuricemia. They performed an average of twelve consecutive intubations and observed a remarkable sedative action on the pruritus in all cases. In 2 cases the eczema rapidly disappeared, and in 14 cases there was partial or temporary improvement In 5 cases there was no improvement.

The author believes that the cholagogue effect of the intubation, and, through it, a favorable action on hepatic function explain the good results. He advocates this treatment in all resistant eczemas. H. Thiers, Racouchot and Tholot presented at the same meeting their observations on this treatment. They did duodenal intubation in order to find out latent vesical disorders by the study of the bile in a patient suffering from generalized exudative eczema. The bile was found to be normal or thick containing no formed elements, or microscopically slightly purulent, but with a negative culture. The results from repeated intubations were on the whole favorable. Complete recoveries were more infrequent but were obtained in patients with a slightly purulent bile; some complete failures were experienced; patients with a thick bile have been especially improved. In the discussion, Professor Gate showed interest in this new treatment of obstinate eczema.

Inquests on Cancer

In 1943, the National Institute of Hygiene (Cancer Section) set up a permanent enquiry on cancer in order to centralize all the documentation concerning this disease. It has just issued a statement showing that it succeeded in collecting, to date, 20 per cent of the cases occurring each year in France; 10,000 cases are taken up by anticancer centers, 2,000 cases by hospitals not specializing in the treatment of cancer, and 2,000 by the Social Security Service. Thanks to a specially organized social service, keeping in contact with patients has improved. In order to obtain the maximum of documentation the permanent enquiry has been extended to Africa. Interesting data have been collected on the comparison of cancer in white persons and in Negroes of other continents. For example, primitive cancer of the liver represents 35 per cent of recognized and histologically verified cancers among the Negroes of other continents, whereas in France it represents 0.5 per cent only. Conjunctival tumors appear to amount to 19.5 per cent, a proportion also much higher than in white persons. On the other hand, an enquiry on the eventual relation of cancer and heredity has been started. A French *département* (district) has been selected for the establishment of a genealogic index in which all the families will be inscribed and in which all births and deaths (those due to cancer being specified) are to be recorded; a minimum of three generations will be necessary to give information on this problem. A special bibliographic service, including all the world literature on cancer, has been organized.

Nanism As An Aftermath of War

In the aftermath of diseases of the last war a noteworthy increase has been recorded in the incidence of Fröhlich's syndrome, and, above all, in the large number of dwarfs. Nanism, or any serious retardation of growth, often represents an enigma. Greenblatt, professor of endocrinology at the Georgia School of Medicine in Augusta, has divided nanism into the genetic, hypohormonal and hyperhormonal types and has subdivided the genetic type into proportionate and disproportionate; the hypohormonal type into hypothyroid, hypopituitary, hypogonadal and diabetic, and the hyperhormonal type into hypergonadal and hypercorticosteroid.

The anterohypophysial region is involved in the majority of cases of nanism. However, if detailed roentgenographic examination in various projections of the sella turcica or pituitary fossa is done, no specific changes may be observed in the majority of cases, except in cases of cysts with calcification. The same applies to the obscure relation between alimentation and nanism in cases of secondary infantilism. No doubt, deficiency of nutritive elements which are hormonic stimulants affects the stature of persons by delaying growth and development, as was demonstrated by results of food shortages during the last war, but there must be other factors which aggravate the effects of a deficient diet until it determines the anterohypophysial reaction. Whatever the mechanism may be, poor results follow present methods of treatment. The director of the Radiologic Institute of the University of Naples, Professor Mario Bertolotti, at a conference at the Medicophysical Academy of Florence and in another at the University of Naples, has demonstrated, that a large percentage of patients sent to him for endocrine disturbances attributed to the hypophysis, showed definite manifestations of serous meningitis rather than pituitary lesions. Serous meningitis was demonstrated in all forms of adiposogenital dystrophy, nanism and gigantism of genitals in the absence of any increase in body size.

MENINGITIS IN THE ABSENCE OF CLINICAL SIGNS

When members of the family of children with serous meningitis were interviewed, their answers always were negative with regard to an occasional infirmity of the meningeal type. The meningitis had a silent course, without any sign of meningism, or with signs which were definitely unappreciable (mild headache or temporary gastric disturbances). According to Bertolotti, this serous meningitis is responsible for inflammatory reactions of short duration which involve the entire diencephalohypophyseal system. These reactions are instrumental to a functional disturbance of the diencephalohypophyseal system, although they do not determine anatomic lesions which might cause deformation of the sella turcica or of the hypophysis demonstrable on roentgenographic examination. The signs of insufficiency may be followed by endocrinopathic repercussions of various importance: from nanism, which formerly has been defined generically as infantilism, to the syndromes of pseudo Fröhlich type.

What is the origin of this meningitis? Bertolotti has no doubts that it is an adenoid complication in the ethmoidal nasal region. Little by little the adenoid syndrome increases in children compelled to live inadequately with regard to dietetics and climate (effects of air warfare), until it assumes the form of a clinical entity which on roentgenographic examination may be revealed as chronic posterior ethmoiditis or ethmoidosphenoiditis. The author has roentgenographic documents of hundreds of cases with manifestations of alterations concerning the structure of the sinuses, and in the near future there will be published a volume by a pupil of Bertolotti, who is the head of the most frequently quoted school of roentgenology of the skull in Italy.

PRACTICAL CONCLUSIONS

Bertolotti, who adheres to the clinicoradiologic management of the American School of Cushing, emphasizes that the ethmoiditis may escape detection, because it is submerged in the general picture of extensive adenoidism. In the controversies concerning the sequelae of the removal of the tonsils and adenoids in the genital sphere, the point of view of Bertolotti, which reveals a link between adenoidism as a sequela of ethmoiditis and anterohypophysial disturbances, deserves consideration. According to Bertolotti, it is necessary to act first concerning the latent serous meningitis in order to prevent the dangerous repercussions in the diencephalohypophyseal system. Lumbar puncture may be performed to attenuate the hypertension of the cerebrospinal fluid, or other therapeutic measures which the clinical surgeons may consider advisable may be resorted to. Treatment should be directed at the adenoidism and at the insidious manifestations of the ethmoiditis before it becomes chronic, involving the hormones. Bertolotti postulates continuous roentgenographic observations of the skull of all children with signs of adenoidism and mild manifestations of sinusitis and ethmoiditis. Lumbar puncture directed at the incipient meningitis may be much more effective than the customary opotherapeutic measures, particularly in cases in which there may be functional disturbances of the anterohypophysis or of the hypothalmus.

MADRID

Congress on Obstetrics and Gynecology

The Second Portuguese-Spanish Congress on Obstetrics and Gynecology was held in Lisbon May 2-8, 1948. Drs. F. Luque Beltrán of Madrid and Novais Esousa of Coimbra were presidents. The President of Portugal, the Embassador of Spain in Lisbon and the Ministers of State and of National Education of Portugal were present at the first session. The official topics on May 2 and 3 were: "The human embryo in the first few weeks," by Prof. Dr. Celestino da Costa; "History of Establishment of the Alfredo Costa Maternity," by Prof. Dr. Carbalho Dias; "Physiology of Menstruation," by Prof. Dr. C. Botella Llusia, of the Faculty of Medicine of Madrid, and "General Conception and Nomenclature of Changes in Menstruation," by Prof. Dr. M. Usandizaga Soraluce. The topics were interesting and the discussions which followed were important.

The official topics on May 4 were: "Chemotherapy and Antibiotic Therapy in Puerperal Infection," by Dr. Albertino de Barros; "The Stillborn from Obstetric and Legal Points of View," by Dr. Macau Moncanut; "Physiopathologic Aspects of Fetal Respiration," by Dr. Silva Nuñes; "Need of an International Concept for Determination of the Stillborn," by Dr. Amaral Pyrrait.

The whole session on May 5 was given to the problem of cancer. Official topics were: "Therapeutic Orientation on Carcinoma of Female Genital Organs," by Prof. Dr. J. García Orcoyen of the Faculty of Medicine of Madrid, and "Conduct Followed in Therapeutics of Cancer at the Instituto Portugues de Oncologia." There were also receptions and other festivities.

The congress resolved (1) to appoint a committee for uniformity of Nomenclature Concerning Menstrual Changes; (2) to request from the governments of both countries agreement on the Concept of the Stillborn; (3) to stimulate elevation of the educational level of midwives practicing in rural zones; (4) to increase the number of beds in obstetric hospitals for women of moderate economic means; (5) to establish and follow social and legal crusades against criminal abortion; (6) to give impulse and strength to social campaigns for investigation of and work against cancer, and (7) to hold the Third Spanish-Portuguese Congress at Barcelona, Spain, in 1950, with Prof. Dr. Lubiola of the Faculty of Medicine of Barcelona, the chairman, and Profs. Drs. Conill, Garriga Roca and Morais Ferias vice president, secretary and chairman of the Portuguese committee, respectively.

University Professors Appointed

The following professors have been appointed during this year: Professor of obstetrics and gynecology on the Faculty of Medicine of Madrid, Dr. J. Botella Llusia and on the Faculty of Valencia, Dr. F. Bonilla Marti; professor of physical therapy on the Faculty of Barcelona, Dr. V. Carulla Riera; professor of pediatrics and puericulture on the Faculty of Santiago, Dr. M. Suarez Perdiguero, and on the Faculty of Granada, Dr. A. Galdo Villegas; professors of descriptive anatomy and of anatomic technics on the Faculty of Salamanca, Drs. L. Jiménez Gonzales and J. L. Puente Domínguez. Professor of general histology and of pathologic anatomy on the Faculty of Santiago de Compostela, Dr. J. L. Arteta Algibez, and on the Faculty of Cadiz, Dr. D. Ferrer y Fernández de la Riva; professor of general pathology and clinical propedeutics on the Faculty of Santiago, Dr. A. Aznar Reig, and on the Faculty of Cadiz, Dr. F. Díaz González and professor of general and special physiology on the Faculty of Santiago, Dr. R. Domínguez Sánchez.

Lectures

Lectures were given at the Colegio Provincial de Médicos of Baleares in April by Prof. Dr. A. Pedro y Pons, on "Differential Diagnosis of Jaundice"; Prof. Dr. Piulachs, on "Minimal Picture of Acute Abdomen"; Dr. P. Barcelo Torrents, on "Painful Shoulder"; Dr. A. Rocha, on "Preoperative Treatment of Diseases of Digestion"; Dr. C. Perez Vitoria, on "New Antithyroid Medications," and Dr. M. Estevez, on "Psychosomatic Medicine."

Congresses

The Seventh National Congress of Pediatrics will be held at Sevilla on May 1949, under the chairmanship of Dr. Saiz de los Terreros.

The second meeting of the Sociedad Internacional de Gastroenterología will be held at Spain in 1950, under the chairmanship of Dr. Gallart Mones of Barcelona.

Personals

Dr. L. García Tornell was recently appointed member of the Real Academia de Medicina of Barcelona. His speech of entrance to the Academia was on "Surgery in Spain in the Nineteenth Century."

Dr. P. Lain Entralgo, professor of the history of medicine at the University of Madrid, recently lectured in various South American countries. He was appointed honorary professor on the Faculty of Medicine of Chile and honorary member of the Society of Neurology and Psychiatry of Chile.

Professor Dr. G. Marañón, of Madrid, was recently appointed member of the Academia de las Ciencias at Lisbon.

Correspondence

SALICYLATE THERAPY IN RHEUMATIC FEVER

To the Editor:—I read with interest the editorial in The Journal, October 2, page 367, on the subject of "Salicylate Therapy in Rheumatic Fever." In this connection, you quote Coburn's work (Coburn, A. F.: Salicylate Therapy in Rheumatic Fever, *Bull. Johns Hopkins Hosp.*, Dec. 1943, pp. 435-464). If verified, such results would indicate a good method of treating rheumatic fever. However, an analysis of his results casts reasonable doubt on the validity of the conclusions. It is because this subject is such a vital one, and not in order to detract from the value of the work published, that the following considerations are brought forward.

1. In presenting the results, the criteria for determining cardiac damage are not described. The follow-up period seems to be too short to determine adequately the ultimate effect of the acute rheumatic episode or of the treatment, for pathologically demonstrable valvular heart disease may not appear until several years after the acute rheumatic attack. In reading the statement that in 16 of 19 patients with polycyclic attacks mitral valvular disease developed, one wonders how the presence of valvular disease can be noted so soon after the acute episode, unless there was previous valvular damage, for the preliminary group was studied in 1942, and the results published in 1943. Similarly, the statement that a patient escaped clinical signs of heart disease does not necessarily indicate the ultimate effect of the rheumatic episode in the more recently treated group.

2. The criteria for classifying the attacks as severe or mild are not presented. Further, the severity of such an attack need not be related to the subsequent appearance of rheumatic valvular heart disease, for there is a large group of patients with marked rheumatic valvular heart disease from whom no history of an acute rheumatic episode can be elicited.

3. Analysis of the results does not justify enthusiastic conclusions as to the efficacy of the method of treatment presented. In describing the treatment of 12 patients with infusions of 10 Gm. of sodium salicylate daily (preliminary group 3), it is stated that "without exception the sedimentation rates fell progressively and were normal or approaching normal after fourteen infusions." Study of the results listed in table 1 shows that, although all the sedimentation rates were approaching normal, by the fourteenth day of such treatment the sedimentation rates of only 2 patients were 19 or less, and those of 10 patients were 20 or more, of which 4 were 40 or more.

4. In the largest group, consisting of 58 patients, of whom 40 were selected to be reported, massive dose salicylate therapy in group 1 (20 patients) resulted in all of the sedimentation rates becoming normal in fourteen days or less. However, these patients had had elevated sedimentation rates for an average period of forty days before such treatment, thus making a total of sixty-three to forty-nine days before normal levels were reached. This does not seem significantly different from the results described in preliminary group 1, in which 19 patients with polycyclic attacks who were supposedly receiving inadequate salicylate dosage had elevated sedimentation rates for an average of nine weeks.

These points serve to emphasize the need for further observation and study of the effect of salicylate treatment of acute rheumatic fever before salicylates are recommended as a curative measure rather than as a means of achieving purely symptomatic relief.

TOXICITY OF HEXACHLOROCYCLOHEXANE IN SCABIES

To the Editor:—Recent contributors to The Journal found hexachlorocyclohexane to be an effective and safe treatment for scabies even when spread on and rubbed into the entire cutaneous surface of the body in a vanishing cream base (Canon and McRae, The Journal, Oct. 23, pp. 557-560). Before this mode of treatment is accepted it seems that consideration should be given to the fact that recent experiments not cited by these authors show that both oily (Horton, Karel and Chadwick, *Science*, March 5, pp. 246-247) and aqueous (personal communication from Dr. Garner, U. S. Department of Agriculture Animal Research Department, Beltsville, Md., on work done by Department of Agriculture research workers at Kerrville, Texas) solutions of hexachlorocyclohexane can be fatal to rabbits and other animals by cutaneous absorption alone.

In addition to the possibility that hexachlorocyclohexane may be toxic on cutaneous absorption consideration should be given to its possible toxic effect on man and animals when used as an insecticide. This year for the first large scale use of hexachlorocyclohexane thousands of tons of insecticide dust containing this substance as its most potent component were dusted by plane or tractor on cotton fields throughout the South in an effort to control the boll weevil. My attention was first drawn to the possible toxic properties of this dust after the convulsive death of a child who lived but 100 yards from an insecticide mixing plant. This mixing plant in an effort to protect its workers had installed exhaust fans which blew out into the surrounding air spillage of dust incurred in the bagging process of the insecticide mixture containing hexachlorocyclohexane.

After the convulsive death of this child search of the literature revealed that hexachlorocyclohexane does characteristically cause a convulsive death when experimentally fed to (Furman, *J. Econ. Ent.*, vol. 40, p. 518, 1947) or injected into (*J. Pharmacol. & Exper. Therap.*, February, pp. 140-146) animals. It was noted also that, although there was widespread dusting of cotton fields throughout the South with this mixture containing hexachlorocyclohexane and although there was resultant inhalation of the mixture by thousands of animals and human beings, there is as yet no controlled inhalation experiment on hexachlorocyclohexane in the medical literature (a search for an article on inhalation was made by the staff at Army Medical Library, Washington, D. C.; one European report was found and no toxicity reported, but these animals were exposed for but a short period), nor does questioning of experts in public health research reveal that any such experiment is now being made (personal communications from executive heads of governmental and private agencies closely associated with insecticide research).

Further evidence of the toxicity of this chemical is seen in the fact that 6 rabbits placed at the aforementioned insecticide plant and exposed to the dust lost in the normal working process of the plant all died during the second week of exposure. In addition, a personal survey of farms in different areas of North and South Carolina revealed reports of convulsive death in cows, pigs, mules, dogs and chickens (e. g., 5 cows died at Lumber Ridge, N. C., 7 pigs at Clio, S. C., and 100 chickens at Maxton, N. C.) after this insecticide containing hexachlorocyclohexane had been dusted on nearby cotton fields from planes.

In conclusion, would it not seem that further work is indicated on hexachlorocyclohexane before it is to be considered adapted for unrestricted use either as an insecticide or as a cure for scabies?

Robert F. Mobbs, M.D.

Medical Economics

HEALTH AND SOCIAL SECURITY

MORRIS FISHBEIN, M.D., Editor
The Journal of the American Medical Association

Fifteen years have passed since Harvey Cushing wrote one of his most important essays, entitled "Medicine at the Crossroads."[1] Now, in 1948, the forces of medicine are assembling at a point of decision which may well determine the nature and the freedom of medical practice for many years in the future.

The 80th Congress, which was harshly criticized by the President in his campaign speeches because of its failure to enact some legislation which he favored and for enacting other legislation which he did not favor, paid much attention to problems of health and medical care. Extensive hearings were held on both the Taft-Smith-Ball-Donnell bill, which proposed to advance medical science by the well established principle of federal grants to the individual states, and the Wagner-Murray-Dingell bill, which would establish a nationwide system of compulsory sickness insurance.

Few persons realize how greatly our federal government enters into the care of the sick under existing legislation. In 1948 the federal government assumed the total cost of approximately $6,000,000,000 for medical, hospital, educational and welfare needs of veterans. Benefits were paid to more than 2,000,000 persons under the old age and survivors' insurance program.

The 80th Congress passed a bill providing for increased cardiovascular research, improvement and expansion of heart disease detection and diagnostic services and training of workers in research and in matters relating to the diagnosis, prevention and treatment of heart diseases. For the year commencing July 1, 1948, the Congress voted $3,144,088 for this purpose.

The National Dental Research Act was passed for approaching the dental problem in a similar manner, and law authorizes an annual appropriation of $750,000 toward dentistry.

A further expansion of the national mental health program was approved, and grants-in-aid for community mental health services were increased to $3,550,000 annually. Research and training grants were increased to $2,000,000, and smaller increases for work of the Public Health Service in this field were approved.

The 80th Congress voted about $175,000,000 for the control of venereal diseases, tuberculosis control, general public health work, control of communicable diseases, the National Institute of Health, cancer research and control, a hospital construction program, the construction of a medical research center, maternal and child services and services for crippled children.

Other important bills, which were considered but not passed, included federal aid to the states in providing full time public health services, federal aid for school health services and for the treatment of physical and mental defects in conditions of school children, federal aid for providing various expensive drugs and medical services, federal aid for research and training in poliomyelitis and a bill to create a national science foundation.

Also reported favorably to the Senate was a bill to create a Department of Health, Education and Security to supersede the present Federal Security Agency. No action was taken on this bill because there should be available soon a report of a bipartisan commission under ex-President Herbert Hoover which is studying and preparing plans for reorganization of the federal government. This commission will recommend not only structural changes but will also make recommendations on functions of various departments in the light of their cost, their usefulness, their limitations and their curtailment or elimination.

The Social Security Act of the United States provides for cash indemnity to meet the hazards of old age and unemployment and for funds granted to the individual states to be applied in the field of health. The latest reorganization was that of 1946. The programs involved include old age and survivors' insurance, unemployment insurance and public assistance. The latter provides old age assistance, aid to dependent children and to the blind, maternal and child health services, services for crippled children and child welfare services. The benefits under the Act as far as old age is concerned are not available to large classes of workers, including agricultural labor, domestic service in private homes, local governments, employment by religious, charitable, educational and scientific organizations not for profit and similar groups. Railroad employment is covered by the Railroad Retirement Act. The unemployment insurance is administered by the states with federal cooperation.

Under the program for public assistance the federal grants are made to the states to aid them in giving financial assistance to certain groups of needy persons. The state plan must meet requirements set forth in the Social Security Act.

In June 1947 more than 4,000,000 persons were receiving public assistance, of whom 3,300,000 were on the program under the Social Security Act. The expenditures amounted to almost one and one-half billions of dollars.

For maternal and child health and welfare the Social Security Act authorizes federal grants to the states to extend and improve their health and welfare services for mothers and children, especially in rural areas suffering from economic distress. In 1946 the grants were $11,000,000 for maternal and child health services, $7,500,000 for services for crippled children and $3,500,000 for child welfare services. In addition, the states must supply $5,500,000. During 1946 medical services were given to 129,000 women at prenatal clinics and to 456,000 infants and preschool children at child health conferences. Medical health supervision was provided for 1,600,000 school children by state health authorities. Public health nursing service was given to 231,000 expectant mothers and to 952,000 infants and preschool children. Almost 4,000,000 children were immunized against infectious diseases, and 1,143,000 children received dental inspection. In addition to the $7,500,000 given by the federal government for services for crippled children, the states must supply $3,750,000. Thus the funds expended in the field of health under the Social Security Act approximate $35,000,000 to $40,000,000 annually.

The Senate Committee on Finance recently received its third report from its Advisory Council on Social Security under the chairmanship of Edward R. Stettinius Jr., this one covering public assistance. Over a period of twelve years public assistance programs ranged from a high of $472,000,000 in 1938 to $85,500,000 in 1944. During 1947 expenditures for general assistance from the state and local funds amounted to $164,000,000. Under present economic conditions the committee estimated that the annual cost to the federal government would approximate $75,000,000 for assistance payments and $15,000,000 for administrative expenses. Among the suggestions made by the Advisory Committee as concerned medical care, the committee recommended that the federal government should participate in payments made directly to agencies and persons providing medical care as well as in money payments to recipients. They suggest that the federal government should pay one-half the medical care costs incurred by the states above the regular maximums of $50 a month for the recipient but should not participate in medical costs above the regular maximums.

They also recommended that state public assistance agencies should be required to submit their plans to the Social Security Administration for its approval, setting forth the conditions under which medical needs will be met, the scope and standards of care, the methods of payment and the amount of compensation for medical care.

Most of the states are now financing the medical care they provide from state and local funds. Since the states with comparatively meager resources cannot spend funds without federal matching, these states provide little or nothing for medical care. Moreover, it is said that in almost all states the medical care provided under this program is inadequate.

One paragraph of the report merits emphasis. They suggest that medical care for assistance recipients should be provided under arrangements that afford the assistance agency flexibility in establishing policies and procedures. "It is frequently desirable to let recipients make their own arrangements for medical services. On the other hand, there are many circumstances in which the assistance agency finds it preferable to pay the doctor or other supplier of medical care directly." Again they emphasize, "Choice could be made of the best way to make medical care available to a recipient in his particular situation."

---

[1] Cushing, H.: Medicine at the Crossroads, J. A. M. A. **100:** 1567 (May 20) 1933.

The report indicates, "Recipients of old age assistance have an average age of 75 years and have great need of medical services." Like other persons of advanced age they are particularly subject to chronic diseases. One third of the recipients of medical care for dependent blind persons are 65 years of age or over. These persons have other infirmities besides blindness. About one fifth of the recipients are blind as a result of cataract, which, it is suggested, might have been corrected by surgical treatment. More than one tenth of the recipients suffer from glaucoma.

Another recommendation suggests that the federal government should participate in payments made to or for the care of old age assistance recipients living in public medical institutions other than mental hospitals. "To receive federal funds to assist old people in medical institutions under either public or private auspices," says the report, "a State should be required to establish and maintain adequate minimum standards for the facilities and for the care of persons living in these facilities. These standards should be subject to approval by the Social Security Administration." The Advisory Council feels that care for aged and chronically ill persons is a growing problem and in the opinion of the Council is a federal concern. Today more than 350,000 recipients of old age assistance are bedridden or so infirm as to need help in eating, dressing and getting about indoors. Some 50,000 of these are living in commercial boarding or nursing homes or private institutions, and many are getting unsatisfactory care.

Since the passage of the original Social Security Act in 1935 the number of persons aged 65 and over has increased from 8,000,000 to nearly 11,000,000. Moreover, it is estimated that another 25 years will double the number of persons over 65 years of age. Investigators found that needy persons without additional resources are allowed $50 a month. In Connecticut in 1946 the average cost of nursing home care for aged persons was $118 a month.

Another recommendation of the Advisory Council on social security suggests that a commission should be appointed to study current child health and welfare needs and to review the programs operating under title V of the Social Security Act, relating to maternal and child health services, services for crippled children and child welfare services. The Council recognizes that these problems can be approached from several different points of view. The question is asked, "Should necessary health and welfare services be provided to all children and mothers or should they be limited to those whose families cannot afford to pay for the services?" They ask, "Is the present scope of maternal and child health and welfare services sufficiently broad or should new services be instituted?" And then they inquire, "Should new or expanded services be supplied by governmental agencies, by voluntary agencies or by both acting together?"

The health needs which the Children's Bureau feels are most urgent are:

1. Inadequate health services for both mothers and children; these services are lacking in many areas, particularly in rural communities.

2. Rheumatic fever; some 500,000 children are suffering from rheumatic fever.

3. Premature birth; some 150,000 infants are born prematurely each year.

4. Lack of dental care; some 20,000,000 children are in urgent need of dental attention.

5. Cerebral palsy; between 100,000 and 160,000 children have cerebral palsy.

6. Physical and mental defects; many children of school age lack provision for medical examinations and for the correction of handicapping conditions found.

7. Inadequate supply of professional personnel; nearly all parts of the United States lack a sufficient number of pediatricians, public health nurses and medical social workers to provide adequate health services for children.

This then is the status of social security in the United States, particularly from the point of view of health, on the eve of the convening of a new Congress and the taking of office by a reelected president.

Strangely, an acceptable statement on the condition of health and medical care in the United States at this time is not easily available. Most sound of all of the statements thus far published was the report of the Brookings Institution to the Senate Committee headed by Senator Alexander Smith. Yet shortly after the publication of this report the propagandists for compulsory sickness insurance refused to accept its facts, figures and conclusions and issued a document in opposition. Presumably the report to the President by Oscar R. Ewing entitled "The Nation's Health," issued in September 1948 after a week of conferences in Washington, should offer an acceptable statement. Yet it comes far indeed from being anything resembling a scientific document. Those who understand the nature of these governmental performances were not astonished at the result. Almost from the first it was apparent that Mr. Ewing was stacking his executive committee. When that condition was corrected, Mr. Ewing made it clear that he would in any event recommend compulsory sickness insurance. What came forth was a shrewdly contrived document, designed to break down the confidence of the American people in their medical care and pointing repeatedly to compulsory sickness insurance as the cure for the misrepresentation that the document sets forth. A peculiar folly is the suggestion that every state should have a medical school and a medical center around the school. That type of broad generalization could have been made only by someone totally lacking in a knowledge of medical education and its problems. It will take far more than ten years to accomplish that objective.

The report says that a scant 20 per cent of our people are able to afford all the medical care they need—and this in a nation with the highest standard of living of any nation in the world. Who determines how much medical care people need? What kind of medical care meets the needs of the American people? We have in the United States some 200,000 physicians, 16,000 chiropractors and 7,000 or 8,000 osteopaths, with perhaps 15,000 or 20,000 more nondescript healers of every type from faith healing to the utilization of electric gadgets. How much could be saved by the elimination of this borderline quackery? Bear in mind that no other nation in the world is subject to the amount of medical quackery that we seem to tolerate and support.

The report says that 30 per cent of American families with incomes between $3,000 and $5,000 would have to make great sacrifices or go into debt to meet the costs of a severe or chronic illness. How many of these families go into debt to purchase motor cars, furs, jewelry or other luxury items? The cigaret bill of the nation rose from 10 billion cigarets in 1915 to 350 billion cigarets in 1945. Many an American family spends over $180 a year on tobacco. Certainly individual planning in a democracy is just as important as government planning. Many a family fails to plan for medical care, but finds itself quite efficient in planning for other purposes, like radio, television, motion pictures, football games and similar amusements. The bill for sports and pastimes in the United States far exceeds the bill for medical care. Yet Mr. Ewing comes to the ultimate conclusion in which he says, "I have reached the considered conclusion that more extensive and efficient nationwide planning is the only effective way to accomplish a significant betterment in national health."

When the last Congress adjourned, a committee was established to report in March 1949 on legislation in the field of medical care. No doubt additional hearings will be held, and conceivably the Congress may find a means to encourage federal aid to help in solving at least in part our medical problem.

Fundamental to every advance in the field of medical care is the quality of medical education. American medical education is today the best in the world. Medical education in the United States includes the voluntary contributions to medical teachings of great numbers of American physicians who recognize that the dissemination of medical knowledge to future generations is basic to the existence of the profession itself.

The statement has been made that we do not have enough medical manpower, enough health facilities or enough research. Medical manpower is basic to a wider extension of research. No doubt the Congress will eventually pass the National Science Foundation bill and thus increase the training of young men in qualified medical schools, but particularly in the basic sciences, which are today in serious need.

In England, following the adoption of the National Health Act which promised everyone in England free medical service and free hospitals, free eyeglasses and free teeth, as well as everything else free in the field of medicine, the service has been marked by utter inability of the doctors, the hospitals, the pharmacists or the dentists to meet the demands placed on them by a great rush of people who wanted perhaps simply to find out how the system works.

My personal observations in England led me to the opinion that the quality of medical service rendered under the National Health Act would never be satisfactory to the average American laborer or farmer. The greatest mistake that England made in adopting its National Health Act was its failure to realize that even moderately good functioning of such an act depends on adequate medical personnel and medical facilities. These England did not have. British politicians felt that any kind of medical care was better than no medical care. That is a hazardous hypothesis.

The American people, including leadership from all of the professions concerned in medicine, have been striving in recent years to develop a plan for distributing medical care suitable to the American free enterprise system. The growth of prepayment plans for hospitalization and for medical care has been phenomenal. At least 30,000,000 persons are now covered by hospitalization insurance under the Blue Cross plans, and commercial carriers have more than doubled their enrolment, giving protection against the costs of hospitalization in 1947 to 14,000,000 voluntary subscribers. In the years from 1944 through 1947 private group health and accident insurance increased from 7,000,000 to more than 14,000,000 persons. Simultaneously, physicians were organizing physician-sponsored prepayment medical and surgical care plans. Today there are some 70 such plans in operation, with a coverage of approximately 7,000,000 persons. Complete medical care programs by the end of 1947 covered more than 1,000,000 persons. No other country has ever developed such a voluntary coverage in such a period of time, and there is reason to believe that this system of coverage is far better suited to the conditions that prevail in the United States than would be any system under government control.

The problem of providing medical care wherever needed is not nearly as simple as many economists and political leaders would lead the people to believe. Again and again political leaders have denied that nationwide compulsory sickness insurance is socialized medicine. Yet the nations that embark on such programs move inevitably into a socialized state in which mines, banks, transportation and practically all public services become nationalized, private responsibility and ownership disappear, individual initiative is destroyed and the result is a socialized state. At the same time that many of our political leaders oppose communism they move toward communism by embracing socialism.

Nowhere else in the world are people as free from the fear of epidemic disease or from the danger of preventable death as in the United States. Obviously we have not yet reached perfection. Anyone familiar with the history of disease would state positively that mankind may never reach perfection in this regard. Disease itself is not static but constantly changing. One need only compare the leading causes of death in 1910 with those of today to know that in the short span of two generations there have been vast changes in our scientific approach to the problems of medical care.

We need no revolution to advance against disease at this tremendous rate of the past forty years, nor do we need a revolution to intensify our progress. The establishment of a compulsory sickness insurance system which would inevitably degrade and deteriorate the medical profession would represent a revolution and would with certainty deteriorate the quality of medical care rendered to our people. Once a nation has embarked on such a program, the ability to retrace the steps becomes less and less with every year that passes. As the years go by, the quality of medical education deteriorates. As the years go by, young men seek opportunity to enter other professions than medicine. Research fails to attract the type of men who in the past have given us the discoveries that have removed the fear of tuberculosis and pneumonia and of epidemic disease.

With what sophistic explanations will those who propose to tear down the great edifice of medical education, medical research and the quality of medical care that we have established in this country and to replace it with a bureaucratic civil servant type of medical care justify their conduct in the years to come?

Medical Motion Pictures

FILM REVIEWS

The following 16 mm., black and white, sound motion pictures were prepared in 1918 under the technical supervision of F. L. Fitzpatrick, Ph.D., *Professor of Natural Sciences, Teachers College, Columbia University*, New York. Produced by and procurable on rental or purchase from: United World Films, Inc., 445 Park Avenue, New York 22.

Paramecium. 390 feet, showing time ten minutes.

The anatomy and physiology of the paramecium including the phenomena of conjugation and of fission are well shown in this motion picture. The internal structure is demonstrated by illumination and magnification. The film is completely objective and well balanced in choice of material.

Amoeba. 275 feet, showing time seven minutes.

This film shows the living amoeba, demonstrating the behavior of the pseudopodia and its ingestion of prey, illustrating how the contents of a food vacuole are digested and absorbed.

The narrator does not always refer to what is being shown at the moment and occasionally contradicts what the audience sees. It must also be mentioned that the word "cyst," used by the narrator to mean a membranous wall, is misleading, since the word is ordinarily defined as a sac with fluid or semisolid contents. In every other respect the film is excellent.

The Life Cycle of Trout. 325 feet, showing time nine minutes.

The development of a fish is depicted beginning with the eggs as they lie on the bottom and with the sperm as it settles like a cloud through the water upon the eggs; however, the source from which the eggs or the sperm originated is not shown. The activity of the individual sperm cells and the peculiar movements on the surface of a developing egg are illustrated. The growth of the embryo is portrayed in an excellent manner and the cardiovascular system is well illustrated.

General Comment.—The terminology used by the narrator in these films can only be appreciated by adequately prepared high school or college classes; otherwise, for complete understanding, the films should be preceded either by reading or by other special preparation. These productions should be valuable material for courses in nursing education in which references to amoeba and paramecium are frequently made in courses in physiology in the absence of facilities for showing the living object. They would also supplement a program for sex education.

All three films are distinguished by a commendable pedagogical device; namely, a succinct recapitulation of the subject matter in the closing sentences of the narration. The photography and photomicrography are excellent throughout these films.

Removal of Intervertebral Discs by the Abdominal Extraperitoneal Route. 16 mm., color, sound, 400 feet, showing time twelve minutes. Prepared in 1948 by Paul H. Harmon, M.D., Oakland, Calif. Procurable on loan from the author, The Permanente Hospitals, Department of Orthopedic Surgery, Broadway and MacArthur Blvd., Oakland 11.

The operation portrayed in this motion picture is unique; however, its use is not justifiable because the more or less standard types of surgical procedures for the removal of intraspinal lesions employed by innumerable surgeons have given satisfactory results. The operative procedure illustrated does not enable the surgeon to visualize the porton of the intervertebral disk which is protruded and produces the patient's symptoms and signs. It probably would be easy to overlook loose intraspinal fragments of the disk. It would be impossible to remove an intraspinal neoplasm which had masqueraded as a protruded intervertebral disk, and if hemorrhage occurred in the spinal canal, it likely would not be recognized until gross neurologic signs developed. Then, a rather extensive laminectomy for removal of blood clot would be required. The abdominal incision cutting across muscle fibers and the nerves which supply the abdominal muscles would result in a weakness of the abdominal wall, if not actual hernia. Furthermore, there seems to be unjustifiable danger to the great vessels coursing anterior to the spinal column and to the sympathetic trunk. Although this type of procedure could be used for some protrusions of thoracic disks, such a surgical attack on thoracic disks is likely to carry a much higher morbidity and mortality rate than the usual laminectomy operation. The operation, of course, is not applicable to protrusions of cervical disks, and the posterior approach through the spinal canal which is applicable to disk lesions in the lumbar, thoracic and cervical regions should be, for the time being at least, the approach of choice.

Photography is very good.

Listening Eyes. 16 mm., color, sound, 700 feet (1 reel), showing time seventeen minutes. Prepared in 1948 for The John Tracy Clinic, Los Angeles, by the University of Southern California, Department of Cinema, under the sponsorship of Walt Disney Productions. Procurable on loan from: The John Tracy Clinic, 924 West Thirty-Seventh Street, Los Angeles 7.

This is an excellent demonstration of methods used to develop the deaf child mentally, physically, emotionally and socially, and also depicts the activities of sense training, speech reading and speech preparation. It shows the mother attending psychology and speech classes once a week observing and eventually taking a part in the teaching program for her child.

This motion picture is recommended for showing to pediatricians, otologists, general practitioners and medical students. It should also be suitable for parent-teachers' groups, boards of education, teachers of exceptional children, prospective teachers at universities and service organizations, to inform them that there is an institution which helps parents understand the problems of deafness and that handicapped children can be helped.

This is a well planned motion picture. The photography is excellent.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Food and Drug Acts: Use of Qualified Medical Witnesses to Establish Misbranding.—This was a consolidation for purposes of trial of four libel actions by the United States for the condemnation of quantities of a proprietary drug called "nue-ovo." The defendant intervened as claimant of the seized property and, from judgments of condemnation, appealed to the circuit court of appeals, ninth circuit.

The defendant, an Oregon corporation, has engaged in the manufacture, sale and distribution of, among others, a proprietary drug product known as "nue-ovo." The product is manufactured at Portland, Ore., and shipped to purchasers and distributors in most of the states west of the Mississippi River. The defendant's direct sales program involves extensive use of advertisements in daily and weekly newspapers and similar publications. The advertisements referred to are not, of course, part of the labeling. The libel alleges, however, that certain statements contained in circulars shipped with the product are false and misleading in that they represent and suggest and create in the mind of the reader thereof the impression that "nue-ovo" is effective in the treatment of arthritis, rheumatism, neuritis, sciatica and lumbago, whereas the article is not effective in the treatment of such conditions. One of the defendant's major contentions on appeal was that the trial court had erred in submitting the issues to the jury since every statement in the labeling as to the effectiveness of the product is a statement of opinion and at the conclusion of the case the record showed nothing more than a difference of opinion among qualified medical experts as to the effectiveness of the product.

Great reliance was placed, by the defendant, on a Supreme Court decision which was made about four years prior to the enactment of the original Food and Drugs Act in 1906. In that early case (*American School of Magnetic Healing v. McAnnulty*, 187 U. S. 94), the Supreme Court said that as the effectiveness of almost any particular method of treatment of disease is, to a more or less extent, a fruitful source of difference of opinion, even though the great majority may be of one way of thinking, the efficacy of any special method is certainly not a matter for the decision of the Postmaster General within these statutes relative to fraud. Unless the question may be reduced to one of fact, as distinguished from mere opinion, the decision continued, we think these statutes cannot be invoked for the purpose of stopping the delivery of mail matter. To illustrate some of the changes which have taken place in the law since the enactment of the Food and Drugs Act, however, the court of appeals said that in contrast to the meager technical facilities for the determination of medical questions possessed by the Postmaster General—at least at the time that the McAnnulty case was decided—the Federal Security Agency has at its disposal almost unlimited professional resources with which to carry out its investigations in the enforcement of the Federal Food, Drug and Cosmetic Act of 1938. This extensive professional implementation now authorized by the Food and Drug Act, said the court of appeals, was fully utilized in the case at bar.

Much of the government's evidence in the instant case consisted of "controlled clinical studies" conducted by eminently qualified physicians and surgeons. Dr. Frances Baker, Director of the Department of Physical Medicine at the University of California, whose professional qualifications appear to be highly impressive, testified at great length regarding a clinical study that she made in 1944 with the "nue-ovo" that contained cascara and licorice, but not vitamin B_1 and salicylate. The study was made on patients in the orthopedic clinic at the University of California Hospital. At the end of two months, 5 of the patients "were no better at all" and "one felt better." As the results of her studies, Dr. Baker testified that she thought that "nue-ovo" "offers us nothing that is of value in the treatment of arthritis." She expressed similar opinions as to "nue-ovo's" effectiveness in cases of lumbago, sciatica, neuritis and rheumatism and stated that the addition of sodium salicylate and vitamin B_1 in quantities found in one type of "nue-ovo" would not "give us any value whatever." Dr. John H. Wheeler, a practicing physician in Kansas City, Mo., and on the teaching staff of the University of Kansas, in 1944, at the request of the Food and Drug Administration in Kansas City, made a study of "nue-ovo" in the outpatient department of the University of Kansas. The type of "nue-ovo" that he used was also that containing cascara and licorice, without the vitamin B_1 and salicylates. Six patients were asked to continue the medicine for six weeks. Dr. Wheeler testified that the medicine had "no effect whatsoever" on 3 patients, and 2 patients stated that they "were of the opinion . . . that they were no worse." On the day of his return, the sixth patient "felt that he had definitely improved while taking his "nue-ovo," but "was complaining of some new pains involving both knees." This sixth patient, however, made that report ten months after starting the medication with "nue-ovo" and still had some of the six weeks' supply of the medicine left. On the basis of this experience and the experience of prior experiments in 1940, Dr. Wheeler was of the opinion that, with or without cascara, licorice or sodium salicylate or thiamine in the amount stipulated, "nue-ovo's" "effectiveness is nil" in the treatment of arthritis, rheumatism, lumbago, neuritis and sciatica. Dr. James M. Dille, professor of pharmacology and assistant dean of the School of Medicine of the University of Washington, while on the witness stand went down the list of ingredients of "nue-ovo" and categorically reported that scientific "investigation" by "doctors or pharmacologists" has shown that many of the ingredients have no "action" as drugs.

The testimony of experts that is based on tests or experiments made by them does not come within the ambit of the McAnnulty rule, said the court of appeals. It is generally agreed that testimony as to the consensus of medical opinion may be considered in drug-misbranding cases. In this circuit and elsewhere it has been held that expert testimony even in its broadest sense—i. e., where the witness has neither tested the product nor purports to report the consensus of medical opinion—is admissible on the question of therapeutic value. Altogether, the court concluded, there was ample evidence to support the verdict of the jury.

This, and other contentions of the defendant were accordingly overruled, and the judgment of condemnation was affirmed [Certiorari was denied by the Supreme Court of the United States.]—*Research Laboratories, Inc. v. United States, 167 F. (2d) 410 (1948).*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I & II.* Various Centers, Feb., June and Sept. 1949. *Part II.* April, 1949. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2, Pa.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology, Inc.: *Written.* July 15. Various locations. Final date for filing application is April 15. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Avenue, New York 27.

American Board of Internal Medicine: *Oral.* San Francisco, Feb. 8-10, 1949. New York City, March 23-25. Final date for filing application is Jan. 2. Philadelphia, June 1-3. Final date for filing application is Jan. 2. *Written.* Oct. 17, 1949. Final date for filing application is May 1. Asst. Sec.-Treas., Dr. W. A. Werrell, 1 W. Main St., Madison 3, Wis.

American Board of Neurological Surgery: *Oral.* Chicago, June 1949. Final date for filing application is Jan. 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

American Board of Ophthalmology: *Written.* Jan. 14. *Oral.* San Francisco, March 21-24; New York, June 11-15; St. Louis, Oct. 15-19; Boston, Dec. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

American Board of Obstetrics and Gynecology, Inc.: *Oral.* Chicago, May 8-14. Final date for filing application is April 1. Sec., Dr. Paul Titus, 1015 Highland Building, Pittsburgh 6.

American Board of Orthopedic Surgery: *Part I.* Various Centers, April and May. Final date for filing application is Dec. 31. Sec., Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14.

American Board of Otolaryngology: New York, May 11-14; Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

American Board of Pathology: Boston, April. Final date for filing application is March 1. Sec., Dr. Robert A. Moore, 507 S. Euclid Ave., St. Louis 10, Mo.

American Board of Pediatrics: *Oral.* St. Louis, Feb. 18-20. Baltimore, May 7-9. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Rd., Rosemont, Pa.

American Board of Physical Medicine: Atlantic City, June 4-5. Final date for filing application is March 15. Sec., Dr. R. L. Bennett, 30 N. Michigan Blvd., Chicago.

American Board of Plastic Surgery: Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

American Board of Psychiatry and Neurology: *Oral.* May. Final date for filing application is Feb. 15. Sec., Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Surgery: *Written.* Various Centers, March 1949. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

American Board of Urology: Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 28-30, 1949. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

Alaska:* Juneau, March 1. Sec.-Treas., Dr. W. M. Whitehead, Box 140, Juneau.

Arkansas:* Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 2-3. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

Colorado:* Denver, Jan. 4-7. Final date for filing application is Dec. 18. Sec.-Treas., Dr. W. W. King, 831 Republic Bldg., Denver 2.

Connecticut:* Hartford, March 8-9. Secretary to the Board, Dr. Creighton Barker, 258 Church Street, New Haven.

Delaware: *Examination.* Dover, Jan. 11-13. *Endorsement.* Jan. 20. Sec., Dr. J. S. McDaniel, 229 S. State St., Dover.

Georgia: *Examination.* June, Atlanta and Augusta. *Reciprocity.* Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

Guam: *Endorsement.* Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam, % F.P.O. San Francisco, Calif.

Hawaii: *Examination.* Honolulu, Jan. 10-13. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu 53.

Idaho: Boise, Jan. 10-12. Dir., Bureau of Occupational Licenses, Miss Estella S. Mulliner, State House, Boise.

Illinois: Chicago, Jan. 11-13. Superintendent of Registration, Mr. Fred W. Ruegg, State House, Springfield.

Indiana: *Examination.* Indianapolis, June. Sec., Board of Medical Registration and Examination, Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

Maine: Portland, March 8-9. Sec., Dr. Adam P. Leighton, 192 State Street, Portland.

Massachusetts: *Examination.* Boston, March 8-11. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

Minnesota:* *Minneapolis, Jan. 18-20. Sec., Dr. J. F. DuBois, 230* Lowry Medical Arts Building, St. Paul.

Montana: Helena, April 4-6. Sec., Dr. O. G. Klein, First National Bank Building, Helena.

Nebraska:* *Examination.* Omaha, June. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

Nevada: Carson City, May 2. Sec., Dr. G. H. Ross, 112 N. Curry Street, Carson City.

New Hampshire: Concord, March 10. Sec., Board of Registration in Medicine, Dr. John S. Wheeler, 107 State House, Concord.

New Jersey: *Examination.* Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

New Mexico: Santa Fe, April 11-12. Sec., Dr. V. E. Berchtold, 141 Palace Ave., Santa Fe.

New York: *Examination.* Various Centers, Feb. 1-4. Sec., Dr. J. L. Lochner, Jr., 23 S. Pearl St., Education Bldg., Albany.

North Carolina: *Endorsement.* Raleigh, Jan. 17. Sec., Dr. Ivan M. Procter, 226 Hillsboro St., Raleigh.

North Dakota: *Examination.* Grand Forks, Jan. 4-7. Act. Sec., Dr. C. J. Glaspel, Grafton.

Oregon:* *Examination.* Jan. 5-7. *Endorsement.* Jan. 21-22. Final date for filing application is Jan. 3. Exec. Sec., Mr. Howard I. Bobbitt, 608 Failing Bldg., Portland.

Pennsylvania: *Examination.* Philadelphia, Jan., 1949. Act. Sec., Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

Puerto Rico: *Examination.* Santurce, March 1. Sec., Mr. Luis Cueto Coll, Box 3717, Santurce.

Rhode Island:* *Examination.* Providence, Jan. 6-7. Chief, Mr. *Thomas B. Casey, 366 State Office Building,* Providence.

South Dakota:* Pierre, Jan. 18-19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

Texas: *Examination.* Austin, June 16-18. Sec., Dr. M. H. Crabb, 209 Medical Arts Bldg., Fort Worth 2.

Utah: *Examination.* Salt Lake City, July. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

Vermont: *Examination.* Burlington, Feb. 3-5. Sec., Dr. F. J. Lawliss, Richford.

Washington:* Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia *Wotherspoon, Olympia.*

West Virginia: Charleston, Jan. 3-5. Sec., Public Health Council, Dr. N. H. Dyer, Capitol Bldg., Charleston 5.

Wisconsin:* Madison, Jan. 11-13, 1949. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls, Wis.

Wyoming: *Examination.* Cheyenne, Feb. 7. Sec., Dr. Franklin D. Yoder, Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Alaska: Juneau, Feb. 21-26. Sec.-Treas., Dr. C. Earl Albrecht, Box 1931, Juneau.

Connecticut: New Haven, Feb. 12. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

District of Columbia: *Examination.* Washington, April 18-19. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., East, Washington.

Florida: *Examination.* Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

Iowa: *Examination.* Des Moines, Jan. 11. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination.* Ann Arbor & Detroit, Jan. 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

Minnesota: *Examination.* Jan. 4-5, April, June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

Oklahoma: Spring of 1949. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Rhode Island: *Examination.* Providence, Feb. 9. Chief, Mr. Thomas B. Casey, 366 State Office Building, Providence.

Tennessee: *Examination.* Memphis, Dec. 30-31. Sec., Dr. O. W. Hyman, 874 Union Avenue, Memphis 3.

Washington: Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia Wotherspoon, Olympia.

Wisconsin: Madison, April 2.. Milwaukee, June 4. Sec., Prof. W. H. Barber, Ripon College, Ripon.

POSTGRADUATE CONTINUATION COURSES FOR PHYSICIANS

Compiled by the Council on Medical Education and Hospitals for the Period January 1, 1949 to July 15, 1949

Table of Contents

Subject Page
Allergy 1259
Anatomy 1259
Anesthesiology 1260
Arthritis 1260
Bacteriology 1260
Basic Sciences 1260
Biochemistry 1261
Cardiovascular Disease 1261
Chest Diseases 1262
Dermatology and Syphilology 1262
Diabetes 1262
Electrocardiography 1263
Electroencephalography 1263
Endocrinology 1263
Endoscopy 1264
Fractures 1264
Subject Page
Gastroenterology 1264
Geriatrics 1264
Hematology 1265
Histology 1265
Hospital Administration 1265
Industrial Health 1265
Internal Medicine 1265
Malignant Diseases 1266
Medicine, General 1266
Neurology and Psychiatry 1268
Neurosurgery 1269
Nutrition 1269
Obstetrics and Gynecology 1269
Ophthalmology 1270
Orthopedic Surgery 1271
Otolaryngology 1271
Subject Page
Otology 1271
Otorhinolaryngology 1271
Pathology 1272
Pediatrics 1272
Pharmacology 1273
Physical Medicine 1273
Physiology 1273
Physiological Chemistry 1273
Poliomyelitis 1273
Proctology 1273
Public Health 1274
Radiology 1274
Surgery 1274
Therapy 1276
Urology 1276
Venereal Disease 1276

Courses are not cross indexed. In some instances a course may be included under more than one specialty.

Postgraduate Courses for Practicing Physicians—Jan. 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	ALLERGY		
American Academy of Allergy and University of Georgia Medical School, Augusta	Orientation Course in Allergy	5 days, March 7-11, 1949	$ 50.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago	Allergy, One Month Personal Course in Allergy	1 month, full time, first of every month	200.00
	Part Time Personal Course in Allergy and Related Conditions	10 weeks, April 20, part time, one day each week	125.00
	Six Month Personal Course in Allergy	6 months, full time, by appointment	500.00
University of Michigan Medical School, Department of Postgraduate Medicine, Ann Arbor At: University Hospital, Ann Arbor	Allergy	5 days, April 18-22, 1949	30.00
Wayne University College of Medicine, 1516 St. Antoine St., Detroit, Mich. At: City of Detroit Receiving Hospital	Allergy Clinic and Conference	3 months, part time, March 21-June 18, 1949	25.00
Joint Committee on Post-Graduate Education, Long Island College of Medicine, Medical Society of the County of Kings, 1313 Bedford Ave., Brooklyn At: Beth El Hospital	Allergy (1)	8 weeks, part time, begins April 1949	30.00
At: Kings County Hospital	Allergy (11)		20.00
Columbia University College of Physicians and Surgeons, 630 W. 168th St., New York 32 At: Mount Sinai Hospital	Medicine PM 36, Allergy	2 months, part time, once a week, Jan. 25-March 28, 1949	40.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York	Allergy	2 months, part time, Tuesday mornings, arranged	50.00
New York University-Bellevue Medical Center, 477 First Ave., New York	A-302, Allergy	Jan. 7-Feb. 5, part time, Friday afternoons	25.00
	B-331, Allergy	3 weeks, full time, March 7-25, 1949	200.00
The American College of Physicians, 4200 Pine St., Philadelphia 4 At: Haddon Hall Hotel, Atlantic City, N. J.	Diseases Caused by Immune Mechanisms	1 week, full time, April 28-May 1, 1949	30.00 60.00
The Thomas Clinic, Richmond, Va.	Course of Training in Clinical Allergy	12 months, full time, January 1 and July 1 each year	None
	ANATOMY		
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago	Part Time Personal Course in Anatomy of the Extremities on the Cadaver	1 day each week for ten weeks, March 16	125.00
	Part Time Course in Surgical Anatomy on the Cadaver	1 day each for ten weeks, March 17	125.00
University of Illinois College of Medicine, 1853 W. Polk St., Chicago 12	Dissection (essentially a review dissection without didactic instruction)	3 months, at physician's own choosing of time when material is available	Arranged
University of Maryland School of Medicine, Baltimore	General Anatomy "A"	Arranged	Arranged
	Surgical Anatomy "B"	15 weeks, 2 days 1 week, 3 hours 1 day, Jan 26-June 4, 1949	150.00
Harvard Medical School, 25 Shattuck St., Boston	Surgical Anatomy	54 days, May 2-June 24, 1949	200.00
Tufts College Medical School Postgraduate Division, 30 Bennet St., Boston 11 At: Ziskind Research Laboratories	Surgical Anatomy [18]	8 weeks, part time, March 7-April 30, 1949	200.00 [3] 5.00 [4]
University of Michigan Medical School Department of Postgraduate Medicine, Ann Arbor At: East Medical Building, Ann Arbor	Anatomy	16 days, Feb. 10-May 26, 1949	40.00
Wayne University College of Medicine 1512 Antoine St., Detroit 26	Surgical Anatomy	24 weeks, March 21-June 18, 1949	35.00 [5]
	Advanced Dissection (Trunk, Head and Neck, Back and Extremities) (Female Pelvis)	1 afternoon, March 21-June 18, 1949	50.00

References will be found on page 1276.

Postgraduate Courses for Practicing Physicians—Jan. 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	ANATOMY—Continued		
Cornell University Medical College, 1300 York Ave., New York 12	Course in Surgical Anatomy	4 weeks, May 31, 1949-June 25, 1949	200.00
New York Medical College, Flower and Fifth Avenue Hospital, 20 East 106th St., New York.	Applied Anatomy for the General Surgeon	Approximately 250 hours, arranged	375.00
	Anatomy of the Abdomen	100 hours, to be arranged	150.00
	Anatomy of the Thorax	100 hours, to be arranged	150.00
New York Polyclinic Medical School, 341-353 W. 50th St., New York 19	Head and neck dissection	6 weeks, part time, arranged	150.00
New York Post-Graduate Medical School, 303 E. 20th St., New York 3	A-241, Surgical Anatomy as Applied to Operative Gynecology (Cadaver)[18]	12 sessions, Tues., Thurs. and Sat., 11 a.m.-12:30 p.m.; Feb. 1-March 1, 1949 and April 5-May 7, 1949	200.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	C-1603, Anatomy of the Abdomen	Part time	
		12 weeks, 5 days a week, 4 hours daily	150.00
		16 weeks, 5 days a week, 4 hours daily	200.00
		8 weeks, 5 days a week, 6 hours daily January-June 1949	225.00
	C-1604 (A), Anatomy of the Female Pelvis	Part time, 12 weeks, 5 days a week, 4 hours daily, January-June 1949	150.00
	C-1601, Anatomy of the Head and Neck	Part time	
		12 weeks, 5 days a week, 4 hours daily	150.00
		16 weeks, 5 days a week, 4 hours daily	200.00
		8 weeks, 5 days a week, 6 hours daily January through June	225.00
	C-1604 (B), Anatomy of the Male Pelvis	Part time, 12 weeks, 5 days a week, 4 hours daily, January-June 1949	150.00
	C-1605, Anatomy of the Musculoskeletal System	Part time	
		12 weeks, 5 days a week, 4 hours daily	150.00
		16 weeks, 5 days a week, 4 hours daily January-June 1949	200.00
	C-1602, Anatomy of the Thorax and its Viscera	Part time, 12 weeks, 5 days a week, 4 hours daily, January-June 1949	150.00
	C-1606, General Anatomy	Part time, 8 weeks, 5 days a week, 3 hours daily (mornings), January-June 1949	150.00
School of Medicine, Western Reserve University, 2101 Adelbert Rd., Cleveland 6	Postgraduate Applied Anatomy	5 afternoons weekly for 2 to 6 months, January-April 30, 1949, may start at beginning of each month	70.00[6]
	ANETHESIOLOGY		
The Colorado State Medical Society, Colorado State and Denver Society of Anesthesiologists At: The University of Colorado Medical Center, 4200 E. 9th Ave., Denver 7	General Practitioners on the Techniques and Practice of Anesthesiology	4 days, full time, Jan. 12-15, 1949	20.00[3] 5.00[4]
The George Washington University School of Medicine and Hospital, 1335 H St. N.W., Washington 5, D. C.	Anesthesiology	1 week, full time, Feb. 28-March 4, 1949	50.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	One Month Practical Course in Inhalation Anesthesia, including Ether and Nitrous Oxide	1 month, full time, available first of every month	125.00
	One Month Practical Course in Inhalation Anesthesia, including Ether, Nitrous Oxide, Ethylene and Cyclopropane	1 month, full time, available first of every month	200.00
	Two Weeks Practical Course in Spinal Anesthesia and Intravenous Anesthesia	2 weeks, full time, available every two weeks	150.00
	Two Weeks Practical Course in Endotracheal Anesthesia	2 weeks, full time, available every two weeks	150.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York	Applied Anatomy for the Anesthetist	125 hours, to be arranged	275.00
	Clinical Anesthesiology	3 months, full time, to be arranged	200.00
New York Polyclinic Medical School and Hospital, 341-353 W. 50th St., New York 19	Anesthesia	3 months, full time, Jan. 3, 1949; April 4, 1949	350.00
	Applied Anesthesia	3 months, full time, April 1, 1949	300.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 1st Ave., New York 16	B-942, Anesthesia	Full time, two weeks January-June	125.00[7] 65.00[9]
	B-943, Regional Anesthesia	2 weeks, full time, Monday through Friday, 9-5 p.m., Jan. 3-Jan.14, 1949; May 2-May 13, 1949	200.00
	B-944, Anesthesiology	2 weeks, full time, Monday through Friday, 9-5 p.m., April 11-April 23, 1949	150.00
Graduate School of Medicine, University of Pennsylvania, 237 Medical Laboratories, Philadelphia 4 At: Graduate Hospital and Private Offices	Segmental Neuralgias; Relief by Regional Anesthesia[35]	3 weeks (48 hours), February 1949-May 1949; *monthly*	200.00
	ARTHRITIS		
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16 At: *Jewish Hospital*	Arthritis	8 weeks, part time, beginning April 1949	30.00
New York University-Bellevue Medical Center Postgraduate Medical School, 477 First Ave., New York 16	B-330, Arthritis and Allied Rheumatic Disorders	5 days, full time, March 7-11, 1949	55.00
	A-301, Arthritis and Allied Rheumatic Disorders	Part time, Tuesday 9-12 p.m., Jan. 4-Feb. 15, 1949	45.00
	A-370, Arthritis and Rheumatic Disorders	6 weeks, part time, Mon., Wed., Thurs., 9-12 p.m., Jan. 3-Feb. 10, 1949	100.00
Tufts College Medical School, Postgraduate Division, 30 Bennet St., Boston 11 At: Pratt Diagnostic Hospital	Rheumatic Diseases	5 days, full time, March 21-25, 1949	40.00[3] 5.00[4]
	BACTERIOLOGY		
Wayne University College of Medicine, 1512 Antoine St., Detroit 26	Antibiotic Substances	1 hour/week, March 21-June 18, 1949	15.00
	Immunology and Virology	1 afternoon/week, March 21-June 18, 1949	35.00
	Parasitology	1 afternoon/week, March 21-June 18, 1949	35.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York	Bacteriology	3 months, half time, to be arranged	100.00
	Parasitology	6 weeks, half time, to be arranged	75.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 1st Ave., New York 16	C-109, Bacteriology	16 weeks, part time, Monday 2-4 p.m., Feb. 28-June 13, 1949	75.00
	A-110, Clinical Bacteriology and Serology	Part time, Monday through Saturday 9 a.m.-12 p.m., Feb. 1-28, 1949	100.00
New York Polyclinic Medical School and Hospital, 341-353 W. 50th St., New York 19	Practical Laboratory Instruction in Bacteriology	Arranged	Arranged
	BASIC SCIENCES		
University of Michigan Medical School, Department of Postgraduate Medicine, 1313 E. Ann St., Ann Arbor At: University Hospital, Ann Arbor	Application of the Basic Sciences to Clinical Medicine	1 month, Jan. 3-29, 1949	100.00

References will be found on page 1276.

Postgraduate Courses for Practicing Physicians—Jan. 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
BASIC SCIENCES—Continued			
Center for Continuation Study, University of Minnesota, Minneapolis 14	The Basic Sciences and Their Clinical Correlation	11 weeks, Jan. 4-March 19, 1949	150.00 [3] 11.15 [4]
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York	Basic Sciences, Pathology related to Various Specialties	3 months to 1 year, full-time, arranged	200.00 to 600.00 [35]
	Basic Sciences, Pathology related to Various Specialties	4-5 weeks, full time, arranged	200.00
University of South Dakota School of Medicine, Vermillion, S. D.	Clinical Considerations of Biochemistry, Applied Pathology, Clinical Applications of Physiology, Applied Anatomy, Clinical Applications to Pharmacology, Applied Bacteriology	3-6 months, any time	None
Southwestern Medical College of the Southwestern Medical Foundation, 2211 Oak Lawn Ave., Dallas 4, Texas	Individual Review in Basic Sciences	Part or full time, arranged	25.00 [10]
University of Wisconsin Medical School, 418 N. Randall St., Madison	The Basic Sciences	Semester basis, Feb. 7-18, 1949	160.00 [43]
BIOCHEMISTRY			
Baylor University College of Medicine, 500 Lincoln Ave., Houston, Texas	Seminar in Clinical Biochemistry	10 2-hour seminars, every third or fourth week, January-May 1949	Arranged
CARDIOVASCULAR DISEASE			
University Extension (Medical Extension), University of California, 405 Hilgard Ave., Los Angeles 24	Cardiology	5 days, full time, Jan. 31-Feb. 4, 19 9	To be announced
Yale University School of Medicine and Connecticut State Medical Society, 333 Cedar St., New Haven 11, and 258 Church St., New Haven 10 At: Yale University School of Medicine, 333 Cedar St., New Haven 11	Medicine 200, Cardiovascular Disease	12 sessions, March 10-May 26, 1949	45.00
George Washington University School of Medicine, 1335 H St., N.W., Washington, D. C.	Cardiovascular Diseases	2 weeks, full time, April 25-May 6, 1949	100.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Part time Personal Course in Cardiovascular Diseases	1 day each week for 10 weeks, April 13	80.00
	Part time Personal Course in Heart Disease and Electrocardiography	1 day each week for 10 weeks, February 23	125.00
	Four week Course in Electrocardiography and Heart Disease	4 weeks, to be announced	175.00
	Two week Personal Course in Electrocardiography and Heart Diseases	2 weeks, July 18	150.00
	Part time Course in Surgical Aspects of Peripheral Vascular Disease	1 day each week for 5 weeks, March 23	60.00
Harvard Medical School, 25 Shattuck St., Boston 25 At: Boston City Hospital, Boston	Cardiology (1)	3½ months, daily all day except Saturday afternoons, Jan. 31-May 14, 1949	500.00
At: Massachusetts General Hospital	Cardiovascular Disease	12 months, daily, April 1, 1949-March 1950	800 00
At: Peter Bent Brigham Hospital	Clinical Heart Disease	1 month, full time, probably in July 1949	150.00
Tufts College Medical School, Postgraduate Division, 30 Bennet St., Boston 11 At: Pratt Diagnostic Hospital	Cardiology	5 days, full time, April 4-8, 1949	40.00 [3] 5.00 [4]
Michigan State Medical Society, 2020 Olds Tower, Lansing 8, Mich. At: Book Cadillac Hotel, Detroit	Heart and Rheumatic Fever	1 day, March 26, 1949	None
University of Michigan Medical School, Department of Postgraduate Medicine, 1313 E. Ann St., Ann Arbor, Mich. At: University Hospital, Ann Arbor	Diseases of the Heart	5 days, April 4-8, 1949	30.00
Minnesota Heart Association At: University of Minnesota Center for Continuation Study, Minneapolis 14	Cardiovascular Diseases	2 days, Feb. 14 and 15, 1949	To be announced
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16 At: Beth El Hospital	Peripheral Vascular Diseases (I)	10 weeks, part time, beginning April 1949	20.00
	Peripheral Vascular Diseases (III)	8 weeks, part time, beginning April 1949	20.00
At: Coney Island Hospital	Peripheral Vascular Diseases (II)	5 weeks, part time, beginning April 1949	20.00
At: Jewish Hospital	Hypertension and Nephritis	8 weeks, part time, beginning April 1949	20.00
Columbia University, 630 W. 168th St., New York 32 At: Montefiore Hospital	Medicine, PM 61-B, Advanced Cardiology	4 months, once a week, three hours, Feb. 1, 1949-June 6, 1949	250.00
At: Mount Sinai Hospital	Medicine, PM 48, Bedside Diagnosis and Treatment of Heart Disease with Special Emphasis on Measurements of the Circulatory	2 months, once a week, 2 hours, Jan. 10, 1949-March 14, 1949	45.00
	Cardiovascular Diseases (Medicine PM-31)	2 months, part time, Jan. 25-March 24, 1949	125.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York City	Cardiology	20 successive Wednesdays, 9-11:30, May begin any Wednesday except during July and August	150.00
New York Polyclinic Medical School and Hospital, 341-353 W. 50th St., New York 19	Diagnosis and Treatment of Diseases of the Heart	3 weeks, arranged, part time, arranged	75.00
New York University-Bellevue Medical Center, Post-Graduate Medical School, 477 1st Ave., New York 16 At: Beth Israel Hospital	A-37, Cardiovascular Diseases	12 weeks, part time, Jan. 6-March 24, 1949; March 31-June 16, 1949	50.00
New York University-Bellevue Medical Center, Post-Graduate Medical School, 477 1st Ave., New York 16	A-319, Peripheral Vascular Diseases	Part time, Tuesday, 2 p.m.-4 p.m. Jan. 4-Feb. 15, 1949	30.00
	B-340, Peripheral Vascular Diseases	Full time, five days duration, March 21-25, 1949	55.00
	B-349, Cardiology	Full time, 4 weeks duration, May 3-27, 1949	175.00
	A-303, Cardiology	Part time, Monday, 2 p.m.-5 p.m., Jan. 3-Feb. 21, 1949	45.00
St. Francis Sanatorium for Cardiac Children, Roslyn, N. Y.	Comprehensive Postgraduate Course in Rheumatic Fever and Rheumatic Heart Disease	2 weeks, full time, June 1-14, 1949	75.00
The American College of Physicians, 4200 Pine St., Philadelphia 4 At: Philadelphia General Hospital, Philadelphia	Cardiology	1 week, full time, to be announced, tentative date May 2-7, 1949	30.00 [1] 60.00 [2]
Graduate School of Medicine, University of Pennsylvania, 237 Medical Laboratories, Philadelphia 4	Cardiology	8 consecutive Thursdays (48 hours total) to start 1st Thursday of January and April 1949	80.00

Postgraduate Courses for Practicing Physicians—Jan. 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	CHEST DISEASES		
College of Medical Evangelists, Boyle and Michigan Aves., Los Angeles 33	Bronchiectasis	3 periods, 6 hours, beginning March 6, 1949; Mondays, 7:30-9:30 p.m.	15.00
George Washington University School of Medicine, 1335 H St., N.W., Washington, D. C.	Thoracic Diseases	1 week, full time, April 18-22, 1949	50.00
University of Florida, Department of Medicine, Graduate School, 2033 Riverside Ave., Jacksonville, Fla. At: Orlando, Florida	Tuberculosis Seminar	3 days, Jan. 5-7, 1949	Undetermined
American College of Chest Physicians, Pennsylvania Chapter and the Laennec Society, 500 N. Dearborn St., Chicago 10 At: Philadelphia	Postgraduate Course in Diseases of the Chest	1 week, full time, Feb. 28, 1949-March 5, 1949	Undetermined
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Part time Personal Course in Technic of Physical Examination and Diagnosis of the Chest	1 day each week for 8 weeks, April 13	60.00
Indiana University School of Medicine and the American Trudeau Society, 1040 W. Michigan St., Indianapolis 7 At: Indiana University Medical Center, Indianapolis, Ind.	Postgraduate Course in Thoracic Disease	5 days, full time, March 14-18, 1949, inclusive	50.00
American Trudeau Society; St. Louis University School of Medicine, 1402 S. Grand Blvd., St. Louis 4; Missouri State Medical Association, 634 N. Grand Blvd., St. Louis 3	Postgraduate Course in Pulmonary Disease for General Practitioners	3 days, Jan. 17-19, 1949	25.00
American Trudeau Society, 1790 Broadway, New York 19; Emory University School of Medicine, 101 Physiology Bldg., Emory University, Ga. At: Atlanta, Ga.	Postgraduate Course in Pulmonary Diseases	5½ days, April 4-9, 1949	50.00
American Trudeau Society, Medical Section, National Tuberculosis Association, 1790 Broadway, New York 19; Tulane University of Louisiana School of Medicine and Louisiana State University, 1430 Tulane Ave., New Orleans 12 At: New Orleans, La.	Postgraduate Course in Pulmonary Diseases	2 weeks, March 13-26, 1949	100.00
American Trudeau Society, Medical Section, National Tuberculosis Association, 1790 Broadway, New York 19; Indiana University Medical School, 1040 W. Michigan St., Indianapolis 7 At: Indianapolis, Ind.	Postgraduate Course in Pulmonary Diseases	5½ days, March 7-12, 1949	50.00
Columbia University, 630 W. 168th St., New York 32 At: Columbia-Presbyterian Medical Center	Medicine PM-1, Physiologic Therapy in Broncho-Pulmonary Diseases	5 days, full time, Jan. 24-29, 1949	40.00
At: *Montefiore Hospital*	Medicine PM-63, Diseases of the Chest	4½ months, once a week, 2½ hours, Jan. 7, 1949-May 20, 1949	100.00
At: Mount Sinai Hospital	Diseases of the Chest (Medicine PM-37)	2 months, once a week, 3 hours, Jan. 29-March 28, 1949	60.00
American Trudeau Society, Medical Section, National Tuberculosis Association, 1790 Broadway, New York 19; College of Medical Evangelists and University of Southern California School of Medicine, Boyle and Michigan Aves., Los Angeles 33, and 3551 University Ave., Los Angeles 7 At: Los Angeles, Calif.	Postgraduate Course in Pulmonary Diseases	5 days, Jan. 25-29, 1949	50.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York City At: New York City Municipal Sanatorium, Otisville, N. Y.	Pulmonary Tuberculosis	3 weeks, full time	175.00 [26]
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 1st Ave., New York 16	A-308, Acute and Chronic Diseases of Chest	Part time, Thursdays, 9 a.m.-12 p.m., Jan. 6-Feb. 24, 1949	45.00
	B-333, Acute and Chronic Pulmonary Diseases	Full time, 5 day duration, May 2-6, 1949	55.00
Temple University School of Medicine, Philadelphia 40	Bronchology and Esophagology	2 weeks, Feb. 7-18, 1949	250.00
	DERMATOLOGY AND SYPHILOLOGY		
College of Medical Evangelists, Boyle and Michigan Aves., Los Angeles 33	Dermatology	12 periods, 18 hours, begins Jan. 4, 1949, Tuesdays 8-9:30 p.m.	40.00
University Extension in cooperation with University of California Medical School, San Francisco and Los Angeles, Calif. At: Quonset Hut Conference Room, General Medical and Surgical Hospital, V. A. Center, Wilshire and Sawtelle Blvds., Los Angeles 25	Dermatology in Internal Medicine	8 meetings of 2 hours, January 3rd weekly through February 21	35.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Clinical Course in Dermatology	2 weeks or one month, begins every Monday except when no. 2 in session	75.00 [9] 125.00 [10]
	Two week Course in Dermatology	2 weeks, April 18, June 13	100.00
	Twelve month Clinical Course in Dermatology	12 months, by appointment	1,000.00
Harvard Medical School Courses for Graduates, 25 Shattuck St., Boston 15 At; Massachusetts General Hospital	Dermatology	1 month, half, February, March, April, May 1949	75.00
	Dermatology 2	Monthly, daily, all day, except Saturday afternoons, monthly, February to May 1949	125.00
	Dermatology and Syphilology	12 months, full time, April 1, 1949-March 1950	750.00
Tufts College Medical School, Postgraduate Division, 30 Bennet St., Boston 11 At: Boston City Hospital	Dermatology II	5 days, full time, April 11-15, 1949	40.00 [2] 5.00 [4]
Wayne University College of Medicine, 1512 Antoine St., Detroit 26 At: *Receiving Hospital*	Dermatology Seminar	2 hours/week, March 21- June 18, 1949	15.00
At: Social Hygiene Clinic	Conference on Venereal Diseases	1½ hours/week, March 21-June 18, 1949	15.00
University of Minnesota Center for Continuation Study, Minneapolis 14	Dermatology	2 days, May 16 and 17, 1949	To be announced
Columbia University, 630 W. 168th St., New York 32 At: Mount Sinai Hospital	Venereal and Skin Diseases (Medicine PM-40)	6 weeks, part time, Jan. 26-March 11, 1949	30.00
New York Polyclinic Medical School and Hospital, 341-353 W. 50th St., New York 19	Dermatology and Syphilology	6 weeks, part time, and 3 months, part time, Jan. 3, April 4, 1949	100.00 300.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	B-1210, Seminar in Dermatological Histopathology [18]	5 days duration, full time, May 9-13, 1949	75.00
	B-1230, Symposium on Dermatology and Syphilology [18]	5 days duration, full time, May 23-27, 1949	100.00
	DIABETES		
University of California, Medical Extension, San Francisco 22	Endocrinology, including Diabetes	5 days, full time, June 20-24, 1949	Not given
Cook County Graduate School *of Medicine*, 427 S. *Honore* St., Chicago 12	*Part time* Course in Medical and Surgical Diabetes	1 day each week for 10 weeks, March 16	80.00
Harvard Medical School, 25 Shattuck St., Boston 15 At: New England Deaconess Hospital	Diabetes in Relation to General Medicine	5 days, full time, Monday, July 11-15, 1949	Not given

Postgraduate Courses for Practicing Physicians—January 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	DIABETES—Continued		
Tufts College Medical School, Postgraduate Division, 30 Bennet St., Boston 11 At: Pratt Diagnostic Hospital	Diabetes	6 days, full time, March 23-April 2, 1949	40.00[3] 5.00[4]
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16 At: Maimonides Hospital	Diabetes Mellitus	12 weeks, part time, beginning April 1949	30.00
New York University College of Medicine, 477 First Ave., New York 16 At: New York Post-Graduate Medical School, 303 E. 20th St., New York 3	B-337, Diabetes Mellitus, Nephritis and Hypertension	5 days, full time, March 14-18, 1949	55.00
New York University-Bellevue Medical Center Post Graduate Medical School, 477 First Ave., New York 16 At: Lenox Hill Hospital	A-384, Diabetes Mellitus	6 weeks, part time, Monday and Thursday, 3-4:30 p.m., Jan. 10-Feb. 17, 1949; April 4-May 12, 1949	50.00
The Frank E. Bunts Educational Institute, 2020 E. Ninety-Third St., Cleveland At: The Cleveland Clinic Foundation	Diabetes	2½ days, Thursday, Friday and Saturday, March 17-19, 1949	15.00
University of Oregon Medical School, Marquam Hill, Portland 1, Oregon	Diabetes	3 days, Jan. 31-Feb. 2, 1949	30.00
	ELECTROCARDIOGRAPHY		
University Extension in cooperation with University of California Medical Schools, San Francisco and Los Angeles At: University of California at Los Angeles Campus	Electrocardiography	6 meetings of 2 hours, January 4-20, Tuesdays and Thursdays	15.00
University of California Medical School, University Extension, San Francisco 22	Interpretation of Electrocardiograms	5 days, part time, Jan. 31-Feb. 3, 1949, to be announced	To be announced
Michael Reese Hospital Postgraduate School, 29th and Ellis Ave., Chicago 16	Electrocardiographic Interpretation	13 weeks, 2 hours per week, Feb. 8-May 3, 1949	50.00
Tufts College Medical School, Postgraduate Division, 30 Bennet St., Boston 11 At: Pratt Diagnostic Hospital, Boston	Electrocardiography I	5 days, full time, Feb. 28-March 4, 1949	40.00[3] 5.00[4]
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16	Basic Electrocardiography	5 weeks, part time, beginning April 1949	20.00
At: Beth El Hospital At: Jewish Hospital	Clinical Electrocardiography	5 weeks, part time, beginning April 1949	20.00
	Electrocardiography and Clinical Cardiology	5 weeks, part time, beginning April 1949	30.00
At: Maimonides Hospital	Clinical Cardiology and Advanced Electrocardiography	4 weeks, part time, beginning April 1949	20.00
Columbia University, 630 W. 168th St., New York 32 At: Mount Sinai Hospital	Intensive Course in Elementary Electrocardiography (Medicine PM-41)	5 days, full time, Jan. 17-22, 1949	60.00
	Intensive Course in Advanced Electrocardiography (Medicine PM-42)	5 days, full time, March 29-April 2, 1949	40.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York City	Electrocardiography	2 weeks, part time, April 1949	100.00
New York Polyclinic Medical School and Hospital, 341-353 W. 50th St., New York 19	Electrocardiographic Interpretation	2 weeks, part time, 2 hours daily, arranged	75.00
New York University-Bellevue Medical Center, Post-Graduate Medical School, 477 First Ave., New York 16 At: Beth Israel Hospital	A-372, Electrocardiography	12 weeks, part time, Thursdays 2-3 p.m., Jan 6-March 24, March 31-June 16, 1949	40.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	A-373, Practical Electrocardiography for the Practicing Physician	6 weeks, part time, Tuesday 1-4 p.m., Jan. 4-Feb. 8, April 5-May 10, 1949	65.00
	B-345, Electrocardiography	5 days duration, full time, Feb. 28, March 4, 1949	55.00
	A-380, Fundamentals of Electrocardiographic Theory	16 weeks, part time, Thursdays 9-11 a.m., March 3-June 16, 1949	125.00
University of Oregon Medical School, Marquam Hill, Portland 1, Oregon	Electrocardiography	5 days, June 13-17, 1949	50.00
The American College of Physicians, 4200 Pine St., Philadelphia 4 At: Massachusetts General Hospital, Boston	Electrocardiography	1 week, full time, April 25-30, 1949	60.00[1] 120.00[2]
	ELECTROENCEPHALOGRAPHY		
University of Colorado Medical Center, 4200 E. Ninth Ave., Denver 7 At: Electroencephalography Laboratory of Colorado Psychopathic Hospital and Associated Laboratories	Electroencephalography[37]	12 weeks, first Monday in March 1949	125.00
University of Illinois College of Medicine, 1853 W. Polk St., Chicago 12 At: Univ. of Illinois—Illinois Neuropsychiatric Institute	Training Course in Electroencephalography	3 months, Winter and Spring quarters	200.00
University of Pennsylvania Graduate School of Medicine, 237 Medical Laboratories, Philadelphia 4 At: Graduate Hospital and Pennsylvania Institute	Electroencephalography	6 consecutive Thursdays, 36 hours 2 weeks, 36 hours Additional week Start first Thursday of October, January, March and May	150.00 200.00 100.00
	ENDOCRINOLOGY		
College of Medical Evangelists, Boyle and Michigan Aves., Los Angeles 33	Endocrinology	8 periods, 12 hours, begins April 4, 1949	30.00
University of California Medical School, University Extension, San Francisco 22	Endocrinology, including Diabetes	5 days, full time, June 20-24, 1949, to be announced	To be announced
University of Georgia School of Medicine, University Place, Augusta, Ga.	Endocrinology	May or June (tentative)	Not given
Universit[illegible], Department of Post-grad[illegible] Ann Arbor, Mich. At: [illegible] or, Mich.	Metabolism and Endocrinology	5 days, March 21-25, 1949	30.00
Joint [illegible] Education, Medical Society of the County of Kings, Long Island College of Medicine	Pediatric Endocrinology	8 weeks, part time, beginning April 1949	20.00
At: Beth El Hospital At: Greenpoint Hospital	Sterility[18]	12 weeks, part time, beginning April 1949	40.00
At: Jewish Hospital	Disorders of the Endocrine System	6 weeks, part time, beginning April 1949	40.00
	Female Sex Endocrinology	10 weeks, part time, beginning April 1949	20.00
At: Jewish Sanitarium and Hospitals for Chronic Diseases	Applied Endocrinology	6 weeks, part time, beginning April 1949	30.00
Columbia University, 630 W. 168th St., New York 32 At: Mount Sinai Hospital	Endocrinological Diseases (Medicine PM-39)	2 months, part time, Jan. 24-March 21, 1949	30.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York City	Endocrinology	3 weeks, full time, May 1949	150.00
	Physiology of the Endocrine System	1 month, to be arranged	75.00

Postgraduate Courses for Practicing Physicians—January 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	PATHOLOGY		
University of California School of Medicine, and University Extension, Los Angeles and San Francisco At: Los Angeles	Surgical Pathology [33]	Spring 1949	Not given
At: General Medical and Surgical Hospital, V. A. Center, Los Angeles	General Surgical Pathology Review	16 meetings, 2 hours each, March 1-April 21, 1949	60.00
Yale University School of Medicine and Connecticut State Medical Society, New Haven At: Yale University School of Medicine	Pathology (200)	11 sessions, 2 hours each, Jan. 4-March 15, 1949	45.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Special Courses in Surgical Pathology for Intensive Concentration in a Specific Field	1 or 2 weeks, by appointment	15.00 [34]
	Personal Course in Pathology and Laboratory Medicine [18]	10 weeks, part time, one day a week, April 13, 1949	100.00
	Personal Course in Surgical Pathology, Gross & Microscopic [18]	10 weeks, part time, one day a week, March 16, 1949	100.00
	Course in Clinical Pathology	10 weeks, part time, one day a week, March 23, 1949	75.00
	Personal Course in Surgical Pathology [18]	2 weeks, full time, every 2 weeks	150.00
	Personal Course in Surgical Pathology [18]	4 weeks, full time, every 2 weeks	250.00
	Course in Gross and Surgical Pathology [18]	6 months, full time, by appointment	500.00
	Course in Gross and Surgical Pathology [18]	12 months, full time, by appointment	900.00
	Course in Gross and Microscopic Pathology [18]	12 months, full time, by appointment	500.00
Wayne University College of Medicine, 1512 St. Antoine St., Detroit 26	Gynecologic Pathology	3 months, part time, 1 afternoon a week, March 21-June 18, 1949	50.00
	Pathology of Children's Diseases	3 months, part time, 1 afternoon a week, March 21-June 18, 1949	50.00
Columbia University College of Physicians and Surgeons, 630 W. 168th St., New York 32 At: Mount Sinai Hospital	Surgical Pathology	3½ months, part time, Jan. 29-May 14, 1949	100.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York	Clinical Pathology	26 hours, arranged	100.00
	Pathology	16 weeks, half time, arranged	200.00
	Advanced Pathology for Pathologists	Varies according to need of applicant	Not given [35]
New York Polyclinic Medical School and Hospital, 341 W. 50th St., New York 19	Practical Laboratory Instruction in Pathology	Arranged	Arranged
New York University College of Medicine, 477 First Ave., New York 16 At: Lenox Hill Hospital	Histopathology for Gynecologists	6 weeks, part time, March 1-Apr. 8, 1949	50.00
	Pathology for Surgeons (C-158)	5 weeks, part time, Feb. 28-March 31, 1949	50.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	Surgical Pathology (C-155) [18]	15 weeks, part time, March-June 1949	200.00
University of Utah School of Medicine, 2nd So. and University Sts., Salt Lake City 1	Surgical Pathology	Winter quarter 1949	50.00
	PEDIATRICS		
University of Colorado Medical Center, Colorado State Health Department and Colorado State Medical Society, Denver At: University of Colorado Medical Center	Medical Care of the Premature Infant	3 days, full time, April 7-9, 1949	10.00 Regis.
Yale University School of Medicine and Connecticut State Medical Society, New Haven, Conn.	Pediatrics (200)	12 sessions, 2 hours each, Jan. 6-March 24, 1949	60.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Formal Intensive Course in Pediatrics [18]	4 weeks, full time, April 4, 1949	150.00
	Pediatrics	4 weeks, full time, April 1949	150.00
	Informal Course in General Pediatrics	2 weeks, full time, first of every week except when formal course is in session	60.00
	Informal Course in General Pediatrics	1 month, full time, first of every week except when formal course is in session	100.00
Michael Reese Hospital Postgraduate School, 29th and Ellis Ave., Chicago 16	Recent Advances in Pediatrics	2 weeks, full time, May 16-28, 1949	100.00
University of Louisville School of Medicine and Kentucky State Medical Association, Louisville At: Louisville General Hospital	Intensive Refresher Course in Pediatrics	3 days, June 1949	25.00
Louisiana State University School of Medicine and Louisiana State Board of Health, New Orleans At: Bastrop, Minden, Natchitoches, Ruston	Diseases of Children in General Practice	12 hours, Jan. 10-13, 1949	None
	Diseases of Children in General Practice	12 hours, Feb. 14-17, 1949	None
At: Louisiana State University School of Medicine	Review of Pediatrics for Rural Physicians	5 days, full time, March 21-25, 1949	None
Tulane University of Louisiana School of Medicine, Division of Graduate Medicine, 1430 Tulane Ave., New Orleans 13	Review of Pediatrics [18]	5½ days, Feb. 7-12, 1949	30.00
Harvard Medical School, 25 Shattuck St., Boston 15 At: Massachusetts General Hospital	Pediatrics (1A)	4 months, full time, Feb. 1-May 31, 1949	400.00
Tufts College Medical School, Postgraduate Division, 416 Huntington Ave., Boston At: Boston Floating Hospital and Boston Dispensary	Pediatrics	2 weeks, full time, March 7-19, 1949	75.00 5.00 [4]
	Clinical Pediatrics	4 weeks, mornings, March 7-Apr. 2, 1949	60.00 5.00 [4]
University of Michigan Medical Department of Postgraduate Medicine, Ann Arbor	Pediatrics	3 days, April 13-15, 1949	20.00
University of Minnesota Medical School, Minneapolis 14 At: Center for Continuation Study	Pediatrics	3 days, Feb. 7-9, 1949	Not given
	Pediatrics	3 days April 7-9, 1949	Not given
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16 At: Beth El Hospital	Clinical Pediatrics	5 weeks, part time, beginning April 1949	30.00
New York State Department of Health, Albany At: University of Buffalo School of Medicine	Intensive Refresher Course in Pediatrics for General Practitioners Participating in Child Health Programs	2 weeks, arranged, Spring 1949	Not given
Columbia University College of Physicians and Surgeons, 630 W. 168th St., New York 32 At: Mount Sinai Hospital	Clinical Pediatrics (PM-30)	9 weeks, part time, Feb. 1-April 12, 1949	80.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York	Clinical Pediatrics	1 month, full time, all year	150.00
	Clinical Pediatrics	3 months, full time, all year	250.00
	Clinical Pediatrics	6 months, full time, all year	450.00
	Clinical Pediatrics	9 months, full time, all year	650.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	Clinical Pediatrics (B-410)	4 weeks, full time, Jan. 3-29, 1949	150.00
	Clinical Pediatrics (B-410)	4 weeks, full time, March 7-April 2, 1949	150.00
	Clinical Pediatrics (B-410)	4 weeks, full time, May 2-28, 1949	150.00
	Practical Clin. Pediatrics (B-413)	4 weeks, full time, Jan. 31-Feb. 26, 1949	125.00
	Practical Clin. Pediatrics (B-413)	4 weeks, full time, April 4-30, 1949	125.00
	Practical Clin. Pediatrics (B-413)	4 weeks, full time, May 31-June 25, 1949	125.00

	SURGERY—Continued		
Yale University School of Medicine and Connecticut State Medical Society, 333 Cedar Street, New Haven 11, and 258 Church St., New Haven 10 At: Yale University School of Medicine	Surgery 201, Traumatic Surgery	12 sessions, 2 hours, Jan. 5-March 23, 1949	45.00
The George Washington University Medical School and Hospital, 1335 H St., N.W., Washington, D. C. (5)	General Surgery	7 weeks, full time, Feb. 21-April 8, 1949	350.00
	Abdominal Surgery	2 weeks, full time, March 14-25, 1949	100.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Part time Personal Course in Surgical Pathology, Gross and Microscopic	10 weeks, 1 day a week, March 16, 1949	100.00
American College of Surgeons, 40 E. Erie St., Chicago At: Rice Hotel Houston, Texas	Sectional Meeting	Not given, Jan. 14-15, 1949	Not given
At: Edgewater Gulf Hotel, Edgewater Park, Miss.	Sectional Meetings	Not given, Jan. 7-8, 1949	Not given
At: Hotel President, Kansas City, Mo.	Sectional Meetings	Not given, Feb. 11-12	Not given
At: Statler Hotel, Buffalo	Sectional Meeting	Not given, March 21-22	Not given
At: Statler Hotel, Washington, D. C.	Sectional Meeting	Not given, March 15-16	Not given
At: Olympic Hotel, Seattle	Sectional Meeting	Not given, April 21-22	Not given
At: MacDonald Hotel, Edmonton, Alberta	Sectional Meeting	Not given, April 12-13	Not given
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Surgical Technique with Practice, Clinical Surgery, Surgical Anatomy and Preoperative and Postoperative Management [18]	4 weeks, Feb. 7, March 7, April 4, May 2, June 6, July 11	300.00
	Personal Course in Esophageal Surgery [18]	1 week, June 13	150.00
	Personal Course in Breast and Thyroid Surgery [18]	1 week, June 27	150.00
	Personal Course in Surgery of the Colon and Rectum [18]	1 week, March 7, April 11, May 16, June 13	100.00
	Personal Course in Thoracic Surgery [18]	1 week, June 20	100.00
	Surgical Technique with Practice	10 weeks, one day each week, Feb. 23	200.00
	Clinical Surgery	10 weeks, one day each week, March 10	150.00
	Personal Course in Surgical Diagnosis, Preoperative and Postoperative Management	10 weeks, one day each week, April 6	100.00
	Personal Lecture Course with Discussion in General Surgery	10 weeks, one day each week, March 24	100.00
	Esophageal Surgery	10 weeks, one day each week, March 8	150.00
	Treatment of Varicose Veins	2 weeks, one day each week, first and third Wednesdays each month	40.00
	Personal Course in Thoracic Surgery	10 weeks, one day each week, April 6	100.00
	Personal Course in Gallbladder Surgery	1 week, May 2, June 20	100.00
	Treatment of Varicose Veins	10 hours, one week, starts every Monday	40.00
	Course in Fractures and Traumatic Surgery	2 weeks, April 18, June 13	125.00
	Surgical Anatomy on the Cadaver and Clinical Surgery	2 weeks, Feb. 21, March 21, April 18, May 16, June 20, July 25	150.00
	Surgical Technique with Practice	2 weeks, Jan. 24, Feb. 21, March 21, April 18, May 16, June 20, July 25	200.00
	Intensive Review Course Considering Basic Principles in General Surgery	2 weeks, full time, April 4	200.00
Michael Reese Hospital Postgraduate School, 29th and Ellis Ave., Chicago 16	Recent Advances in Surgery	1 week, full time, May 2-7, 1949	50.00
Northwestern University Medical School, 303 E. Chicago Ave., Chicago 11	Basic Surgery	3 months, full time, April 1-June 30, 1949	300.00
American Trudeau Society, 1790 Broadway, New York 19 At: University of Indiana School of Medicine, Indianapolis	Postgraduate Course (Chronic Surgery)	1 week, March 7-12, 1949	Not given
Tulane University School of Medicine, Division of Graduate Medicine, 1430 Tulane Ave., New Orleans 12	Review of General Surgery and Traumatology	5½ days, Jan. 10-15, 1949	30.00
Tufts College Medical School Postgraduate Division, 30 Bennet St., Boston 11 At: Ziskind Research Laboratories	Principles of Surgical Technique	6 weeks, part time, May 31-July 8, 1949	200.00 [3] 5.00 [4]
University of Michigan Medical School Department of Postgraduate Medicine, 1313 E. Ann St., Ann Arbor, Mich.	Clinical Exercises for Practitioners	25 days, Oct. 20, 1948-May 4, 1949 (Wednesdays), 25 days	50.00
Wayne University College of Medicine, 1512 St. Antoine St., Detroit 26	Surgery Seminar	1 hour, one week, March 21-June 18,	15.00
University of Minnesota Center for Continuation Study,	General Surgery	3 days, May 9-11, 1949	To be announced
V. 168th St., New York 32	Surgery PM 100, Recent Developments in Surgery	5 days, full time, May 16-20, 1949	50.00
Flower and Fifth Avenue Hos- New York City	Thoracic Surgery	3 weeks, full time, Spring semester	325.00
	Surgical Technique	50 hours, to be arranged	375.00
New York Polyclinic Medical School and Hospital, 341-353 W. 50th St., New York 19	Combined Surgical Course including Cadaver Surgery and Gynecology	3 months, full time, April 4, 1949	350.00
	Clinical Surgery	6 weeks, full time, April 4, 1949	100.00
	Clinical and Operative (Cadaver) Surgery	6 weeks, full time, arranged	200.00
New York Post-Graduate Medical School, 477 First Ave., New York 16	B-530, Diagnosis and Treatment of Trauma	6 days, full time, May 9-14, 1949	60.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	B-556, Basic Course in Traumatic Surgery [18]	6 weeks, full time, May 16-June 24, 1949	300.00
	B-560, Seminar in Traumatic Surgery [18]	2 weeks, full time, March 7-19, 1949	125.00
	B-901, Review of General Surgery for Surgeons [18]	4 weeks, full time, April 4-30, 1949	300.00
	B-924, Recent Advances in Surgery	10 days, full time, March 7-17, 1949	175.00
At: Beekman-Downtown Hospital	Surgery of Trauma A-570	10 weeks, part time, Thursdays 1-5 p.m., April 7-June 9, 1949	150.00
University of Oregon Medical School, Marquam Hill, Portland 1, Ore.	General Surgery	5 days, March 7-11, 1949	50.00
University of Pennsylvania Graduate School of Medicine, 237 Medical Laboratories, Philadelphia 4	Oral Surgery and Anesthesia	8 months, October-May, yearly	800.00
	Surgery	8 months, October-May, yearly	800.00
Washington State Medical Association, 327 Cobb Bldg., Seattle 1 At: Harborview Hospital	General Surgery	5 days, March 7-11, inclusive	25.00
University of Wisconsin Medical School, 418 N. Randall Ave., Madison	Observation Course in Surgery [18]	2-6 months, arranged	100.00 [6]

References will be found on page 1276.

Postgraduate Courses for Practicing Physicians—January 1, 1949 to July 15, 1949—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	THERAPY		
Yale University School of Medicine and Connecticut State Medical Society, 333 Cedar St., New Haven 11, and 258 Church St., New Haven 10 At: Yale University School of Medicine	Therapeutics 200, Modern Drugs and Common Problems in Therapy	16 sessions, 2 hours each, Feb. 1-May 31, 1949	55.00
The George Washington University School of Medicine and Hospital, 1335 H St., N.W., Washington 5, D. C.	Therapeutics	1 week, full time, Jan. 31-Feb. 4, 1949	50.00
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16 At: Jewish Sanitarium and Hospital for Chronic Diseases	Clinical Therapeutics	7 weeks, part time, beginning April 1949	40.00
University of Oregon Medical School, Marquam Hill, Portland 1, Ore.	*Applied Therapeutics*	*5 days, March 14-18, 1949*	50.00
University of Utah, 2nd South and University Sts., Salt Lake City 1	Recent Advances in Therapeutics	Spring quarter (tentative)	Not given
	UROLOGY		
College of Medical Evangelists, Boyle and Michigan Aves., Los Angeles 33	General Urology	9 periods, 13½ hours, beginning Jan. 5, 1949, Wednesdays 8-9:30 p.m.	35.00
Cook County Graduate School of Medicine, 427 S. Honore St., Chicago 12	Ten day Practical Course in Cystoscopy	10 days, Jan. 10, Jan. 24, Feb. 7, Feb. 21, March 7, March 21, April 4, May 2, May 16, June 6, June 20, July 11, July 25	150.00
	Two week Course in Genitourinary Surgery	2 weeks, April 18	225.00
American Urological Association, Central Committee on Graduate Instruction, 899 Madison Ave., Memphis 3, Tenn. At: New Orleans, La.	Graduate Course of Instruction, Southeastern Section, American Urological Association	5 days, 6 hours, March 1949	50.00
Detroit Urological Society, University of Michigan Medical School Department of Postgraduate Medicine, 1313 E. Ann St., Ann Arbor, Mich. At: University Hospital, Ann Arbor, Mich.	Urology Conference	2 days, Jan. 19-20, 1949	15.00
Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, Long Island College of Medicine, 1313 Bedford Ave., Brooklyn 16	Urology	1 month, part time, begins April 1949	50.00
American Urological Association, Central Committee on Graduate Instruction, 899 Madison Ave., Memphis 3, Tenn. At: Buffalo, New York	Postgraduate Urological Seminar	5 days, 6 hours, Jan. 3-8, 1949	50.00
Department of Urology, James Buchanan Brady Foundation of the New York Hospital, 525 E. 68th St., New York	Postgraduate Course in Urology	31 weeks, Jan. 1, 1949	500.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 E. 106th St., New York City	Anatomy of the Urogenital System	130 hours, to be arranged	300.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16 At: Beth Israel Hospital	A-1020, Urology	6 weeks, part time, Mon.-Sat. 8:30-11 a.m., Tues. and Thurs. 2:30-4:30 p.m., Jan. 17-March 26, April 18-May 28, 1949	100.00
New York University-Bellevue Medical Center Post-Graduate Medical School, 477 First Ave., New York 16	B-1010, Advanced Course in Urology [18]	2 months, full time, Jan. 3-Feb. 26, 1949	300.00
University of Cincinnati College of Medicine and Society of General Physicians, Eden and Bethesda Aves., Cincinnati 29	Office Gynecology and Urology	8 sessions, 10-12 a.m., each Tuesday and Thursday mornings thru month of May	15.00
University of Pennsylvania Graduate School of Medicine, 237 Medical Laboratories, Philadelphia 4	Urology	8 months, October-May yearly	800.00
	VENEREAL DISEASE		
U. S. Public Health Service and Arkansas State Board of Health, Hot Springs National Park, Ark.	[illegible] Disease	1 week, April 1949 and October 1949 of each year	None
		8 weeks, Spring 1949	Not given
University of Michigan School of Public Health, Ann Arbor, Mich.	Venereal Disease Control	Not given	Not given
Bureau of Social Hygiene, Department of Health, New York City	Postgraduate Course in Diagnosis and Treatment of Venereal Diseases	15 sessions, Fall 1948, Spring 1949	None
	Practical Seminar in Diagnosis, Treatment and Control of Venereal Disease	2 mornings a week, optional, all year round	None
University of Pennsylvania School of Medicine, the U. S. Public Health Service Institute for the Study of Venereal Disease, 237 Medical Laboratories, Philadelphia 4	Essential Basic Training Course	6 months, not given	Arranged 800.00
	Intensive Review Course	4 weeks, full time, not given	Arranged 800.00
	Refresher Course in Venereal Disease Control	10 days, not given	Arranged 800.00
	Venereal Disease Review Course	3 weeks, not given	Arranged 800.00
	Staff Assistantships as Part of Fellowships in Dermatology and Syphilology	Not given	Arranged 800.00

---

1. Members.
2. Non-members.
3. Tuition.
4. Registration.
5. Per quarter.
6. Per month.
7. $25.00 for two weeks.
8. Third week additional $65.
9. $75 for two weeks, $125 for one month.
10. Per week.
11. One day a week for 20 weeks group—the latest possible date for entrance into this group will be Friday, Feb. 11, 1949.
12. For interns.
13. Chicago Medical Society, members free, non-members $5.00.
14. Paid by Council of Rochester Regional Hospitals.
15. For half course.
16. Clinical neurology, Jan. 3-Feb. 28; psychiatry, March 7-May 2; analytic psychology-psychopathology, Jan. 14 and 28, Feb. 11 and 25, March 11 and 25; Pediatrics 201, pediatric neurology, April 8-29, 1949.
17. Open to qualified clinical psychiatrists and psychologists.
18. Specialists only.
19. Advanced candidates in training.
20. Full maintenance.
21. Maintenance not provided.
22. Students with one basic course in Rorschach.
23. For those without training in psychoanalysis.
24. For those with some training in psychoanalysis.
25. For all courses.
26. Plus $10.00 lab. fee.
27. M.D.'s, $25.

[illegible] therapists, registered [illegible] $15.

[illegible] ve taken 1413.

31. No fee. Fellowship honorarium $200 per month.
32. Each section (3 sections, a, b and c). May take one or more sections.
33. This course is designed especially for those surgeons preparing for the second part of the examination by the American Board of Surgery.
34. Per hour.
35. This course is available only to physicians certified by American Boards.
36. No charge for room and board.
37. Open to M.D.'s from medical schools approved by Council on Medical Education and Hospitals of the American Medical Association who have had at least one year of acceptable training in physiology, neurology or psychiatry.
38. There may be a nominal registration fee.
39. Per year.
40. Open to Hospital Administrators.
41. Members of Local Medical Profession.
42. No charge to medical officers of the participating agencies.
43. Per semester.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American J. Obstetrics and Gynecology, St. Louis

56:205-408 (Aug.) 1948. Partial Index

Further Studies on Electrical Potentials of Human Uterus in Labor. L. V. Dill and R. M. Maiden.—p. 213.
*Microscopic Observations of Placental Barrier in Transplacental Erythrocytotoxic Anemia (Erythroblastosis Fetalis) and in Normal Pregnancy. B. S. Kline.—p. 226.
Progressive Resistance Exercise in Functional Restoration of Perineal Muscles. A. H. Kegel.—p. 238.
*Intestinal Changes Secondary to Irradiation of Pelvic Malignancies. J. M. Maas.—p. 249.
Tissue Localization and Excretion Routes of Radioactive Dibromestrone. G. H. Twombly, L. McClintock and M. Engelman.—p. 260.
Effects of Various Estrogenic Preparations on Vaginal Mucosa. Mildred Vogel, T. H. McGavack and J. Mellow.—p. 269.
Role of Uterine Motility in Essential Dysmenorrhea. W. K. Diehl and J. M. Hundley Jr.—p. 281.
Outcome of Pregnancy Following Vaginal Operations. W. F. Finn.—p. 291.
Solid Teratoma of Ovary, with Report of 5 Cases. E. R. Novak.—p. 300.
Theca-Cell Tumors of Ovary with Report of 15 Cases and Review of Literature. W. R. Knight III.—p. 311.
Smear Diagnosis of in Situ Carcinoma of Cervix. F. W. Foote and Katherine Li.—p. 335.
*Retreatment of Pregnant Woman for Syphilis Following Penicillin. Is Additional Therapy Necessary When Effective Treatment Has Been Given Prior to Conception. N. R. Ingraham Jr., Elizabeth Kirk Rose, J. H. Stokes, and others.—p. 340.
Prediction of Day of Human Ovulation by Rat Test as Confirmed by Fifty Conceptions. E. J. Farris.—p. 347.
Vaginal Delivery Under Heavy Pontocaine Spinal Anesthesia. R. E. Ahearn and J. W. Huston.—p. 353.
Vaginal Cytologic Survey in Gynecologic Cancer. V. Parrett, C. Small and L. Winn.—p. 360.
Shock from Posterior Pituitary Extract. A. E. Kanter and A. H. Klawans.—p. 366.
Breech Presentation and Delivery: Review of 445 Consecutive Cases in General Hospital. H. Meyer.—p. 375.

Microscopic Observations of Placental Barrier.—On microscopic examination of placentas from 15 patients with erythroblastosis fetalis Kline found in all numerous breaks in the barrier associated with hemorrhage from the fetal circulation into the maternal intervillous spaces. Nucleated red blood cells of the fetus were observed in areas of recent hemorrhage in the regional intervillous spaces. The breaks in the placental barrier involved the surface and villi and trunks and apparently resulted from the occlusion of peripheral capillaries or larger vessels by agglutinated red blood cells and fibrin. Regional to the areas of vascular occlusion, the overlying epithelium showed degenerative or necrotic change and in places erosion associated with hemorrhage from the fetal circulation into the regional intervillous spaces. Coincidentally, access of maternal blood to the fetal circulation was afforded. The mixture of bloods is stopped quickly, apparently by the formation of a clot at the site of injury. Since the erythroblastosis is a secondary manifestation, the designation "erythroblastosis fetalis" is no longer justified. Furthermore, it was found that destruction of the incompatible fetal red blood cells in the disease occurs in part by phagocytosis. The term "congenital hemolytic anemia," therefore, is not entirely accurate and "transplacental erythrocytotoxic anemia" is suggested as a better name for the disease. Microscopic examination of the placentas in 213 cases in the last half of the normal pregnancy showed in the barrier in all numerous breaks of the same type as observed in the cases of erythroblastosis fetalis. The demonstration of numerous breaks in the placental barrier in erythroblastosis fetalis in the last half of pregnancy adds evidence confirming the studies of Levine, which established erythroblastosis fetalis as a disease caused by the destruction of fetal red blood cells by antibodies produced in the mother to some incompatible factor within the fetal red blood cells.

Intestinal Changes Following Irradiation of Pelvic Cancers.—Maas reviewed 600 cases in which irradiation was used for cancers in the pelvic area. There were 523 cases of radiation sickness and 70 cases in which permanent rectal changes developed. Onset and course of radiation sickness are unpredictable and their management unsatisfactory. Higher doses of radiation therapy tend to produce permanent rectal lesions earlier and of a more serious nature. Radium is a more serious offender than are roentgen rays. Factitial proctitis makes up the bulk of permanent rectal changes secondary to irradiation of the pelvis for pelvic cancers. The region of the rectosigmoid junction is most frequently involved by factitial proctitis. Colostomy is employed to check excessive bleeding or relieve obstructions. The results obtained frequently are negligible. Rectal stenosis following radiation to pelvic cancers occurred forty-eight times in the 600 cases. The process is irreversible. One case of fibrosis without stricture was encountered. Rectovaginal fistula, which occurs secondarily to metastatic invasion of the bowel and devitalization of tissue in the rectovaginal septum, developed in 13 cases. Secondary carcinoma of the bowel occurred in 10 cases. One primary adenocarcinoma of the rectum developed in a case of squamous cell carcinoma of the cervix.

Retreatment of Pregnant Woman for Syphilis.—Ingraham and his associates say that in a group of 52 mothers treated for syphilis with penicillin before but not during pregnancy, 46 apparently normal and no syphilitic living infants resulted. The three abortions, one miscarriage, one stillbirth and one neonatal death which occurred could not be attributed to syphilis, and probably resulted from other causes. Speiser and his co-workers recently found 1 syphilitic infant among 84 similarly studied pregnancies. Syphilis occurred in this infant when a mother who was delivered nine months after being treated for symptomatic early syphilis was not adequately observed during pregnancy and was subsequently found to have an abnormal response to therapy. Under the ideal antepartum care which dictates monthly physical examination and blood serologic test for the woman once syphilitic, it is apparently safe to permit the expectant mother to go untreated during her pregnancy, assuming normal response to treatment. Retreatment of the syphilitic pregnant woman should be instituted if the clinical or laboratory response is not normal, or in circumstances in which there is some risk of infection of the fetus and anticipated antepartum care may fall below the optimum. The authors do not feel that final conclusions can be drawn from a short period of observation of the limited material collected, but they hope that such a report may serve as a stimulus to the collection of additional data which in the aggregate may give a definite answer to the question of re-treating the syphilitic woman because of pregnancy, when she has had an acceptable course of penicillin for this disease prior to conception.

American Journal of Psychiatry, New York

Nitrogen Metabolism of Gram-Positive Bacteria. E. F. Gale.—p. 119.
*Sulfhydryl Compounds and the Sickling Phenomenon: Preliminary Report. L. Thomas and C. A. Stetson Jr.—p. 176.

Sulfhydryl Compounds and the Sickling Phenomenon.—According to Thomas and Stetson the methods which are in current use for the routine laboratory diagnosis of sickle cell disease are based on the widely accepted concept that the sickling phenomenon is brought about by the reduction of hemoglobin in the red cell. The authors studied the effect of a variety of reducing agents on sickle cells with the purpose of devising a dependable means for the rapid diagnosis of sickle cell disease. It was found that sulfhydryl compounds, notably hydrogen sulfide, BAL (2,3-dimercaptopropanol) and cysteine, caused complete sickling within less than a half hour. It is suggested that sulfhydryl compounds may be of value in the laboratory diagnosis of sickle cell disease because of the rapidity with which reliable and reproducible results can be obtained.

7:447-544 (July-Aug.) 1948

*Epidemiological Significance of Behavior of Poliomyelitis in Warmer Climates. W. L. Aycock.—p. 461.
*Sudden Death in Filipino Men: Unexplained Syndrome. A. V. Majoska.—p. 469.
Intra-Uterine Fetal Asphyxia. C. C. McCorriston.—p. 474.
Adoption: Complex Community Responsibility. M. A. Busch.—p. 477.

Poliomyelitis in Warmer Climates.—According to Aycock, the spread of the virus of poliomyelitis is extensive and is the result of ordinary, unavoidable and probably irreducible contact. Infection with this virus is preponderantly benign, the one serious sequel of infection, paralysis, occurring in only a small fraction of those exposed. In the tropics the evidence indicates that in terms of parasitism adaptation between virus and host is even more nearly balanced. Widespread exposure to the virus, more frequently during the persistence of equally widespread maternal immunity, apparently results in more frequent modified infection, but still with propagation of virus, with resultant active immunity to be passed on to the offspring for repetition of the cycle. Thus in warm climates a high degree of commensalism with the virus has been attained. In poliomyelitis there are a number of selectivities seen in the occurrence of paralytic disease in the few of them exposed to the virus which indicate that this "complication" of the ordinarily subclinical infection is determined primarily not by circumstances of exposure to the virus but by autarceologic influences. The mechanism through which a lower incidence of paralysis occurs in warmer climate seems to be the operation in nature of the principle of variolation rather than the principle of vaccination. It is suggested that the virus of poliomyelitis requires host conditions of warm weather or warm climate both for disease production and for multiplication and hence propagation. Such a conception, under which this virus could be active for only a brief part of the year in more temperate climates and throughout the year in warmer climates, could account for the more rapid and extensive dissemination of the virus in warmer climates.

Sudden Death in Filipino Men.—Majoska reports the occurrence of sudden death in 81 young Filipino men. There were 51 such deaths in the years 1937 to 1944 and 30 from 1945 to 1948, with no particular seasonal occurrence. The highest incidence of these deaths was observed between the ages of 30 and 34 years. There was a consistent lack of exposure to noxious industrial substances in practically all cases. The men retired in apparently the best of health and died sometime during the night. The one person dying in the day time was one who worked at night and died at noon in his sleep. The death is usually preceded by sounds of gasping, groaning, moaning or choking. Cyanosis, generalized visceral congestion, subpleural and subpericardial petechial hemorrhages were revealed on necropsy. Acute hemorrhagic pancreatitis was the chief postmortem observation, but it is not known whether this was cause or effect. Frequently the stomach is dilated by a large amount of partially digested food. Food, poisons, supernatural forces, intestinal parasites, hypoglycemia and reflex shock possibly initiated by sudden fright or nightmare have been suggested as possible causes but have been fairly well eliminated. The syndrome apparently does not affect women or men of other races.

Prefrontal Lobotomy.—Watts and Freeman performed prefrontal lobotomy on 531 mental patients with only 12 operative deaths (2.3 per cent). Secondary operations were performed in 70 cases with no operative death. This brings the total number of operations up to 610 with an operative mortality slightly under 2 per cent. Prefrontal lobotomy is a simple but precise operation. It has been necessary to terminate the operation before completion in only 4 cases. Incontinence and inertia occur in almost every patient and constitute the main nursing problems during the short hospital stay. Excitement is rare. Operative hemorrhage was sufficient to require enlargement of the bony opening to control it in 6 patients. Hemiparesis developed in 4 and proved permanent in 2. Chronic intracerebral hematoma developed in 3 patients and a hygroma in 1. Hemorrhage was the cause of death in 3 patients operated on (0.5 per cent). Convulsions are the most embarrassing sequela of prefrontal lobotomy and occurred in 66 (12.3 per cent) of the authors' patients. Further analysis revealed that 7.2 per cent had attacks after a single operation, but 47 per cent developed convulsions after secondary operations. A majority can be controlled by anticonvulsive therapy. Although the patient does not complain, morphine withdrawal symptoms may be severe when the drug is withheld after lobotomy.

Vagotomy.—Mandl performed vagotomy by the subdiaphragmatic route on 101 patients with ulcers of the stomach, pylorus, duodenum and jejunum and anastomotic recurrences after resection. Sixty-nine patients had ulcers of the pylorus and duodenum. In 13 the operation was combined with gastrojejunostomy. In all cases the roentgen findings cleared up after vagotomy. Twelve cases were complicated by severe coronary and heart disease, chronic lung disease, epilepsy, thyrotoxicosis, megacolon and pregnancy; in no case was the complicating condition aggravated by vagotomy. Only 1 of the 101 patients operated on, most of them poor risks, died on the tenth postoperative day of causes unrelated to the operative procedure. Gastric and intestinal atony could be controlled with ease. Twenty-five patients sooner or later had diarrhea. All patients were relieved after some weeks or days of treatment with opiates, betaine hydrochloride with pepsin or sulfonamide compounds. Examination of the diastase level in the urine and the blood sugar level in 20 patients showed that the diastase rose postoperatively to values on an average of 1 : 128 in all patients, while the blood sugar level rose only in 10. Diastase levels returned to normal after five to nine days, and blood sugar levels after five days. On the basis of the balance between vagal and sympathetic innervation of the stomach a new test was developed demonstrating that all vagal fibers are cut; the assumption is that if vagotomy is complete no rise in gastric acidity will occur after sympathetic block. The author believes that vagotomy will in time have a solid place in the surgery of peptic ulcer.

Antibody Formation in Early Infancy.—According to Cooke and her associates the belief that there is a defect in the ability of young infants to produce specific antibodies has been widely held and has been the basis for the practice of deferring active immunization until later infancy. The authors made studies on 284 healthy infants, whose ages varied between 1 and 14 months, the majority being under 6 months of age. At the first visit, blood was drawn, tested for diphtheria and tetanus antitoxins, and a subcutaneous injection of combined diphtheria and tetanus toxoid given. A second injection of the same material was given two months later, and one month after this second injection a blood sample was again titered for diphtheria and tetanus antitoxin. It was found that the production of tetanus antitoxin is as good in the early months of life as later, and this finding denotes that the mechanism for the production of antibodies is well developed in young infants. With diphtheria antigen, the development of antitoxin is definitely defective in a considerable number during the first six months of life. This impairment of antibody formation is related to the presence of passive immunity in the resistant infants and appears specific for diphtheria. Recently, there has been some tendency to use a routine of diphtheria, pertussis and tetanus antigens by simultaneous injection. While such multiple antigens are as effective in immunization as those given individually, they would seem to be most useful when given to infants after six months of age. Since there exist definite advantages in immunizing against diphtheria later in infancy and against pertussis in the early months, the "timing" is bad for routine use of combined antigens. A course which appears to meet the requirements, and which has been in use in the Washington University Children's Clinic for the past year, is to give pertussis vaccine at the sixth, ninth and twelfth weeks, and combined diphtheria and tetanus toxoids in the seventh and ninth months.

Sickle Cell Anemia and Rheumatic Heart Disease.—Ohrenstein calls attention to the confusing resemblance between the symptoms of sickle cell anemia and those of rheumatic heart disease. It is often overlooked that anemia may cause heart disease, and it may be difficult to decide whether sickle cell anemia alone is present or whether there is an accompanying rheumatic heart lesion. The pathology files of the Cook County Hospital were searched to ascertain the incidence of sickle cell anemia concomitant with rheumatic heart disease. Since 1929, 53 autopsies have been performed on patients who gave positive evidence of sickle cell anemia. In 13 of these sickle cell anemia was the direct cause of death. Among the remaining 40 patients sickle cell anemia was an indirect cause of death. Three of these patients showed evidence of rheumatic heart disease, and the primary anatomic diagnosis in 2 of these was rheumatic heart disease. The ages of these 3 patients were 3, 7 and 22 years. The incidence of sickle cell anemia concomitant with rheumatic heart disease was 5.6 per cent.

Prevention of Decompression Sickness by the Arne Zetterström Method for Deep-Sea Diving.—Bjurstedt and Severin describe the Zetterström hydrogen deep diving method as developed and practiced in the Royal Swedish Navy. The theoretic properties of hydrogen as a substitute for the nitrogen of the air for diving purposes are discussed. Comparisons are made between nitrogen, hydrogen, helium and other gases with respect to gas uptake and elimination, narcotic effect and inhalational resistance. The authors also discuss the basis for the calculation of hydrogen half-times and decompression tables and curves and report practical diving experiments in the open sea with the hydrogen deep diving method.

Diverticulitis.—LeRoyer and White report on 200 cases of diverticulitis seen at the Hartford Hospital during the years 1927 to 1946. The diagnosis was made by the clinical picture in addition to the roentgen findings in 161 cases, at operation in 32, by the clinical picture alone in 5 and at necropsy in 2. The relative incidence of the leading symptoms and signs was essentially similar to that generally reported. A notable exception was the occurrence of pain in the lower part of the back as a prominent symptom in 20.5 per cent of the cases. The presence of melena was noted in 16.5 per cent of the cases. The frequency of bleeding from the rectum is somewhat disconcerting, because it detracts from the significance of blood in the rectosigmoid as an indication of polyps or other neoplastic lesions and complicates the differential diagnosis. Diagnostic confusion occurred most frequently in cases presenting signs suggestive of acute appendicitis and in those in which masses in the lower part of the abdomen or pelvis could not be differentiated from carcinoma of the bowel or from genitourinary lesions. Complications occurred in 50 cases. These included 7 of obstruction secondary to ligneous induration of the affected sigmoid and 43 perforations. Thirty-two of the latter led to local abscesses, 6 to fistulas, 4 to mechanical obstruction and 1 to generalized peritonitis.

Dangers in Use of Penicillin in Diphtheria.—Stein points out that diphtheria has become more prevalent during the war and immediate postwar period. An infection of the upper respiratory tract caused by the diphtheria bacillus could be hastily classified as "ordinary" pharyngitis. Such a diagnostic error, apart from the failure to use antitoxin, may lead to the use of penicillin, thus masking the diagnosis and giving the toxin a chance to spread. The author reports a case which illustrates the tragedy of not making a correct diagnosis of diphtheria. This patient was treated with penicillin and was discharged on the ninth day. Later he had to be readmitted, and he died on the twenty-seventh day. Necropsy revealed diphtheritic myocarditis. The author reports 2 other cases which illustrate the possibility of confusion between follicular tonsillitis and faucial diphtheria. A fourth case reported was one of nasal diphtheria. The author stresses that diphtheria should always be kept in mind in the presence of nasopharyngeal and tonsillar infection. Penicillin should not be used in such cases until the diagnosis is certain. Smears and cultures should be taken first and antitoxin should be given if diphtheria can be suspected, for penicillin cannot replace diphtheria antitoxin in the treatment of acute diphtheria. It can be of value in the treatment of the chronic diphtheria carrier state.

Intravenous Injections of Procaine for Injured Hands.—Graubard and his co-workers treated 28 patients with trauma of the fingers, the hand or those contiguous structures which produced hand symptoms, with eighty-five infusions of 4 mg. procaine hydrochloride per kilogram of body weight to be given in twenty minutes. One gram of vitamin C was added to 1,000 cc. of isotonic solution of sodium chloride, containing 1 Gm. of procaine hydrochloride. Twenty-one patients had reflex sympathetic dystrophy, 2 had phantom limbs, 2 had stiffness of the hand after a fracture, 2 had contusions, abrasions and lacerations and 1 had a "trigger" finger. Relief of pain, early restoration of function and early rehabilitation were achieved by the intravenous use of procaine in the treatment of 27 of these patients. When procaine is administered intravenously it reaches the dysfunctioning capillary bed and anesthetizes the irritated nerve endings. The resulting relief of pain is usually accompanied by increased mobility and improved circulation. Procaine given intravenously will not overcome the pain initiated and maintained by a mechanical factor; three infusions given during a period of two weeks produced no change in the condition of the patient with "trigger" finger.

Penicillin in Cutaneous Anthrax.—Griffin and his co-workers treated with penicillin 17 employees in a carpet factory, 16 men and 1 woman between the ages of 25 and 69 years, who had cutaneous anthrax. The lesions were chiefly on the exposed parts of the body and on the right side. The average number of hospital days was twelve, with the shortest five and the longest thirty-three. In general, each patient received from 100,000 to 300,000 units of penicillin every three hours intramuscularly, with a total average of 12,882,940 units during the hospital course. All persons with lesions on face and head received sulfadiazine in addition to penicillin. In 1 case antianthrax serum was also used. No ill effects were noted. All patients recovered. The suspicion of anthrax, the promptness of reporting to the physician and the immediate institution of treatment were the three factors which made a malignant disease a rather benign innocuous one with a relatively uneventful course in the hospital.

Anorectal Divulsion Versus Pectenotomy.—Spiesman examined microscopically the anorecta of 14 adults, of 5 newborn infants, of 3 dogs and 2 rabbits, and 16 stained sections of removed pecten bands. Comparison of the normal and pathologic pecten areas proved that true pecten bands are not found in normal recta, but that pectenosis is a pathologic entity caused by chronic passive congestion and inflammation, as first suggested by Miles and Abel. Pecten bands are fibromuscular bands consisting of larger amounts of fibrous connective tissue intermingled with smaller amounts of smooth muscle fibers. These latter fibers are some of the terminal branches of the longitudinal muscle fibers of the rectal wall terminating in the pecten area, or possibly extensions of the muscularis mucosae of the rectum, or both. Pecten bands were found mainly in the pecten area but frequently extended above and below the pecten area. The pecten bands varied in thickness from 1.5 mm. to over 5 mm. The duration of the disease determines the existence and amount of infiltration fibrosis or hyalinization in the subpecten area. The cutting of the sphincter muscles is not necessary or advisable. Pectenotomy—i. e., incision of the pecten band—results in normal relaxation of these muscles. Anorectal divulsion is unsurgical, traumatic and unnecessary. Pectenotomy is the surgically correct procedure replacing the objectionable practice of divulsion. Clinically, pectenosis is commonly found in patients suffering from cryptitis, papillitis, anal spasm, fissure in ano, pruritus ani and hemorrhoids. Pectenotomy offers a new surgical approach to the treatment of common anorectal conditions.

Prolapse of Gastric Mucosa.—Van Noate and his co-workers report 7 patients, 6 men and 1 woman between the ages of 23 and 60 years, with complaints of the upper part of the gastrointestinal tract, who were observed to have only prolapse of the gastric mucosa as the explanation for their symptoms. Intermittent epigastric pain was the presenting complaint of all but 1 patient, nausea and vomiting occurred in 5 and were associated with pain, bloating and epigastric fulness in 4. A variable filling defect in the pyloric portion of the duodenal bulb, with an "umbrella" or "mushroom" configuration, was the most constant roentgenologic observation in this series. Serial gastroscopic studies failed to demonstrate disease of the antral mucosa in any patient. Other diseases of the antrum were therefore satisfactorily excluded. Chronic gastritis was not an etiologic factor. No secondary changes in the mucosa resulted from the prolapse. In each patient a simple medical regimen adequately controlled the symptoms and in none did the clinical, roentgen or gastroscopic observations indicate the necessity for surgical treatment. Enforced rest may well have been the most important therapeutic influence.

Volvulus of Colon.—According to Michel and McCafferty volvulus of the colon is a relatively infrequent form of intestinal obstruction which carries a high mortality. In a series of 119 cases of acute obstruction of the large bowel (exclusive of the rectum) observed by the authors at Charity Hospital of Louisiana at New Orleans and at Touro Infirmary, there were 24 cases of volvulus. The age range in this series was 13 to 84 years, but volvulus is predominantly a disease of middle and late life, and it is rather unusual to find, as in this series, patients of 13, 17 and even 25 and 28 years of age. The 3 patients with volvulus of the cecum were 17, 28 and 40 years of age, respectively, which makes their average age 28.3 years, as compared with an average of 55 years for the 21 patients with volvulus of the sigmoid colon. The advanced age of the majority of patients largely explains the unfavorable prognosis. Two of the 6 patients who died were 78 years of age, 1 was 79 and 2 were 84. The sixth patient, aged 28, was moribund when hospitalized. The diagnosis of volvulus can be made on the basis of a history of (1) sudden acute abdominal pain, sometimes associated with a previous history of similar, less acute attacks or of milder symptoms; (2) nausea and vomiting; (3) constipation; (4) distention, sometimes associated with circulatory collapse; (5) tenderness, and (6) absence of fever early in the illness. The treatment of all cases of volvulus of the colon by the same method can lead only to disaster. Each case must be individualized with respect to the location of the volvulus, the degree of circulatory change in the wall of the affected bowel and the status of the patient. Treatment may be proctosigmoidoscopic intubation or operative intervention, which may range from simple detorsion to resection. Volvulus of the transverse colon and cecum must be treated surgically. Conservative measures have no place in the treatment of volvulus of the large bowel. Deaths from shock and peritonitis in volvulus of the colon emphasize the importance of prompt diagnosis and treatment, before irreversible circulatory changes have occurred.

Bronchiogenic Carcinoma.—Ochsner and his associates review observations on 548 cases of bronchiogenic carcinoma, of which 194 were considered inoperable when first seen. Of the 354 patients with cancer considered operable, 47 refused operation. Of the 307 cases in which an exploration was done, 112 were found to be nonresectable and in 195 a pneumonectomy was done. In 138 the operation was considered as a palliative procedure because of the extension, either grossly or microscopically, to other structures; in only 57 was the procedure considered curative. The hospital mortality rate has progressively decreased with experience. Whereas before 1940 it was 65.5 per cent, in 1948 it is 11.1 per cent. Even though in almost three fourths of the 195 cases the operation was done at a time when the lesion had extended beyond the originating lung, the survival rate is considerable. Over half of the patients are alive at the end of six months. In the group in which a curative resection was done, 14.5 per cent are alive at the end of five years, and 12.5 per cent of those in whom a palliative resection was done survived the operation five years. In none of the cases in which resection was not done did the patient survive as long as three years, although all patients were treated by the accepted nonsurgical therapeutic measures, such as therapy with high voltage roentgen rays, nitrogen mustard and antireticular cytotoxic serum.

INDICATIONS FOR CESAREAN SECTION

To the Editor:—A woman, aged 37, was referred to me for cesarean section. She was eight and one-half months pregnant, and according to recent roentgenograms the baby was in a left sacroanterior position with the presenting part not engaged. This was her seventh pregnancy. She has been married eight years and has living 3 healthy children who were all delivered after short labors. The other pregnancies ended spontaneously in miscarriages. A few years prior to marriage she had generalized peritonitis due to acute appendicitis with perforation. At that time she had a complication of severe phlebitis of the right leg, which since that time has been slightly larger than the left, and during her pregnancies she felt much more comfortable when wearing an elastic stocking. With all her pregnancies she has never had an acute flare-up of the phlebitis. During the present pregnancy the discomfort has been much worse, but she was still able to do her house work and take care of her children. Physical examination at this time reveals a pelvis normal to external measurements. There are no varicose veins or pitting edema. She wishes to have a cesarean section and sterilization at the same time. I told her that no section was indicated unless definite cephalopelvic disproportion was shown by roentgenogram at the onset of labor. Should her request have been granted?

M.D., Delaware.

ANSWER.—It was correct to refuse to do a cesarean section on this patient. It is unwise to perform a cesarean section simply to perform sterilization by ligation of the tubes. If there is an indication for a hysterectomy such as large fibromyomas there might be some justification, but this patient presumably has a normal uterus and has had no dystocia in previous labors. Furthermore, in view of the previous generalized peritonitis and the phlebitis there would have been a decidedly increased opportunity for serious trouble during and after the cesarean section. Incidentally, in the presence of normal babies, it is difficult to determine cephalopelvic disproportion in breech presentations. When a hydrocephalus is present, the enlarged size of the head is obvious, but in many roentgenograms of breech presentations, the head appears larger than it really is.

TETANUS REIMMUNIZATION

To the Editor:—Many ex-service men are seen for industrial injuries which require tetanus toxoid or antitoxin. Five years since discharge has been arbitrarily selected as a dividing line for the use of stimulating toxoid or passively immunizing antitoxin. (1) How long will a routine series plus one booster at one year's interval give immunity? (2) How frequently should "booster shots" be given to maintain this immunity? (3) If a man has received no stimulating dose of toxoid since his original series, at how many years' interval can a satisfactory immunologic response be expected from a stimulating dose? (4) To reimmunize a person who has had no toxoid for several years, is a complete series necessary or will one dose raise his titer satisfactorily? (5) What is an acceptable policy to be followed in the use of toxoid or antitoxin in ex-service men?

M.D., West Virginia.

ANSWER.—1. Accurate antitoxin estimations relative to the immunity conferred by a basic immunization with tetanus toxoid followed by a recall (booster) dose at the end of one year are not available. The experiences in the United States Army indicate that adequate response to a booster dose of toxoid was observed for at least three years after the basic immunization and two years after the routine recall dose. It is not unlikely that in some persons protection continues for considerably longer periods. The blood serum of only 4 of 42 subjects who had not received toxoid for from two to five years contained antitoxin in a concentration generally considered inadequate for protection.

2. While the majority of persons even at the end of five years after a basic immunization and one recall dose may have antitoxin concentrations adequate for protection, it is a sound policy to administer an emergency stimulating dose of 1.0 cc. (10 Lf.) fluid tetanus toxoid whenever an injury makes the danger of tetanus a possibility. There is good reason to believe that an adequate response occurs within the usual incubation period for tetanus.

3. According to Wishart and Jackson (*Canad. J. Pub. Health* **39:**181-186 [May] 1948), 55 young adults who had been previously immunized with tetanus toxoid during the war all responded to a recall dose of 1.0 cc. of tetanus toxoid. In another study by McBryde and Poston, dealing with children (*J. of Pediat.* **28:**692-696, 1946), those who received a small amount of tetanus toxoid subcutaneously five years after the original immunization showed a decided increase in serum antitoxin content. Thus, it is proved that for at least five years, probably longer, the immunologic response to a 1 cc. stimulating dose will be fully adequate.

4. If a person has had no toxoid for years a 1 cc. (10 Lf.) dose of fluid toxoid is probably adequate to recall the antitoxin level in the blood to a protective concentration of from 0.01 to 0.2 unit per cubic centimeter of serum.

5. Unless the ex-service man has retained a record of the immunizations administered to him while he was in service the proper procedure to be followed if he sustains wounds or injuries which may lead to tetanus may well be difficult to determine. "In general it is a reasonably safe procedure to administer [*fluid*] toxoid rather than antitoxin prophylactically if the individual concerned states that he was in the service for at least a year subsequent to Pearl Harbor, and that he received all of the routine immunizations administered in his organization. Such military experience would almost certainly indicate that he had received at least the basic tetanus immunization; hence, he could be expected to respond satisfactorily to a stimulating dose of toxoid" (Long, A. P., and Sartwell, P. E., *Bull. U. S. Army M. Dept.*, 1947, vol. 7, p. 384). When no adequate record of previous active immunization is available, antitoxin should be given prophylactically. Experience has taught that in civilian practice and in the presence of badly contaminated wounds the dose should be increased to 4,500 units given in three doses of 1,500 units over a period of six days.

ALUMINUM DUST IN SILICOSIS

To the Editor:—A male patient, aged 42, has slowly progressive pulmonary fibrosis as a result of exposure to silica dust at the age of 19. The present symptoms are dyspnea on exertion and nonproductive cough. Physical examination showed no cardiac involvement. There were numerous sibilant rales in both lung fields. The laboratory findings revealed a normal blood count, a normal electrocardiogram and a vital capacity of 68 per cent of normal. The roentgenogram of the chest revealed a large calcified node in the right hilar region and an increase of markings in the lung fields which I interpreted to be pulmonary fibrosis. Kindly advise treatment, especially with reference to aluminum. Is there any simplified office procedure for this method of treatment?

M.D., Texas.

ANSWER.—If your patient, now 42, has not been exposed to dangerous concentrations of silica dust since he was 19 years old, it is most unlikely that he has slowly progressive pulmonary fibrosis as a result of exposure so long ago. After both experimental and clinical studies, Gardner stated that one who has silicosis and is removed from the dust will have fibrosis develop progressively until all of the particles are encapsulated in nodules. Old nodules will not continue to enlarge or new ones form for an indefinite period. Hayhurst said that the pulmonary effects of silica have about spent themselves by the end of two years after the last work exposure and thereafter, unless the affliction is complicated by infection or emphysema, it remains practically stationary. Sander reported observations on 299 cases of silicosis selected from 3,377 foundry workers. Six years of observation prior to 1939 brought to light no case of visible progression of the silicotic fibrosis. He expressed the opinion that this is due to the fact that when the condition was discovered, although the workmen continued in the foundry, measures were instituted which markedly reduced the concentration of silica dust in the air which they breathed. He concluded that it is safe to keep those with uncomplicated silicosis at their regular work under the controlled conditions of minimal dust exposure and adequate respiratory protection, as well as under the medical control of periodic examination and absence of possibilities of contracting tuberculosis at work. Continued observation on the same persons has not changed Sander's opinion.

The large calcified node in the right hilar region is not adequate to make a diagnosis of silicosis. Such depositions of calcium are more often due to infections with tubercle bacilli or fungi, such as Histoplasma capsulatum and Coccidioides immitis. The increased markings in the lung fields may also be due to any one of a number of conditions other than silicosis. In fact, if definite nodulation is not in evidence, the condition is probably not due to silica dust.

There is no accepted treatment for well established silicosis. Denny and others have shown that aluminum dust in a concentration of about 1 per cent of the total dust inhaled affords some protection against the development of silicosis in animals. Gardner conducted experiments with animals which showed that aluminum and aluminum hydrate definitely inhibit the fibrous reaction of tissue to quartz. Moreover, they prevent progression of silicotic lesions already established and actually cause retrogression in immature tissue responses. Some evidence has accrued to indicate that aluminum dust serves as a prophylactic among persons exposed to silica dust. This is probably because the silica particles become covered with an insoluble and impermeable coating which is gelatinous, hydrated alumina. Therefore, prophylactic treatment has been installed in many places where workmen inhale a high concentration of silica dust. Not enough work has been done to justify ultimate conclusions concerning the efficacy of aluminum dust in prophylaxis.

Vrooman stated: "It will be some years before . . . its *full value in humans* [*can be assessed.*] As a therapeutic measure its use at present is entirely experimental, and a great deal of animal experimentation remains to be done before it can be accepted generally as of any more than psychological value in the treatment of silicosis."

CIGARET HABIT

To the Editor:—Please supply recent information on management of the tobacco habit. What can be done to stop the use of cigarets?

P. H. Schmiedicke, M.D., Williamsport, Ind.

Answer.—Little can be done to stop the use of cigarets by a free adult who enjoys the practice. Parenteral injunctions, penalties and prohibition appear alike ineffective. Provision of special smoking compartments and facilities for disposal of burning cigarets seem more effective than "No Smoking" signs in lessening fire and other hazards. Although the pleasures of smoking may be diminished by rinsing the mouth or swabbing the throat with 0.5 per cent silver nitrate, even this may fail with confirmed smokers. Under some conditions substitution of a pipe for cigaret may lessen fire hazards or other disadvantages while yielding the same or similar physiologic consequences.

Persuasion and the development of personal conviction against the use of tobacco as a result of religious teaching, and consideration of financial disadvantages of smoking, from the cost of the habit and fire and other consequences of it, and particularly emphasis on the effect of tobacco on physical efficiency may go far to offset the advertising propaganda of commercial interests. Deleterious effects of tobacco on growth of minors and on athletic prowess are widely accepted arguments against smoking by adolescents. The literature and scientific data regarding effects of tobacco on physical efficiency were summarized by Schrumpf-Pierron (New York, Hoeber, 1927) and by Bogen (in Fisher, I., and Emerson, H.: How to Live, ed. 20, New York, Funk & Wagnalls Company, 1938).

It is much easier to abstain from smoking completely than to stop the practice after it has once been practiced. The person who is desirous of stopping cigaret smoking may reinforce this intention by reading the literature on studies on tobacco and may secure entertainment and suggestions from reading accounts of successful exsmokers. Eating candy or otherwise raising the blood sugar may compensate for lack of the habitual adrenal stimulation from nicotine and so overcome the acute symptoms of deprivation such as tremors and nervousness suffered by some smokers soon after cessation of the habit. Chewing gum, camomile or gentian root, or the use of cigarets with low nicotine content such as denicotinized cigarets and particularly the newly developed cigaret naturally low in nicotine, may satisfy the conditioned reflex or habitual urge to handle or touch a cigaret while the subject avoids the effects of the alkaloid itself.

ECZEMA

To the Editor:—Please give a brief definition of the terms eczematous dermatitis and eczematoid dermatitis.

M.D., Pennsylvania.

Answer.—An eczematoid eruption is one that resembles eczema; eczematous refers to one that is affected with or of the nature of eczema. A patch of psoriasis, for example, is not eczematoid; yet from overtreatment it may become eczematous. Dermatophytosis is usually eczematoid, although it, too, may become eczematous. The distinction between eczematoid and eczematous dermatitis, if any, cannot be explained readily because the question is still being debated whether or not eczema and dermatitis are the same disease. According to Sutton, all cases of eczema are, to the pathologist, dermatitis. "Eczema" implies chronicity, a tendency to recurrence, an element of idiosyncrasy, and the absence of complete etiologic analysis. The dualist school, however, always refers to sunburn as an example of dermatitis which is certainly not eczema. The tendency in recent years seems to be to regard eczema as an inclusive term much like rheumatism, and to regard all cases, whether solved etiologically or not, as examples of dermatitis. There are many physicians, however, who challenge this concept.

MYOPIA

To the Editor:—Is there value in exercising the eye muscles in cases of myopia or advantage in keeping severely myopic eyes undercorrected? Should full correction ever be attempted?

Harry Epstein, M.D., New York.

Answer.—Muscle exercises and visual training programs for the improvement of vision in myopia were reviewed recently by Hildreth and others at Washington University (*Am. J. Ophth.* **30**:1563, 1947) and Woods at Johns Hopkins (*Am. J. Ophth.* **29**:28, 1946). In each group of myopes about 25 per cent of the patients studied showed a low grade improvement in reading ability following training, but the change was within the limits of error of subjective testing. The maximum benefit was obtained by those who initially had visual acuity less than was expected from their refractive errors. The exercises were valuable in producing a psychologic change in some patients, convincing them that they saw better and with greater satisfaction to themselves, although there was no change in measurable visual acuity. These patients showed no diminution in the basic underlying myopia, and the improvement probably occurred at a level rather than an ocular level. Woods concluded that the exercises educated some patients to interpret blurred retinal images more carefully and convinced others that they saw better, although there was no measurable improvement. He decided that visual training was not otherwise valuable in myopia.

There is no advantage in undercorrecting myopia except in patients with over 20 D. in whom there is frequently no improvement in vision with greater correction. Myopes should receive the smallest correction that will give them maximum vision; this is usually the full correction as found on examination with cycloplegia.

CONGENITAL SYPHILIS

To the Editor:—A woman discovered four years ago that she had congenital syphilis. A physician treated her with heavy metal compounds for three years. Her Wassermann reaction has remained strongly positive. The blood reaction of the husband is negative.

1. Spinal fluid and colloidal gold curves as well as roentgenograms of the patient's cardiovascular system are negative. What course of treatment should be followed at this time? 2. What advice should be given this couple concerning the question of child bearing? 3. What course of treatment should be followed if this patient becomes pregnant?

M.D., Pennsylvania.

Answer.—Serologic tests of the blood of a patient who has congenital syphilis may give positive results for many years, and yet the patient may never display clinical evidence of activity of the disease. The negative results of examination of the cerebrospinal fluid and of a cardiovascular examination, and the fact that this patient had three years of treatment, although the extent of it is not stated, suggest that the positive results of serologic tests in this young woman are not of great importance. No mention is made as to whether she has had interstitial keratitis or other manifestations of congenital syphilis. If she has not had any manifestations of these complications to date, it is not necessary to treat her simply because of the positive reactions to serologic tests. This suggestion is based on the statement that the patient had three years of treatment with heavy metal compounds and has no clinical manifestations of the disease.

It is extremely rare that a congenitally syphilitic woman transmits the disease to her children. In fact, it is so rare that when it occurs it is considered to be a clinical curiosity. For this reason and the fact that penicillin is so valuable in the prevention of congenital syphilis, there would be no objection to this young woman's having a child. If she becomes pregnant, she should receive, as a precautionary measure, one course of penicillin administered at the end of the first trimester and another at the beginning of the third trimester. Patients of this type are not infectious, so that the possibility of transmitting the disease to her husband may be ignored.

VERTIGO FROM STREPTOMYCIN

To the Editor:—What therapy will hasten recovery from the loss of equilibrium brought on by streptomycin during treatment of subacute endocarditis? Treatment with streptomycin was given continuously for 6 weeks and was stopped two months ago. Improvement in the intense vertigo has not occurred and other causes for the vertigo cannot be found.

G. D. Bullock, M.D., Inwood, Ia.

Answer.—Known specific treatment of value for the vertigo resulting from streptomycin therapy is lacking. Intensive effort to get the patient to adjust to this dysfunction by walking exercises is suggested.

CHRONIC CYSTIC MASTITIS

To the Editor:—A woman, 27, with 1 child 5 years of age, has breasts so painful that she can hardly bear the touch of her clothes against them. This pain lessens during her periods but increases several days afterward and lasts through the following weeks. The only substance which has helped her is male hormone, as "linguets"; these completely relieved her at first, but lately they seem to have no effect. Please suggest treatment. Clement H. Arnold, M.D., Palo Alto, Calif.

ANSWER.—Chronic cystic mastitis with mastodynia is usually considered to result from a relatively excessive estrogenic hormone elaboration by the ovaries. This may be due to an absolute increase in estrogen secretion, a lack of normal destruction of estrogen by the liver through a vitamin B complex deficiency or an imbalance between the estrogen-progesterone ratio as secreted by the ovaries. If there is evidence of a nutritional deficiency it is suggested that large doses of vitamin B complex be administered. Otherwise, the most successful therapy is through the use of male hormone. It is suggested that adequate doses of male hormone be administered, such as 10 mg. of methyl testosterone by mouth daily for about two months, or 25 mg. of testosterone propionate once or twice a week by injection for at least two months. It is more than likely that the patient will be relieved of her painful breasts for at least a number of months. If there is a resumption of her discomfort, another course of androgen therapy is justified. If the dosage of androgens is less than 200 mg. per month by parenteral administration or 300 mg. per month by the oral route, dangers of virilism are rather slight. If changes do occur, however, such as acne, hoarse voice or hirsutism, a reduction in dosage level should be made.

SPEECH DEFECT

To the Editor:—A male child, 8 years of age, is apparently normal except for a speech defect which is more pronounced in words beginning with the letter "c." For example, he pronounces "city" as "tity." I have told the parents that he will improve with age, and also suggested a speech correction school. I do not believe he needs psychiatric treatment. Please advise where this child could be sent for treatment. Is there any treatment that can be used at home?

Oscar A. Kafer, M.D., New Bern, N. C.

ANSWER.—Such cases should be analyzed by experts if they have any degree of severity, but it seems probable that this 8 year old child is merely talking baby talk. He is getting considerable attention from his mispronunciation of words, and if the parents, children and teachers will not nag him about it and will relieve the tension, it will probably clear up. If not, he should be sent to a Child Guidance Clinic. A new Directory of Child Guidance Clinics is to be published soon by the National Committee for Mental Hygiene, 1790 Broadway, New York, and if the child has not improved in six months, the directory will then be available, and the child can be sent to a clinic. If the child is of average intelligence, the best treatment for this condition would be wholesome neglect of the symptom. To send him to a clinic at present, or to a speech correction school, would be like using a sledge hammer to drive carpet tacks.

VITAMIN B_1 IN POLIOMYELITIS

To the Editor:—What is the value of intraspinal injections of vitamin B_1 in acute poliomyelitis? Since thiamine hydrochloride (vitamin B_1) given intraspinally has been shown to have a specific stimulatory action on the respiratory centers, and is essential for nerve function, should this method of treatment not be given further trial, especially in bulbar types of poliomyelitis with respiratory paralysis? What objections are there to the intraspinal use of vitamin B_1 in the convalescent stages of this disease, particularly in those victims confined to iron lungs?

Elias L. Stern, M.D., San Diego, Calif.

ANSWER.—N. Greve (*Ztschr. f. Krüppelfürsorge* **32**:102, 1939) and S. Stone (*Arch. Phys. Therapy*, **24**:350, 1943; *J. Pediat.* **22**:142, 1943) have published reports on intrathecal injections of vitamin B_1 in the therapy of poliomyelitis. The latter author combined artificial fever with vitamin therapy. One possible reason why this form of treatment has not been tried more extensively is the total lack of evidence in its favor from animal experiments. Deficiency of thiamine has not been found to increase susceptibility of animals to the experimental disease. Actually, thiamine deficiency increases the resistance of mice. It does not appear to affect the resistance of cotton rats or of monkeys.

Evidence is not available that thiamine, given in excess of the normal requirement, could do any harm during the convalescent stages. The only objections that might be raised are the uncertainties with respect to (*a*) any beneficial effect and (*b*) the advantage of administration by the intraspinal rather than other routes.

DIATHERMY WITH ROENTGEN RAYS

To the Editor:—I have been told that it was inadvisable to use short wave diathermy in the treatment of a patient who is being given roentgen therapy at the same time. *Recently an excellent roentgenologist stated that diathermy and roentgen treatment could be used together and were sometimes synergistic. Which view is correct?*

Charles J. Clock, M.D., Redlands, Calif.

ANSWER.—There is no authenticated evidence to support the contention that short wave diathermy nullifies the efficacy of roentgen rays. On the other hand, there is clinical evidence to support the contention that short wave diathermy enhances the effects of roentgen rays. For that matter, any agent that produces hyperemia, increases edema or increases blood flow enhances the action of roentgen rays by increasing the secondary or scattered roentgen rays in tissues. These soft radiations have a pronounced effect on the cells which they reach and add considerably to the incident roentgen ray beam reaching the tissues. The roentgenologist, however, has to take into consideration the additional increases in secondary radiations caused by the applications of short wave diathermy. This is essential in order to prevent overdosage and undue damage to tissues receiving both roentgen rays and diathermy.

COLD ALLERGY IN DROWNING

To the Editor:—Please give information on mechanism of cold allergy in cases of drowning. Alfred B. Sundquist, M.D., Manchester, Conn.

ANSWER.—The mechanism of cold allergy in cases of drowning is presumed to be on the same basis as other less serious or local types of cold hypersensitivity. The evidence indicates that in cold hypersensitivity of any degree there is a release of an excessive amount of histamine. This localized release of histamine results in localized vasodilation and edema and constitutes the common form of cold urticaria or angioneurotic edema. If the amount is great enough or if histamine is released from large areas of tissues a general histamine effect can be obtained. This may include flushing of the face, headache, gastric hypersecretion and lowered blood pressure. If the histamine release is still greater, profound depression of the blood pressure may ensue. This may result in fainting. It is understandable that fainting while swimming can result in drowning.

CANKER SORES

To the Editor:—In the discussion of the causes of canker sores, published in The Journal in Queries and Minor Notes, June 12, 1948, inadequate attention was given to food allergy, which is the commonest cause. Foods oftenest responsible for the various clinical manifestations of allergy, especially wheat, milk, eggs, fish, nuts, chocolate and certain fruits and vegetables, must be suspected. Many or even all fruits and tomato are often causative of canker sores. As in most chronic food allergies, cutaneous testing rarely implicates any or all of the allergenic foods. Therefore diet trial is required, for which my standardized fruit-free elimination diet has long been used with excellent results. The published menus and recipes should be given the patient (Rowe, A. H.: Elimination Diets and the Patient's Allergies: A Handbook of Allergy, second edition, Philadelphia, Lea and Febiger, 1944). Absolute adherence to the diet and the ingestion of enough of the foods to maintain weight are imperative. Ascorbic acid, 50 mg. daily, should be ordered as long as fruit is out of the diet. Other vitamins in harmony with the diet can be given after relief occurs. The diet must be continued longer than former periods of relief. After relief, foods may be added one by one, eliminating any which reproduce the canker sores.

With such diet trial I have found food allergy responsible for canker sores except in a few cases, in which bacterial allergy, arising from foci of infection, especially in the oral and pharyngeal cavities, and drug allergy at times have been responsible. The possibility of an electrolytic reaction between gold and amalgam fillings has been suggested in the literature and might require consideration in this case. Canker sores, moreover, occur in debilitated patients, but in them concomitant food allergy also may exist.

The exhaustion and drowsiness in this patient may be part of the syndrome of allergic toxemia due to food allergy, originally described by me and corroborated by Randolph (*Ann. Allergy* 3:418, 1945).

The possibility of food allergy in this patient certainly was not excluded. Cutaneous testing was done, but as stated, it rarely reveals the foods producing clinical allergy. Many reactions, moreover, are nonspecific or indicative of past or potential allergy. When canker sores or other allergic manifestations due to food allergy rapidly develop after the ingestion of food, such as walnuts, which frequently causes canker sores, then the cutaneous reaction may be positive. Usually, however, the food allergy is accumulative or delayed and the reacting bodies are minimal or absent in the skin. The dietary history at times is suggestive, but of limited help. Diet diaries, moreover, are of little aid, largely because of the refractoriness which often develops after an attack of clinical allergy such as asthma, headaches or canker sores, during which refractoriness the allergenic foods can be eaten without any symptoms for days or even weeks. Therefore only with the use of trial diets can food allergy as a cause of canker sores in a case of this sort be recognized and controlled in the great majority of cases. Albert H. Rowe, M.D., Oakland, Calif.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, SEPTEMBER—DECEMBER 1948

Titles have been listed or abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past four months. Any of the journals, except those starred, will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1937. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in The Journal. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "OS," Organization Section; "ab," abstracts; the star (*) indicates an original article in The Journal.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1336.

A

A. C. S. in Hodgkin's disease, [Abernethy] 998—ab
ABBOTT LABORATORIES, thenylene hydrochloride, protected name, 131
ABDOMEN: See also Ascites; Gastrointestinal Tract; Pelvis; Peritoneum
  Distention: See Flatulence
  hematomas (spontaneous) of wall, [Sanderud] 461—ab
  pain (paroxysmal), bouts of, or abdominal epilepsy, [Moore] 387—ab
  Surgery: See also Cesarean Section; Gallbladder excision
  surgery, controlled respiration and curare as adjunct in, [Orton] 1125—ab
  symptoms and herpes zoster, [Bosher] 388—ab
  tumors in lower part, ascites and hydrothorax in [Blombert] 1002—ab
  tumors, lipogranuloma after use of liquid petrolatum in, [Whitaker & others] *363
  tumors, retroperitoneal neurogenic, 1070
ABELL, IRVIN, portrait, 1216
ABNORMALITIES: See also Crippled; Monsters; under specific organ and region as Heart
  congenital defects, 653—E
  congenital, in child and maternal measles, mumps and chickenpox, [Fox] 536—ab
  congenital, in child and maternal rubella, [Zewi] 390—ab
ABORTION, therapeutic, not indicated if mother Rh negative and father Rh positive, 931
ABSCESS: See also Ulcers; under organ affected as Ovary
  Amebic: See Liver, amebic abscess
  Brodie's: See Bones
  perinephric, penicillin obscured progress; empyema developed, [Archer & others] *648
ABSENTEEISM: See Industrial Health workers
ACADEMY: See under names of specific academies; under Societies at end of letter S
ACCIDENTS: See also Disability; Trauma; Wounds
  Automobile: See Automobiles
  Industrial: See Workmen's Compensation
  prevention, A.M.A. resolution on, 1173; (Reference Committee report) 1239
  what is an accident? 984
ACETABULUM, protrusion in labor as cause of dystocia, [Petersen] 244—ab
ACETONE, industrial hazard, 936
ACETYL-beta-methylcholine: See Mecholyl
ACHIEVEMENT Award: See Prizes
ACID, acetylsalicylic, possible to make stable solution? 331
  acetylsalicylic, safe to give simultaneously with sulfonamides, 626
  Amino: See Amino Acids
  p-aminobenzoic, [Elvehjem] *969
  p-aminobenzoic treatment of amebiasis, [Dwork] 532—ab
  p-aminobenzoic, treatment of leukemia, [Zarafonetis] 844—ab
  p-aminobenzoic, treatment of rheumatic fever, [Belisle] 98—ab
  p-aminobenzoic, treatment of Rocky Mountain spotted fever, [Muntz] 453—ab
  4-aminopteroyl-glutamic (aminopterin) causes remissions in leukemia, [Farber] 617—ab
  p-aminosalicylic, treatment of tuberculosis, [Ragaz] 246—ab; [Erdel] 619—ab
  Ascorbic: See also Vitamins C
  ascorbic, N.N.R., (Warren-Teed) 24
  ascorbic, plus histidine for arteriosclerosis obliterans, [Friedell & others] *1036
  Ascorbic, Sodium Salt of: See Sodium ascorbate
  ascorbic, vitamin A and amino acids in relation to, 1042—E
  Cevitamic: See Acid, ascorbic
  citric, lyphilized plasma with, for hypoprothrombinemia, [Cosgriff & others] *405
  fatty, in tuberculosis, 366—E; (correction) 833

ACID - Continued
  fatty, unsaturated, treatment of eczema, 466
  folic, [Elvehjem] *969
  folic, antagonists: aminopterin, in leukemia, [Farber] 617—ab
  folic, effects on blood changes, [Wilkinson] 458—ab
  folic, treatment of hemopoietic disorders, [Adams] 989—ab
  folic, treatment of pernicious anemia, [Haden & Bortz] *870
  glutamic, and intelligence, 1231—E
  hydrochloric (dilute), inject in atrophic gastritis, [Berry & Cole] *487; *488
  linoleic, treatment of eczema, France, 446
  Mesoxalic Acid, Ureide of: See Alloxan
  nicotinic, [Elvehjem] *963
  nicotinic acid amide, N.N.R., (Upjohn) 131
  nicotinic, inject in atrophic gastritis, [Berry & Cole] *488
  pantothenic, [Elvehjem] *965
  phenylpyruvic oligophrenia, [Delay] 100—ab; [Josephy] 1199—ab
  pteroyltriglutamic and pteroylheptaglutamic, effects on blood, [Wilkinson] 458—ab
  salicylic, treatment of sclerokeratosis, 467
  silicic, hydrated, 1206
  tannic, and silver nitrate to remove tattoo marks, 790
  test reactions to, [Under-
  See Acidosis
  Stomach acidity
  vent by using whisky 104
ACNE treatment, penicillin of no value in, 1008
  treatment in adolescence; use androgens? 1206
  vulgaris, estrogenic substances for, 256
ACOUSTICON Hearing Aid, Model A-100, 293
ACROANGIOTHROMBOSIS, thrombocytic, neuropathologic aspects, [Adams] 159—ab
ACROMEGALY, progressive, treatment, roentgen therapy, (replies) [Buschke; Shorr] 1070
ACTINOMYCES, Antibiotic prepared from: See Streptomycin
ACTINOMYCOSIS of jaw, diasone for [Arnold & Austin] *955
  bronchopulmonary, [Kay] 235—ab
  treatment, penicillin, [Nichols] 534—ab
ACTIVITY: See also Convalescence, early rising; Exercise
  physical activity and nitrogen balance, [Keys] *502
ACUPUNCTURE, International Congress, 3rd, 833; 904
ADANON, methadone addiction, [Anslinger] 609—C
ADDICTION: See Alcoholism; Methadone;
  Anemia, Pernicious
  atment, desoxycorti-
  59—ab
  illary, of intestine,
  See Goiter
  oiter, Toxic
  tubulare testiculare ovarii, [Anker] 783—ab
ADENOMYOSIS: See Endometriosis
ADHESIONS after intra-abdominal use of liquid petrolatum, [Whitaker & others] *363
  postoperative, caused by talc, [Mackey] 850—ab
ADOLESCENCE, acne in, treatment, androgens indicated? 1206
  irradiate spleen and pituitary to control puberal bleeding; no effect on offspring, [Kaplan] 1054-C
ADOPTION of child of syphilitic father advisable? 933
ADRENALIN: See Epinephrine
ADRENALS: See also Addison's Disease
  cancer, [Cahill] *357; *415
  cancer, feminism in policeman aged 40 from, [Armstrong] 389—ab

ADRENALS—Continued
  Cortex Hormone (crystalline): See Desoxycorticosterone
  cortical tumor with Cushing's syndrome, [Kepler] 994—ab
  hemorrhage, Waterhouse-Friderichsen syndrome, [Ferguson] 1057—ab
  Hormone (sympathetic): See Epinephrine
  insufficiency during early life, [Jaudon] 845—ab
  insufficiency, histoplasmosis and torulosis as causes of, [Rawson] 315—ab
  medulla, substance in serum and platelets that stimulates, [Reid] 850—ab
  necrosis in exchange tranfusion in erythroblastosis, 1044—E
  tumors, laminography, [Ewert] 186—ab
  tumors, pheochromocytoma and hypertension, 514—E
  tumors, pheochromocytomas, [Cahill] *180
ADVERTISING, A. M. A. Cooperative Medical Advertising Bureau, (report) 665
  medical, in newspapers, committee to review, Colo., 898
  of cigarettes by A. M. A. Journal, 652—E
AERO Medical Association, meeting, June 16-18, 1948, 433—E
AEROSOL Therapy: See Inhalation; Penicillin treatment; Streptomycin
AFTERBIRTH: See Placenta
AGE, cancer, incident rates by [Griswold] *882; *883
  Old: See Old Age
AGENE, agenizing of flour, [Riley] *335; 857; [Radomski] 1060—ab
  chlorine dioxide likely to replace agene in flour milling, 827—OS
AGGLUTINATION of sheep erythrocytes by patient's serum in rheumatoid arthritis [Rose] 919—ab
  rapid, in brucellosis, [Basset] 246—ab
  reaction, (positive cold) in primary atypical pneumonia, [Laurell] 324—ab
AGGLUTININS, Rh Factor: See Rh Factor
AGGLUTINOGEN, Rh Factor: See Rh Factor
AGRICULTURE: See Farm; Rural Communities
AIR: See also Oxygen
  borne infections, control in nursery: The Cradle, [Rosenstern] 614—ab
  disinfection, General Electric Germicidal Lamp, 1157
  effect of breathing high pressures on blood circulation, 433—E
  Injection: See Pneumoperitoneum
  mattress for bedsores, [Gardner] *583
  pollution control ordinance, Pa., 763
  pollution, "filth we breathe," England, 1188
  Presence of, in Cavity: See Pneumothorax
  smog disaster, 1179—OS
  tons of dust per square mile, Chicago, 979
AIR FORCE: See Aviation
AIR PASSAGES: See Respiratory System
AIRPLANES: See Aviation
ALASKA, asthma in, incidence, 467
  BCG vaccinations progressing in, 515—OS
ALBUMIN, Concentrated Human Serum: See Blood proteins
ALCOHOL Addicts: See Alcoholism
  antifreeze fluids, hazard from breathing, 1130
  Isopropyl (Rubbing): See Isopropyl Alcohol
  Methyl: See Methyl Alcohol
  octyl alcohol, epidermal absorption, [Luduena] 151—ab
  whisky acidosis, prevent by using whisky with "club soda," 104
  Wood: See Methyl Alcohol
ALCOHOLISM, chronic, McBride treatment with atropine and strychnine, 330
  chronic, nystagmus induced by amytal in, [Bender] 913—ab
  in mental patients treated with insulin, [Tillim] 1118—ab
  rehabilitation center for addicts, N. Y., 1183
  research on, grant for, Chicago, 762
  treatment of addicts, [Young] 847—ab
ALDARSONE treatment of neurosyphilis, [Eisenberg] 995—ab

- ALIENS: See Immigrants; Physicians, *foreign*
- ALIMENTARY Tract: See Digestive System
- ALKALI therapy (adjuvant) with sulfadiazine alone, [Garb & Janoff] 381—C; (reply) [Rheinhold & Flippin] 1054—C
- ALKALOSIS: See Acidosis
- ALLERGENS; ALLERGY: See Anaphylaxis and Allergy
- ALLOXAN, diabetes from, 891—E
- ALOPECIA areata as conversion symptom, [Peck] 775—ab
  - in women, 467
- ALPHA Chi Omega Scholarships: See Scholarships
  - Gamma Delta Fellowships: See Fellowships
- ALTITUDE, High: See also Aviation
  - high, and gastric motility, 935
  - high, hypoxia: also loss of consciousness at, 433—E
  - high, vacation at, for person with hypertension advisable? 857
- ALUDRINE sulfate therapy of bronchial asthma (Council report), 888
- ALUMINUM acetate treatment of Paget's disease, 256
  - calcined, effect on workmen placing chinaware, [Meiklejohn] 455—ab
  - hydroxide gel, N.N.R., [Rorer] 431
  - treatment of silicosis, [Berry] 1197—ab; 1286
- AMAUROSIS: See Blindness; Idiocy, amaurotic
- AMBERLITE IR IV, treatment of hyperacidity *and gastric ulcers, 330; (correction) 603*
  - treatment of peptic ulcer, [Kraemer] 153—ab; 992—ab
- AMBULANCES, state laws on calls, [Hall] ★757
- AMBULATION: See Convalescence, early rising
- AMEBIASIS: See also Liver, amebic abscess
  - chronic cholecystitis and, 985
  - chronic intestinal upsets due to, [Groff] 814—ab
  - treatment, *para*-aminobenzoic acid, [Dwork] 532 ab
  - treatment, conessine hydrochlorate, 115
  - treatment, emetine, [Parmer] 1061—ab
  - treatment, rotenone, toxicity, 626
- AMENORRHEA in diabetes insipidus, 332
  - pituitary gonadotropin excretion during, 379
  - secondary, estrogen therapy, [Kimbrough & Israel] ★1217
- America's Health: Report to the Nation; 436—OS
